Half-life: 0.9 hr.

TIME/ACTION PROFILE (levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1 hr; 4–8 hr	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity reactions to salicylates; Cross-sensitivity with furosemide, sulfonyleurea hypoglycemic agents, or carbonic anhydrase inhibitors may exist; Glucose-6-phosphate dehydrogenase (G6PD) deficiency; Urinary tract or intestinal obstruction; Porphyria; **Lactation:** Lactation; **Pedi:** Children <2 yr (safety not established).

Use Cautiously in: Severe hepatic or renal impairment; Renal impairment (↑ risk of renal tubular damage); **OB:** Pregnancy; **Geri:** Consider ↓ body mass, hepatic/renal/cardiac function, intercurrent illness and drug therapies.

Adverse Reactions/Side Effects

CNS: ataxia, confusion, dizziness, drowsiness, headache, mental depression, psychosis, restlessness. **GI:** diarrhea, abdominal pain, anorexia, exacerbation of colitis, drug-induced hepatitis, nausea, vomiting.

Derm: itching, rash. **Hemat:** blood dyscrasias.

Interactions

Drug-Drug: ↑ risk of bleeding after neuraxial anesthesia with **low molecular weight heparins** and **heparinoids**; discontinue olsalazine before initiation of therapy or monitor closely if discontinuation not possible. May ↓ metabolism, and ↑ effects/toxicity of **mercaptopurine** or **thioguanine** with and ↑ risk of myelosuppression (use lowest possible dose and monitor closely). ↑ risk of developing Reye's syndrome; avoid olsalazine during 6 wk after **varicella vaccine**.

Route/Dosage

PO (Adults): 500 mg twice daily.

Availability

Capsules: 250 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for allergy to sulfonamides and salicylates. Patients allergic to sulfasalazine may take mesalamine or olsalazine without difficulty, but therapy should be discontinued if rash or fever occur.
- Monitor intake and output ratios. Fluid intake should be sufficient to maintain a urine output of at least 1200–1500 mL daily to prevent crystalluria and stone formation.
- **Inflammatory Bowel Disease:** Assess abdominal pain and frequency, quantity, and consistency of stools at the beginning of and throughout therapy.
- **Lab Test Considerations:** Monitor urinalysis, BUN, and serum creatinine prior to and periodically during therapy.
- Olsalazine may cause ↑ AST and ALT levels.
- **Lab Test Considerations:** Monitor CBC prior to and every 3–6 mo during prolonged therapy. Discontinue olsalazine if blood dyscrasias occur.

Potential Nursing Diagnoses

Acute pain (Indications)

Diarrhea (Indications)

Implementation

- **PO:** Administer with food in evenly divided doses every 12 hr.

Patient/Family Teaching

- Instruct patient to take medication as directed, even if feeling better. Take missed doses as soon as remembered unless almost time for next dose.
- May cause dizziness. Caution patient to avoid driving or other activities that require alertness until response to medication is known.
- Advise patient to notify health care professional if skin rash, sore throat, fever, mouth sores, unusual bleeding or bruising, wheezing, fever, or hives occurs.
- Instruct patient to notify health care professional if symptoms do not improve after 1–2 mo of therapy.
- Instruct patient to notify health care professional if symptoms worsen or do not improve. If symptoms of acute intolerance (cramping, acute abdominal pain, bloody diarrhea, fever, headache, rash) occur, discontinue therapy and notify health care professional immediately.
- Inform patient that proctoscopy and sigmoidoscopy may be required periodically during treatment to determine response.

Evaluation/Desired Outcomes

- Decrease in diarrhea and abdominal pain.
- Return to normal bowel pattern in patients with inflammatory bowel disease. Effects may be seen

within 3–21 days. The usual course of therapy is 3–6 wk.

- Maintenance of remission in patients with inflammatory bowel disease.
- Decrease in pain and inflammation, and increase in mobility in patients with rheumatoid arthritis.

omega-3-acid ethyl esters (oh-me-ga three as-id eth-il es- ters)

Lovaza

Classification

Therapeutic: lipid-lowering agents
Pharmacologic: fatty acids

Pregnancy Category C

Indications

Hypertriglyceridemia (triglycerides $\geq$ 500 mmg/dL) in adults; used with specific diet.

Action

Inhibits synthesis of triglycerides. **Therapeutic Effects:** Lowering of triglycerides.

Pharmacokinetics

Absorption: Well absorbed.

Distribution: Unknown.

Metabolism and Excretion: Incorporated into phospholipids.

Half-life: Unknown.

TIME/ACTION PROFILE (lowering of triglycerides)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2 mo	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Allergy/hypersensitivity to fish; **OB, Lactation:** Pregnancy or lactation; **Pedi:** Safety not established.

Adverse Reactions/Side Effects

GI: altered taste, eructation. **Derm:** rash.

Interactions

Drug-Drug: May ↑ risk of bleeding with aspirin or warfarin.

Route/Dosage

PO (Adults): 4 g/day; may be given as a single dose or 2 g twice daily.

Availability

Gelatin capsules (oil-filled): 1 g. **Cost:** \$196.69/100.

🍁 = Canadian drug name. 🧬 = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

NURSING IMPLICATIONS

Assessment

- Obtain a diet history, especially with regard to fat consumption.
- **Lab Test Considerations:** Monitor serum triglyceride levels prior to and periodically during therapy.
- Monitor serum ALT periodically during therapy. May cause ↑ serum ALT without concurrent ↑ in AST levels.
- Monitor serum LDL cholesterol levels periodically during therapy. May cause ↑ in serum LDL levels.

Potential Nursing Diagnoses

Noncompliance (Patient/Family Teaching)

Implementation

- **Do not confuse Lovaza with lorazepam.**
- An appropriate lipid-lowering diet should be followed before therapy and should continue during therapy.
- **PO:** May be taken as a single 4-g dose or as 2 g twice daily. May be administered with meals. Swallow capsules whole; do not break or chew.

Patient/Family Teaching

- Instruct patient to take medication as directed, not to skip doses or double up on missed doses. Take missed doses as soon as remembered, but if a day is missed, do not double doses the next day. Medication helps control but does not cure elevated serum triglyceride levels.
- Advise patient that this medication should be used in conjunction with diet restrictions (fat, cholesterol, carbohydrates, alcohol), exercise, weight loss in overweight patients, and control of medical problems (such as diabetes mellitus and hypothyroidism) that may contribute to hypertriglyceridemia.
- Emphasize the importance of follow-up exams to determine effectiveness.

Evaluation/Desired Outcomes

- Lowering of serum triglyceride levels. Patients who do not have an adequate response after 2 mo of treatment should be withdrawn from therapy.

 **omeprazole** (o-mep-ra-zole)
 Losec, PriLOSEC, PriLOSEC OTC

Classification

Therapeutic: antiulcer agents

Pharmacologic: proton-pump inhibitors

Pregnancy Category C

Indications

GERD/maintenance of healing in erosive esophagitis. Duodenal ulcers (with or without anti-infectives for *Helicobacter pylori*). Short-term treatment of active

benign gastric ulcer. Pathologic hypersecretory conditions, including Zollinger-Ellison syndrome. Reduction of risk of GI bleeding in critically ill patients. **OTC:** Heartburn occurring $\geq$ twice/wk.

Action

Binds to an enzyme on gastric parietal cells in the presence of acidic gastric pH, preventing the final transport of hydrogen ions into the gastric lumen. **Therapeutic Effects:** Diminished accumulation of acid in the gastric lumen with lessened gastroesophageal reflux. Healing of duodenal ulcers.

Pharmacokinetics

Absorption: Rapidly absorbed following oral administration; immediate release formulation contains bicarbonate to prevent acid degradation.

Distribution: Good distribution into gastric parietal cells.

Protein Binding: 95%.

Metabolism and Excretion: Mostly metabolized by the liver via the cytochrome P450 (CYP) system (primarily CYP2C19 isoenzyme, but also the CYP3A4 isoenzyme) (the CYP2C19 enzyme system exhibits genetic polymorphism; $\approx$ 15–20% of Asian patients and 3–5% of Caucasian and Black patients may be poor metabolizers and may have significantly ↑ omeprazole concentrations and an ↑ risk of adverse effects); inactive metabolites are excreted in urine (77%) and feces.

Half-life: 0.5–1 hr (↑ in liver disease to 3 hr).

TIME/ACTION PROFILE (antisecretory effects)

ROUTE	ONSET	PEAK	DURATION
PO-delayed release	within 1 hr	within 2 hr	72–96 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **Lactation:**

Discontinue omeprazole or discontinue breast feeding.

Use Cautiously in: Liver disease (dose ↓ may be necessary); **OB, Lactation, PEDI:** Safety not established in pregnant or breast-feeding women, or children <1 yr; Patients using high-doses for >1 year (↑ risk of hip, wrist, or spine fractures).

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, fatigue, headache, weakness. **CV:** chest pain. **GI:** **PSEUDOMEMBRANOUS COLITIS**, abdominal pain, acid regurgitation, constipation, diarrhea, flatulence, nausea, vomiting. **F and E:** hypomagnesemia (especially if treatment duration $\geq$ 3 mo). **Derm:** itching, rash. **MS:** bone fracture. **Misc:** allergic reactions.

Interactions

Drug-Drug: Omeprazole is metabolized by the CYP450 enzyme system and may compete with other agents metabolized by this system. ↓ metabolism and may ↑ effects of **antifungal agents, diazepam, di-**

goxin, flurazepam, triazolam, cyclosporine, phenytoin, saquinavir, tacrolimus, and warfarin. May ↓ absorption of drugs requiring acid pH, including ketoconazole, itraconazole, ampicillin, iron salts, and digoxin. Has been used safely with antacids. May significantly ↓ effects of atazanavir and nelfinavir (concurrent use not recommended). May ↑ risk of bleeding with warfarin (monitor INR/PT).

Voriconazole may ↑ levels. May ↓ the antiplatelet effects of clopidogrel; avoid concurrent use. May ↑ levels of cilostazol; consider ↓ dose of cilostazol from 100 mg twice daily to 50 mg twice daily. **Rifampin** may ↓ levels and may ↓ response; avoid concurrent use. Hypomagnesemia ↑ risk of digoxin toxicity. May ↑ levels of tacrolimus and methotrexate.

Drug-Natural Products: St. John's wort may ↓ levels and may ↓ response; avoid concurrent use.

Route/Dosage

PO (Adults): GERD/erosive esophagitis—20 mg once daily. Duodenal ulcers associated with *H. pylori*—40 mg once daily in the morning with clarithromycin for 2 wk, then 20 mg once daily for 2 wk or 20 mg twice daily with clarithromycin 500 mg twice daily and amoxicillin 1000 mg twice daily for 10 days (if ulcer is present at beginning of therapy, continue omeprazole 20 mg daily for 18 more days); has also been used with clarithromycin and metronidazole. Gastric ulcer—40 mg once daily for 4–6 wk. Reduction of the risk of GI bleeding in critically ill patients—40 mg initially, then another 40 mg 6–8 hr later, followed by 40 mg once daily for up to 14 days. Gastric hypersecretory conditions—60 mg once daily initially; may be increased up to 120 mg 3 times daily (doses >80 mg/day should be given in divided doses); OTC—20 mg once daily for up to 14 days.

PO (Children 1–16 yr and 5–9 kg): GERD/erosive esophagitis—5 mg once daily.

PO (Children 1–16 yr and 10–19 kg): GERD/erosive esophagitis—10 mg once daily.

PO (Children 1–16 yr and ≥20 kg): GERD/erosive esophagitis—20 mg once daily.

Availability (generic available)

Delayed-release capsules: 10 mg, 20 mg^{Rx, OTC}, 40 mg. **Delayed-release powder for oral suspension (peach-mint):** 2.5 mg/packet, 10 mg/packet. **In combination with:** metronidazole and clarithromycin in a compliance package (Losec 1-2-3 M); with amoxicillin and clarithromycin in a compliance package (Losec 1-2-3-A) (both in Canada only); with sodium bicarbonate (Zegerid [OTC]; see Appendix B).

NURSING IMPLICATIONS

Assessment

- Assess patient routinely for epigastric or abdominal pain and frank or occult blood in the stool, emesis, or gastric aspirate.
- **Monitor bowel function.** Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of pseudomembranous colitis. May begin up to several weeks following cessation of therapy.
- **Lab Test Considerations:** Monitor CBC with differential periodically during therapy.
- May cause ↑ AST, ALT, alkaline phosphatase, and bilirubin.
- May cause serum gastrin concentrations to ↑ during first 1–2 wk of therapy. Levels return to normal after discontinuation of omeprazole.
- Monitor INR and prothrombin time in patients taking warfarin.
- May cause hypomagnesemia. Monitor serum magnesium prior to and periodically during therapy.

Potential Nursing Diagnoses

Acute pain (Indications)

Implementation

- **Do not confuse Prilosec (omeprazole) with Prozac (fluoxetine) or Pristiq (desvenlafaxine).** Do not confuse omeprazole with fomepizole.
- **PO:** Administer doses before meals, preferably in the morning. Capsules should be swallowed whole; do not crush or chew. Capsules may be opened and sprinkled on cool applesauce, entire mixture should be ingested immediately and followed by a drink of water. Do not store for future use.
- **Powder for oral suspension:** Administer on empty stomach, at least 1 hr before a meal. For patients with nasogastric or enteral feeding, suspend feeding for 3 hr before and 1 hr after administration. Empty packet contents into a small cup containing 1–2 tablespoons of water. **Do not use other liquids or foods.** If administered through a nasogastric tube, suspend in 20 mL of water. Stir well and drink immediately. Refill cup with water and drink again.
- May be administered concurrently with antacids.

Patient/Family Teaching

- Instruct patient to take medication as directed for the full course of therapy, even if feeling better. Take missed doses as soon as remembered but not if almost time for next dose. Do not double doses.
- May cause occasional drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.

★ = Canadian drug name. † = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise patient to avoid alcohol, products containing aspirin or NSAIDs, and foods that may cause an increase in GI irritation.
- Advise patient to report onset of black, tarry stools; diarrhea; abdominal pain; or persistent headache to health care professional promptly.
- **Instruct patient to notify health care professional of onset of black, tarry stools; diarrhea; abdominal pain; or persistent headache or if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.**
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in abdominal pain or prevention of gastric irritation and bleeding. Healing of duodenal ulcers can be seen on x-ray examination or endoscopy.
- Decrease in symptoms of GERD and erosive esophagitis. Therapy is continued for 4–8 wk after initial episode.

ondansetron (on-dan-se-tron)

★ Ondissolve ODF, Zofran, Zofran ODT, Zuplenz

Classification

Therapeutic: antiemetics

Pharmacologic: 5-HT₃ antagonists

Pregnancy Category B

Indications

Prevention of nausea and vomiting associated with highly or moderately emetogenic chemotherapy. **PO:** Prevention of nausea and vomiting associated with radiation therapy. Prevention and treatment of postoperative nausea and vomiting.

Action

Blocks the effects of serotonin at 5-HT₃—receptor sites (selective antagonist) located in vagal nerve terminals and the chemoreceptor trigger zone in the CNS. **Therapeutic Effects:** Decreased incidence and severity of nausea and vomiting following chemotherapy or surgery.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability; 100% absorbed following oral administration.

Distribution: Unknown.

Metabolism and Excretion: Extensively metabolized by the liver (primarily by CYP3A4); 5% excreted unchanged by the kidneys.

Half-life: *Adults*—3.5–5.5 hr; *Children 5 mo–12 yr*—2.9 hr.

TIME/ACTION PROFILE (antiemetic effect)

ROUTE	ONSET	PEAK	DURATION
PO, IV	rapid	15–30 min	4–8 hr
IM	rapid	40 min	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Orally disintegrating tablets contain aspartame and should not be used in patients with phenylketonuria; Congenital long QT syndrome; Concurrent use of apomorphine.

Use Cautiously in: Hepatic impairment (daily dose not to exceed 8 mg); Abdominal surgery (may mask ileus); **OB, Lactation, Pedi:** Pregnancy, lactation, or children ≤3 yr (PO) or <1 mo (parenteral) (safety not established).

Adverse Reactions/Side Effects

CNS: headache, dizziness, drowsiness, fatigue, weakness. **CV:** **TORSADE DE POINTES**, QT interval prolongation. **GI:** constipation, diarrhea, abdominal pain, dry mouth, ↑ liver enzymes. **Neuro:** extrapyramidal reactions.

Interactions

Drug-Drug: Use with **apomorphine** ↑ risk of severe hypotension and loss of consciousness; concurrent use contraindicated. **Carbamazepine, phenytoin, and rifampin** may ↓ levels.

Route/Dosage

PO (Adults): Prevention of nausea/vomiting associated with highly-emetogenic chemotherapy—24 mg 30 min prior to chemotherapy.

PO (Adults and Children >11 yr): Prevention of nausea/vomiting associated with moderately emetogenic chemotherapy—8 mg 30 min prior to chemotherapy and repeated 8 hr later; 8 mg q 12 hr may be given for 1–2 days following chemotherapy. Prevention of radiation-induced nausea/vomiting—8 mg 1–2 hr prior to radiation; may be repeated q 8 hr, depending on type, location, and extent of radiation. Prevention of postoperative nausea/vomiting—16 mg 1 hr before induction of anesthesia.

PO (Children 4–11 yr): Prevention of nausea/vomiting associated with moderately emetogenic chemotherapy—4 mg 30 min prior to chemotherapy and repeated 4 and 8 hr later; 4 mg q 8 hr may be given for 1–2 days following chemotherapy.

IV (Adults): Prevention of chemotherapy-induced nausea/vomiting—0.15 mg/kg (max dose = 16 mg) 30 min prior to chemotherapy, repeated 4 and 8 hr later.

IM, IV (Adults): *Prevention of postoperative nausea/vomiting*—4 mg before induction of anesthesia or postoperatively.

IV (Children 6 mo–18 yr): *Prevention of chemotherapy-induced nausea/vomiting*—0.15 mg/kg (max dose = 16 mg) 30 min prior to chemotherapy, repeated 4 and 8 hr later.

IV (Children 1 mo–12 yr and >40 kg): *Prevention of postoperative nausea/vomiting*—4 mg.

IV (Children 1 mo–12 yr and ≤40 kg): *Prevention of postoperative nausea/vomiting*—0.1 mg/kg.

Hepatic Impairment

PO, IM, IV (Adults): *Severe hepatic impairment*—Not to exceed 8 mg/day.

Availability (generic available)

Orally disintegrating tablets (contain aspartame) (strawberry flavor): 4 mg, 8 mg. **Cost:** *Generic*—4 mg \$668.78/30, 8 mg \$1,113.95/30. **Oral soluble film (Zuplenz):** 4 mg, 8 mg. **Cost:** All strengths \$16.50/1. **Tablets:** 4 mg, 8 mg, 24 mg. **Cost:** *Generic*—4 mg \$735.05/30, 8 mg \$1,217.42/30, 24 mg \$105.50/1. **Oral solution (strawberry flavor):** 4 mg/5 mL. **Cost:** \$269.74/50 mL. **Solution for injection:** 2 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess patient for nausea, vomiting, abdominal distention, and bowel sounds prior to and following administration.
- Assess patient for extrapyramidal effects (involuntary movements, facial grimacing, rigidity, shuffling walk, trembling of hands) periodically during therapy.
- **Monitor ECG in patients with hypokalemia, hypomagnesemia, HF, bradyarrhythmias, or patients taking concomitant medications that prolong the QT interval.**
- **Lab Test Considerations:** May cause transient ↑ in serum bilirubin, AST, and ALT levels.

Potential Nursing Diagnoses

Imbalanced nutrition: less than body requirements (Indications)

Diarrhea (Side Effects)

Constipation (Side Effects)

Implementation

- First dose is administered prior to emetogenic event.
- **PO:** For orally disintegrating tablets, do not attempt to push through foil backing; with dry hands, peel back backing and remove tablet. Immediately place tablet on tongue; tablet will dissolve in seconds, then swallow with saliva. Administration of liquid is not necessary.

IV Administration

- **Direct IV:** Administer undiluted (2 mg/mL) immediately before induction of anesthesia or postoperatively if nausea and vomiting occur shortly after surgery. **Rate:** Administer over at least 30 sec and preferably over 2–5 min.
- **Intermittent Infusion:** **Diluent:** Dilute doses for prevention of nausea and vomiting associated with chemotherapy in 50 mL of D5W, 0.9% NaCl, D5/0.9% NaCl, D5/0.45% NaCl. Solution is clear and colorless. Stable for 7 days at room temperature following dilution. **Concentration:** 1 mg/mL. **Rate:** Administer each dose over 15 min.
- **Y-Site Compatibility:** acetaminophen, aldesleukin, alemtuzumab, alfenitil, amifostine, amikacin, aminocaproic acid, anakinra, anidulafungin, argatroban, ascorbic acid, atropine, azithromycin, aztreonam, benztrapine, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gulconate, carboplatin, carmustine, caspofungin, cefazolin, cefotaxime, cefoxitin, ceftriaxone, cefazidime, cefuroxime, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daunorubicin, dexamethasone sodium phosphate, dexmedetomidine, dextrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doripenem, doxorubicin, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, flouxuridine, fluconazole, fludabine, folic acid, fosaprepitant, gemcitabine, gentamicin, glycopyrrolate, heparin, hetastarch, hydrocortisone sodium succinate, hydrocortisone sodium phosphate, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, irinotecan, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, magnesium sulfate, mannitol, mechloroethamine, melphalan, meperidine, mesna, methotrexate, methoxamine, methyldopate, metoclopramide, metoprolol, metronidazole, midazolam, mitomycin, mitoxantrone, morphine, moxifloxacin, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxacillin, oxaliplatin, oxytocin, paclitaxel, pamidronate, pancuronium, papaverine, penicillin G, pentamidine, pentazocine, pentostatin, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, prot-

✳ = Canadian drug name. ✳ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

amine, pyridoxine, ranitidine, remifentanyl, rocuronium, sodium acetate, sodium phosphates, streptokinase, streptozocin, succinylcholine, sufentanil, tacrolimus, telavancin, teniposide, theophylline, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, topotecan, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** acyclovir, allopurinol, aminophylline, amphotericin B cholesteryl, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, azathioprine, cefepime, cefoperazone, chloramphenicol, dantrolene, diazoxide, ertapenem, furosemide, ganciclovir, indomethacin, lorazepam, micafungin, milrinone, pantoprazole, pemetrexed, pentobarbital, phenobarbital, phenytoin, rituximab, sargramostim, sodium bicarbonate, thiopental, trastuzumab, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Instruct patient to take orlistat as directed.
- Advise patient to notify health care professional immediately if symptoms of irregular heart beat or involuntary movement of eyes, face, or limbs occur.

Evaluation/Desired Outcomes

- Prevention of nausea and vomiting associated with emetogenic cancer chemotherapy.
- Prevention of postoperative nausea and vomiting.
- Prevention of nausea and vomiting due to radiation therapy.

orlistat (or-li-stat)

Alli, Xenical

Classification

Therapeutic: weight control agents
Pharmacologic: lipase inhibitors

Pregnancy Category X

Indications

Obesity management (weight loss and maintenance) when used in conjunction with a reduced-calorie diet in patients with an initial BMI ≥ 30 kg/m² or ≥ 27 kg/m² in the presence of additional risk factors (diabetes, hypertension, hyperlipidemia). Reduces the risk of weight regain after prior loss. May delay onset of type 2 diabetes in prediabetic patients.

Action

Decreases the absorption of dietary fat by reversibly inhibiting enzymes (lipases), which are necessary for the breakdown and subsequent absorption of fat. **Therapeutic Effects:** Weight loss and maintenance in obese patients. Delayed onset of type 2 diabetes.

Pharmacokinetics

Absorption: Minimal systemic absorption.

Distribution: Action is local, within the GI tract.

Protein Binding: Minimally absorbed drug is >99% bound to plasma proteins.

Metabolism and Excretion: Major route is fecal elimination of unabsorbed drug.

Half-life: 1–2 hr.

TIME/ACTION PROFILE (effects on fecal fat)

ROUTE	ONSET	PEAK	DURATION
PO	24–48 hr	unknown	48–72 hr†

†Following discontinuation

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Chronic malabsorption syndrome or cholestasis; **OB:** Pregnancy (weight loss not recommended during pregnancy).

Use Cautiously in: **Lactation:** Breast feeding; **Pedi:** Children <12 yr (safety not established).

Adverse Reactions/Side Effects

With initial use; incidence decreases with prolonged use.

GI: HEPATOTOXICITY, fecal urgency, flatus with discharge, ↑ defecation, oily evacuation, oily spotting, fecal incontinence. **GU:** nephrolithiasis, renal impairment.

Interactions

Drug-Drug: ↓ absorption of some **fat-soluble vitamins**, **beta-carotene**, **levothyroxine** (separate orlistat and levothyroxine by ≥ 4 hr), and **cyclosporine** (give cyclosporine 3 hr after orlistat). May ↓ effectiveness of **anticonvulsants**.

Route/Dosage

PO (Adults and children ≥ 12 yr): 60–120 mg 3 times daily with each meal containing fat.

Availability

Capsules: 60 mg^{OTC}, 120 mg.

NURSING IMPLICATIONS

Assessment

- Monitor patients for weight loss and adjust concurrent medications (antihypertensives, antidiabetics, lipid-lowering agents) as needed.

Potential Nursing Diagnoses

Disturbed body image (Indications)

Imbalanced nutrition: more than body requirements (Indications)

Implementation

- **Do not confuse Xenical (orlistat) with Xeloda (capecitabine).**
- **PO:** Administer one capsule 3 times daily with or up to 1 hr after a meal. If a meal is missed or contains no fat, dose of orlistat can be omitted.

- A supplemental multivitamin containing vitamins A, D, E, K, and beta-carotene should be taken daily, at least 2 hr before or after orlistat dose.
- Psyllium 6 g with each dose or 12 g at bedtime may decrease GI side effects.

Patient/Family Teaching

- Instruct patient to take orlistat with meals as directed. If a meal is missed or contains no fat, orlistat dose can be omitted. Do not take more than recommended dose; does not improve benefit.
- Instruct patient to adhere to a reduced-calorie diet. Daily intake of fat should be distributed over three main meals. Meals should contain no more than 30% fat. Taking orlistat with a meal high in fat may increase the GI side effects.
- Advise patient that regular physical activity, approved by a health care professional, should be used in conjunction with orlistat and diet.
- Inform patient of common GI side effects (oily spotting, gas with discharge, urgent need to go to the bathroom, oily or fatty stools, an oily discharge, increased number of bowel movements, inability to control bowel movements). Oil in bowel movement may be clear or have orange or brown colorations. GI side effects usually occur in first weeks of treatment and are more increased following a meal high in fat. May lessen or disappear, or may continue for 6 mo or longer.
- Advise patient to notify health care professional if signs and symptoms of hepatotoxicity (weakness, fatigue, fever, jaundice, brown urine, abdominal pain, nausea, vomiting, light-colored stools, itching, loss of appetite) occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient to notify health care professional if pregnancy is planned or suspected.

Evaluation/Desired Outcomes

- Slow, consistent weight loss when combined with a reduced-calorie diet.
- Delayed onset of type 2 diabetes.

oseltamivir (o-sel-tam-i-vir)

Tamiflu

Classification

Therapeutic: antivirals

Pharmacologic: neuraminidase inhibitors

Pregnancy Category C

Indications

Treatment of uncomplicated acute illness due to influenza infection in adults and children ≥ 2 wk who have had symptoms for ≤ 2 days. Prevention of influenza in patients ≥ 1 yr.

Action

Inhibits the enzyme neuraminidase, which may alter virus particle aggregation and release. **Therapeutic Effects:** Reduced duration or prevention of flu-related symptoms.

Pharmacokinetics

Absorption: Rapidly absorbed from the GI tract and converted by the liver to the active form, oseltamivir carboxylate. 75% reaches systemic circulation as the active drug.

Distribution: Unknown.

Protein Binding: oseltamivir phosphate: 42%; oseltamivir carboxylate: 3%.

Metabolism and Excretion: Rapidly metabolized by the liver to oseltamivir carboxylate, the active drug. $>99\%$ excreted unchanged in urine.

Half-life: *Oseltamivir carboxylate*—6–10 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **Pedi:** Children < 1 yr.

Use Cautiously in: **Pedi:** Children < 2 wk (safety and efficacy not established for treatment); children < 1 yr (safety and efficacy not established for prevention). Oral suspension contains sodium benzoate, avoid use in neonates; **OB, Lactation:** Safety not established; use only if potential benefits outweigh possible risks.

Adverse Reactions/Side Effects

CNS: **SEIZURES**, abnormal behavior, agitation, confusion, delirium, hallucinations, insomnia, nightmares, vertigo. **Resp:** bronchitis. **GI:** nausea, vomiting.

Interactions

Drug-Drug: May $\downarrow$ the therapeutic effect of **influenza virus vaccine** avoid use 2 days prior to and 2 weeks after vaccine administration.

Route/Dosage

Treatment of Influenza

PO (Adults and Children ≥ 13 yr): 75 mg twice daily for 5 days.

PO (Children 1–12 yr and >40 kg): 75 mg twice daily for 5 days.

✶ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

PO (Children 1–12 yr and 23.1–40 kg): 60 mg twice daily for 5 days.

PO (Children 1–12 yr and 15.1–23 kg): 45 mg twice daily for 5 days.

PO (Children 1–12 yr and ≤15 kg): 30 mg twice daily for 5 days.

PO (Infants 2 wk–<1 yr): 3 mg/kg/dose twice daily for 5 days.

Renal Impairment

PO (Adults): *CCr* 10–30 mL/min—75 mg once daily for 5 days.

Influenza Prevention

PO (Adults and Children ≥13 yr): 75 mg once daily for at least 10 days.

PO (Children 1–12 yr and >40 kg): 75 mg once daily for 10 days.

PO (Children 1–12 yr and 23.1–40 kg): 60 mg once daily for 10 days.

PO (Children 1–12 yr and 15.1–23 kg): 45 mg once daily for 10 days.

PO (Children 1–12 yr and ≤15 kg): 30 mg once daily for 10 days.

Renal Impairment

PO (Adults): *CCr* 10–30 mL/min—75 mg every other day or 30 mg every day for 10 days.

Availability

Capsules: 30 mg, 45 mg, 75 mg. **Oral suspension (tutti-frutti flavor):** 6 mg/mL, ★ 12 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor influenza symptoms (sudden onset of fever, cough, headache, fatigue, muscular weakness, sore throat). Additional supportive treatment may be indicated to treat symptoms.

Potential Nursing Diagnoses

Risk for infection (Indications)

Implementation

- Treatment with oseltamivir should be started as soon as possible from the first sign of flu symptoms within 2 days of exposure.
- Consider available information on influenza drug susceptibility patterns and treatment effects before using oseltamivir for prophylaxis.
- **PO:** May be administered with food or milk to minimize GI irritation.
- **Use correct oral dosing device for measuring oral solution.** Dosing errors have occurred due to oseltamivir dosing in mg and solution in mL. Make sure units of measure on prescription instructions match dosing device provided with the drug.
- If oral suspension is not available, capsules can be opened and mixed with flavored foods (regular or sugar-free chocolate syrup, corn syrup, caramel

topping, light brown sugar (dissolved in water). If correct dose and oral suspension are not available, pharmacist may compound emergency supply of oral suspension from 75 mg capsules.

Patient/Family Teaching

- Instruct patient to take oseltamivir as soon as influenza symptoms appear and to continue to take it as directed, for the full course of therapy, even if feeling better. Take missed doses as soon as remembered unless within 2 hr of next dose. Do not double doses.
- Caution patient that oseltamivir should not be shared with anyone, even if they have the same symptoms.
- Advise patient that oseltamivir is not a substitute for a flu shot. Patients should receive annual flu shot according to immunization guidelines.
- Advise patients to report behavioral changes (hallucinations, delirium, and abnormal behavior) to health care professional immediately.
- Advise patient to consult health care professional before taking other medications concurrently with oseltamivir.

Evaluation/Desired Outcomes

- Reduced duration or prevention of flu-related symptoms.

ospemifene (os- pem-i-feen)

Osphena

Classification

Therapeutic: hormones

Pharmacologic: estrogen agonists/antagonists

Pregnancy Category X

Indications

Moderate to severe dyspareunia due to menopausal vulvar/vaginal atrophy.

Action

Has agonist (estrogen-like) effects on the endometrium of the uterus; effects are tissue-specific. **Therapeutic Effects:** Decreased dyspareunia.

Pharmacokinetics

Absorption: Well absorbed following oral administration; food enhances absorption 2–3 fold.

Distribution: Unknown.

Protein Binding: >99%.

Metabolism and Excretion: Mostly metabolized by the liver (CYP3A4 and CYP2C9 enzyme systems); 75% excreted in feces, 7% in urine as metabolites; minimal amounts excreted unchanged in urine.

Half-life: 26 hr.

TIME/ACTION PROFILE (improvement in symptoms)

ROUTE	ONSET	PEAK	DURATION
PO	within 12 wk	unknown	unknown

Contraindications/Precautions

Contraindicated in: Undiagnosed/abnormal genital bleeding; History/suspicion of estrogen-dependent cancer; History of/current DVT/PE/MI/cardiovascular/arterial thromboembolic pathology; Concurrent estrogens, estrogen agonist/antagonists, fluconazole, or rifampin; **OB:** Known/suspected pregnancy (may cause fetal harm); **Lactation:** Breast feeding should be avoided.

Use Cautiously in: Patients with risk factors for cardiovascular disease, arterial vascular disease or venous thromboembolism (including hypertension, obesity, family history, tobacco use, diabetes mellitus, history of DVT/PE or systemic lupus erythematosus); Known or suspected breast cancer; Severe hepatic impairment.

Adverse Reactions/Side Effects

CV: STROKE, DEEP VEIN THROMBOSIS/PE. **GU:** ENDOMETRIAL CANCER, genital/vaginal discharge. **Derm:** hot flush, hyperhidrosis. **MS:** muscle spasms.

Interactions

Drug-Drug: Blood levels, effects and risk of adverse reactions ↑ by **fluconazole**, avoid concurrent use. Blood levels and effects may be ↑ by **ketocoazole** or other **drugs that inhibit the CYP3A4 or CYP2C9 enzyme systems**. Blood levels and beneficial effects ↓ by **rifampin**, avoid concurrent use. Avoid concurrent use of other **estrogens or estrogen agonist/antagonists** due to ↑ estrogen effects. May displace or be displaced by other **drugs that are highly protein bound**.

Route/Dosage

PO (Adults): 60 mg once daily with food.

Availability

Tablets: 60 mg.

NURSING IMPLICATIONS

Assessment

- Assess amount of pain during intercourse prior to and periodically during therapy.
- Determine methods previously use to treat dyspareunia.
- Assess BP before and periodically during therapy.

Potential Nursing Diagnoses

Sexual dysfunction (Indications)

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- **PO:** Administer once daily with food.

Patient/Family Teaching

- Instruct patient to take ospemifene as directed. Advise patient to read *Patient Information* sheet before starting therapy and with each Rx refill in case of changes.
- Advise patient to report signs and symptoms of unusual vaginal bleeding, changes in vision or speech, sudden new severe headaches, severe pains in chest or legs with or without shortness of breath, weakness, or fatigue promptly to health care professional.
- Inform patient that ospemifene may cause hot flashes, vaginal discharge, muscle spasm, and increased sweating.
- Patients who still have a uterus should discuss addition of progestin with health care professional.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Women should be monitored for breast and uterine cancer (pelvic exam, breast exam, mammogram) at least yearly.
- Caution patient that cigarette smoking, high BP, high cholesterol, diabetes, and being overweight during estrogen therapy may increase risk of heart disease.
- Ospemifene should not be taken during pregnancy. Instruct patient to notify health care professional immediately if pregnancy is planned or suspected or if breast feeding.
- Advise patient to discuss dose and need for ospemifene every 3–6 mo.

Evaluation/Desired Outcomes

- Decrease in pain during intercourse.

oxacillin, See **PENICILLINS, PENICILLINASE RESISTANT.**

oxaliplatin (ox-a-li-pla-tin)
Eloxatin

Classification

Therapeutic: antineoplastics

Pharmacologic: alkylating agents

Pregnancy Category D

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Indications

Adjuvant treatment of stage III colon cancer in patients who have undergone complete resection of the primary tumor (in combination with 5-fluorouracil and leucovorin). Treatment of advanced colorectal cancer (in combination with 5-fluorouracil and leucovorin).

Unlabeled Use: Treatment of ovarian cancer that has progressed despite treatment with other agents.

Action

Inhibits DNA replication and transcription by incorporating platinum into normal cross-linking (cell-cycle nonspecific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Extensive tissue distribution.

Protein Binding: >90% (platinum).

Metabolism and Excretion: Undergoes rapid and extensive nonenzymatic biotransformation; excreted mostly by the kidneys.

Half-life: 391 hours.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity to other platinum compounds; **OB, Lactation:** Pregnancy or lactation.

Use Cautiously in: Renal impairment; **Geri:** ↑ risk of adverse reactions; **Pedi:** Safety not established.

Adverse Reactions/Side Effects

Adverse reactions are noted for the combination of oxaliplatin, 5-FU and leucovorin.

CNS: REVERSIBLE POSTERIOR LEUKOENCEPHALOPATHY SYNDROME, fatigue. **CV:** chest pain, edema, thromboembolism. **EENT:** visual abnormalities. **Resp:** PULMONARY FIBROSIS, coughing, dyspnea. **GI:** diarrhea, nausea, vomiting, abdominal pain, anorexia, gastroesophageal reflux, stomatitis. **F and E:** dehydration, hypokalemia. **Hemat:** leukopenia, NEUTROPENIA, THROMBOCYTOPENIA, anemia. **Local:** injection site reactions. **MS:** back pain. **Neuro:** neurotoxicity. **Misc:** ANAPHYLAXIS/ANAPHYLACTOID REACTIONS, fever.

Interactions

Drug-Drug: Concurrent use of nephrotoxic agents may ↑ toxicity.

Route/Dosage

IV (Adults): Day 1—85 mg/m² with leucovorin 200 mg/m² at the same time over 2 hr, followed by 5-fluorouracil 400 mg/m² bolus over 2–4 min, then 5-fluorouracil 600 mg/m² as a 22 hr infusion. Day 2—leucovorin 200 mg/m² over 2 hr, followed by 5–

fluorouracil 400 mg/m² bolus over 2–4 min, then 5–fluorouracil 600 mg/m² as a 22 hr infusion. Cycle is repeated every 2 wk. Dosage reduction/alteration may be required for neurotoxicity or other serious adverse effects.

Renal Impairment

IV (Adults): *CCr* <30 mL/min—↓ dose on Day 1 to 65 mg/m².

Availability (generic available)

Solution for injection: 5 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess for peripheral sensory neuropathy. *Acute onset* occurs within hr to 1–2 days of dosing, resolves within 14 days, and frequently recurs with further dosing (transient paresthesia, dysesthesia and hypoesthesia of hands, feet, perioral area, or throat). Symptoms may be precipitated or exacerbated by exposure to cold or cold objects; avoid ice during symptoms. May also cause jaw spasm, abnormal tongue sensation, dysarthria, eye pain, and a feeling of chest pressure. *Persistent* (>14 days) causes paresthesias, dysesthesias, and hypoesthesias, but may also include deficits in proprioception that may interfere with daily activities (walking, writing, swallowing). Persistent neuropathy may occur without prior acute neuropathy and may improve upon discontinuation of oxaliplatin.
- Assess for signs of pulmonary fibrosis (non-productive cough, dyspnea, crackles, radiological; infiltrates). May be fatal. Discontinue oxaliplatin if pulmonary fibrosis occurs.
- Monitor for signs of anaphylaxis (rash, hives, swelling or lips or tongue, sudden cough). Epinephrine, corticosteroids, and antihistamines should be readily available.
- Monitor for signs and symptoms of reversible posterior leukoencephalopathy syndrome (headache, altered mental functioning, seizures, abnormal vision from blurriness to blindness, associated or not with hypertension).
- Lab Test Considerations:** Monitor WBC with differential, hemoglobin, platelet count, and blood chemistries (ALT, AST, bilirubin, and creatinine) before each oxaliplatin cycle.

Potential Nursing Diagnoses

Nausea (Adverse Reactions)

Implementation

- Extravasation may result in local pain and inflammation that may be severe and lead to necrosis.
- Premedicate patient with antiemetics with or without dexamethasone. Prehydration is not required.

IV Administration

- **pH:** 4.8–7.5.
- **Intermittent Infusion:** Protect concentrated solution from light; do not freeze. **Diluent:** Must be further diluted with 250–500 mL of D5W. **Do not use 0.9% NaCl or any other chloride-containing solution for final solution.** Do not use aluminum needles or administration sets containing aluminum parts; aluminum may cause degradation of platinum compounds. May be stored in refrigerator for 24 hr or 6 hr at room temperature. Diluted solution is not light-sensitive. Do not administer solutions that are discolored or contain particulate matter. **Concentration:** 0.2–0.6 mg/mL. **Rate:** Administer oxaliplatin simultaneously with leucovorin in separate bags via Y-line over 120 min. Prolonging infusion time to 6 hr may decrease acute toxicities. Infusion times for fluorouracil and leucovorin do not need to change.
- **Y-Site Compatibility:** alemtuzumab, alfantanil, amifostine, amikacin, aminocaproic acid, amiodarone, amphotericin B colloid, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, cefepime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin, dexamethasone sodium phosphate, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxacurium, doxorubicin, doxorubicin liposomal, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, etoposide, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, foscarnet, fosphenytoin, furosemide, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, levoleucovorin calcium, levorphanol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, meropenem, mesna, metaraminol, methyldopate, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreo-

tide, ondansetron, paclitaxel, palonosetron, pancuronium, pemetrexed, pentamidine, pentazocine, phenolamine, phenylephrine, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinuapristin/dalfopristin, ranitidine, rocuronium, sodium acetate, sodium phosphates, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiopental, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zolendronic acid.

- **Y-Site Incompatibility:** cefepime, cefoperazone, dantrolene, diazepam. Alkaline solutions, chloride-containing solutions. Infusion line should be flushed with D5W prior to administration of other solutions or medications.

Patient/Family Teaching

- Inform patients and caregivers of potential for peripheral neuropathy and potentiation by exposure to cold or cold objects. Advise patient to avoid cold drinks, use of ice in drinks or as ice packs, and to cover exposed skin prior to exposure to cold temperature or cold objects. Caution patients to cover themselves with a blanket during infusion, do not breathe deeply when exposed to cold air, wear warm clothing, and cover mouth and nose with a scarf or pull-down ski cap to warm the air that goes to their lungs, do not take things from the freezer or refrigerator without wearing gloves, drink fluids warm or at room temperature, always drink through a straw, do not use ice chips for nausea, be aware that most metals (car doors, mailbox) are cold; wear gloves to touch, do not run air conditioning at high levels in house or car, if hands get cold wash them with warm water. Advise health care professional of how you did since last treatment before next infusion.
- Instruct patient to notify health care professional immediately if signs of reversible posterior leukoencephalopathy syndrome, low blood cell counts (fever, persistent diarrhea, infection) or if persistent vomiting, signs of dehydration, cough or breathing difficulty, thirst, dry mouth, dizziness, decreased urination, signs of infection (fever (temperature of $\geq 100.5^\circ\text{F}$, cough that brings up mucus, chills or shivering, burning or pain on urination, pain on swallowing, sore throat, redness or swelling at intravenous site) or signs of allergic reactions occur.
- Advise female patient to use effective contraception during therapy and to avoid breastfeeding; oxaliplatin is teratogenic.

Evaluation/Desired Outcomes

- Decrease in size and spread of malignancies.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

oxaprozin (ox-a-proe-zin)

Daypro

Classification

Therapeutic: antirheumatics, nonsteroidal anti-inflammatory agents

Pregnancy Category C (first and second trimester), **D** (third trimester)**Indications**

Osteoarthritis. Rheumatoid arthritis. Juvenile rheumatoid arthritis.

ActionInhibits prostaglandin synthesis. **Therapeutic Effects:** Suppression of pain and inflammation.**Pharmacokinetics****Absorption:** Well absorbed following oral administration (80%); 35% is rapidly converted to an active metabolite.**Distribution:** Unknown.**Protein Binding:** 99.9%.**Metabolism and Excretion:** The active metabolite is metabolized by the liver to inactive compounds.**Half-life:** 42–50 hr.**TIME/ACTION PROFILE** (antirheumatic action)

ROUTE	ONSET	PEAK	DURATION
PO	within 7 days	unknown	unknown

Contraindications/Precautions**Contraindicated in:** Hypersensitivity; Cross-sensitivity may exist with other NSAIDs, including aspirin; Active GI bleeding or ulcer disease; Peri-operative pain from coronary artery bypass graft (CABG) surgery; **Lactation:** Lactation.**Use Cautiously in:** Cardiovascular disease or risk factors for cardiovascular disease (may ↑ risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke, especially with prolonged use); Severe hepatic disease; Renal impairment (lower initial dose may be necessary); History of ulcer disease; **OB:** May cause premature closure of the ductus arteriosus; not recommended for use in the second half of pregnancy; **Pedi:** Children <6 yr (safety not established); **Geri:** Appears on Beers list; at ↑ risk of GI bleeding; may require ↓ dose due to age-related ↓ in renal function.**Adverse Reactions/Side Effects****CNS:** agitation, anxiety, confusion, depression, dizziness, drowsiness, fatigue, headache, insomnia, malaise, weakness. **EENT:** abnormal vision, tinnitus.**Resp:** dyspnea, hypersensitivity pneumonitis. **CV:** edema, vasculitis. **GI:** GI BLEEDING, abdominal pain, diarrhea, dyspepsia, ↑ liver enzymes, anorexia, cholestatic jaundice, constipation, dry mouth, duodenal ulcer, flatulence, gastritis, increased appetite, nausea,stomatitis, vomiting. **GU:** albuminuria, azotemia, interstitial nephritis. **Derm:** EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, ↑ sweating, photosensitivity, pruritus, rash. **Hemat:** prolonged bleeding time. **Metab:** weight gain. **Neuro:** paresthesia, tremor. **Misc:** allergic reactions including ANAPHYLAXIS, ANGIOEDEMA.**Interactions****Drug-Drug:** ↑ adverse GI effects and toxicity with aspirin, other NSAIDs, potassium supplements, corticosteroids, or alcohol. Chronic use with acetaminophen may ↑ risk of adverse renal reactions. May ↓ effectiveness of diuretics or antihypertensive therapy. May ↑ hypoglycemic effects of insulin or oral hypoglycemic agents. ↑ risk of toxicity from methotrexate. ↑ risk of bleeding with cefotetan, cefoperazone, thrombolytic agents, anticoagulants, ticlopidine, clopidogrel, eptifibatide, or tirofiban. ↑ risk of adverse hematologic reactions with antineoplastics or radiation therapy.**Drug-Natural Products:** ↑ anticoagulant effect and bleeding risk with arnica, chamomile, clove, feverfew, garlic, ginger, ginkgo, Panax ginseng, and others.**Route/Dosage****Osteoarthritis or Rheumatoid Arthritis****PO (Adults):** 1200 mg once daily; onset may be more rapid with an initial 1800-mg dose. Patients with low body weight, mild disease, or renal impairment may be started at 600 mg/day (not to exceed 1800 mg/day or 26 mg/kg/day). Daily doses >1200 mg should be given in 2–3 divided doses. Consideration should be given to decreasing dose to lowest effective amount.**Juvenile Rheumatoid Arthritis****PO (Children 6–16 yr):** ≥55 kg—1200 mg once daily; 32–54 kg—900 mg once daily; 22–31 kg—600 mg once daily.**Availability (generic available)****Tablets:** 600 mg.**NURSING IMPLICATIONS****Assessment**

- Patients who have asthma, aspirin-induced allergy, and nasal polyps are at increased risk for developing hypersensitivity reactions. Monitor for rhinitis, asthma, and urticaria.
- Assess pain and range of motion prior to and periodically during therapy.
- **Lab Test Considerations:** May cause prolonged bleeding time, which may persist for up to 2 wk following discontinuation of therapy.
- Evaluate BUN, serum creatinine, CBC, and liver function tests periodically in patients receiving prolonged therapy. Serum potassium, BUN, serum creatinine, alkaline phosphatase, LDH, AST, and ALT

tests may show ↑ levels. Blood glucose, hemoglobin, and hematocrit concentrations, leukocyte and platelet counts, and CCr may be ↓.

Potential Nursing Diagnoses

Acute pain (Indications)

Implementation

- Administration in higher than recommended doses does not provide increased effectiveness but may cause increased side effects. Use lowest effective dose for shortest period of time.
- **PO:** Administer with food or antacids to decrease GI irritation.

Patient/Family Teaching

- Advise patient to take oxaprozol with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Instruct patient to take medication as directed. Take missed doses as soon as remembered but not if almost time for the next dose. Do not double doses.
- May cause drowsiness and dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Caution patient to avoid the concurrent use of alcohol, aspirin, acetaminophen, and other OTC or herbal products without consulting health care professional.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery. Oxaprozol should be discontinued 2 wk prior to surgery.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to consult health care professional if rash, itching, visual disturbances, tinnitus, weight gain, edema, black stools, persistent headache, or influenza-like syndrome (chills, fever, muscle aches, pain) occurs.

Evaluation/Desired Outcomes

- Decreased pain and improved joint mobility. Maximum effectiveness may require 2 wk or more of continuous therapy. Patients who do not respond to one NSAID may respond to another.

oxazepam (ox-az-e-pam)

✳ Novoxapam, ✳ Oxepam, Serax

Classification

Therapeutic: antianxiety agents, sedative/hypnotics

Pharmacologic: benzodiazepines

Schedule IV

Pregnancy Category D

Indications

Management of anxiety, anxiety associated with depression. Symptomatic treatment of alcohol withdrawal.

Action

Depresses the CNS, probably by potentiating GABA, an inhibitory neurotransmitter. **Therapeutic Effects:** Decreased anxiety. Diminished symptoms of alcohol withdrawal.

Pharmacokinetics

Absorption: Well absorbed following oral administration. Absorption is slower than with other benzodiazepines.

Distribution: Widely distributed. Crosses the blood-brain barrier. May cross the placenta and enter breast milk.

Metabolism and Excretion: Metabolized by the liver to inactive compounds.

Protein Binding: 97%.

Half-life: 5–15 hr.

TIME/ACTION PROFILE (sedation)

ROUTE	ONSET	PEAK	DURATION
PO	45–90 min	unknown	6–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with other benzodiazepines may exist; Comatose patients or those with pre-existing CNS depression; Uncontrolled severe pain; Angle-closure glaucoma; Some products contain tartrazine and should be avoided in patients with known intolerance; **OB, Lactation:** Pregnancy or lactation.

Use Cautiously in: Hepatic dysfunction (may be preferred over some benzodiazepines due to short half-life); History of suicide attempt or substance use disorder; Debilitated patients (initial dosage ↓ recommended); Severe chronic obstructive pulmonary disease; Myasthenia gravis; **Pedi:** Children <6 yr (safety not established); **Ger:** Appears on Beers list (associated with ↑ risk of falls; ↓ dose required); ↑ sensitivity to benzodiazepines.

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, confusion, hangover, headache, impaired memory, mental depression, paradoxical excitation, slurred speech. **EENT:** blurred vision. **Resp:** respiratory depression. **CV:** tachycardia.

GI: constipation, diarrhea, drug-induced hepatitis, nausea, vomiting, weight gain (unusual). **GU:** urinary problems. **Derm:** rashes. **Hemat:** leukopenia.

Misc: physical dependence, psychological dependence, tolerance.

✳ = Canadian drug name. ~~✳~~ = Genetic implication. ~~✳~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Interactions

Drug-Drug: Additive CNS depression with other CNS depressants, including alcohol, antihistamines, antidepressants, opioid analgesics, and other sedative/hypnotics (including other benzodiazepines). May ↓ the therapeutic effectiveness of levodopa. Hormonal contraceptives or phenytoin may ↓ effectiveness. Theophylline may ↓ sedative effects.

Drug-Natural Products: Concomitant use of kava-kava, valerian, skullcap, chamomile, or hops can ↑ CNS depression.

Route/Dosage

PO (Adults): *Antianxiety agent* — 10–30 mg 3–4 times daily. *Sedative/hypnotic/management of alcohol withdrawal* — 15–30 mg 3–4 times daily.

PO (Geriatric Patients): 5 mg 1–2 times daily initially or 10 mg 3 times daily; may be ↑ as needed.

Availability (generic available)

Capsules: 10 mg, 15 mg, 30 mg. **Tablets:** ★ 10 mg, 15 mg, ★ 30 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for anxiety and orientation, mood and behavior.
- Assess level of sedation (ataxia, dizziness, slurred speech) periodically throughout therapy.
- Assess regularly for continued need for treatment.
- Prolonged high-dose therapy may lead to psychological or physical dependence. Restrict the amount of drug available to patient.
- **Ger:** Assess CNS effects and risk of falls. Institute falls prevention strategies.
- **Lab Test Considerations:** Monitor CBC and liver function tests periodically during prolonged therapy.
- May cause decreased thyroidal uptake of sodium iodide ^{123}I and ^{131}I .

Potential Nursing Diagnoses

Anxiety (Indications)

Ineffective coping (Indications)

Risk for injury (Side Effects)

Implementation

- Medication should be tapered at the completion of therapy (taper by 0.5 mg q 3 days). Sudden cessation of medication may lead to withdrawal (insomnia, irritability, nervousness, tremors).
- **PO:** Administer with food if GI irritation becomes a problem.

Patient/Family Teaching

- Instruct patient to take oxazepam exactly as directed. Missed doses should be taken within 1 hr; if remembered later, omit and return to regular dosing schedule. Do not double or increase doses. If

dose is less effective after a few weeks, notify health care professional.

- Inform patient that oxazepam is usually prescribed for short-term use. Encourage patient to participate in psychotherapy to address source of anxiety and improve coping skills.
- Encourage patient to participate in psychotherapy to address source of anxiety and improve coping skills.
- Teach other methods to decrease anxiety, such as increased exercise, support group, relaxation techniques.
- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid the use of alcohol and to consult health care professional prior to the use of OTC preparations that contain antihistamines or alcohol.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to inform health care professional if pregnancy is planned or suspected.
- Emphasize the importance of follow-up exams to monitor effectiveness of medication.
- **Ger:** Instruct patient and family how to reduce falls risk at home.

Evaluation/Desired Outcomes

- Decreased sense of anxiety.
- Increased ability to cope.
- Prevention or relief of acute agitation, tremor, and hallucinations during alcohol withdrawal.

OXcarbazepine (ox-kar-baz-e-peen) Oxtellar XR, Trileptal

Classification

Therapeutic: anticonvulsants

Pharmacologic: carbamazepine analogues

Pregnancy Category C

Indications

Monotherapy or adjunctive therapy of partial seizures in adults and children 4 yr and older with epilepsy (extended-release tablets only indicated for adjunctive therapy). Adjunctive therapy in patients 2–16 yr with epilepsy. **Unlabeled Use:** Management of trigeminal neuralgia.

Action

Blocks sodium channels in neural membranes, stabilizing hyperexcitable states, inhibiting repetitive neuronal firing, and decreasing propagation of synaptic impulses. **Therapeutic Effects:** Decreased incidence of seizures.

Pharmacokinetics

Absorption: Rapidly absorbed after oral administration and rapidly converted to the active 10-hydroxy metabolite (MHD).

Distribution: Enters breast milk in significant amounts.

Metabolism and Excretion: Extensively converted to MHD, which is then primarily excreted by the kidneys.

Half-life: Oxcarbazepine—2 hr; MHD—9 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO 12 hr	PO	rapid	4.5 hr†

†Steady-state levels of MHD are reached after 2–3 days during twice-daily dosing

Contraindications/Precautions

Contraindicated in: Hypersensitivity; cross-sensitivity with carbamazepine may occur; **Lactation:** Lactation.

Use Cautionally in: All patients (may ↑ risk of suicidal thoughts/behaviors); Renal impairment (dose ↓ recommended if CCr <30 mL/min); Severe hepatic impairment; **OB:** May be teratogenic; use only if potential benefit justifies potential risk to the fetus; **Pedi:** Children <4 yr (safety not established).

Adverse Reactions/Side Effects

CNS: **SUICIDAL THOUGHTS,** dizziness/vertigo, drowsiness/fatigue, headache, cognitive symptoms. **EENT:** abnormal vision, diplopia, nystagmus. **GI:** abdominal pain, dyspepsia, nausea, vomiting, thirst. **Derm:** acne, rash, urticaria. **Endo:** hypothyroidism. **F and E:** hyponatremia. **Neuro:** ataxia, gait disturbances, tremor. **Misc:** allergic reactions, hypersensitivity reactions including STEVENS-JOHNSON SYNDROME and MULTIORGAN REACTIONS, lymphadenopathy.

Interactions

Drug-Drug: May inhibit the CYP 2C19 enzyme system and would be expected to alter the effects of other drugs that are metabolized by this system. Oxcarbazepine and MHD induce the P450 3A4/5 enzyme systems and would be expected to alter the effects of other drugs that are metabolized by this system. This may result in ↓ levels and effectiveness of **hormonal contraceptives, felodipine, isradipine, nifedipine, nimodipine, and cyclosporine.** In addition, oxcarbazepine itself is metabolized by cytochrome P450 system and other **drugs that alter the activity of this system.** ↑ CNS depression may occur with other CNS depressants, including **alcohol, antihistamines, antidepressants, sedative/hypnotics, and opioids.** Carbamazepine, phenobarbital,

phenytoin, valproic acid, and verapamil ↓ levels. May ↑ serum levels and effects of **phenytoin** (dose ↓ of phenytoin may be required).

Route/Dosage

(Immediate-release tablets and oral suspension can be interchanged at equal doses.)

PO (Adults): *Adjunctive therapy (immediate-release)*—300 mg twice daily, may be ↑ by up to 600 mg/day at weekly intervals up to 1200 mg/day (up to 2400 mg/day may be needed); *Adjunctive therapy (extended-release)*—600 mg once daily for 1 wk; may ↑ by 600 mg/day at weekly intervals up to 1200–2400 mg once daily; *Conversion to monotherapy*—300 mg twice daily; may be ↑ by 600 mg/day at weekly intervals, whereas other antiepileptic drugs are tapered over 3–6 wk; dose of oxcarbazepine should be ↑ up to 2400 mg/day over a period of 2–4 wk; *Initiation of monotherapy*—300 mg twice daily, ↑ by 300 mg/day every 3rd day, up to 1200 mg/day. Maximum maintenance dose should be achieved over 2–4 wk.

PO (Children 2–16 yr): *Adjunctive therapy (immediate release)*—4–5 mg/kg twice daily (up to 600 mg/day), ↑ over 2 wk to achieve 900 mg/day in patients 20–29 kg, 1200 mg/day in patients 29.1–39 kg and 1800 mg/day in patients >39 kg (range 6–51 mg/kg/day). In patients <20 kg, initial dose of 16–20 mg/kg/day may be used not to exceed 60 mg/kg/day. *Conversion to monotherapy (immediate release)*—8–10 mg/kg/day given twice daily; may be ↑ by 10 mg/kg/day at weekly intervals, whereas other antiepileptic drugs are tapered over 3–6 wk; dose of oxcarbazepine should be ↑ up to 600–900 mg/day in patients ≤20 kg, 900–1200 mg/day in patients 25–30 kg, 900–1500 mg/day in patients 35–40 kg, 1200–1500 mg/day in patients 45 kg, 1200–1800 mg/day in patients 50–55 kg, 1200–2100 mg/day in patients 60–65 kg, and 1500–2100 mg/day in patients 70 kg. Maximum maintenance dose should be achieved over 2–4 wk.

PO (Children 6–17 yr): *Adjunctive therapy (extended-release)*—8–10 mg/kg once daily (up to 600 mg/day) for 1 wk; may ↑ by 8–10 mg/kg/day at weekly intervals over 2–3 wk to achieve 900 mg/day in patients 20–29 kg, 1200 mg/day in patients 29.1–39 kg and 1800 mg/day in patients >39 kg.

Renal Impairment

PO (Adults): CCr <30 mL/min (*immediate and extended-release*). Initiate therapy at 300 mg/day and ↑ slowly to achieve desired response.

Availability (generic available)

Tablets: 150 mg, 300 mg, 600 mg. **Cost:** Generic—150 mg \$145.36/100, 300 mg \$264.46/100, 600 mg \$487.92/100. **Extended-release tablets:** 150 mg, 300 mg, 600 mg. **Cost:** 150 mg \$357.60/100, 300 mg

★ = Canadian drug name. ‡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

\$496.80/100, 600 mg \$909.60/100. **Oral suspension:** 60 mg/mL. **Cost:** *Generic*—\$206.80/250 mL.

NURSING IMPLICATIONS

Assessment

- **Monitor** closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- **Seizures:** Assess frequency, location, duration, and characteristics of seizure activity. Hyponatremia may increase frequency and severity of seizures.
- **Monitor** patient for CNS changes. May manifest as cognitive symptoms (psychomotor slowing, difficulty with concentration, speech or language problems), somnolence or fatigue, or coordination abnormalities (ataxia, gait disturbances).
- **Lab Test Considerations:** Monitor ECG and serum electrolytes before and periodically during therapy. May cause hyponatremia. Usually occurs during the first 3 mo of therapy. May require dose reduction, fluid restriction, or discontinuation of therapy. Sodium levels return to normal within a few days of discontinuation.

Potential Nursing Diagnoses

Risk for injury (Indications, Side Effects)

Implementation

- **Do not confuse** oxcarbazepine with carbamazepine.
- Implement seizure precautions as indicated.
- **PO:** Administer twice daily with or without food.
- Administer extended-release tablets on an empty stomach, at least 1 hr before or 2 hr after meals; giving with food increases risks of adverse effects. Swallow extended-release tablets whole, do not crush, break, or chew.
- Shake oral suspension well and prepare dose immediately after. Withdraw using oral dosing syringe supplied by manufacturer. May be mixed in a small glass of water just prior to administration or swallowed directly from syringe. Rinse syringe with warm water and allow to dry.

Patient/Family Teaching

- Instruct patient to take oxcarbazepine in equally spaced doses, as directed. Take missed doses as soon as possible but not just before next dose; do not double dose. Notify health care professional if more than 1 dose is missed. Medication should be gradually discontinued to prevent seizures. Instruct patient to read the *Medication Guide* before starting and with each Rx refill, changes may occur.
- May cause dizziness, drowsiness, or CNS changes. Advise patients to avoid driving or other activities requiring alertness until response to medication is known. Do not resume driving until physician gives clearance based on control of seizure disorder.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal prod-

ucts being taken and to consult with health care professional before taking other medications. Advise patient not to take alcohol or other CNS depressants concurrently with this medication.

- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking, other unusual changes in behavior or mood occur.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Advise female patients to use an additional nonhormonal method of contraception during therapy and until next menstrual period. Instruct patient to notify health care professional if pregnancy is planned or suspected.
- Advise patients to carry identification describing disease and medication regimen at all times.

Evaluation/Desired Outcomes

- Absence or reduction of seizure activity.

oxiconazole, See ANTIFUNGALS (TOPICAL).

OXYBUTYNIN (ox-i-byoo-ti-nin)

oxybutynin (oral)

Ditropan, Ditropan XL

oxybutynin (gel)

Gelnique

oxybutynin (transdermal system)

Oxytrol, Oxytrol for Women

Classification

Therapeutic: urinary tract antispasmodics

Pharmacologic: anticholinergics

Pregnancy Category B

Indications

Urinary symptoms that may be associated with neurogenic bladder including: Frequent urination, Urgency, Nocturia, Urge incontinence. Overactive bladder with symptoms of urge incontinence, urgency, and frequency.

Action

Inhibits the action of acetylcholine at postganglionic receptors. Has direct spasmolytic action on smooth muscle, including smooth muscle lining the GU tract, with-

out affecting vascular smooth muscle. **Therapeutic Effects:** Increased bladder capacity. Delayed desire to void. Decreased urge incontinence, urinary urgency, and frequency and decreased number of urinary accidents associated with overactive bladder.

Pharmacokinetics

Absorption: Rapidly absorbed following oral administration, but undergoes extensive first-pass metabolism; XL tablets provide extended release. Transdermal absorption occurs by passive diffusion through intact skin and bypasses the first-pass effect.

Distribution: Highly bound (>99%) to plasma proteins. Widely distributed.

Metabolism and Excretion: Extensively metabolized by the liver (CYP3A4 enzyme system); 1 metabolite is pharmacologically active; metabolites are renally excreted with negligible (<0.1%) excretion of unchanged drug.

Half-life: 7–8 hr (oral and patch); 30–64 hr (gel).

TIME/ACTION PROFILE (urinary spasmolytic effect)

ROUTE	ONSET	PEAK	DURATION
PO	30–60 min	3–6 hr	6–10 hr (up to 24 hr with XL tablet)
TD-patch	within 24 hr	36 hr	3–4 days
TD-gel	unknown	unknown	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Uncontrolled angle-closure glaucoma; Intestinal obstruction or atony; Urinary retention.

Use Cautiously in: Hepatic/renal impairment; Bladder outflow obstruction; Ulcerative colitis; Benign prostatic hyperplasia; Cardiovascular disease; Reflux esophagitis or gastrointestinal obstructive disorders; Patients with dementia receiving acetylcholinesterase inhibitors; Myasthenia gravis; **OB, Lactation:** Pregnancy or lactation; **Pedi:** Oral: Safety not established in children <5 yr; Patch and gel: Safety not established in children <18 yr; **Geri:** Appears on Beers list. Poorly tolerated due to anticholinergic effects. Initiate treatment at lower doses.

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, agitation, confusion, hallucinations, headache. **EENT:** blurred vision, hoarseness. **CV:** chest pain, edema, tachycardia. **GI:** constipation, dry mouth, nausea, abdominal pain, anorexia, diarrhea, dysphagia. **GU:** ↑ thirst, urinary retention.

Derm: ↓ sweating, hot flushes, *transdermal only:* application site reactions, pruritus. **Metab:** hyperthermia. **Misc:** **ANAPHYLAXIS, ANGIOEDEMA.**

Interactions

Drug-Drug: ↑ anticholinergic effects with other agents having anticholinergic properties, including amantadine, antidepressants, phenothiazines, disopyramide, and haloperidol. Additive CNS depression with other CNS depressants, including alcohol, antihistamines, antidepressants, opioids, and sedative/hypnotics. Ketoconazole, itraconazole, erythromycin, and clarithromycin may ↑ effects.

Route/Dosage

PO (Adults): Immediate-release tablets—5 mg 2–3 times daily (not to exceed 5 mg 4 times daily) (may start with 2.5 mg 2–3 times daily in elderly). *Extended-release tablets*—5–10 mg once daily; may ↑, as needed (in 5-mg increments) up to maximum dose of 30 mg/day.

PO (Children >5 yr): Immediate-release tablets—5 mg 2–3 times daily (not to exceed 15 mg/day). *Extended-release tablets (children ≥6 yr)*—5 mg once daily; may ↑, as needed, (in 5-mg increments) up to maximum dose of 20 mg/day.

PO (Children 1–5 yr): 0.2 mg/kg/dose 2–3 times daily.

Transdermal (Adults): Patch—Apply one 3.9 mg system twice weekly (every 3–4 days); *Gel (Gelnique 3%)*—Apply contents of 3 pumps (84 mg) once daily; *Gel (Gelnique 10%)*—Apply contents of one sachet (100 mg/g) once daily.

Availability (generic available)

Tablets: 5 mg. **Cost: Generic**—\$52.94/100. **Extended-release tablets:** 5 mg, 10 mg, 15 mg. **Cost: Generic**—5 mg \$105.23/100, 10 mg \$106.08/100, 15 mg \$117.04/100. **Syrup:** 5 mg/5 mL. **Cost: Generic**—\$38.95/473 mL. **Gel (Gelnique):** 3%, 1 g unit dose (sachet) contains 100 mg/g (10%). **Cost:** 3% \$224.11/92 g, 10% \$30.12/3 g. **Transdermal system:** 3.9 mg/day system^{OTC}.

NURSING IMPLICATIONS

Assessment

- Monitor voiding pattern and intake and output ratios, and assess abdomen for bladder distention prior to and periodically during therapy. Catheterization may be used to assess postvoid residual. Cystometry is usually performed to diagnose type of bladder dysfunction prior to prescription of oxybutynin.
- **Geri:** Assess geriatric patients for anticholinergic effects (sedation and weakness).

Potential Nursing Diagnoses

Impaired urinary elimination (Indications)
Acute pain (Indications)

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Implementation

- **Do not confuse Ditropan XL (oxybutynin) with Diprivan (propofol).**
- **PO:** Immediate release tabs should be administered on an empty stomach; XL tablets may be given with or without food. XL tablets should be swallowed whole; do not break, crush, or chew.
- **Transdermal patch:** Apply patch on same two days each week (Sunday/Wednesday, Monday/Thursday) to hip, abdomen, or buttock in an area that is clean, dry, and without irritation. Patch should be worn continuously.
- **Transdermal gel:** Apply clear, colorless gel once daily to intact skin on abdomen (avoid area around navel), upper arms/shoulders, or thighs until dry. Rotate sites; do not use same site on consecutive days.

Patient/Family Teaching

- Instruct patient to take oxybutynin as directed. Take missed doses as soon as remembered unless almost time for next dose. Advise patient to read *Information for the Patient* prior to beginning therapy and with each Rx refill in case of new information.
- May cause drowsiness or blurred vision. Advise patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to avoid concurrent use of alcohol and other CNS depressants while taking this medication.
- Instruct patient that frequent rinsing of mouth, good oral hygiene, and sugarless gum or candy may decrease dry mouth. Health care professional should be notified if mouth dryness persists >2 wk.
- Advise patient to stop taking oxybutynin and notify health care professional immediately if signs of angioedema and/or anaphylaxis (swelling of face, tongue, or throat; rash; dyspnea).
- Inform patient that oxybutynin decreases the body's ability to perspire. Avoid strenuous activity in a warm environment because overheating may occur.
- Advise patient to notify health care professional if urinary retention occurs or if constipation persists. Discuss methods of preventing constipation, such as increasing dietary bulk, increasing fluid intake, and increasing mobility.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Discuss need for continued medical follow-up. Periodic cystometry may be used to evaluate effectiveness. Ophthalmic exams should be performed periodically to detect glaucoma, especially in patients over 40 yr of age.

- **Transdermal patch:** Instruct patient on correct application and disposal of patch. Open pouch by tearing along arrows; apply immediately. Apply 1/2 patch to skin by removing 1/2 protective cover and applying firmly to skin. Apply second half by bending in half and rolling patch onto skin while removing protective liner. Press patch firmly in place.
- Remove slowly; fold in half, sticky sides together, and discard. Wash site with mild soap and water or a small amount of baby oil.
- Advise patient referred for MRI to remove patch prior to test and give directions for replacing patch.
- **Transdermal gel:** Instruct patient on correct application of oxybutynin gel. Do not apply to recently shaved skin, skin with rashes, or areas treated with lotions, oils, or powders; may be used with sunscreen. Wash area with mild soap and water and dry completely before applying. Tear packet open just before use and squeeze entire contents into hand or directly onto application site of abdomen, arms/shoulders, or thighs. Amount of gel will be size of a nickel on the skin. Gently rub into skin until dry. Wash hands immediately following application. Avoid application near open fire or when smoking; medication is flammable. Do not shower, bathe, swim, exercise, or immerse the application site in water within 1 hr after application. Cover application site with clothing if close skin-to-skin contact at application site is anticipated.

Evaluation/Desired Outcomes

- Relief of bladder spasm and associated symptoms (frequency, urgency, nocturia, and incontinence) in patients with a neurogenic or overactive bladder.

REMS HIGH ALERT

oxyCODONE (ox-i-koe-done)

Oxecta, OxyCONTIN, ★Oxy IR,
★Oxyneo, Roxicodone, ★Supeudol

Classification

Therapeutic: opioid analgesics
Pharmacologic: opioid agonists, opioid agonists/nonopioid analgesic combinations

Schedule II

Pregnancy Category B

Indications

Moderate to severe pain; extended release product should be used for patients requiring around-the-clock management of chronic pain.

Action

Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli, while producing generalized CNS depression. **Therapeutic Effects:** Decreased pain.

Pharmacokinetics

Absorption: Well absorbed from the GI tract.

Distribution: Widely distributed. Crosses the placenta; enters breast milk.

Protein Binding: 38–45%.

Metabolism and Excretion: Mostly metabolized by the liver by the CYP3A4 isoenzyme.

Half-life: 2–3 hr.

TIME/ACTION PROFILE (analgesic effects)

ROUTE	ONSET	PEAK	DURATION
PO	10–15 min	60–90 min	3–6 hr
PO-CR†	10–15 min	3 hr	12 hr

†Controlled release

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Some products contain alcohol or bisulfites and should be avoided in patients with known intolerance or hypersensitivity; Significant respiratory depression; Paralytic ileus; Acute or severe bronchial asthma; Acute, mild, intermittent, or postoperative pain (extended-release);

Use Cautiously in: Head trauma: ↑ intracranial pressure; Severe renal or hepatic disease; Hypothyroidism; Adrenal insufficiency; Alcoholism; Seizure disorders; Undiagnosed abdominal pain; Prostatic hyperplasia; Difficulty swallowing or GI disorders that may predispose patient to obstruction (↑ risk for GI obstruction); **OB:** Avoid chronic use; weigh maternal benefit against fetal risks; **Lactation:** Lactation; **Geri:** Elderly or debilitated patients (initial dose ↓ recommended).

Adverse Reactions/Side Effects

CNS: confusion, sedation, dizziness, dysphoria, euphoria, floating feeling, hallucinations, headache, unusual dreams. **EENT:** blurred vision, diplopia, miosis.

Resp: RESPIRATORY DEPRESSION. **CV:** orthostatic hypotension. **GI:** constipation, dry mouth, choking, GI obstruction, nausea, vomiting. **GU:** urinary retention.

Derm: flushing, sweating. **Misc:** physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Use with caution in patients receiving **MAO inhibitors** (may result in unpredictable reactions—↓ initial dose of oxycodone to 25% of usual dose). Additive CNS depression with **alcohol, antihistamines, and sedative/hypnotics**. Administration of **partial-antagonist opioid analgesics** may precipitate withdrawal in physically dependent patients. **Nalbuphine, buprenorphine, or pentazocine** may ↓ analgesia. Potent **CYP3A4 inhibitors** including erythromycin, ketoconazole, itraconazole, voriconazole, or ritonavir may ↑ levels. Potent **CYP3A4 inducers** including rifampin, carbamazepine, and phenytoin may ↓ levels.

Route/Dosage

Larger doses may be required during chronic therapy.

PO (Adults ≥50 kg): 5–10 mg q 3–4 hr initially, as needed. Controlled-release tablets (Oxycontin) may be given q 12 hr.

PO (Adults <50 kg): 0.2 mg/kg q 3–4 hr initially, as needed.

PO (Children): 0.05–0.15 mg/kg q 4–6 hr as needed, as immediate-release product.

Rect (Adults): 10–40 mg 3–4 times daily initially, as needed.

Availability (generic available)

Tablets (Oxecta, Roxicodone): 5 mg, 10 mg, 15 mg, 20 mg, 30 mg. **Cost: Generic**—5 mg \$47.99/100, 10 mg \$62.50/100, 15 mg \$75.90/100, 20 mg \$110.30/100, 30 mg \$145.47/100. **Immediate-release capsules:** 5 mg. **Cost: Generic**—\$79.59/100. **Controlled-release tablets (Oxycontin):** 10 mg, 15 mg, 20 mg, 30 mg, 40 mg, 60 mg, 80 mg. **Cost:** 10 mg \$52.54/20, 15 mg \$78.60/20, 20 mg \$100.42/20, 30 mg \$142.16/20, 40 mg \$178.10/20, 60 mg \$259.32/20, 80 mg \$335.08/20. **Oral solution:** 1 mg/mL. **Cost: Generic**—\$142.50/500 mL. **Concentrated oral solution:** 20 mg/mL. **Cost: Generic**—\$218.75/30 mL. **Suppositories:** ★ 10 mg, ★ 20 mg. **In combination with:** aspirin (Endodan, Percodan), acetaminophen (Endocet, Magnacet, Oxycet, Percocet, Roxicet, Tylox); see Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess type, location, and intensity of pain prior to and 1 hr (peak) after administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numerical or visual analog scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal.
- Patients taking controlled-release tablets may also be given supplemental short-acting opioid doses for breakthrough pain.
- An equianalgesic chart (see Appendix K) should be used when changing routes or when changing from one opioid to another.
- Assess BP, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Physical stimulation may be sufficient to prevent significant hypventilation. Dose may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use.

★ = Canadian drug name. ⚡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive oxycodone for pain do not develop psychological dependence. Progressively higher doses may be required to relieve pain with long-term therapy.
- Assess bowel function routinely. Prevention of constipation should be instituted with increased intake of fluids and bulk, and laxatives to minimize constipating effects. Stimulant laxatives should be administered routinely if opioid use exceeds 2–3 days, unless contraindicated.
- **Lab Test Considerations:** May ↑ plasma amylase and lipase levels.
- **Toxicity and Overdose:** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by direct IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

Potential Nursing Diagnoses

Acute pain (Indications)

Chronic pain (Indications)

Risk for injury (Side Effects)

Implementation

- **High Alert:** Accidental overdose of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders; have second practitioner independently check original order and dose calculations.
- Do not confuse short-acting oxycodone with long-acting Oxycontin. Do not confuse oxycodone with hydrocodone. Do not confuse Oxycontin with MS Contin.
- Explain therapeutic value of medication prior to administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Coadministration with nonopioid analgesics may have additive analgesic effects and may permit lower doses.
- Oxycodone should be discontinued gradually after long-term use to prevent withdrawal symptoms.
- **PO:** May be administered with food or milk to minimize GI irritation.
- Administer solution with properly calibrated measuring device.
- **Controlled Release:** Take 1 tablet at a time. Swallow controlled-release tablet whole; do not crush, break, or chew. **Taking broken, chewed, crushed or**

dissolved controlled-release tablets leads to rapid release and absorption of a potentially fatal dose of oxycodone. Advise patients not to pre-soak, lick, or wet controlled-release tablets prior to placing in the mouth. Take each tablet with enough water to ensure complete swallowing immediately after placing in mouth. Dose should be based on 24-hr opioid requirement determined with short-acting opioids then converted to controlled-release form.

- Do not use *Oxecta* for administration via nasogastric, gastric or other feeding tubes as it may cause obstruction of feeding tubes.

Patient/Family Teaching

- Instruct patient on how and when to ask for and take pain medication.
- Advise patient that oxycodone is a drug with known abuse potential. Protect it from theft, and never give to anyone other than the individual for whom it was prescribed.
- Medication may cause drowsiness or dizziness. Advise patient to call for assistance when ambulating or smoking. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patients taking *Oxycontin* tablets that empty matrix tablets may appear in stool.
- Advise patient to make position changes slowly to minimize orthostatic hypotension.
- Advise patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.
- Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.

REMS HIGH ALERT

oxymorphone (ox-i-mor-fone)
Opana, Opana ER

Classification

Therapeutic: opioid analgesics

Pharmacologic: opioid agonists

Schedule II

Pregnancy Category C

Indications

Management of moderate to severe pain. Extended-release tablets should only be used in patients who require continuous, around-the-clock management of chronic pain. Supplement in balanced anesthesia.

Action

Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli, while producing generalized CNS depression. **Therapeutic Effects:** Decrease in pain.

Pharmacokinetics

Absorption: 10% absorbed following oral administration. Food and alcohol significantly ↑ absorption (38%). Well absorbed following IM or subcut administration.

Distribution: Widely distributed; crosses placenta, enters breast milk.

Metabolism and Excretion: Mostly metabolized by the liver; at least 2 metabolites are pharmacologically active, <1% excreted unchanged in urine.

Half-life: 2.6–4 hr.

TIME/ACTION PROFILE (analgesic effects)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	4–6 hr
PO ER	unknown	unknown	12 hr
IM	10–15 min	30–90 min	3–6 hr
IV	5–10 min	15–30 min	3–6 hr
Subcut	10–20 min	unknown	3–4 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent alcohol; Moderate/severe hepatic impairment; Significant respiratory depression (unless monitoring and resuscitative equipment are readily available); Acute or severe bronchial asthma (extended-release); Acute, mild, intermittent, or postoperative pain (extended-release); Paralytic ileus.

Use Cautiously in: Acute alcoholism or delirium tremens or other toxic psychoses; Mild hepatic impairment; Head injury/↑ intracranial pressure (may obscure neurologic signs and further ↑ pressure); Volume depletion or drugs that may cause hypotension including diuretics and phenothiazines (↑ risk of severe hypotension); Circulatory shock (may ↑ risk of severe hypotension); Adrenocortical insufficiency; Seizure disorders; Hypothyroidism; Prostatic hypertrophy or ureteral stricture; Severe pulmonary or renal impairment; Biliary tract disease or pancreatitis; **OB:** Use only in pregnancy if maternal benefit outweighs fetal risk; **Lactation:** Lactation; **Geri:** Blood levels are ↑; dose accordingly.

Exercise Extreme Caution in: Conditions associated with hypoxia, hypercapnea, ↓ respiratory reserve

(including asthma, COPD, cor pulmonale, morbid obesity, sleep apnea, myxedema, kyphoscoliosis, CNS depression and coma).

Adverse Reactions/Side Effects

CNS: confusion, sedation, dizziness, dysphoria, euphoria, floating feeling, hallucinations, headache, unusual dreams. **EENT:** blurred vision, diplopia, miosis.

Resp: **RESPIRATORY DEPRESSION.** **CV:** orthostatic hypotension. **GI:** constipation, dry mouth, nausea, vomiting.

GU: urinary retention. **Derm:** flushing, sweating.

Misc: physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Use with caution in patients receiving **MAO inhibitors** (may result in unpredictable reactions—↓ initial dose of oxymorphone to 25% of usual dose). ↑ risk of CNS depression, hypotension and respiratory depression with **alcohol**, other **opioids** or **CNS depressants** including **sedatives**, **hypnotics**, **general anesthetics**, **phenothiazines**, **tranquilizers**, **skeletal muscle relaxants**, or **sedating antihistamines**; may initiate therapy with 1/3 to 1/2 usual starting dose. **Drugs that may cause volume depletion or hypotension** including **diuretics**, **phenothiazines** may ↑ risk of severe hypotension. Administration of **partial-antagonist opioid analgesics** may precipitate withdrawal in physically dependent patients. **Nalbuphine**, **buprenorphine**, or **pentazocine** ↓ analgesia.

Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression.

Route/Dosage

Larger doses may be required during chronic therapy.

PO (Adults): *Opioid-naïve patients*—10–20 mg every 4–6 hr, some patients may require initial dose of 5 mg, not to exceed 20 mg. Once optimal analgesia is obtained, chronic pain patients may be converted to an equivalent 24-hr dose given as extended release tablets every 12 hr.

Subcut, IM (Adults): 1–1.5 mg q 3–6 hr as needed. *Analgesia during labor*—0.5–1 mg.

IV (Adults): 0.5 mg q 3–6 hr as needed; ↑ as needed.

Availability (generic available)

Tablets (Opana): 5 mg, 10 mg. **Extended-release tablets (Opana ER):** 5 mg, 7.5 mg, 10 mg, 15 mg, 20 mg, 30 mg, 40 mg. **Solution for injection:** 1 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess type, location, and intensity of pain prior to and 1 hr following IM and 15–30 min (peak) fol-

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

lowing IV administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numerical or visual analogue scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal.

- Patients taking controlled-release tablets should also be given supplemental short-acting opioid doses for breakthrough pain.
- An equianalgesic chart (see Appendix K) should be used when changing routes or when changing from one opioid to another.
- **Assess BP, pulse, and respirations before and periodically during administration.** If respiratory rate is <10/min, assess level of sedation. Physical stimulation may be sufficient to prevent significant hypoventilation. Dose may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use.
- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive oxymorphone for pain do not develop psychological dependence. Progressively higher doses may be required to relieve pain with long-term therapy.
- Assess bowel function routinely. Prevention of constipation should be instituted with increased intake of fluids and bulk, and laxatives. Stimulant laxatives should be administered routinely if opioid use exceeds 2–3 days, unless contraindicated.
- **Lab Test Considerations:** May ↑ plasma amylase and lipase levels.
- **Toxicity and Overdose:** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by direct IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

Potential Nursing Diagnoses

Acute pain (Indications)

Chronic pain (Indications)

Risk for injury (Side Effects)

Implementation

- **High Alert:** Accidental overdose of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders; have second practitioner independently check original order, dose calculations, and infusion pump settings.
- Explain therapeutic value of medication prior to administration to enhance the analgesic effect.

- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Coadministration with nonopioid analgesics may have additive analgesic effects and may permit lower doses.
- Medication should be discontinued gradually after long-term use to prevent withdrawal symptoms.
- **PO:** Administer at least 1 hr prior to or 2 hr after eating.
- **Extended Release:** Swallow controlled-release tablets whole; do not break, crush, or chew. Titrate to mild to no pain with regular use of no more than 2 doses of supplemental analgesia (rescue) per 24 hr. Dose should be based on 24-hr opioid requirement determined with short-acting opioids then converted to controlled-release form.
- If patient is opioid-naïve, start with 5 mg every 12 hr, then titrate in increments of 5–10 mg every 12 hr every 3–7 days to a level that provides adequate analgesia with minimal side effects.
- If converting from *Opana* to *Opana ER*, administer half the patient's total daily dose of *Opana* as *Opana ER* every 12 hr.
- If converting from parenteral oxymorphone, administer 10 times the patient's total daily parenteral oxymorphone dose as *Opana ER* in two equally divided doses every 12 hr.
- If converting from other opioids, 10 mg of oral oxymorphone is equianalgesic to hydrocodone 20 mg, oxycodone 20 mg, methadone 20 mg, and morphine 30 mg orally.

IV Administration

- **Direct IV:** Administer undiluted. **Concentration:** 1 mg/mL. **Rate:** Give over 2–3 min.

Patient/Family Teaching

- Instruct patient on how and when to ask for pain medication.
- Instruct patient to take oxymorphone as directed and not to adjust dose without consulting health care professional. Take missed doses as soon as possible if on chronic therapy. If almost time for next dose, skip dose and return to regular schedule. Do not double doses unless advised by health care professional. Do not stop taking oxymorphone abruptly, may cause withdrawal symptoms. Discontinue gradually under supervision of health care professional. Caution patient to keep medication out of reach of children and pets.
- Advise patient that oxymorphone is a drug with known abuse potential. Protect it from theft, and never give to anyone other than the individual for whom it was prescribed.
- Caution patient not to share this medication; may cause harm or death and is against the law.
- Medication may cause drowsiness or dizziness. Advise patient to call for assistance when ambulating

or smoking. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.

- Advise patient to make position changes slowly to minimize orthostatic hypotension.
- Advise patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.
- Inform patients taking *Opana ER* tablets that soft mass resembling tablets may appear in stool; active medication was already absorbed.
- Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.

HIGH ALERT

oxytocin (ox-i-toe-sin)

Pitocin

Classification

Therapeutic: hormones

Pharmacologic: oxytocics

Pregnancy Category X

Indications

IV: Induction of labor at term. **IV:** Facilitation of threatened abortion. **IV, IM:** Postpartum control of bleeding after expulsion of the placenta.

Action

Stimulates uterine smooth muscle, producing uterine contractions similar to those in spontaneous labor. Has vasopressor and antidiuretic effects. **Therapeutic Effects:** Induction of labor. Control of postpartum bleeding.

Pharmacokinetics

Absorption: IV administration results in 100% bioavailability.

Distribution: Widely distributed in extracellular fluid. Small amounts reach fetal circulation.

Metabolism and Excretion: Rapidly metabolized by liver and kidneys.

Half-life: 3–9 min.

TIME/ACTION PROFILE (reduction in uterine contractions)

ROUTE	ONSET	PEAK	DURATION
IV	immediate	unknown	1 hr
IM	3–5 min	unknown	30–60 min

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Anticipated nonvaginal delivery.

Use Cautiously in: **OB:** First and second stages of labor; slow infusion over 24 hr has caused water intoxication with seizure and coma or maternal death due to oxytocin's antidiuretic effect.

Adverse Reactions/Side Effects

Maternal adverse reactions are noted for IV use only.

CNS: *maternal*—**COMA, SEIZURES; fetal, INTRACRANIAL HEMORRHAGE.** **Resp:** *fetal*—**ASPHYXIA, hypoxia.** **CV:** *maternal*—hypotension; *fetal*, arrhythmias. **F and E:** *maternal*—hypochloremia, hyponatremia, water intoxication. **Misc:** *maternal*—↑ uterine motility, painful contractions, abruptio placentae, ↓ uterine blood flow, hypersensitivity.

Interactions

Drug-Drug: Severe hypertension may occur if oxytocin follows administration of **vasopressors**.

Route/Dosage

Induction/Stimulation of Labor

IV (Adults): 0.5–1 milliunits/min; ↑ by 1–2 milliunits/min q 30–60 min until desired contraction pattern established; dose may be ↓ after desired frequency of contractions is reached and labor has progressed to 5–6 cm dilation.

Postpartum Hemorrhage

IV (Adults): 10 units infused at 20–40 milliunits/min.

IM (Adults): 10 units after delivery of placenta.

Incomplete/Inevitable Abortion

IV (Adults): 10 units at a rate of 20–40 milliunits/min.

Availability (generic available)

Solution for injection: 10 units/mL.

NURSING IMPLICATIONS

Assessment

- Fetal maturity, presentation, and pelvic adequacy should be assessed prior to administration of oxytocin for induction of labor.
- Assess character, frequency, and duration of uterine contractions; resting uterine tone; and fetal heart rate frequently throughout administration. If contractions occur <2 min apart and are >50–65 mm Hg on monitor, if they last 60–90 sec or longer, or if a signif-

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

icant change in fetal heart rate develops, stop infusion and turn patient on her left side to prevent fetal anoxia. Notify health care professional immediately.

- Monitor maternal BP and pulse frequently and fetal heart rate continuously throughout administration.
- This drug occasionally causes water intoxication. Monitor patient for signs and symptoms (drowsiness, listlessness, confusion, headache, anuria) and notify physician or other health care professional if they occur.
- **Lab Test Considerations:** Monitor maternal electrolytes. Water retention may result in hyponatremia or hyponatremia.

Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- Do not administer oxytocin simultaneously by more than one route.

IV Administration

- **Continuous Infusion:** Rotate infusion container to ensure thorough mixing. Store solution in refrigerator, but do not freeze.
- Infuse via infusion pump for accurate dose. Oxytocin should be connected via Y-site injection to an IV of 0.9% NaCl for use during adverse reactions.
- Magnesium sulfate should be available if needed for relaxation of myometrium.
- **Induction of Labor:** **Diluent:** Dilute 1 mL (10 units) in 1 L of compatible infusion fluid (0.9% NaCl, D5W, or LR). **Concentration:** 10 milliunits/mL. **Rate:** Begin infusion at 0.5–2 milliunits/min (0.05–0.2 mL); increase in increments of 1–2 milliunits/min at 15–30-min intervals until contractions simulate normal labor.
- **Postpartum Bleeding:** **Diluent:** For control of postpartum bleeding, dilute 1–4 mL (10–40 units) in 1 L of compatible infusion fluid. **Concentration:** 10–40 milliunits/mL. **Rate:** Begin infusion at a rate of 20–40 milliunits/min to control uterine atony. Adjust rate as indicated.
- **Incomplete or Inevitable Abortion:** **Diluent:** For incomplete or inevitable abortion, dilute 1 mL (10 units) in 500 mL of 0.9% NaCl or D5W. **Concentration:** 20 milliunits/mL. **Rate:** Infuse at a rate of 20–40 milliunits/min.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amikacin, aminocaproic acid, aminophylline, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid, atropine, azathioprine, azithromycin, aztreonam, benzotropine, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium

gluconate, capreomycin, caspofungin, ceftazolin, cefepime, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, ciprofloxacin, cisatracurium, clindamycin, cyanocobalamin, cyclosporine, daptomycin, dexmethasone, dexmedetomidine, digoxin, digoxin, diphenhydramine, dobutamine, dolasetron, dopamine, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epoetin alfa, epifibatide, ertapenem, erythromycin, esmolol, famotidine, fenoldopam, fentanyl, fluconazole, folic acid, foscarnet, fosphenytoin, furosemide, ganciclovir, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone sodium succinate, hydromorphone, imipenem/cilastatin, isoproterenol, ketamine, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, meprobamate, metaraminol, methyldopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, morphine, moxifloxacin, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxacillin, palonosetron, pamidronate, papaverine, penicillin G, pentamidine, pentazocine, pentobarbital, phenobarbital, phenolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, ranitidine, sodium acetate, sodium bicarbonate, sodium phosphates, streptokinase, succinylcholine, sufentanil, tacrolimus, theophylline, thiamine, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, vancomycin, vasopressin, verapamil, vitamin B complex with C, voriconazole, warfarin, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** dantrolene, diazepam, diazoxide, indomethacin, methohexital, phenytoin, remifentanyl, trimethoprim/sulfamethoxazole.
- **Solution Compatibility:** dextrose/Ringer's or lactated Ringer's combinations, dextrose/saline combinations, Ringer's or lactated Ringer's injection, D5W, D10W, 0.45% NaCl, 0.9% NaCl.

Patient/Family Teaching

- Advise patient to expect contractions similar to menstrual cramps after administration has started.

Evaluation/Desired Outcomes

- Onset of effective contractions.
- Increase in uterine tone.
- Reduction in postpartum bleeding.

PAClitaxel (pak-li-tax-el)

Taxel

PAClitaxel protein-bound particles (albumin-bound)

Abraxane

Classification

Therapeutic: antineoplastics

Pharmacologic: taxoids

Pregnancy Category D

Indications

Paclitaxel: Advanced ovarian cancer (with cisplatin). Non-small cell lung cancer when potentially curative surgery and/or radiation therapy is not an option. Metastatic breast cancer unresponsive to other therapy. Node-positive breast cancer when administered sequentially to standard combination chemotherapy that includes doxorubicin. Treatment of AIDS-related Kaposi's sarcoma. **Paclitaxel (albumin-bound):** Metastatic breast cancer after treatment failure or relapse where therapy included an anthracycline. Locally advanced or metastatic non-small cell lung cancer, in combination with carboplatin, when potentially curative surgery or radiation therapy is not an option. Metastatic pancreatic adenocarcinoma (with gemcitabine).

Action

Interferes with the normal cellular microtubule function that is required for interphase and mitosis. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Cross the placenta.

Protein Binding: 89–98%.

Metabolism and Excretion: Highly metabolized by the liver (primarily by CYP2C8 and CYP3A4), <10% excreted unchanged in urine.

Half-life: *Paclitaxel*—13–52 hr; *Paclitaxel protein-bound particles (albumin-bound)*—27 hr.

TIME/ACTION PROFILE (effect on WBCs)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	11 days	3 wk

Contraindications/Precautions

Contraindicated in: Hypersensitivity to paclitaxel or to castor oil (non-protein-bound vehicle contains polyoxyethylated castor oil); Known alcohol intolerance; **OB, Lactation:** Pregnancy or lactation; ANC

≤1500/mm³ in patients with ovarian, lung, or breast cancer; ANC ≤1000/mm³ in patients with AIDS-related Kaposi's sarcoma.

Use Cautiously in: Moderate or severe hepatic impairment; **Geri:** ↑ risk of neuropathy, myelosuppression, and cardiovascular events; **OB:** Childbearing potential; Active infection; ↓ bone marrow reserve; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: dizziness, headache, seizures. **CV:** ECG changes, edema, hypotension, bradycardia. **GI:** diarrhea, ↑ liver enzymes, mucositis, nausea, vomiting, pancreatitis. **Derm:** alopecia. **Hemat:** anemia, neutropenia, thrombocytopenia. **MS:** arthralgia, myalgia. **GU:** renal failure. **Neuro:** peripheral neuropathy. **Resp:** PULMONARY EMBOLISM, PULMONARY FIBROSIS, cough, dyspnea, interstitial pneumonia. **Local:** injection site reactions. **Misc:** hypersensitivity reactions including ANAPHYLAXIS and STEVENS-JOHNSON SYNDROME, SEPSIS, TOXIC EPIDERMAL NECROLYSIS.

Interactions

Drug-Drug: CYP3A4 inhibitors including atazanavir, clarithromycin, indinavir, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, saquinavir, and telithromycin may ↑ levels and risk of toxicity; concurrent use should be undertaken with caution. CYP3A4 inducers including carbamazepine, rifampin, and phenytoin may ↓ levels and ↑ risk of treatment failure; concurrent use should be undertaken with caution. Gemfibrozil may ↑ levels and risk of toxicity; concurrent use should be undertaken with caution. ↑ risk of myelosuppression with other antineoplastics or radiation therapy. Myelosuppression ↑ when given after cisplatin. May ↑ levels and toxicity of doxorubicin. May ↓ antibody response to and ↑ risk of adverse reactions from live-virus vaccines.

Route/Dosage

Many other regimens are used.

Paclitaxel

Ovarian Cancer

IV (Adults): *Previously untreated patients*—175 mg/m² over 3 hr every 3 wk, or 135 mg/m² over 24 hr every 3 wk, followed by cisplatin; *Previously treated patients*—135 mg/m² or 175 mg/m² over 3 hr every 3 wk.

Breast Cancer

IV (Adults): *Adjuvant treatment of node-positive breast cancer*—175 mg/m² over 3 hr every 3 wk for 4 courses administered sequentially to doxorubicin-containing combination chemotherapy; *Failure of initial therapy for metastatic disease or relapse within*

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

6 mo of adjuvant therapy—175 mg/m² over 3 hr every 3 wk.

Non-Small Cell Lung Cancer

IV (Adults): 135 mg/m² over 24 hr every 3 wk, followed by cisplatin.

AIDS-Related Kaposi's Sarcoma

IV (Adults): 135 mg/m² over 3 hr every 3 wk or 100 mg/m² over 3 hr every 2 wk (dose ↓/adjustment may be necessary in patients with advanced HIV infection).

Paclitaxel Protein-Bound Particles (albumin-bound)

Breast Cancer

IV (Adults): 260 mg/m² over 30 min every 3 wk.

Hepatic Impairment

IV (Adults): *Moderate hepatic impairment (AST levels <10 × ULN and bilirubin levels 1.26–2 × ULN)*—200 mg/m² over 30 min every 3 wk; *Severe hepatic impairment (AST levels <10 × ULN and bilirubin levels 2.01–5 × ULN)*—130 mg/m² over 30 min every 3 wk; dose may be ↑ to 200 mg/m² for subsequent courses based on individual tolerance; *Severe hepatic impairment (AST levels >10 × ULN or bilirubin levels >5 × ULN)*—Avoid use.

Non-Small Cell Lung Cancer

IV (Adults): 100 mg/m² over 30 min on Days 1, 8, and 15 of each 21-day cycle.

Pancreatic Adenocarcinoma

IV (Adults): 125 mg/m² over 30–40 min on Days 1, 8, and 15 of each 28–day cycle.

Hepatic Impairment

IV (Adults): *Moderate hepatic impairment (AST levels <10 × ULN and bilirubin levels 1.26–2 × ULN)*—75 mg/m² over 30 min on Days 1, 8, and 15 of each 21–day cycle; *Severe hepatic impairment (AST levels <10 × ULN and bilirubin levels 2.01–5 × ULN)*—50 mg/m² over 30 min on Days 1, 8, and 15 of each 21–day cycle; dose may be ↑ to 75 mg/m² for subsequent courses based on individual tolerance; *Severe hepatic impairment (AST levels >10 × ULN or bilirubin levels >5 × ULN)*—Avoid use.

Availability

Paclitaxel (generic available)

Solution for injection: 6 mg/mL.

Paclitaxel Protein-Bound Particles (albumin-bound)

Powder for injection: 100 mg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs frequently, especially during first hour of the infusion.

- Monitor cardiovascular status especially during first 3 hr of infusion. Hypotension and bradycardia are common but usually do not require treatment. Continuous ECG monitoring is recommended only for patients with serious underlying conduction abnormalities or those concurrently taking doxorubicin.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for dyspnea and orthostatic hypotension. Granulocyte-colony stimulating factor (G-CSF) may be used if necessary.
- Assess for development of peripheral neuropathy. If severe symptoms occur, subsequent dose should be reduced by 20%.
- Monitor intake and output, appetite, and nutritional intake. Paclitaxel causes nausea and vomiting in 50% of patients. Prophylactic antiemetics may be used. Adjust diet as tolerated to help maintain fluid and electrolyte balance and nutritional status.
- Assess patient for arthralgia and myalgia, which usually begin 2–3 days after therapy and resolve within 5 days. Pain is usually relieved by nonopioid analgesics but may be severe enough to require treatment with opioid analgesics.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome and toxic epidermal necrolysis. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- **Paclitaxel:** Monitor for hypersensitivity reactions continuously during the first 30 min and frequently thereafter. These occur frequently (19%), usually during the first 10 min of paclitaxel infusion, after the first or second dose. Pretreatment is recommended for **all** patients and should include dexamethasone 20 mg PO (10 mg for patients with advanced HIV disease) 12 and 6 hr prior to paclitaxel, diphenhydramine 50 mg IV 30–60 min prior to paclitaxel, and ranitidine 50 mg IV 30–60 min prior to paclitaxel. Most common manifestations are dyspnea, flushing, tachycardia, rash, hypotension, and chest pain. If these occur, stop infusion and notify health care professional. Treatment may include bronchodilators, epinephrine, antihistamines, and corticosteroids. Keep these agents and resuscitative equipment close by in the event of an anaphylactic reaction. Other manifestations of hypersensitivity reactions include flushing and rash.
- No premedication for hypersensitivity is required for *paclitaxel protein-bound (albumin-bound)*.
- **Lab Test Considerations: Paclitaxel:** Monitor CBC and differential prior to and periodically dur-

ing therapy. The nadir of leukopenia occurs in 11 days, with recovery by days 15–21. Notify health care professional if the leukocyte count is $<1500/\text{mm}^3$ ($1000/\text{mm}^3$ in AIDS-related Kaposi's sarcoma) or if the platelet count is $<100,000/\text{mm}^3$. Subsequent doses are usually held until leukocyte count is $>1500/\text{mm}^3$ ($1000/\text{mm}^3$ in AIDS-related Kaposi's sarcoma) and platelet count is $>100,000/\text{mm}^3$.

- **Paclitaxel Protein-Bound Particles (albumin-bound):** Monitor CBC and differential prior to therapy and prior to dosing on Days 1, 8, and 15. Do not administer if neutrophil count is $<1500/\text{mm}^3$. If severe neutropenia (neutrophils <500 cells/ mm^3 for seven days or more), reduce dose in subsequent courses. Monitor liver function studies (AST, ALT, LDH, bilirubin) prior to and periodically during therapy to detect hepatotoxicity.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)

Risk for injury (Adverse Reactions)

Implementation

- Do not confuse Taxol (paclitaxel) with Taxotere (docetaxel). Do not confuse Taxol (paclitaxel) with Paxil (paroxetine).

Paclitaxel

IV Administration

- **Continuous Infusion:** Paclitaxel must be diluted prior to injection. **Diluent:** Dilute contents of 5-mL (30-mg) vials with the following diluents: 0.9% NaCl, D5W, D5/0.9% NaCl, or dextrose in Ringer's solution. **Concentration:** 0.3–1.2 mg/mL. Although haziness in solution is normal, inspect for particulate matter or discoloration before use. Use an in-line filter of not >0.22 -micron pore size. Solutions are stable for 27 hr at room temperature and lighting. Do not use PVC containers or administration sets. **Rate:** Dose for *breast cancer or AIDS-related Kaposi's sarcoma* is administered over 3 hr. Dose for *ovarian cancer* is administered as a 24-hr infusion.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amphotericin B lipid complex, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, ciprofloxacin, cisatracurium, cis-

platin, cladribine, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, dantrolene, daptomycin, daunorubicin hydrochloride, dexamethasone sodium phosphate, dexmedetomidine, dextrazoxane, diltiazem, diphenhydramine, dobutamine, dolasetron, dopamine, doripenem, doxorubicin hydrochloride, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, etanercept, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, flouxuridine, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, meropenem, mesna, methohexital, methotrexate, methylolopate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, morphine, moxifloxacin, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, pentamidine, pentazocine, pentobarbital, pentostatin, phenobarbital, phentolamine, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propofol, quinupristin/dalfopristin, ranitidine, remifentanyl, rituximab, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, topotecan, trastuzumab, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** amiodarone, amphotericin B cholesteryl, amphotericin B colloidal, amphotericin B liposome, chlorpromazine, diazepam, digoxin, doxorubicin liposome, hydroxyzine, idarubicin, indomethacin, labetalol, methylprednisolone sodium succinate, mitoxantrone, phenytoin, propranolol.

Paclitaxel Protein-Bound Particles (albumin-bound)

IV Administration

- **Intermittent Infusion:** Reconstitute by slowly adding 20 mL to each vial over at least 1 min for a

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

concentration of 5 mg/mL. Direct solution to inside wall of vial to prevent foaming. Allow vial to sit for at least 5 min to ensure proper wetting of cake/powder. Gently swirl or invert vial for at least 2 min until powder is completely dissolved; avoid foaming. If foaming or clumping occurs, allow vial to stand for 15 min until foaming dissolves. Solution should be milky and homogenous without visible particles. If particles or settling are visible, gently invert vial to resuspend. Inject appropriate amount into sterile PVC IV bag. Do not use an in-line filter during administration. Do not administer solutions that are discolored or contain particulate matter. Reconstituted solution should be administered immediately but is stable for 8 hr if refrigerated. Discard unused portion. **Rate:** Administer over 30–40 min. Monitor infusion site closely for infiltration.

Patient/Family Teaching

- Explain purpose of paclitaxel to patient.
- Advise patient to notify health care professional immediately of rash, difficulty breathing, or symptoms of hypersensitivity reaction occurs.
- Instruct patient to notify health care professional promptly if fever; chills; cough; hoarseness; sore throat; signs of infection; lower back or side pain; painful or difficult urination; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or to take medication containing aspirin or NSAIDs; may precipitate gastric bleeding.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient to notify health care professional if abdominal pain, yellow skin, weakness, paresthesia, gait disturbances, or joint or muscle aches occur.
- Instruct patient to inspect oral mucosa for redness and ulceration. If mouth sores occur, advise patient to use sponge brush and rinse mouth with water after eating and drinking. Stomatitis usually resolves in 5–7 days.
- Discuss with patient the possibility of hair loss. Complete hair loss usually occurs between days 14 and 21 and is reversible after discontinuation of therapy. Explore coping strategies.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Advise patient to use a nonhormonal method of contraception and to avoid breast feeding during therapy. Advise male patients not to father a child while receiving paclitaxel.

- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in size or spread of malignancy.

palifermin (pa-liff-er-min)

Kepivance

Classification

Therapeutic: cytoprotective agents
Pharmacologic: keratinocyte growth factors (rDNA)

Pregnancy Category C

Indications

To decrease incidence/duration of severe oral mucositis (at least WHO grade 3) associated with myelotoxic therapy in patients requiring stem cell support for hematologic malignancies.

Action

Enhances proliferation of epithelial cells. **Therapeutic Effects:** Decreased incidence/duration of mucositis.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Distributes into extravascular space.

Metabolism and Excretion: Unknown.

Half-life: 4.5 hr.

TIME/ACTION PROFILE (levels)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	end of dose	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to palifermin or other *E. coli*-derived proteins.

Use Cautiously in: **OB:** Use only if maternal benefit outweighs fetal risk; **Lactation, Pedi:** Safety not established.

Adverse Reactions/Side Effects

Derm: skin toxicity. **GI:** oral toxicity. **Metab:** ↑ amylase, ↑ lipase. **MS:** arthralgia. **Neuro:** dysesthesia.

Interactions

Drug-Drug: Binds to and inactivates heparin (flush tubing between use). Administration within 24 hr after myelotoxic therapy (chemotherapy/radiation) ↑ severity and duration of mucositis.

Route/Dosage

IV (Adults): 60 mcg/kg/day for 3 days before and 3 days after myelotoxic therapy.

Availability

Powder for injection: 6.25 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess level of oral mucositis prior to and periodically during therapy.
- **Lab Test Considerations:** May cause ↑ serum lipase and amylase; usually reversible.
- May cause proteinuria.

Potential Nursing Diagnoses

Acute pain (Indications)

Impaired oral mucous membrane (Indications)

Implementation

- Do not administer paliperidone within 24 hr before, during infusion, or 24 hr after infusion of myelotoxic chemotherapy.
- Administer doses for 3 consecutive days before (third dose 24–48 hr prior to chemotherapy) and 3 consecutive days after myelotoxic chemotherapy (fourth dose on same day as hematopoietic stem cells infusion after infusion is completed and at least 4 days after most recent paliperidone administration) for a total of 6 doses.

IV Administration

- **pH:** No Data.
- **Direct IV: Diluent:** Reconstitute paliperidone powder by slowly injecting 1.2 mL of sterile water for injection aseptically. **Concentration:** 5 mg/mL. Swirl gently; do not shake or vigorously agitate. Solution should be clear and colorless; do not administer solution that is discolored or contains particulate matter. Dissolution usually takes less than 3 minutes. Administer immediately after reconstitution or refrigerate and administer within 24 hr. Do not freeze. Allow to reach room temperature for up to 1 hr. Protect from light. Discard paliperidone after expiration date or if left at room temperature for more than 1 hr. **Rate:** Administer via bolus injection. Do not use a filter.
- **Y-Site Incompatibility:** heparin. If heparin solution is used to maintain IV line, flush with 0.9% NaCl prior to and after use of paliperidone.

Patient/Family Teaching

- Explain the purpose of paliperidone to patient.
- Inform patient of evidence of tumor growth and stimulation in cell culture and animal models.
- Advise patient to notify health care professional if rash, erythema, edema, pruritus, oral/perioral dysesthesia (tongue discoloration, tongue thickening, alteration of taste) occur.

Evaluation/Desired Outcomes

- Decrease in incidence and duration of oral mucositis in patients receiving myelotoxic therapy requiring hematopoietic stem cell support.

paliperidone (pa-li-per-i-done)

Invega, Invega Sustenna

Classification

Therapeutic: antipsychotics
Pharmacologic: benzisoxazoles

Pregnancy Category C

Indications

PO, IM: Acute and maintenance treatment of schizophrenia. **PO:** Acute treatment of schizoaffective disorder (as monotherapy or as adjunct to mood stabilizers and/or antidepressants).

Action

May act by antagonizing dopamine and serotonin in the CNS. Paliperidone is the active metabolite of risperidone. **Therapeutic Effects:** Decreased manifestations of schizophrenia. Decreased manifestations of schizoaffective disorder.

Pharmacokinetics

Absorption: 28% absorbed following oral administration, food ↑ absorption; slowly absorbed after IM administration (concentrations higher and more rapidly achieved with administration into deltoid muscle).

Distribution: Unknown.

Metabolism and Excretion: 59% excreted unchanged in urine; 32% excreted in urine as metabolites.

Half-life: 23 hr (PO); 25–49 days (IM).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	24 hr	24 hr
IM	unknown	13 days	1 mo

Contraindications/Precautions

Contraindicated in: Hypersensitivity to paliperidone or risperidone; Concurrent use of drugs known to cause QTc prolongation (including quinidine, procainamide, sotalol, amiodarone, chlorpromazine, thioridazine, moxifloxacin); History of congenital QTc prolongation or other cardiac arrhythmias; Bradycardia, hypokalemia, hypomagnesemia (↑ risk of QTc prolongation); Pre-existing severe GI narrowing (due to nature of tablet formulation); CCr <50 mL/min (for IM); **Lactation:** Discontinue drug or bottle feed.

Use Cautiously in: Patients with Parkinson's disease or dementia with Lewy Bodies (↑ sensitivity to effects of antipsychotics); History of suicide attempt; Patients at risk for aspiration pneumonia; History of seizures; Conditions which may ↑ body temperature (strenuous exercise, exposure to extreme heat, con-

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

current anticholinergics or risk of dehydration); ↓ GI transit time (may ↑ blood levels); May mask symptoms of some drug overdoses, intestinal obstruction, Reye's Syndrome or brain tumor (due to antiemetic effect); Diabetes mellitus; Severe hepatic impairment; Renal impairment (dose ↓ recommended if $CCr < 80$ mL/min); **OB:** Neonates at ↑ risk for extrapyramidal symptoms and withdrawal after delivery when exposed during the 3rd trimester; use only if maternal benefit outweighs fetal risk; **Pedi:** Children <12 yr (safety not established); **Geri:** ↑ risk of mortality in elderly patients treated for dementia-related psychosis; consider age-related ↓ in renal function.

Adverse Reactions/Side Effects

CNS: **NEUROLEPTIC MALIGNANT SYNDROME, SUICIDAL THOUGHTS**, drowsiness, extrapyramidal disorders (dose related), headache, insomnia, anxiety, confusion, dizziness, dysarthria, fatigue, syncope, tardive dyskinesia, weakness. **EENT:** blurred vision. **Resp:** dyspnea, cough. **CV:** palpitations, tachycardia (dose related), bradycardia, orthostatic hypotension, QTc interval prolongation. **GI:** abdominal pain, dry mouth, dyspepsia, nausea, swollen tongue. **GU:** impotence, priapism. **Endo:** amenorrhea, dyslipidemia, galactorrhea, gynecomastia, hyperglycemia, weight gain. **Hemat:** **AGRANULOCYTOSIS**, leukopenia, neutropenia. **MS:** back pain, dystonia (dose related). **Neuro:** akathisia, dyskinesia, tremor (dose related). **Misc:** fever.

Interactions

Drug-Drug: ↑ risk of CNS depression with other CNS depressants including alcohol, antihistamines, sedative/hypnotics, or opioid analgesics. May antagonize the effects of levodopa or other dopamine agonists. ↑ risk of orthostatic hypotension with antihypertensives, nitrates, or other agents that lower BP. Carbamazepine may ↓ levels/effects.

Route/Dosage

Schizophrenia

PO (Adults): 6 mg once daily; may titrate by 3 mg/day at intervals of at least 5 days (range 3–12 mg/day).

PO (Children 12–17 yr): 3 mg once daily; may titrate by 3 mg/day at intervals of at least 5 days (not to exceed 6 mg if <51 kg or 12 mg if ≥51 kg).

IM (Adults): 234 mg initially, then 156 mg one week later; continue with monthly maintenance dose of 117 mg (range of 39–234 mg based on efficacy and/or tolerability).

Renal Impairment

PO (Adults): CCr 50–79 mL/min—3 mg/day initially; dose may be ↑ to maximum of 6 mg/day; CCr 10–<50 mL/min—1.5 mg/day initially; dose may be ↑ to maximum of 3 mg/day.

Renal Impairment

IM (Adults): CCr 50–79 mL/min—156 mg initially, then 117 mg one week later; continue with monthly maintenance dose of 78 mg; CCr <50 mL/min—Contraindicated.

Schizoaffective Disorder

PO (Adults): 6 mg/day; may titrate by 3 mg/day at intervals of at least 4 days (range 3–12 mg/day).

Renal Impairment

PO (Adults): CCr 50–79 mL/min—3 mg/day initially; dose may be ↑ to maximum of 6 mg/day; CCr 10–<50 mL/min—1.5 mg/day initially; dose may be ↑ to maximum of 3 mg/day.

Availability

Extended-release tablets (Invega): 1.5 mg, 3 mg, 6 mg, 9 mg. **Intramuscular injection (Invega Sustenna):** 39 mg, 78 mg, 117 mg, 156 mg, 234 mg.

NURSING IMPLICATIONS

Assessment

- Monitor patient's mental status (orientation, mood, behavior) before and periodically during therapy. Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression, especially during early therapy. Restrict amount of drug available to patient.
- Assess weight and BMI initially and throughout therapy.
- Monitor BP (sitting, standing, lying down) and pulse before and periodically during therapy. May cause prolonged QT interval, tachycardia, and orthostatic hypotension.
- Observe patient when administering medication to ensure that medication is actually swallowed and not hoarded or cheeked.
- Monitor patient for onset of extrapyramidal side effects (*akathisia*—restlessness; *dystonia*—muscle spasms and twisting motions; or *pseudoparkinsonism*—mask-like face, rigidity, tremors, drooling, shuffling gait, dysphagia). Report these symptoms; reduction of dose or discontinuation of medication may be necessary.
- Monitor for tardive dyskinesia (involuntary rhythmic movement of mouth, face, and extremities). Report immediately; may be irreversible.
- Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness). Discontinue paliperidone and notify health care professional immediately if these symptoms occur.
- Monitor for symptoms related to hyperprolactinemia (menstrual abnormalities, galactorrhea, sexual dysfunction).

- **Lab Test Considerations:** Monitor fasting blood glucose and cholesterol levels before and periodically during therapy.
- Monitor serum prolactin prior to and periodically during therapy. May cause ↑ serum prolactin levels.
- Monitor CBC frequently during initial months of therapy in patients with pre-existing or history of low WBC. May cause leukopenia, neutropenia, or agranulocytosis. Discontinue therapy if this occurs.

Potential Nursing Diagnoses

Risk for self-directed violence (Indications, Adverse Reactions)

Disturbed sensory perception: (specify: visual, auditory, kinesthetic, gustatory, tactile, olfactory) (Indications)

Implementation

- **PO:** Administer once daily in the morning without regard to food. Tablets should be swallowed whole; do not crush, break or chew.
- **IM:** Administer initial and second doses in deltoid using a 1 1/2-inch, 22 gauge needle for patients ≥ 90 kg (≥ 200 lb) or 1-inch 23 gauge needle for patients < 90 kg (< 200 lb). Monthly maintenance doses can be administered in either deltoid or gluteal sites. For gluteal injection, use 1 1/2-inch, 22 gauge needle regardless of patient weight. To avoid missed dose, may give second dose 4 days before or after the 1-wk timepoint. Monthly doses may be given up to 7 days before or after the monthly timepoint. *After 1st month, if missed dose is within 4 wk of scheduled dose*, administer 2nd dose of 156 mg as soon as possible. Give 3rd dose of 117 mg in either deltoid or gluteal muscle 5 wk after first injection (regardless of timing of 2nd injection). Then return to normal monthly injections in either deltoid or gluteal muscle. *If > 4 wk and < 7 wk since 1st injection*, resume by administering 156 mg dose in deltoid as soon as possible, a second 156 mg dose in deltoid in 1 wk, followed by monthly doses in deltoid or gluteal sites. *If > 7 months since scheduled dose*, administer using initial dosing schedule. During regular monthly dose schedule, *if < 6 wks since last injection*, administer previously stabilized dose as soon as possible, then monthly. *If > 6 wks since last injection*, resume dose previously stabilized on, unless stabilized on 234 mg (then 1st two injections should be 156 mg). Administer 1 dose in deltoid as soon as possible, then another deltoid injection of same dose 1 wk later, then resume regular monthly schedule. *If > 6 months since last injection*, administer using initial dosing schedule.

Patient/Family Teaching

- Instruct patient to take medication as directed. Advise patient that appearance of tablets in stool is normal and not of concern.
- Inform patient of the possibility of extrapyramidal symptoms. Instruct patient to report these symptoms immediately to health care professional.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking, other unusual changes in behavior or mood occur.
- Advise patient that extremes in temperature should also be avoided; this drug impairs body temperature regulation.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications and alcohol.
- Advise patient to seek nutritional, weight, or medical management as needed for weight gain or cholesterol elevation.
- Instruct patient to notify health care professional promptly if sore throat, fever, unusual bleeding or bruising, rash, tremors, menstrual abnormalities, galactorrhea, or sexual dysfunction occur.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Advise female patients to notify health care professional if pregnancy is planned or suspected, or if breast feeding or planning to breast feed.
- Emphasize the importance of routine follow-up exams to monitor side effects and continued participation in psychotherapy to improve coping skills.

Evaluation/Desired Outcomes

- Decrease in excited, manic behavior.
- Decrease in positive symptoms (delusions, hallucinations) of schizophrenia.
- Decrease in negative symptoms (social withdrawal, flat, blunted affect) of schizophrenia.

🍁 = Canadian drug name. 🧬 = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

palonosetron

(pa-lone-o-se-tron)
Aloxi

Classification

Therapeutic: antiemetics
Pharmacologic: 5-HT₃ antagonists

Pregnancy Category B

Indications

Prevention of acute and delayed nausea and vomiting caused by initial or repeat courses of moderate or highly emetogenic chemotherapy (intravenous). Prevention of acute nausea and vomiting caused by initial or repeat courses of moderately emetogenic chemotherapy (oral). Prevention of postoperative nausea and vomiting (PONV) for up to 24 hr after surgery (intravenous).

Action

Blocks the effects of serotonin at receptor sites (selective antagonist) located in vagal nerve terminals and in the chemoreceptor trigger zones in the CNS. **Therapeutic Effects:** Decreased incidence and severity of nausea and vomiting following emetogenic chemotherapy or surgery.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability; oral bioavailability = 97%.

Distribution: Unknown.

Metabolism and Excretion: 50% metabolized; 40% excreted unchanged in urine.

Half-life: 40 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	within 30 min	unknown	7 days
PO	within 1 hr	unknown	7 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; cross sensitivity with other 5-HT₃ antagonists may occur; **Lactation:** Lactation.

Use Cautiously in: **OB, Peds:** Safety not established.

Adverse Reactions/Side Effects

CNS: dizziness, headache. **GI:** constipation, diarrhea.

Interactions

Drug-Drug: None significant.

Route/Dosage

IV (Adults): *Prevention of chemotherapy-induced nausea/vomiting*—0.25 mg 30 min before start of chemotherapy; *Prevention of PONV*—0.075 mg given immediately before induction of anesthesia.

PO (Adults): 0.5 mg given 1 hr before start of chemotherapy.

Availability (generic available)

Solution for IV injection: 0.05 mg/mL. **Capsules:** 0.5 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for nausea, vomiting, abdominal distention, and bowel sounds prior to and following administration.
- **Lab Test Considerations:** May cause transient ↑ in serum bilirubin, AST, and ALT levels.

Potential Nursing Diagnoses

Imbalanced nutrition: less than body requirements (Indications)

Diarrhea (Side Effects)

Constipation (Side Effects)

Implementation

- First dose is administered prior to emetogenic event.
- Repeated dose within a 7-day period is not recommended.
- **PO:** May be administered with or without food 1 hr prior to the start of chemotherapy.

IV Administration

- **pH:** 4.5–5.5.
- **Direct IV:** Administer dose undiluted 30 min prior to chemotherapy or immediately prior to the induction of anesthesia. Flush line prior to and after administration with 0.9% NaCl. Do not administer solutions that are discolored or contain particulate matter.
- **Concentration:** 0.05 mg/mL. **Rate:** Administer over 30 seconds for chemotherapy and over 10 seconds for postoperative nausea and vomiting.
- **Syringe Compatibility:** dexamethasone.
- **Y-Site Compatibility:** alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B liposome, ampicillin, ampicillin/sulbactam, atracurium, atropine, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium acetate, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, dantrolene, daptomycin, daunorubicin, dexmethasone sodium phosphate, dexmedetomidine, dextrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxacurium, doxorubicin hydrochloride, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, epifibitide, erythromycin, esmolol, etoposide, etoposide phos-

phate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, gemcitabine, gentamicin, glycopyrrolate, haloperidol, heparin, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechloroethamine, melphalan, meperidine, meprenem, mesna, metaraminol, methotrexate, methyl-dopate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, nalbuphine, naloxone, nesiritide, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxaliplatin, oxytocin, paclitaxel, pamidronate, pancuronium, pentazocine, phenobarbital, phenolamine, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, ranitidine, remifentanyl, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiopental, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, zidovudine.

- **Y-Site Incompatibility:** acyclovir, allopurinol, amphotericin B colloidal, diazepam, doxycycline, ganciclovir, imipenem/cilastatin, methylprednisolone, minocycline, nafcillin, pantoprazole, pentamidine, pentobarbital, phenytoin, thiopental.

Patient/Family Teaching

- Inform patient of purpose of medication.
- Advise patient to notify health care professional if nausea or vomiting occurs.

Evaluation/Desired Outcomes

- Prevention of nausea and vomiting associated with initial and repeat courses of emetogenic cancer chemotherapy or surgery.

pamidronate (pa-mid-roe-nate) Aredia

Classification

Therapeutic: bone resorption inhibitors
Pharmacologic: bisphosphonates, hypocalcemics

Pregnancy Category D

Indications

Moderate to severe hypercalcemia associated with malignancy. Osteolytic bone lesions associated with multiple myeloma or breast cancer. Moderate to severe Paget's disease.

Action

Inhibits resorption of bone. **Therapeutic Effects:** Decreased serum calcium. Decreased skeletal destruction in multiple myeloma or breast cancer. Decreased skeletal complications in Paget's disease.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Rapidly absorbed by bone. Reaches high concentrations in bone, liver, spleen, teeth, and tracheal cartilage. Approximately 50% of a dose is retained by bone and then slowly released.

Metabolism and Excretion: 50% is excreted unchanged in the urine.

Half-life: Elimination half-life from plasma is biphasic—1st phase 1.6 hr, 2nd phase 27.2 hr. Elimination half-life from bone is 300 days.

TIME/ACTION PROFILE (effect on serum calcium)

ROUTE	ONSET	PEAK	DURATION
IV	24 hr	7 days	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to pamidronate, other bisphosphonates, or mannitol; **OB, Lactation:** Pregnancy or lactation.

Use Cautiously in: Underlying cardiovascular disease, especially HF (initiate saline hydration cautiously); Invasive dental procedures, cancer, receiving chemotherapy or corticosteroids, poor oral hygiene, periodontal disease, dental disease, anemia, coagulopathy, infection, or poorly-fitting dentures (may ↑ risk of jaw osteonecrosis); History of thyroid surgery (may be at ↑ risk for hypocalcemia); Renal impairment (dose ↓ recommended); **Pedi:** Safety not established.

Adverse Reactions/Side Effects

CNS: fatigue. **EENT:** conjunctivitis, blurred vision, eye pain/inflammation, rhinitis. **Resp:** rales. **CV:** arrhythmias, hypertension, syncope, tachycardia. **GI:** nausea, abdominal pain, anorexia, constipation, vomiting. **F and E:** hypocalcemia, hypokalemia, hypomagnesemia, hypophosphatemia, fluid overload. **GU:** nephrotoxicity. **Hemat:** leukopenia, anemia. **Local:** phlebitis at injection site. **Metab:** hypothyroidism. **MS:** muscle stiffness, musculoskeletal pain, femur fractures, osteonecrosis (primarily of jaw). **Misc:** fever, generalized pain.

✳ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Interactions

Drug-Drug: Hypokalemia and hypomagnesemia may ↑ risk of **digoxin** toxicity. **Calcium** and **vitamin D** will antagonize the beneficial effects of pamidronate. Concurrent use of **thalidomide** may ↑ risk of renal dysfunction.

Route/Dosage

Single doses should not exceed 90 mg.

Hypercalcemia of Malignancy

IV (Adults): *Moderate hypercalcemia*—30–90 mg; may be repeated after 7 days.

Osteolytic Lesions from Multiple Myeloma

IV (Adults): 90 mg monthly.

Osteolytic Lesions from Metastatic Breast Cancer

IV (Adults): 90 mg q 3–4 wk.

Paget's Disease

IV (Adults): 90–180 mg/treatment; may be given as 30 mg daily for 3 days up to 30 mg/wk for 6 wk. Single doses of 60–90 mg may also be effective.

Availability (generic available)

Powder for injection: 30 mg/vial, 90 mg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor intake/output ratios and BP frequently during therapy. Assess for signs of fluid overload (edema, rales/crackles).
- Monitor symptoms of hypercalcemia (nausea, vomiting, anorexia, weakness, constipation, thirst, and cardiac arrhythmias).
- Observe for evidence of hypocalcemia (paresthesia, muscle twitching, laryngospasm, and Chvostek's or Trousseau's sign). Protect symptomatic patients by elevating and padding side rails; keep bed in low position.
- Monitor IV site for phlebitis (pain, redness, swelling). Symptomatic treatment should be used if this occurs.
- Assess for bone pain. Treatment with nonopioid or opioid analgesics may be necessary.
- **Lab Test Considerations:** Assess serum creatinine prior to each treatment. Withhold dose if renal function has deteriorated in patients treated for bone metastases.
- Monitor serum electrolytes (including calcium, phosphate, potassium, and magnesium), hemoglobin, and creatinine closely. Monitor CBC and platelet count during the first 2 wk of therapy. May cause hyperkalemia or hypokalemia, hypernatremia, and hematuria.
- Monitor renal function periodically during therapy.

Potential Nursing Diagnoses

Acute pain (Indications, Side Effects)

Risk for injury (Indications)

Implementation

- Initiate a vigorous saline hydration, maintaining a urine output of 2000 mL/24 hr, concurrently with pamidronate therapy. Patients should be adequately hydrated, but avoid overhydration. Use caution in patients with underlying cardiovascular disease, especially HF. Do not use diuretics prior to treatment of hypovolemia.
- Patients with severe hypercalcemia should be started at the 90-mg dose.
- **IV:** Reconstitute by adding 10 mL of sterile water for injection to each vial. **Concentration:** 30 mg/10 mL or 90 mg/10 mL. Allow drug to dissolve before withdrawing. Solution is stable for 24 hr if refrigerated.
- **Hypercalcemia:** **Diluent:** Dilute further in 1000 mL of 0.45% NaCl, 0.9% NaCl, or D5W. Solution is stable for 24 hr at room temperature. **Rate:** Administer 60-mg infusion over at least 4 hr and 90-mg infusion over 24 hr.
- **Multiple Myeloma:** **Diluent:** Dilute reconstituted solution in 500 mL of 0.45% NaCl, 0.9% NaCl, or D5W. **Rate:** Administer over 4 hr.
- **Paget's Disease:** Dilute reconstituted solution in 500 mL of 0.45% NaCl, 0.9% NaCl, or D5W.
- **Rate:** Administer over 4 hr.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, carboplatin, carmustine, cefazolin, cefepime, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, daptomycin, dexamethasone, dexmedetomidine, dextrazoxane, digoxin, diliazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, docaxurium, doxorubicin, doxorubicin liposomal, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, eripapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarneyl, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydralazine, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, insulin, isoproterenol, ketorolac, labetalol, levofloxacin, levorphanol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meclizeth-

amine, melphalan, meperidine, meropenem, mesna, metaraminol, methotrexate, methyl dopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxytocin, paclitaxel, palonosetron, pancuronium, pemetrexed, pentamidine, pentazocine, pentobarbital, phenobarbital, phentolamine, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, ranitidine, remifentanyl, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vincristine, vincristine, vinorelbine, voriconazole, zidovudine.

- **Y-Site Incompatibility:** amphotericin B colloidal, caspofungin, dantrolene, diazepam, leucovorin, phenytoin.
- **Additive Incompatibility:** Calcium-containing solutions, such as Ringer's solution.

Patient/Family Teaching

- Advise patient to report signs of hypercalcemic relapse (bone pain, anorexia, nausea, vomiting, thirst, lethargy) or eye problems (pain, inflammation, blurred vision, conjunctivitis) to health care professional promptly.
- Advise patient to notify nurse of pain at the infusion site.
- Encourage patient to comply with dietary recommendations. Diet should contain adequate amounts of calcium and vitamin D.
- Advise patient to notify health care professional if bone pain is severe or persistent.
- Advise patient to maintain good oral hygiene and have regular dental examinations. Instruct patient to inform health care professional of pamidronate therapy prior to dental surgery.
- Emphasize the need for keeping follow-up exams to monitor progress, even after medication is discontinued, to detect relapse.

Evaluation/Desired Outcomes

- Lowered serum calcium levels.
- Decreased pain from lytic lesions.

pancrelipase (pan-kre-li-pase)

Creon,  Pancrease-V, Pancrease, Pertzye, Ultresa, Viokace, Zenpep

Classification

Therapeutic: digestive agent

Pharmacologic: pancreatic enzymes

Pregnancy Category C

Indications

Pancreatic insufficiency associated with: Chronic pancreatitis, Pancreatectomy, Cystic fibrosis, GI bypass surgery, Duodenal obstruction secondary to tumor.

Action

Contains lipolytic, amylolytic, and proteolytic activity.

Therapeutic Effects: Increased digestion of fats, carbohydrates, and proteins in the GI tract.

Pharmacokinetics

Absorption: Unknown.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: Unknown.

TIME/ACTION PROFILE (digestant effects)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to hog proteins.

Use Cautiously in: Gout, renal impairment, or hyperuricemia (may ↑ uric acid levels); **OB, Lactation:** Safety not established.

Adverse Reactions/Side Effects

EENT: nasal stuffiness. **Resp:** dyspnea, shortness of breath, wheezing. **GI:** **FIBROSIS COLONOPATHY** (high doses only), abdominal pain (high doses only), diarrhea, nausea, stomach cramps, oral irritation. **GU:** hematuria. **Derm:** hives, rash. **Metab:** hyperuricemia. **Misc:** allergic reactions.

Interactions

Drug-Drug: Antacids (calcium carbonate or magnesium hydroxide) may ↓ effectiveness of pancrelipase. May ↓ the absorption of concurrently administered iron supplements.

Drug-Food: Alkaline foods destroy coating on enteric-coated products.

Route/Dosage

PO (Adults and Children ≥4 yr): Initiate with 500 lipase units/kg/meal; dose should be adjusted based on weight, clinical symptoms, and stool fat content;

 = Canadian drug name.  = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

maximum dose = 2500 lipase units/kg/meal (or 10,000 lipase units/kg/day).

PO (Children >1 yr and <4 yr): Initiate with 1000 lipase units/kg/meal; dose should be adjusted based on weight, clinical symptoms, and stool fat content; maximum dose = 2500 lipase units/kg/meal (or 10,000 lipase units/kg/day).

PO (Children ≤1 yr): 2000–4000 lipase units per 120 mL of formula or breast milk.

Availability (generic available)

Delayed-release capsules: 3000 units lipase/9500 units protease/15,000 units amylase, 4000 units lipase/12,000 units protease and amylase, 4200 units lipase/10,000 units protease/17,500 units amylase, 5000 units lipase/17,000 units protease/27,000 units amylase, 6000 units lipase/19,000 units protease/30,000 units amylase, 8000 units lipase/28,750 units protease/30,250 units amylase, ✱ 8000 units lipase/30,000 units protease and amylase, 10,000 units lipase/30,000 units protease and amylase, 10,000 units lipase/34,000 units protease/55,000 units amylase, 10,440 units lipase/39,150 units protease/39,150 units amylase, 10,500 units lipase/25,000 units protease/43,750 units amylase, 12,000 units lipase/38,000 units protease/60,000 units amylase, 13,800 units lipase/27,600 units protease/27,600 units amylase, 15,000 units lipase/51,000 units protease/82,000 units amylase, 16,000 units lipase/57,500 units protease/60,500 units amylase, 20,000 units lipase/44,000 units protease/56,000 units amylase, ✱ 20,000 units lipase/55,000 units protease and amylase, 20,000 units lipase/68,000 units protease/109,000 units amylase, 20,700 units lipase/41,400 units protease/41,400 units amylase, 20,880 units lipase/78,300 units protease/78,300 units amylase, 23,000 units lipase/46,000 units protease/46,000 units amylase, 24,000 units lipase/76,000 units protease/120,000 units amylase.

NURSING IMPLICATIONS

Assessment

- Assess patient's nutritional status (height, weight, skin-fold thickness, arm muscle circumference, and lab values) prior to and periodically throughout therapy.
- Monitor stools for high fat content (steatorrhea). Stools will be foul-smelling and frothy.
- Assess patient for allergy to pork; sensitivity to pancrelipase may exist.
- **Lab Test Considerations:** May cause ↑ serum and urine uric acid concentrations.

Potential Nursing Diagnoses

Imbalanced nutrition: less than body requirements (Indications)

Implementation

Pancreaze is not interchangeable with any other pancrelipase product.

- **PO:** Administer immediately before or with meals and snacks.
- Swallow tablets whole; do not crush, break, or chew.
- Swallow capsules whole. If unable to swallow, capsules may be opened and sprinkled on foods. Delayed-release capsules filled should not be chewed (sprinkle on soft, acidic foods that can be swallowed without chewing, such as applesauce or Jell-O) and followed immediately by water or juice to ensure complete ingestion. These medications should not be chewed or mixed with alkaline foods prior to ingestion or coating will be destroyed.
- Half of the prescribed *Pancreaze* dose for an individualized full meal should be given with each snack. The total daily dose should reflect approximately three meals plus two or three snacks per day.
- Do not mix contents of *Pancreaze* or *Creon* capsules directly into breast milk or formula. Capsule contents may be sprinkled on small amounts of acidic soft food with a pH of 4.5 or less (applesauce) and given to the infant within 15 minutes. Contents of the capsule may also be administered directly to the mouth. Follow administration with breast milk or formula.
- Do not mix *Zenpep* capsule contents directly into formula or breast milk prior to administration. Administer with applesauce, bananas, or pears (commercially prepared) and follow with breast milk or formula.
- Do not chew or retain *Ultresa* capsule in mouth.

Patient/Family Teaching

- Encourage patients to comply with diet recommendations of health care professional (generally high-calorie, high-protein, low-fat). Dose should be adjusted for fat content of diet. Usually 300 mg of pancrelipase is necessary to digest every 17 g of dietary fat. If a dose is missed, it should be omitted and next dose taken with next snack, as directed. Do not increase dose without consulting health care professional. Several days may be required to determine correct dose. Advise patient to read *Medication Guide* before starting therapy and with each Rx refill; information may be updated.
- Instruct patient not to chew tablets and to swallow them quickly with plenty of liquid to prevent mouth and throat irritation. Sit upright to enhance swallowing. Eating immediately after taking medication helps further ensure that the medication is swallowed and does not remain in contact with mouth and esophagus for a prolonged period. Patient should avoid sniffing powdered contents of capsules, as sensitization of nose and throat may occur (nasal stuffiness or respiratory distress).
- Advise patients and caregivers notify health care professional if symptoms of fibrosing colonopathy

(abdominal pain, distention, vomiting, constipation) occur. Occur more frequently with doses exceeding 6000 lipase units/kg of body weight per meal (10,000 lipase units/kg of body weight/day) and have been associated with colonic strictures in children below the age of 12 years.

- Instruct patient to notify health care professional if joint pain, swelling of legs, gastric distress, or rash occurs.
- Advise female patients to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Improved nutritional status in patients with pancreatic insufficiency.
- Normalization of stools in patients with steatorrhea.

HIGH ALERT

pancuronium
(pan-cure-oh-nee-yum)
Pavulon

Classification

Therapeutic: neuromuscular blocking agents—nondepolarizing

Pregnancy Category C

Indications

Induction of skeletal muscle paralysis and facilitation of intubation after induction of anesthesia in surgical procedures. Facilitation of compliance during mechanical ventilation.

Action

Prevents neuromuscular transmission by blocking the effect of acetylcholine at the myoneural junction. Has no analgesic or anxiolytic properties. **Therapeutic**

Effects: Skeletal muscle paralysis.

Pharmacokinetics

Absorption: Following IV administration, absorption is essentially complete.

Distribution: Rapidly distributes into extracellular fluid; small amounts cross the placenta.

Metabolism and Excretion: Excreted mostly unchanged by the kidneys; small amounts are eliminated in bile.

Half-life: 2 hr.

TIME/ACTION PROFILE (neuromuscular blockade)

ROUTE	ONSET	PEAK	DURATION
IV	30–45 sec	3–4.5 min	40–60 min

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity to bromides; **Pedi:** Products containing benzyl alcohol should be avoided in neonates.

Use Cautiously in: Underlying cardiovascular disease (↑ risk of arrhythmias); Dehydration or electrolyte abnormalities (should be corrected); Situations in which histamine release would be problematic; Fractures or muscle spasm; Renal impairment (↓ elimination); Hyperthermia (↑ duration/intensity of paralysis); Hepatic impairment (altered response); Shock; Extensive burns (may be more resistant to effects); Low plasma pseudocholinesterase levels (may be seen in association with anemia, dehydration, cholinesterase inhibitors/insecticides, severe liver disease, pregnancy, or hereditary predisposition); **OB, Lactation:** Safety not established; may be used during caesarian section; **Pedi:** Contains benzyl alcohol which can cause potentially fatal gasping syndrome in neonates; **Geri:** Age-related ↓ in renal function may result in prolonged effects.

Exercise Extreme Caution in: Patients with neuromuscular diseases such as myasthenia gravis (small test dose may be used to assess response).

Adverse Reactions/Side Effects

Resp: bronchospasm. **CV:** hypertension, tachycardia. **GI:** excessive salivation. **Derm:** rash. **Misc:** allergic reactions including **ANAPHYLAXIS**.

Interactions

Drug-Drug: Intensity and duration of paralysis may be prolonged by pretreatment with **succinylcholine**, **general anesthesia** (inhalation), **aminoglycosides**, **vancomycin**, **tetracyclines**, **polymyxin B**, **colistin**, **cyclosporine**, **calcium channel blockers**, **clindamycin**, **lidocaine**, and other **local anesthetics**, **lithium**, **quinidine**, **procainamide**, **beta blockers**, **potassium-losing diuretics**, or **magnesium**. **Inhalation anesthetics** including **enflurane**, **isoflurane**, **halothane**, **desflurane**, **sevoflurane** may enhance effects. Higher infusion rates may be required and duration of action may be shortened in patients receiving long-term **carbamazepine**, **steroids** (**chronic**), **azathioprine** or **phenytoin**.

Route/Dosage

IV (Adults and Children >1 mo): *Initial intubating dose*—0.06–0.1 mg/kg initially; additional doses of 0.01 mg/kg may be given q 25–60 min to maintain paralysis. *Continuous infusion*—1–2 mcg/kg/min.

Availability (generic available)

Injection: 1 mg/mL.

✳ = Canadian drug name. ⚡ = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

NURSING IMPLICATIONS

Assessment

- Assess respiratory status continuously throughout therapy with neuromuscular blocking agents. These medications should be used only to facilitate intubation or in patients already intubated.
- Neuromuscular response should be monitored with a peripheral nerve stimulator intraoperatively. Paralysis is initially selective and usually occurs sequentially in the following muscles: levator muscles of eyelids, muscles of mastication, limb muscles, abdominal muscles, muscles of the glottis, intercostal muscles, and the diaphragm. Recovery of muscle function usually occurs in reverse order.
- Monitor ECG, heart rate, and BP throughout administration.
- Observe the patient for residual muscle weakness and respiratory distress during the recovery period.
- Monitor infusion site frequently. If signs of tissue irritation or extravasation occur, discontinue and restart in another vein.
- **Toxicity and Overdose:** If overdose occurs, use peripheral nerve stimulator to determine the degree of neuromuscular blockade. Maintain airway patency and ventilation until recovery of normal respirations occurs.
- Administration of anticholinesterase agents (neostigmine, pyridostigmine) may be used to antagonize the action of neuromuscular blocking agents once the patient has demonstrated some spontaneous recovery from neuromuscular block. Atropine is usually administered prior to or concurrently with anticholinesterase agents to counteract the muscarinic effects.
- Administration of fluids and vasopressors may be necessary to treat severe hypotension or shock.

Potential Nursing Diagnoses

Ineffective breathing pattern (Indications)

Impaired verbal communication (Side Effects)

Fear (Side Effects)

Implementation

- **High Alert:** Unintended administration of a neuromuscular blocking agent instead of administration of the intended medication or administration of a neuromuscular blocking agent in the absence of ventilatory support has resulted in serious harm or death. Confusing similarities in packaging and insufficiently controlled access to these medications are often implicated in these medication errors. Store these products in a separate, locked container.
- Dose is titrated to patient response.
- Neuromuscular blocking agents have *no* effect on consciousness or pain threshold. Adequate anesthesia/analgesia should *always* be used when neuromuscular blocking agents are used as an adjunct

to surgical procedures or when painful procedures are performed. Benzodiazepines and/or analgesics should be administered concurrently when prolonged neuromuscular blocker therapy is used for ventilator patients, because patient is awake and able to feel all sensations.

- If eyes remain open throughout prolonged administration, protect corneas with artificial tears.
- Store pancuronium in refrigerator. To prevent absorption by plastic, pancuronium should not be stored in plastic syringes. May be administered in plastic syringes.
- Most neuromuscular blocking agents are incompatible with barbiturates and sodium bicarbonate. Do not admix.

IV Administration

- **pH:** 3.8–4.2.
- **Direct IV:** **Diluent:** May be administered undiluted. **Concentration:** 1 mg/mL (10-mL vial); 2 mg/mL (2-mL or 5-mL vial). **Rate:** Administer over 1–2 min.
- **Intermittent Infusion:** **Diluent:** Add 100 mg of pancuronium to 250 mL of D5W, 0.9% NaCl, D5/0.9% NaCl, or LR. **Concentration:** 0.4 mg/mL. **Rate:** Based on patient's weight (see Route/Dosage section).
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxorubicin, doxorubicin liposomal, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, epifibatide, ertapenem, erythromycin, esmolol, etomidate, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydralazine, hydrocortisone sodium succinate, hydromorphone, idarubicin, ifosfamide, imipenem-cilastatin, insulin, irinotecan, isoproterenol, ketamine, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, mephallan, meperidine, meropenem, methohexital, methotrexate, methyl dopate, methylprednisolone,

metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, pamidronate, pemetrexed, pentamidine, pentazocine, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, ranitidine, remifentanyl, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, sufentanil, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zolendronic acid.

- **Y-Site Incompatibility:** allopurinol, amphotericin B colloidal, amphotericin B lipid complex, caspofungin, dantrolene, diazepam, furosemide, pantoprazole, phenytoin, thiopental.

Patient/Family Teaching

- Explain all procedures to patient receiving neuromuscular blocker therapy without general anesthesia, because consciousness is not affected by neuromuscular blocking agents alone.
- Reassure patient that communication abilities will return as the medication wears off.

Evaluation/Desired Outcomes

- Adequate suppression of the twitch response when tested with peripheral nerve stimulation and subsequent muscle paralysis.
- Improved compliance during mechanical ventilation.

 **panitumumab**
(pan-i-tu-mu-mab)
Vectibix

Classification

Therapeutic: antineoplastics
Pharmacologic: monoclonal antibodies

Pregnancy Category C

Indications

Treatment of metastatic colorectal cancer that expresses EGFR (epidermal growth factor receptor) and has failed conventional treatments (to be used as monotherapy).

Action

 Binds to EGFR resulting in inactivation of kinases that regulate proliferation and transformation. **Therapeutic Effects:** Decreased progression of colorectal cancer.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Monoclonal antibodies cross the placenta and enter breast milk.

Metabolism and Excretion: Unknown.

Half-life: 7.5 days.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	unknown	end of infusion	unknown

Contraindications/Precautions

Contraindicated in: Concurrent leucovorin;  Patients whose tumors have KRAS mutations in codon 12 or 13 (not effective); **OB, Lactation:** Pregnancy or lactation.

Use Cautiously in: **Pedi:** Safety not established.

Adverse Reactions/Side Effects

CNS: fatigue. **EENT:** OCULAR TOXICITY, eyelash growth. **Resp:** PULMONARY FIBROSIS, cough. **GI:** abdominal pain, constipation, diarrhea, nausea, vomiting, stomatitis. **Derm:** NECROTIZING FASCITIS, paronychia, abscesses, dry skin, erythema, photosensitivity, pruritis, rash, skin fissures. **F and E:** edema, hypocalcemia, hypomagnesemia. **Misc:** INFUSION REACTIONS, sepsis.

Interactions

Drug-Drug: None noted.

Route/Dosage

IV (Adults): 6 mg/kg as a 60-min infusion every 14 days; ↓ infusion rates and dose modifications are recommended for infusion reactions and other serious toxicities.

Availability

Solution for IV administration (requires dilution): 20 mg/mL.

NURSING IMPLICATIONS

Assessment

- **Assess for dermatologic toxicity** (dermatitis aciform, pruritus, erythema, rash, skin exfoliation, paronychia, dry skin, skin fissures). If severe, may lead to infection (sepsis, septic death, abscesses requiring incision and drainage). With severe reac-

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

***CAPITALS** indicates life-threatening; underlines indicate most frequent.

tions, withhold panitumumab and monitor for inflammatory or infectious sequelae.

- Monitor for severe infusion reactions (anaphylactic reaction, bronchospasm, fever, chills, hypotension). If severe reaction occurs, stop panitumumab; may require permanent discontinuation.
- Assess for pulmonary fibrosis (cough, wheezing, exertional dyspnea, interstitial lung disease, pneumonitis, lung infiltrates). Permanently discontinue panitumumab if these signs occur.
- Monitor for diarrhea during therapy.
- **Lab Test Considerations:** Monitor electrolyte levels periodically during and for 8 wk after completion of therapy. May cause hypomagnesemia and hypocalcemia.

Potential Nursing Diagnoses

Risk for impaired skin integrity (Adverse Reactions)
Impaired gas exchange (Adverse Reactions)

Implementation

- **Intermittent Infusion: Diluent:** Withdraw necessary amount of panitumumab. Dilute to a volume of 100 mL with 0.9% NaCl; dilute doses >1000 mg with 150 mL. **Concentration:** 10 mg/mL. Mix by inverting gently; do not shake. Administer via infusion pump using a low-protein binding 0.2 mcg or 0.22 mcg in-line filter. Solution is colorless and may contain a small amount of visible translucent to white, amorphous, proteinaceous particles. Do not administer solutions that are discolored or contain particulate matter. Store in refrigerator; do not freeze. Use diluted solution within 6 hr of preparation if stored at room temperature or within 24 hr if refrigerated. **Rate:** Administer over 60 min every 14 days. Administer doses >1000 mg over 90 min.
- If mild to moderate **infusion reaction** (Grade 1 or 2) occurs decrease infusion rate by 50%. If severe reaction (Grade 3 or 4) occurs, immediately and permanently discontinue panitumumab.
- If severe **dermatologic toxicities** (Grade 3 or higher) or those considered intolerable occur, withhold panitumumab. If toxicity does not improve to $\leq$ grade 2 within 1 mo, discontinue permanently. If toxicity improves to $\leq$ grade 2 and patient improves symptomatically after withholding no more than 2 doses, resume therapy at 50% dose. If toxicities recur, permanently discontinue panitumumab. If toxicities do not recur, increase subsequent doses in 25% increments of the original dose until recommended dose of 6 mg/kg is reached.
- **Y-Site Incompatibility:** Flush line before and after administration with 0.9% NaCl. Do not mix with other medications or solutions.

Patient/Family Teaching

- Explain purpose of panitumumab to patient.
- May cause photosensitivity. Caution patient to wear sunscreen and hats and to limit sun exposure.

- Advise patient to notify health care professional if signs and symptoms of dermatologic toxicity, infusion reactions, pulmonary fibrosis, or ocular changes occur.
- Advise patient that panitumumab may cause fertility impairment and may have teratogenic effects. Caution women of childbearing yr to use contraception during and for at least 6 mo after the last dose and not to breast feed during and for at least 2 mo after the last dose of panitumumab. Encourage women who become pregnant to enroll in *Amgen's Pregnancy Surveillance Program* by calling 1-800-772-6436.
- Emphasize the need for periodic blood tests to monitor electrolyte levels.

Evaluation/Desired Outcomes

- Decreased progression of colorectal cancer.

pantoprazole

(pan-toe-pra-zole)

★ Panto IV, ★ Pantoloc, Protonix, Protonix IV, ★ Tecta

Classification

Therapeutic: antiulcer agents

Pharmacologic: proton-pump inhibitors

Pregnancy Category B

Indications

Erosive esophagitis associated with GERD. Decrease relapse rates of daytime and nighttime heartburn symptoms on patients with GERD. Pathologic gastric hypersecretory conditions. **Unlabeled Use:** Adjunctive treatment of duodenal ulcers associated with *Helicobacter pylori*.

Action

Binds to an enzyme in the presence of acidic gastric pH, preventing the final transport of hydrogen ions into the gastric lumen. **Therapeutic Effects:** Diminished accumulation of acid in the gastric lumen, with lessened acid reflux. Healing of duodenal ulcers and esophagitis. Decreased acid secretion in hypersecretory conditions.

Pharmacokinetics

Absorption: Tablet is enteric-coated; absorption occurs only after tablet leaves the stomach.

Distribution: Unknown.

Protein Binding: 98%.

Metabolism and Excretion: Mostly metabolized by the liver via the cytochrome P450 (CYP) system (primarily CYP2C19 isoenzyme, but also the CYP3A4 isoenzyme) (the CYP2C19 enzyme system exhibits genetic polymorphism; $\frac{1}{3}$ 15–20% of Asian patients and 3–5% of Caucasian and Black patients may be poor metabolizers and may have significantly $\uparrow$ pantopra-

zole concentrations and an ↑ risk of adverse effects); inactive metabolites are excreted in urine (71%) and feces (18%).

Half-life: 1 hr.

TIME/ACTION PROFILE (effect on acid secretion)

ROUTE	ONSET†	PEAK	DURATION†
PO	2.5 hr	unknown	1 wk
IV	15–30 min	2 hr	unknown

†Onset = 51% inhibition; duration = return to normal following discontinuation

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **OB:** Should be used during pregnancy only if clearly needed; **Lactation:** Discontinue breast feeding due to potential for serious adverse reactions in infants.

Use Cautiously in: Patients using high-doses for >1 year (↑ risk of hip, wrist, or spine fractures); **Pedi:** Safety not established.

Adverse Reactions/Side Effects

CNS: headache. **GI:** **PSEUDOMEMBRANOUS COLITIS**, abdominal pain, diarrhea, eructation, flatulence. **Endo:** hyperglycemia. **F and E:** hypomagnesemia (especially if treatment duration ≥3 mo). **MS:** bone fracture.

Interactions

Drug-Drug: May ↓ absorption of drugs requiring acid pH, including **ketoconazole**, **itraconazole**, **atazanavir**, **ampicillin esters**, and **iron salts**. May ↑ risk of bleeding with **warfarin** (monitor INR/PT). Hypomagnesemia ↑ risk of **digoxin** toxicity. May ↑ **methotrexate** levels.

Route/Dosage

GERD

PO (Adults): 40 mg once daily.

PO (Children ≥5 yr): 15–39 kg—20 mg once daily for up to 8 wk; ≥40 kg—40 mg once daily for up to 8 wk.

IV (Adults): 40 mg once daily for 7–10 days.

Gastric Hypersecretory Conditions

PO (Adults): 40 mg twice daily, up to 120 mg twice daily.

IV (Adults): 80 mg q 12 hr (up to 240 mg/day).

Availability (generic available)

Delayed-release tablets: 20 mg, 40 mg. **Cost:** *Generic*—All strengths \$368.22/90. **Powder for injection:** 40 mg/vial. **Delayed-release oral suspension:** 40 mg/packet. **Cost:** \$7.60/1 pkt.

NURSING IMPLICATIONS

Assessment

- Assess patient routinely for epigastric or abdominal pain and for frank or occult blood in stool, emesis, or gastric aspirate.
- **Lab Test Considerations:** May cause abnormal liver function tests, including ↑ AST, ALT, alkaline phosphatase, and bilirubin.
- May cause hypomagnesemia. Monitor serum magnesium prior to and periodically during therapy.

Potential Nursing Diagnoses

Acute pain (Indications)

Implementation

- Do not confuse **Protonix** (pantoprazole) with **Lotronex** (alosetron) or **protamine**.
- Patients receiving pantoprazole IV should be converted to PO dosing as soon as possible.
- **Monitor bowel function.** Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of pseudomembranous colitis. May begin up to several weeks following cessation of therapy.
- **PO:** May be administered with or without food. Do not break, crush, or chew tablets.
- Antacids may be used concurrently.

IV Administration

- **IV:** Reconstitute each vial with 10 mL of 0.9% NaCl. Reconstituted solution is stable for 6 hr at room temperature.
- **Direct IV:** **Diluent:** Administer undiluted. **Concentration:** 4 mg/mL. **Rate:** Administer over at least 2 min.
- **Intermittent Infusion:** **Diluent:** Dilute further with D5W, 0.9% NaCl, or LR. **Concentration:** 0.4–0.8 mg/mL. Diluted solution is stable for 24 hr at room temperature. **Rate:** Administer over 15 min at a rate of <3 mg/min.
- **Y-Site Compatibility:** allopurinol, alprostadil, amifostine, aminocaproic acid, amikacin, aminophylline, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, azithromycin, bleomycin, bumetanide, carboplatin, carmustine, ceftazolin, ceftriaxone, cyclophosphamide, cytarabine, docetaxel, doripenem, doxorubicin liposome, doxycycline, ertapenem, fluorouracil, foscarnet, fosphenytoin, ganciclovir, granisetron, imipenem/cilastatin, irinotecan, mesna, methyldopa, paclitaxel, penicillin G sodium, pentazocine, pentobarbital, phenobarbital, phentolamine, phenylephrine, potassium chloride, procainamide, rifampin, succinylcholine, sufentanyl, telavancin, teniposide, the-

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

ophylline, ticarcillin/clavulanate, tigecycline, tirofiban, vasopressin, zidovudine, zoledronic acid

- **Y-Site Incompatibility:** alemtuzumab, alfentanil, amphotericin B colloidal, atropine, aztreonam, buprenorphine, butorphanol, calcium acetate, calcium chloride, cefepime, cefoperazone, cefotaxime, cefotetan, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, dacarbazine, dactinomycin, dantrolene, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, diazepam, diltiazem, diphenhydramine, dobutamine, dolasetron, doxorubicin hydrochloride, droperidol, ephedrine, epirubicin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludara-bine, furosemide, gemcitabine, glycopyrrolate, haloperidol, heparin, hydralazine, hydromorphone, hydroxyzine, idarubicin, ifosfamide, insulin/regular, ketorolac, labetalol, leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, lorazepam, mecloretamine, melphalan, meperidine, meropenem, methotrexate, methylprednisolone, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, mycophenolate, nalbu-phine, naloxone, nesiritide, nicardipine, norepinephrine, ondansetron, palonosetron, pancuro-nium, pemetrexed, pentamidine, phenytoin, potassium acetate, potassium phosphates, prochlorperazine, promethazine, propranolol, quinu-pristin/dalfopristin, ranitidine, remifentanyl, rocuro-nium, sodium acetate, sodium phosphates, streptozocin, thiotepa, tolazoline, topotecan, vecu-ronium, verapamil, vinblastine, vincristine, vinorel-bine, voriconazole, solutions containing zinc.

Patient/Family Teaching

- Instruct patient to take medication as directed for the full course of therapy, even if feeling better.
- Advise patient to avoid alcohol, products containing aspirin or NSAIDs, and foods that may cause an increase in GI irritation.
- Advise patient to report onset of black, tarry stools; diarrhea; or abdominal pain to health care professional promptly. **Instruct patient to notify health care professional immediately if rash, diarrhea, abdominal cramping, fever, or bloody stools occur and not to treat with antidiarrheals without consulting health care professional.**
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in abdominal pain heartburn, gastric irritation and bleeding in patients with GERD; may require up to 4 wk of therapy.
- Healing in patients with erosive esophagitis. Therapy is continued for up to 8 wk.

paricalcitol, See VITAMIN D COMPOUNDS.

PARoxetine hydrochloride (par-ox-e-teen) Paxil, Paxil CR

PARoxetine mesylate Brisdelle, Pexeva

Classification

Therapeutic: antianxiety agents, antidepressants

Pharmacologic: selective serotonin reuptake inhibitors (SSRIs)

Pregnancy Category D

Indications

Paxil, Paxil CR, Pexeva: Major depressive disorder, panic disorder. **Paxil, Pexeva:** Obsessive compulsive disorder (OCD), generalized anxiety disorder (GAD). **Paxil, Paxil CR:** Social anxiety disorder. **Paxil:** Post-traumatic stress disorder (PTSD). **Paxil CR:** Premenstrual dysphoric disorder (PMDD). **Brisdelle:** Moderate to severe vasomotor symptoms associated with menopause.

Action

Inhibits neuronal reuptake of serotonin in the CNS, thus potentiating the activity of serotonin; has little effect on norepinephrine or dopamine; mechanism for benefit in treating vasomotor symptoms unknown.

Therapeutic Effects: Antidepressant action. Decreased frequency of panic attacks, OCD, or anxiety. Improvement in manifestations of post-traumatic stress disorder. Decreased dysphoria prior to menses. Decreased vasomotor symptoms in postmenopausal women.

Pharmacokinetics

Absorption: Completely absorbed following oral administration. Controlled-release tablets are enteric-coated and control medication release over 4–5 hr.

Distribution: Widely distributed throughout body fluids and tissues, including the CNS; cross the placenta and enter breast milk.

Protein Binding: 95%.

Metabolism and Excretion: Highly metabolized by the liver (partly by P450 2D6 enzyme system); 

the CYP2D6 enzyme system exhibits genetic polymorphism; ~7% of population may be poor metabolizers (PMs) and may have significantly ↑ paroxetine concentrations and an ↑ risk of adverse effects. 2% excreted unchanged in urine.

Half-life: 21 hr.

TIME/ACTION PROFILE (antidepressant action)

ROUTE	ONSET	PEAK	DURATION
PO	1–4 wk	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of MAO inhibitors or MAO-like drugs (linezolid or methylene blue); Concurrent use of thioridazine or pimozide.

Use Cautiously in: Risk of suicide (may ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment); History of seizures; History of bipolar disorder; **OB:** Use during the first trimester may be associated with an ↑ risk of cardiac malformations—consider fetal risk/maternal benefit; use during third trimester may result in neonatal serotonin syndrome requiring prolonged hospitalization, respiratory and nutritional support; **Lactation:** Safety not established; discontinue drug or bottle feed; **Pedi:** May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; may be greater in children and adolescents (safety in children/adolescents not established); **Ger:** Severe renal hepatic impairment; geriatric or debilitated patients (daily dose should not exceed 40 mg); history of mania/risk of suicide.

Adverse Reactions/Side Effects

CNS: **NEUROLEPTIC MALIGNANT SYNDROME**, **SUICIDAL THOUGHTS**, anxiety, dizziness, drowsiness, headache, insomnia, weakness, agitation, amnesia, confusion, emotional lability, hangover, impaired concentration, malaise, mental depression, syncope. **EENT:** blurred vision, rhinitis. **Resp:** cough, pharyngitis, respiratory disorders, yawning. **CV:** chest pain, edema, hypertension, palpitations, postural hypotension, tachycardia, vasodilation. **GI:** constipation, diarrhea, dry mouth, nausea, abdominal pain, ↓/↑ appetite, dyspepsia, flatulence, taste disturbances, vomiting. **GU:** ejaculatory disturbance, ↓ libido, genital disorders, infertility, urinary disorders, urinary frequency. **Derm:** **STEVENS-JOHNSON SYNDROME**, sweating, photosensitivity, pruritus, rash. **F and E:** hyponatremia. **Metab:** weight gain/loss. **MS:** back pain, bone fracture, myalgia, myopathy. **Neuro:** paresthesia, tremor. **Misc:** **SERO-TONIN SYNDROME**, chills, fever.

Interactions

Drug-Drug: Concurrent use with **MAO inhibitors** may result in serious, potentially fatal reactions (wait at least 2 wk after stopping MAO inhibitor before initiating paroxetine; wait at least 2 wk after stopping paroxetine before starting MAO inhibitors). Concurrent use with **MAO-inhibitor like drugs**, such as **linezolid** or **methylene blue** may ↑ risk of serotonin syndrome; concurrent use contraindicated; do not start therapy in patients receiving **linezolid** or **methylene blue**; if **linezolid** or **methylene blue** need to be started in a patient receiving paroxetine, immediately discontinue paroxetine and monitor for signs/symptoms of serotonin syndrome for 2 wk or until 24 hr after last dose of linezolid or methylene blue, whichever comes first (may resume paroxetine therapy 24 hr after last dose of linezolid or methylene blue). Concurrent use with **pimozide** or **thioridazine** may ↑ risk of QT interval prolongation and torsades de pointes; concurrent use contraindicated. May ↓ metabolism and ↑ effects of certain **drugs that are metabolized by the liver**, including other antidepressants, phenothiazines, class IC antiarrhythmics, risperidone, atomoxetine, theophylline, and quinidine. Concurrent use should be undertaken with caution. **Cimetidine** ↑ blood levels. **Phenobarbital** and **phenytoin** may ↓ effectiveness. Concurrent use with **alcohol** is not recommended. May ↓ the effectiveness of **digoxin** and **tamoxifen**. May ↑ risk of bleeding with **warfarin**, **aspirin**, or **NSAIDs**. Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SNRIs**, **fentanyl**, **buspirone**, **tramadol** and **triptans** ↑ risk of serotonin syndrome.

Drug-Natural Products: ↑ risk of serotonergic side effects including serotonin syndrome with **St. John's wort**, **SAME**, and **tryptophan**.

Route/Dosage

Depression

PO (Adults): 20 mg as a single dose in the morning; may ↑ by 10 mg/day at weekly intervals (not to exceed 50 mg/day). **Controlled-release tablets**—25 mg once daily initially. May ↑ at weekly intervals by 12.5 mg (not to exceed 62.5 mg/day).

PO (Geriatric Patients or Debilitated Patients): 10 mg/day initially; may be slowly ↑ (not to exceed 40 mg/day). **Controlled-release tablets**—12.5 mg once daily initially; may be slowly ↑ (not to exceed 50 mg/day).

Obsessive-Compulsive Disorder

PO (Adults): 20 mg/day initially; ↑ by 10 mg/day at weekly intervals up to 40 mg (not to exceed 60 mg/day).

★ = Canadian drug name. ‡ = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Panic Disorder

PO (Adults): 10 mg/day initially; ↑ by 10 mg/day at weekly intervals up to 40 mg (not to exceed 60 mg/day). *Controlled-release tablets*—12.5 mg/day initially; ↑ by 12.5 mg/day at weekly intervals (not to exceed 75 mg/day).

Social Anxiety Disorder

PO (Adults): 20 mg/day. *Controlled-release tablets*—12.5 mg/day initially; may ↑ by 12.5 mg/day weekly intervals (not to exceed 37.5 mg/day).

Generalized Anxiety Disorder

PO (Adults): 20 mg once daily initially; ↑ by 10 mg/day at weekly intervals (not to exceed 50 mg/day).

Post-Traumatic Stress Disorder

PO (Adults): 20 mg/day initially; may ↑ by 10 mg/day at weekly intervals (not to exceed 50 mg/day).

Premenstrual Dysphoric Disorder

PO (Adults): *Controlled-release tablets*—12.5 mg once daily throughout menstrual cycle or during luteal phase of menstrual cycle only; may ↑ to 25 mg/day after one week.

Menopausal Vasomotor Symptoms

PO (Adults): 7.5 mg once daily at bedtime.

Hepatic Impairment

PO (Adults): *Paxil, Paxil CR, or Pexeva: Severe hepatic impairment*—10 mg/day initially; may slowly ↑ (not to exceed 40 mg/day). *Controlled-release tablets*—12.5 mg once daily initially; may slowly ↑ (not to exceed 50 mg/day).

Renal Impairment

PO (Adults): *Paxil, Paxil CR, or Pexeva: Severe renal impairment*—10 mg/day initially; may slowly ↑ (not to exceed 40 mg/day). *Controlled-release tablets*—12.5 mg once daily initially; may slowly ↑ (not to exceed 50 mg/day).

Availability (generic available)

Paroxetine hydrochloride tablets: 10 mg, 20 mg, 30 mg, 40 mg. **Cost:** *Generic*—10 mg \$9.93/90, 20 mg \$9.93/90, 30 mg \$18.82/90, 40 mg \$14.88/90.

Paroxetine hydrochloride controlled-release tablets: 12.5 mg, 25 mg, 37.5 mg. **Cost:** *Generic*—12.5 mg \$263.62/90, 25 mg \$254.13/90, 37.5 mg \$270.06/90. **Paroxetine hydrochloride oral suspension (orange flavor):** 10 mg/5 mL. **Cost:** \$268.35/250 mL. **Paroxetine mesylate tablets (Pexeva):** 10 mg, 20 mg, 30 mg, 40 mg. **Cost:** 10 mg \$235.38/30, 20 mg \$244.69/30, 30 mg \$253.99/30, 40 mg \$263.33/30. **Paroxetine mesylate capsules (Brisdelle):** 7.5 mg. **Cost:** \$161.64/30.

NURSING IMPLICATIONS

Assessment

- **Monitor** appetite and nutritional intake. Weigh weekly. Notify health care professional of continued weight loss. Adjust diet as tolerated to support nutritional status.
- **Depression:** Monitor mental status (orientation, mood, behavior). Inform health care professional if patient demonstrates significant increase in anxiety, nervousness, or insomnia.
- **Assess** for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤24 yr.
- **Assess** for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyperreflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).
- **Monitor** for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness). Discontinue paroxetine and notify health care professional immediately if these symptoms occur.
- **Assess** for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.
- **OCD:** Assess patient for frequency of obsessive-compulsive behaviors. Note degree to which these thoughts and behaviors interfere with daily functioning.
- **Panic Attacks:** Assess frequency and severity of panic attacks.
- **Social Anxiety Disorder:** Assess frequency and severity of episodes of anxiety.
- **Posttraumatic Stress Disorder:** Assess manifestations of post-traumatic stress disorder periodically during therapy.
- **Premenstrual Dysphoria:** Assess symptoms of premenstrual distress prior to and during therapy.
- **Lab Test Considerations:** Monitor CBC and differential periodically during therapy. Report leukopenia or anemia.

Potential Nursing Diagnoses

Ineffective coping (Indications)

Risk for injury (Side Effects)

Implementation

- **Do not** confuse paroxetine with fluoxetine, duloxetine, or piroxicam. **Do not** confuse Paxil (paroxetine) with Doxil (doxorubicin liposomal), Taxol

(paclitaxel), or Plavix (clopidogrel). Do not confuse Pexeva (paroxetine mesylate) with Lexiva (fosamprenavir).

- Paroxetine mesylate (Pexeva) cannot be substituted with paroxetine (Paxil or Paxil CR) or generic paroxetine.
- Periodically reassess dose and continued need for therapy.
- **PO:** Administer as a single dose in the morning. May administer with food to minimize GI irritation.
- Swallow tablets whole. Do not crush, break, or chew. Shake suspension before administering.
- Taper to avoid potential withdrawal reactions.

Patient/Family Teaching

- Instruct patient to take paroxetine as directed. Take missed doses as soon as possible and return to regular dosing schedule. Do not double doses. Caution patient to consult health care professional before discontinuing paroxetine. Daily doses should be decreased slowly. Abrupt withdrawal may cause dizziness, sensory disturbances, agitation, anxiety, nausea, and sweating. Advise patient to read *Medication Guide* before starting and with each Rx refill in case of changes.
- May cause drowsiness or dizziness. Caution patient to avoid driving and other activities requiring alertness until response to the drug is known.
- Advise patient, family and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide, new or worse depression or anxiety, agitation or restlessness, panic attacks, insomnia, new or worse irritability, aggressiveness, acting on dangerous impulses, mania, or other changes in mood or behavior or if symptoms of serotonin syndrome or neuroleptic malignant syndrome occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications and to avoid alcohol or other CNS-depressant drugs during therapy.
- Inform patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may minimize dry mouth. Saliva substitute may be used. Consult dentist if dry mouth persists for more than 2 wk.
- Advise patient to notify health care professional if headache, weakness, nausea, anorexia, anxiety, or insomnia persists.
- Instruct female patient to inform health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the importance of follow-up exams to monitor progress. Encourage patient participation in psychotherapy to improve coping skills.

Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings. May require 1–4 wk of therapy to obtain antidepressant effects.
- Decrease in obsessive-compulsive behaviors.
- Decrease in frequency and severity of panic attacks.
- Decrease in frequency and severity of episodes of anxiety.
- Improvement in manifestations of posttraumatic stress disorder.
- Decreased dysphoria prior to menses.

pazopanib (pah-zoe-puh-nib)

Votrient

Classification

Therapeutic: antineoplastics

Pharmacologic: kinase inhibitors

Pregnancy Category D

Indications

Advanced renal cell carcinoma. Advanced soft tissue sarcoma in patients who have previously received chemotherapy.

Action

Acts as a tyrosine kinase inhibitor of several vascular endothelial growth factor (VEGF) receptors, platelet-derived growth factor receptor, fibroblast growth factor receptor, cytokine receptor, interleukin-2 receptor inducible T-cell kinase, leukocyte-specific protein tyrosine kinase, and transmembrane glycoprotein receptor tyrosine kinase. Overall effect is decreased angiogenesis in tumors. **Therapeutic Effects:** Decreased growth and spread of renal cell carcinoma. Improvement in progression-free survival.

Pharmacokinetics

Absorption: Well absorbed following oral administration; crushing tablet and ingesting food ↑ absorption.

Distribution: unknown.

Protein Binding: >99%.

Metabolism and Excretion: Mostly metabolized by the liver (primarily by the CYP3A4 enzyme system, minor amounts by CYP1A2 and CYP2C8) followed by elimination in feces; <4% excreted by the kidneys.

Half-life: 30.9 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	PO	2–4 hr	24 hr

☼ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Contraindications/Precautions

Contraindicated in: Severe hepatic impairment; History of hemoptysis, cerebral or GI bleeding in preceding 6 mo; Risk/history of arterial thrombotic events, including MI, angina or ischemic stroke within preceding 6 mo; Concurrent use of strong CYP3A4 inhibitors (if concurrent use is necessary, ↓ dose of pazopanib); Concurrent use of strong CYP3A4 inducers (may ↓ effectiveness); Concurrent use of drugs that have narrow therapeutic windows and that are metabolized by CYP3A4, CYP2D6, or CYP2C8 enzyme systems; **OB:** May cause fetal harm, avoid use during pregnancy; **Lactation:** Avoid use during breast feeding.

Use Cautiously in: Congenital prolonged QTc interval or concurrent medications/diseases that prolong QTc (may ↑ risk of torsades de pointes); Electrolyte abnormalities (correct prior to use; may ↑ risk of potentially serious arrhythmia); Patients at risk for gastrointestinal perforation/fistula; Surgery; interruption of therapy recommended; Hypertension; control before therapy is initiated; Hypothyroidism (may worsen condition); Concurrent use of inducers of the CYP3A4 enzyme system; consider alternate concurrent medication with little or no enzyme induction potential or avoid pazopanib; Moderate hepatic impairment (dose ↓ recommended); **Ger:** May be more sensitive to drug effects, consider age-related ↓ in cardiac, renal, and hepatic function, concurrent disease states and drug therapy; **OB:** Women with childbearing potential; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: REVERSIBLE POSTERIOR LEUKOENCEPHALOPATHY SYNDROME, STROKE, fatigue, weakness. **CV:** MYOCARDIAL INFARCTION, QT INTERVAL PROLONGATION, DEEP VEIN THROMBOSIS, bradycardia, hypertension, altered taste, chest pain, dyspepsia, heart failure. **GI:** GI PERFORATION/FISTULA, HEPATOTOXICITY, PANCREATITIS, abdominal pain, anorexia, diarrhea, nausea, vomiting. **GU:** HEMOLYTIC UREMIC SYNDROME, proteinuria.

Derm: alopecia, facial edema, palmar-plantar erythrodysesthesia (hand-foot syndrome), rash, skin depigmentation. **Endo:** hypothyroidism. **Hemat:** BLEEDING, THROMBOEMBOLIC EVENTS, THROMBOTIC THROMBOCYTOPENIC PURPURA. **Metab:** ↑ lipase, weight loss. **Resp:** PULMONARY EMBOLISM. **Misc:** hair color changes (depigmentation).

Interactions

Drug-Drug: Concurrent use of strong CYP3A4 inhibitors, including ketoconazole, ritonavir and clarithromycin may ↑ levels and should be avoided; if required, dose of pazopanib should be ↓ to 400 mg daily or more if necessary. Concurrent use of strong CYP3A4 inducers, including rifampin, may ↓ levels and effectiveness and should be avoided. Concurrent use with **drugs with narrow therapeutic windows that are metabolized by CYP3A4, CYP2D6, or**

CYP2C8 may ↑ levels of such drugs and the risk of toxicity/adverse reactions is not recommended. ↑ risk of hepatotoxicity with **simvastatin**.

Drug-Food: Grapefruit juice may ↑ levels; avoid concurrent use.

Route/Dosage

PO (Adults): 800 mg once daily; *Concurrent use of strong CYP3A4 inhibitors*—400 mg once daily, further reductions may be necessary.

Hepatic Impairment

PO (Adults): *Moderate hepatic impairment*—200 mg once daily.

Availability

Tablets: 200 mg.

NURSING IMPLICATIONS

Assessment

- Monitor BP during frequent therapy; may cause hypertension. BP should be well-controlled prior to initiating therapy. If persistent hypertension occurs despite antihypertensive therapy, reduce dose. If hypertension persists and is severe, discontinue therapy. Baseline and periodic evaluation of LVEF is recommended in patients at risk of cardiac dysfunction.
- Obtain baseline ECG and monitor periodically during therapy. Maintain serum calcium, magnesium, and potassium within normal range during therapy.
- Monitor for signs and symptoms of GI perforation and fistula (abdominal pain; swelling in stomach area; vomiting blood; black sticky stools; GI bleeding) during therapy.
- **Lab Test Considerations:** Monitor serum liver tests before initiation and wks 3, 5, 7, and 9, then at month 3 and month 4 if symptoms occur. Monitor periodically after month 4. *If isolated ALT ↑ between 3 and 8 times the upper limit of normal, therapy may continue with weekly monitoring of liver function until ALT returns to Grade 1 or baseline. If isolated ALT ↑ >8 times the upper limit of normal, stop therapy until ALT returns to Grade 1 or baseline. If benefit outweighs risk, may reintroduce at reduced dose of 400 mg/day with weekly serum liver tests for 8 wk. Following reintroduction, if ALT ↑ >3 times the upper limit of normal recurs, permanently discontinue pazopanib. If ALT ↑ occurs concurrently with ↑ serum bilirubin >2 times the upper limit of normal, discontinue pazopanib permanently. Monitor liver function tests until return to baseline. Patients with only mild indirect hyperbilirubinemia (Gilbert's syndrome) and ↑ ALT >3 times the upper limit of normal should be managed as per recommendations for ↑ ALT.*
- Monitor thyroid function periodically during therapy. May cause hypothyroidism.

- Obtain baseline urinalysis and monitor periodically. May cause proteinuria. Discontinue therapy if Grade 4 proteinuria develops.
- May cause leukopenia, neutropenia, thrombocytopenia, and lymphocytopenia.
- May cause ↑AST and ↓ serum phosphorous, sodium, and magnesium. May cause ↑ or ↓ serum glucose.

Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- **PO:** Administer at least 1 hr before or 2 hr after a meal. Swallow tablets whole; do not crush tablets.

Patient/Family Teaching

- Instruct patient to take pazopanib on an empty stomach as directed. Take missed doses as soon as remembered; if less than 12 hr before next dose, omit dose. Advise patient to read the *Medication Guide* prior to taking pazopanib and with each Rx refill; new information may be available.
- Advise patient to avoid drinking grapefruit juice or eating grapefruit during therapy; may increase amounts of panopanib absorbed.
- Advise patient to notify health care professional immediately if signs and symptoms of liver problems (yellowing of skin or whites of eyes, unusual darkening of urine, unusual tiredness, pain in the right upper stomach area), heart failure (shortness of breath), heart attack or stroke (chest pain or pressure; pain in arms, back, neck or jaw; shortness of breath; numbness or weakness on one side of body; trouble talking; headache; dizziness), blood clots (new chest pain, trouble breathing or shortness of breath that starts suddenly; leg pain; swelling of arms and hands, or legs and feet; cool or pale arm or leg), bleeding problems (unusual bleeding, bruising, wounds that do not heal), GI perforation or fistula, reversible posterior leukoencephalopathy syndrome (headaches, seizures, lack of energy, confusion, high blood pressure, loss of speech, blindness or changes in vision, and problems thinking), severe increase in blood pressure (severe chest pain, severe head ache, blurred vision, confusion, nausea and vomiting, severe anxiety, shortness of breath, seizures, unconsciousness) or severe infections (fever; cold symptoms such as runny nose or sore throat that do not go away; flu symptoms such as cough, tiredness, and body aches; pain when urinating; cuts, scrapes or wounds that are red, warm, swollen or painful) occur.
- Inform patient that diarrhea frequently occurs. Instruct patient on ways to manage diarrhea and to

notify health care professional if moderate to severe diarrhea occurs.

- Inform patient that loss of color (depigmentation) of skin or hair may occur during therapy. Explore methods of coping.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise patient to notify health care professional of any impending surgery. Pazopanib must be stopped for at least 7 days prior to surgery due to the affects on healing.
- Advise female patients to use effective contraception during therapy and to notify health care professional immediately if pregnancy is suspected.

Evaluation/Desired Outcomes

- Decreased growth and spread of renal cell carcinoma.
- Improvement in spread of sarcoma.

pegaspargase

(peg-ass-par-jase)

Oncaspar, PEG-L-asparaginase

Classification

Therapeutic: antineoplastics

Pharmacologic: enzymes

Pregnancy Category C

P

Indications

Treatment (usually with other agents) of acute lymphoblastic leukemia (ALL) in patients who have had a previous hypersensitivity reaction to native asparaginase.

Action

Consists of L-asparaginase bound to polyethylene glycol (PEG). This compound depletes asparagine, which leukemic cells cannot synthesize. Normal cells are able to produce their own asparagine and are less susceptible to the effects of asparaginase. Binding to PEG renders asparaginase less antigenic and therefore less likely to induce hypersensitivity reactions. **Therapeutic Effects:** Death of leukemic cells.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Metabolized by serum proteases and in the reticuloendothelial system.

Half-life: 5.7 days (less in patients with previous hypersensitivity to native L-asparaginase).

☼ = Canadian drug name. ⚡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

TIME/ACTION PROFILE (hematologic effects)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	unknown	14 days

Contraindications/Precautions

Contraindicated in: Pancreatitis or history of pancreatitis; History of previous hemorrhagic reaction to asparaginase therapy; Previous hypersensitivity reactions to pegaspargase.

Use Cautiously in: History of previous hypersensitivity reactions to other drugs; Patients with childbearing potential; **OB, Lactation:** Safety not established.

Adverse Reactions/Side Effects

CNS: SEIZURES, headache, malaise. **GI:** PANCREATITIS, abdominal pain, abnormal liver function tests, anorexia, diarrhea, lip edema, nausea, vomiting. **Derm:** jaundice. **Endo:** hyperglycemia. **F and E:** peripheral edema. **Hemat:** decreased fibrinogen, disseminated intravascular coagulation, hemolytic anemia, increased thromboplastin, leukopenia, pancytopenia, thrombocytopenia. **Local:** injection site hypersensitivity, injection site pain, thrombosis. **MS:** arthralgia, myalgia, pain in extremities. **Neuro:** paresthesia. **Misc:** chills, hypersensitivity reactions, night sweats.

Interactions

Drug-Drug: May alter response to anticoagulants or antiplatelet agents. May alter the response to other drugs that are metabolized by the liver.

Route/Dosage

IM, IV (Adults up to 21 yr, and Children with Body Surface Area ≥ 0.6 m²): 2500 IU/m² q 14 days (usually in combination with other agents).

IM, IV (Children with Body Surface Area <0.6 m²): 82.5 IU/kg q 14 days (usually in combination with other agents).

Availability

Injection: 750 IU/mL.

NURSING IMPLICATIONS**Assessment**

- Assess patient for previous hypersensitivity reactions to native L-asparaginase. Monitor for hypersensitivity reaction (urticaria, diaphoresis, facial swelling, joint pain, hypotension, bronchospasm) for at least 1 hr following administration. Epinephrine and resuscitation equipment should be readily available. Reaction may occur up to 2 hr after administration.
- Monitor for development of bone marrow depression. Assess for fever, sore throat, and signs of infection. Monitor platelet count throughout therapy. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac test stools, urine, and emesis). Avoid giving IM injections and taking rectal temperatures.

Apply pressure to venipuncture sites for 10 min. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.

- Monitor patient frequently for signs of pancreatitis (nausea, vomiting, abdominal pain).**
- Assess nausea, vomiting, and appetite. Weigh patient weekly. Prophylactic antiemetics may be used prior to administration.
- Lab Test Considerations:** Monitor CBC prior to and periodically throughout therapy. May alter coagulation studies. Fibrinogen may be decreased; PT and partial thromboplastin time (PTT) may be ↑.
- Monitor serum amylase frequently to detect pancreatitis.
- Monitor blood glucose; may cause hyperglycemia.
- May cause elevated BUN and serum creatinine.
- Hepatotoxicity may be manifested by increased AST, ALT, or bilirubin. Liver function tests usually return to normal after therapy.
- May cause ↓ serum calcium.
- May cause elevated serum and urine uric acid and hyponatremia.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)

Implementation

- IM is the preferred route because of a lower incidence of adverse reactions.
- Solutions should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in specially designated containers.
- IM:** Limit single injection volume to 2 mL. If volume of injection is >2 mL, use multiple injection sites.

IV Administration

- pH:** 7.3.
- Intermittent Infusion:** **Diluent:** Dilute each dose in 100 mL of 0.9% NaCl or D5W. Do not shake or agitate. Do not use if solution is cloudy or has formed a precipitate.
- Use only 1 dose per vial; do not re-enter the vial. Discard unused portions.
- Keep refrigerated but do not freeze. Freezing destroys activity but does not change the appearance of pegaspargase. **Rate:** Administer over 1–2 hr via Y-site through an infusion that is already running.
- Additive Incompatibility:** Information unavailable. Do not admix with other medications or solutions.

Patient/Family Teaching

- Inform patient of the possibility of hypersensitivity reactions, including anaphylaxis.
- Advise patient that concurrent use of other medications may increase the risk of bleeding and the toxicity of pegaspargase. Consult health care professional before taking any other medications, including OTC drugs.

- Instruct patient to notify health care professional if abdominal pain, severe nausea and vomiting, jaundice, fever, chills, sore throat, bleeding or bruising, excess thirst or urination, or mouth sores occur. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush, electric razor, and to be especially careful to avoid falls. Patients should also be cautioned not to drink alcoholic beverages or take medications containing aspirin or NSAIDs because these may precipitate gastric bleeding.
- Instruct patient not to receive any vaccinations without advice of health care professional. Advise parents that this may alter child's immunization schedule.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Improvement of hematologic status in patients with leukemia.

pegfilgrastim (peg-fil-gra-stim) Neulasta

Classification

Therapeutic: colony-stimulating factors

Pregnancy Category C

Indications

To decrease the incidence of infection (febrile neutropenia) in patients with nonmyeloid malignancies receiving myelosuppressive antineoplastics associated with a high risk of febrile neutropenia.

Action

Filgrastim is a glycoprotein that binds to and stimulates neutrophils to divide and differentiate. Also activates mature neutrophils. Binding to a polyethylene glycol molecule prolongs its effects. **Therapeutic Effects:** Decreased incidence of infection in patients who are neutropenic from chemotherapy.

Pharmacokinetics

Absorption: Well absorbed following subcut administration.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: 15–80 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
Subcut	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to filgrastim or *Escherichia coli*-derived proteins.

Use Cautiously in: Patients with sickle cell disease (↑ risk of sickle cell crisis); Concurrent use of lithium; Malignancy with myeloid characteristics; **OB, Lactation:** Pregnancy or lactation; **Pedi:** 6 mg fixed dose should not be used in infants, children, and adolescents weighing <45 kg.

Adverse Reactions/Side Effects

Resp: ADULT RESPIRATORY DISTRESS SYNDROME (ARDS). **GI:** SPLENIC RUPTURE. **Hemat:** SICKLE CELL CRISIS, leukocytosis. **MS:** medullary bone pain. **Misc:** allergic reaction including ANAPHYLAXIS.

Interactions

Drug-Drug: Simultaneous use with antineoplastics may have adverse effects on rapidly proliferating neutrophils; avoid use for 24 hr before and 24 hr following chemotherapy. **Lithium** may potentiate the release of neutrophils; concurrent use should be undertaken cautiously.

Route/Dosage

Subcut (Adults and Children >45 kg): 6 mg per chemotherapy cycle.

Availability

Solution for injection: 6 mg/0.6 mL in prefilled syringes.

NURSING IMPLICATIONS

Assessment

- Assess patient for bone pain throughout therapy. Pain is usually mild to moderate and controllable with nonopioid analgesics, but may require opioid analgesics.
- Assess patient periodically for signs of ARDS (fever, lung infiltration, respiratory distress). If ARDS occurs, treat condition and discontinue pegfilgrastim and/or withhold until symptoms resolve.
- **Lab Test Considerations:** Obtain CBC and platelet count before chemotherapy. Monitor hematocrit and platelet count regularly.
- May cause elevated LDH, alkaline phosphatase, and uric acid.

Potential Nursing Diagnoses

Risk for infection (Indications)

Acute pain (Side Effects)

Implementation

- Do not confuse Neulasta (pegfilgrastim) with Lu-nesta (eszopiclone) or Neumega (oprelvekin).
- Pegfilgrastim should not be administered between 14 and 24 days after administration of cytotoxic chemotherapy.

✳ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Keep patients with sickle cell disease receiving pegfilgrastim well hydrated and monitor for sickle cell crisis.
- **Subcut:** Administer subcut once per chemotherapy cycle. Do not administer solutions that are discolored or contain particulate matter. Do not shake. Store refrigerated; may be allowed to reach room temperature for a maximum of 48 hr, but protect from light.
- Supplied in prefilled syringes. Following administration, activate UltraSafe Needle Guard to prevent needle sticks by placing hands behind needle, grasping guard with one hand, and sliding guard forward until needle is completely covered and guard clicks into place. If audible click is not heard, guard may not be completely activated. Dispose of by placing entire prefilled syringe with guard activated into puncture-proof container.

Patient/Family Teaching

- Advise patient to notify health care professional immediately if signs of allergic reaction (shortness of breath, hives, rash, pruritus, laryngeal edema) or signs of splenic rupture (left upper abdominal or shoulder tip pain) occur.
- Emphasize the importance of compliance with therapy and regular monitoring of blood counts.
- **Home Care Issues:** Instruct patient on correct disposal technique for home administration. Caution patient not to reuse needle, syringe, or drug product. Provide patient with a puncture-proof container for disposal of prefilled syringe.

Evaluation/Desired Outcomes

- Decreased incidence of infection in patients who receive bone marrow—depressing antineoplastics.

peginterferon alpha-2a, See INTERFERONS, ALPHA.

peginterferon alpha-2b, See INTERFERONS, ALPHA.

REMS

 **pegloticase** (peg-loe-ti-kase)
Krystexxa

Classification

Therapeutic: antigout agents
Pharmacologic: enzymes

Pregnancy Category C

Indications

Treatment of chronic gout in adults who have not responded to/cannot tolerate xanthine oxidase inhibitors, including allopurinol.

Action

Consists of recombinant uricase covalently bonded to monomethoxypoly(ethylene glycol) [mPEG]; uricase catalyzes the oxidation of uric acid to allantoin, a water soluble byproduct that is readily excreted in urine.

Therapeutic Effects: ↓ serum uric acid levels with resultant ↓ in attacks of gout and its sequelae.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: Unknown.

TIME/ACTION PROFILE (effects on serum uric acid)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	within 24 hr	>300 hr

Contraindications/Precautions

Contraindicated in:  Glucose-6—phosphate dehydrogenase (G6—PD) deficiency (risk of hemolysis and methemoglobinemia); **Lactation:** Breast feeding is not recommended.

Use Cautiously in: HF (may ↑ risk of exacerbation); Retreatment after a drug-free interval (↑ risk of allergic reactions, monitor carefully); **Geri:** May be more sensitive to drug effects; **OB:** Use during pregnancy only if clearly needed; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CV: chest pain. **EENT:** nasopharyngitis. **GI:** nausea, constipation, vomiting. **Derm:** contusion/ecchymoses. **Metab:** gout flare. **Misc:** allergic reactions including ANAPHYLAXIS, INFUSION REACTIONS.

Interactions

Drug-Drug: May interfere with the action of other PEG-containing therapies.

Route/Dosage

IV (Adults): 8 mg every 2 wk.

Availability

Injection: 8 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor for joint pain and swelling. Gout flares frequently occur upon initiation of therapy, but do not require discontinuation. Administer prophylactic doses of colchicine or an NSAID at least 1 wk before and concurrently during the first 6 mo of therapy.
- Monitor for signs and symptoms of anaphylaxis (wheezing, peri-oral or lingual edema, hemodynamic instability, rash, urticaria) during and fol-

lowing infusion. May occur with any infusion, including initial infusion; usually occurs with 2 hr of infusion. Delayed reactions have also been reported. Risk is higher in patients with uric acid level >6 mg/dL.

- **Monitor** for infusion reactions (rash, redness of skin, dyspnea, flushing, chest discomfort, chest pain) during and periodically after infusion. If infusion reaction occurs, slow or stop infusion; restart at slower rate. If severe reaction occurs, discontinue infusion and treat as needed. Risk is greater in patients who have lost therapeutic response. Monitor patient for at least 1 hr following infusion.
- **Lab Test Considerations:** Monitor serum uric acid levels prior to infusion. Consider discontinuing therapy if levels $\uparrow$ to >6 mg/dL, especially if 2 consecutive levels are >6 mg/dL.

Potential Nursing Diagnoses

Chronic pain (Indications)

Implementation

- **Premedicate** patient with antihistamines and corticosteroids prior to infusion to minimize risk of anaphylaxis and infusion reaction. Administer in a setting with professionals prepared to manage anaphylaxis and infusion reactions.
- Discontinue all oral urate-lowering medications prior to and during therapy.

IV Administration

- **pH:** 4.4–5.6.
- **Intermittent Infusion:** Withdraw 1 mL of pegloticase from vial and inject into 250 mL bag of NaCl; discard unused portion. Invert bag several times to mix; do not shake. Solution is clear and colorless; do not administer solutions that are discolored or contain a precipitate. Solution is stable for 4 hr if refrigerated or at room temperature. Store in refrigerator and protect from light; do not freeze. Allow solution to reach room temperature before administering; do not use artificial heating. **Rate:** Infuse over 120 min. Do not administer via IV push or bolus.
- **Additive Incompatibility:** Do not mix with other medications.

Patient/Family Teaching

- Explain purpose of pegloticase to patient. Instruct patient to read *Medication Guide* before starting therapy before each infusion.
- Advise patient to notify health care professional immediately if signs of anaphylaxis or infusion reaction occur.
-  Advise patient not to take pegloticase if they have G6PD deficiency.

- Inform patient that gout flares may initially $\uparrow$ at the start of pegloticase. Advise patient to not to stop therapy but to take medication (colchicine, NSAID) to reduce flares regularly for the first few months of pegloticase therapy.
- Instruct patient to not to take oral urate-lowering medications before or during therapy.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- $\downarrow$ in uric acid levels with resultant improvement in gout symptoms in patients with chronic gout.

PEMEtrexed (pe-me-trex-ed)

Alimta

Classification

Therapeutic: antineoplastics

Pharmacologic: antimetabolites, folate antagonists

Pregnancy Category D

P

Indications

Malignant pleural mesothelioma (with cisplatin) when tumor is unresectable or patient is not a candidate for surgery. Local advanced or metastatic nonsquamous non–small cell lung cancer as initial therapy (with cisplatin), in previously treated patients (as monotherapy), or as maintenance treatment in patients whose disease has not progressed after 4 cycles of platinum-based chemotherapy.

Action

Disrupts folate dependent metabolic processes involved in thymidine and purine synthesis. Converted intracellularly to polyglutamate form which increases duration of action. **Therapeutic Effects:** Decreases growth and spread of mesothelioma. Improved survival in patients with nonsquamous non–small cell lung cancer.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Minimal metabolism; 70–90% excreted unchanged in urine.

Half-life: 3.5 hr (normal renal function).

TIME/ACTION PROFILE (hematologic effects)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	8–15 days	21 days

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; CCr <45 mL/min; **OB, Lactation:** Pregnancy, lactation.

Use Cautiously in: Concurrent use of NSAIDs in patients with CCr 45–79 mL/min (avoid those with short half-lives); 3rd space fluid accumulation (ascites, pleural effusions); consider drainage prior to therapy; Hepatic impairment (dose alteration recommended); **Pedi:** Safety not established.

Adverse Reactions/Side Effects

Resp: pharyngitis. **CV:** constipation, nausea, stomatitis, vomiting, anorexia, diarrhea, esophagitis, mouth pain. **Derm:** desquamation, rash.

Hemat: anemia, hemolytic anemia, leukopenia, thrombocytopenia. **Neuro:** neuropathy. **Misc:** fever, infection.

Interactions

Drug-Drug: NSAIDs, especially those with short half-lives, ↑ blood levels and risk of toxicity; avoid for 2 days before, day of, and 2 days after treatment.

Probenecid ↑ blood levels. Concurrent use of **nephrotoxic agents** ↑ risk of nephrotoxicity.

Route/Dosage

IV (Adults): *Mesothelioma and non–small cell lung cancer (with cisplatin)* 500—mg/m² on day 1 of each 21-day cycle (with cisplatin); concurrent hydration, folic acid, and vitamin B₁₂ therapy, and pretreatment with dexamethasone required. *Non–small cell lung cancer (as monotherapy)* —500 mg/m² on day 1 of each 21-day cycle (concurrent folic acid, and vitamin B₁₂ therapy, and pretreatment with dexamethasone required).

Availability

Lyophilized powder for IV infusion: 100 mg/vial, 500 mg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor for rash during therapy. Pretreatment with dexamethasone 4 mg orally twice daily the day before, the day of, and the day after administration reduces incidence and severity or reaction.
- Monitor for hematologic and GI (mucositis, diarrhea) toxicities. If any Grade 3 or 4 toxicities, except mucositis or diarrhea, requiring hospitalization occur, decrease doses of pemetrexed and cisplatin by 75%. If Grade 3 or 4 mucositis occurs decrease pemetrexed dose by 50% and cisplatin by 100% of previous dose.
- **Monitor for bone marrow depression.** Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neu-

tropenia. Anemia may occur; monitor for increased fatigue, dyspnea, and orthostatic hypotension.

- Assess for neurotoxicity during therapy. If Grade 0–1 neurotoxicity occurs, decrease pemetrexed and cisplatin doses by 100% of previous dose. If Grade 2 neurotoxicity occurs, decrease pemetrexed dose by 100% and cisplatin dose by 50% of previous dose. If Grade 3 or 4 neurotoxicity occurs, discontinue therapy.
- **Lab Test Considerations:** Monitor CBC and platelet counts for nadir and recovery and renal function, before each dose and on days 8 and 15 of each cycle and chemistry for renal and liver functions periodically. May cause neutropenia, thrombocytopenia, leukopenia, and anemia. A new cycle should not be started unless the ANC is at least 1500 cells/mm³, platelet count is at least 100,000 cells/mm³, and creatinine clearance is at least 45 mL/min. If nadir of ANC is less than 500/mm³ and nadir of platelets are at least 50,000/mm³ decrease doses of pemetrexed and cisplatin by 75%. If nadir of platelets is less than 50,000/mm³ regardless of ANC nadir decrease pemetrexed and cisplatin doses by 50%.

Potential Nursing Diagnoses

Risk for injury (Adverse Reactions)

Implementation

- **Do not confuse pemetrexed with pralatrexate.**
- Pemetrexed should be administered under supervision of a physician experienced in the use of chemotherapeutic agents.
- Prepare solution in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in designated containers.
- To reduce toxicity, 0.4–1 mg of folic acid must be taken daily for 7 days preceding first dose of pemetrexed and should continue during and for 21 days after last dose. Patients must also receive an injection of vitamin B₁₂ 1 mg IM during the week preceding first dose of pemetrexed and every 3 cycles thereafter. Subsequent doses of vitamin B₁₂ may be given on same day as pemetrexed. Also administer dexamethasone 4 mg twice daily the day before, the day of, and the day after pemetrexed administration.

IV Administration

- **Intermittent Infusion:** Calculate number of pemetrexed 500-mg vials needed; vials contain excess to facilitate delivery. Reconstitute 500 mg with 20 mL of preservative-free 0.9% NaCl. **Concentration:** 25 mg/mL. Swirl gently until powder is completely dissolved. Solution is clear and colorless to yellow or green-yellow. Do not administer if discolored or containing particulate matter. **Diluent:** Dilute further to 100 mL with preservative-free 0.9% NaCl. Solution is stable at room temperature or if

refrigerated for up to 24 hr. **Rate:** Administer over 10 min.

- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, amphoterylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, carboplatin, carmustine, ceftriaxone, cefuroxime, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone sodium phosphate, dexmedetomidine, dextrozanex, digoxin, diltiazem, diphenhydramine, doxetaxel, dolasetron, dopamine, doxacurium, doxorubicin liposome, enalaprilat, ephedrine, epinephrine, etifibitide, ertapenem, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, glycopyrrolate, granisetron, haloperidol, heparin, hydrocortisone sodium succinate, hydromorphone, ifosfamide, imipenem/cilastatin, insulin, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, meropenem, mesna, methyl-dopate, methylprednisolone sodium succinate, metoclopramide, metoprolol, midazolam, milrinone, mitomycin, morphine, moxifloxacin, nafcillin, naloxone, nesiritide, nitroglycerin, norepinephrine, octreotide, oxaliplatin, paclitaxel, pamidronate, pancuronium, pentobarbital, phenobarbital, phen-tolamine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, promethazine, propranolol, ranitidine, remifentanyl, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, succinylcholine, sufentanil, tacrolimus, theophylline, thiopental, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, trimethoprim/sulfamethoxazole, vancomycin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** amphotericin B colloidal, anidulafungin, calcium acetate, calcium chloride, calcium gluconate, caspofungin, ceftazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, chloramphenicol, chlorpromazine, ciprofloxacin, dacarbazine, dantrolene, daunorubicin hydrochloride, diazepam, dobutamine, doxorubicin, doxycycline, droperidol, epirubicin, erythromycin, gemcitabine, gentamicin, hydralazine, idarubicin, irinotecan, metronidazole, mitoxantrone, nalbuphine, nicardipine, nitroprusside, ondansetron, pantoprazole, pentamidine, pentazocine, phenyt-

oin, prochlorperazine, quinupristin/dalfopristin, tobramycin, topotecan, vasopressin.

- **Additive Incompatibility:** Solutions containing calcium, including Lactated Ringer's and Ringer's solution.

Patient/Family Teaching

- Emphasize the importance of taking prophylactic folic acid and vitamin B₁₂ to reduce treatment-related hematologic and GI toxicity.
- Advise patient to notify health care professional immediately if signs and symptoms of infection (fever, sore throat), anemia, or neurotoxicity occur.
- Instruct patients to notify health care professional if persistent vomiting, diarrhea, or signs of dehydration appear.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially NSAIDs and to avoid alcohol during therapy.
- Advise patient to avoid becoming pregnant during therapy. If pregnancy is planned or suspected, notify health care professional promptly.

Evaluation/Desired Outcomes

- Decreased growth and spread of mesothelioma or non-small cell lung cancer.

PENICILLINS (pen-i-sill-ins)

penicillin G

★ Crystapen, Pfizerpen

penicillin V

Pen-VK

procaine penicillin G

Wycillin

benzathine penicillin G

Bicillin L-A, Permapen

Classification

Therapeutic: anti-infectives

Pharmacologic: penicillins

Pregnancy Category B

Indications

Treatment of a wide variety of infections including: Pneumococcal pneumonia, Streptococcal pharyngitis, Syphilis, Gonorrhea strains. Treatment of enterococcal infections (requires the addition of an aminoglycoside). Prevention of rheumatic fever. Should not be used as a single agent to treat anthrax. **Unlabeled Use:** Treatment of Lyme disease. Prevention of recur-

★ = Canadian drug name. ⚠ = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

rent *Streptococcal pneumoniae* septicemia in children with sickle-cell disease.

Action

Bind to bacterial cell wall, resulting in cell death.

Therapeutic Effects: Bactericidal action against susceptible bacteria. **Spectrum:** Active against: Most gram-positive organisms, including many streptococci (*Streptococcus pneumoniae*, group A beta-hemolytic streptococci), staphylococci (non-penicillinase-producing strains) and *Bacillus anthracis*. Some gram-negative organisms, such as *Neisseria meningitidis* and *Neisseria gonorrhoeae* (only penicillin susceptible strains). Some anaerobic bacteria and spirochetes including *Borrelia burgdorferi*.

Pharmacokinetics

Absorption: Variably absorbed from the GI tract. *Penicillin V*—resists acid degradation in the GI tract. *Procaine and benzathine penicillin*—IM absorption is delayed and prolonged and results in sustained therapeutic blood levels.

Distribution: Widely distributed, although CNS penetration is poor in the presence of uninfamed meninges. Cross the placenta and enter breast milk.

Metabolism and Excretion: Minimally metabolized by the liver, excreted mainly unchanged by the kidneys.

Half-life: 30–60 min.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
Penicillin V PO	rapid	0.5–1 hr	4–6 hr
Penicillin G IM	rapid	0.25–0.5 hr	4–6 hr
Penicillin G IV	rapid	end of infusion	4–6 hr
Benzathine penicillin IM	delayed	12–24 hr	3 wk
Procaine penicillin IM	delayed	1–4 hr	12 hr

Contraindications/Precautions

Contraindicated in: Previous hypersensitivity to penicillins (cross-sensitivity may exist with cephalosporins and other beta-lactams); Hypersensitivity to procaine or benzathine (procaine and benzathine preparations only); Some products may contain tartrazine and should be avoided in patients with known hypersensitivity.

Use Cautiously in: Severe renal insufficiency (dose ↓ recommended); **OB:** Although safety not established, has been used safely; **Lactation:** Safety not established; **Geri:** Consider ↓ body mass, age-related ↓ in renal, hepatic, and cardiac function, comorbidities, and concurrent drug therapy when prescribing and dosing.

Adverse Reactions/Side Effects

CNS: SEIZURES. **GI:** PSEUDOMEMBRANOUS COLITIS, diarrhea, epigastric distress, nausea, vomiting. **GU:** interstitial nephritis. **Derm:** rash, urticaria. **Hemat:** eosinophilia, hemolytic anemia, leukopenia. **Local:** pain at IM site, phlebitis at IV site. **Misc:** allergic reactions including ANAPHYLAXIS and SERUM SICKNESS, superinfection.

Interactions

Drug-Drug: May ↓ effectiveness of oral contraceptive agents. **Probenecid** ↓ renal excretion and ↑ levels therapy may be combined for this purpose. **Neomycin** may ↓ absorption of penicillin V. ↓ elimination of **methotrexate** and ↑ risk of serious toxicity.

Route/Dosage

Penicillin G (aqueous)

IM, IV (Adults): Most infections—1–5 million units q 4–6 hr.

IM, IV (Children): 8333–16,667 units/kg q 4 hr; 12,550–25,000 units/kg q 6 hr; up to 250,000 units/kg/day in divided doses, some infections may require up to 300,000 units/kg/day.

IV (Infants >7 days): 25,000 units/kg q 8 hr; meningitis—50,000–75,000 units/kg q 6 hr.

IV (Infants <7 days): 25,000 units/kg q 12 hr; *Streptococcus B meningitis*—100,000–150,000 units/kg/day in divided doses.

Penicillin V

PO (Adults and Children ≥12 yr): Most infections—125–500 mg q 6–8 hr. *Rheumatic fever prevention*—125–250 mg q 12 hr.

PO (Children <12 yr): *Lyme disease*—12.5 mg/kg q 6 hr (unlabeled); prevention of *Streptococcus pneumoniae* sepsis in children with sickle cell disease—125 mg twice daily.

Benzathine Penicillin G

IM (Adults): *Streptococcal infections/erysipeloid*—1.2 million units single dose. *Primary, secondary, and early latent syphilis*—2.4 million units single dose. *Tertiary and late latent syphilis (not neurosyphilis)*—2.4 million units once weekly for 3 wk. *Prevention of rheumatic fever*—1.2 million units q 3–4 wk.

IM (Children >27 kg): *Streptococcal infections/erysipeloid*—900,000–1.2 million units (single dose). *Primary, secondary, and early latent syphilis*—up to 2.4 million units single dose. *Late latent or latent syphilis of undetermined duration*—50,000 units/kg weekly for 3 wk. *Prevention of rheumatic fever*—1.2 million units q 2–3 wk.

IM (Children <27 kg): *Streptococcal infections/erysipeloid*—300,000–600,000 units single dose. *Primary, secondary, and early latent syphilis*—up to 2.4 million units single dose. *Late latent or latent*

syphilis of undetermined duration—50,000 units/kg weekly for 3 wk. *Prevention of rheumatic fever*—1.2 million units q 2–3 wk.

Procaine Penicillin G

IM (Adults): *Moderate or severe infections*—600,000–1.2 million units/day as a single dose or in 2 divided doses. *Neurosyphilis*—2.4 million units/day with 500 mg probenecid PO 4 times daily for 10–14 days.

IM (Children): *Congenital syphilis*—50,000 units/kg/day for 10–14 days.

Availability

Penicillin G Potassium (generic available)

Powder for injection: 5 million units/vial, 20 million units/vial. **Premixed (frozen) solution for injection:** 1 million units/50 mL, 2 million units/50 mL, 3 million units/50 mL.

Penicillin G Sodium (generic available)

Powder for injection: 5 million units/vial.

Penicillin V Potassium (generic available)

Tablets: 250 mg, 500 mg. **Cost:** *Generic*—250 mg \$45.75/100, 500 mg \$77.77/100. **Oral solution:** 125 mg/5 mL, 250 mg/5 mL. **Cost:** *Generic*—125 mg/5 mL \$3.84/100 mL, 250 mg/5 mL \$4.31/100 mL.

Procaine Penicillin G (generic available)

Suspension for IM injection: 600,000 units/mL.

Benzathine Penicillin G

Suspension for IM injection: 600,000 units/mL.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy.
- Obtain a history to determine previous use of and reactions to penicillins, cephalosporins, or other beta-lactam antibiotics. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue drug and notify health care professional immediately if these symptoms occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in case of an anaphylactic reaction.

- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of pseudomembranous colitis. May begin up to several weeks following cessation of therapy.
- Lab Test Considerations:** May cause positive direct Coombs' test results.
- Hyperkalemia may develop after large doses of penicillin G potassium.
- Monitor serum sodium concentrations in patient with hypertension or HF. Hyponatremia may develop after large doses of penicillin sodium.
- May cause ↑ AST, ALT, LDH, and serum alkaline phosphatase concentrations.
- May cause leukopenia and neutropenia, especially with prolonged therapy or hepatic impairment.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)

Noncompliance (Patient/Family Teaching)

Implementation

- Do not confuse penicillin with penicillamine. Do not confuse penicillin G aqueous (potassium or sodium salt) with penicillin G procaine.
- PO:** Administer around the clock. Penicillin V may be administered without regard for meals.
- Use calibrated measuring device for liquid preparations. Solution is stable for 14 days if refrigerated.
- IM:** Reconstitute according to manufacturer's directions with sterile water for injection, D5W, or 0.9% NaCl.
- IM:** Shake medication well before injection. Inject penicillin deep into a well-developed muscle mass at a slow, consistent rate to prevent blockage of the needle. Massage well. Accidental injury near or into a nerve can result in severe pain and dysfunction.
- Penicillin G potassium or sodium may be diluted with lidocaine (without epinephrine) 1% or 2% to minimize pain from IM injection.
- Never give penicillin G benzathine or penicillin G procaine suspensions IV. May cause embolism or toxic reactions.

IV Administration

- IV:** Change IV sites every 48 hr to prevent phlebitis.
- Administer slowly and observe patient closely for signs of hypersensitivity.
- Intermittent Infusion:** **Diluent:** Doses of 3 million units or less should be diluted in at least 50 mL of D5W or 0.9% NaCl; doses of more than 3 million units should be diluted with 100 mL. **Concentration:** 100,000–500,000 units/mL (50,000 units/mL in neonates). **Rate:** Infuse over 1–2 hr in adults or 15–30 min in children.
- Continuous Infusion:** Doses of 10 million units or more may be diluted in 1 or 2 L.

✱ = Canadian drug name. ⚡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- **Rate:** Infuse over 24 hr.

Penicillin G Potassium

- **Y-Site Compatibility:** acyclovir, amiodarone, ascorbic acid, atropine, azathioprine, aztreonam, benztropine, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cefazolin, cefoperazone, cefotaxime, cefazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, dexamethasone, digoxin, diltiazem, diphenhydramine, dopamine, enalaprilat, ephedrine, epinephrine, epoetin alfa, esmolol, famotidine, fentanyl, fluconazole, folic acid, foscarnet, furosemide, glycopyrrolate, heparin, hydrocortisone, hydromorphone, imipenem/cilastatin, indomethacin, insulin, isoproterenol, ketamine, ketorolac, lidocaine, magnesium sulfate, mannitol, meperidine, methyldopate, methylprednisolone, metoclopramide, metoprolol, midazolam, morphine, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxacillin, oxytocin, penicillin G sodium, perphenazine, phenylephrine, phytonadione, potassium chloride, procainamide, prochlorperazine, propranolol, pyridoxime, ranitidine, sodium bicarbonate, streptokinase, succinylcholine, tacrolimus, theophylline, thiamine, ticarcillin/clavulanate, tobramycin, tolazoline, trimetaphan, vancomycin, vasopressin, verapamil, vitamin B complex with C.
- **Y-Site Incompatibility:** If aminoglycosides and penicillins must be administered concurrently, administer in separate sites at least 1 hr apart, aminophylline, amphotericin B colloidal, ampicillin, dantrolene, diazepam, diazoxide, diazoxide, dobutamine, doxycycline, erythromycin, ganciclovir, haloperidol, papaverine, pentamidine, pentazocine, pentobarbital, phenobarbital, phentolamine, phenytoin, promethazine, protamine, tranexamic acid, trimethoprim/sulfamethoxazole.

Penicillin G Sodium

- **Y-Site Compatibility:** alfentanil, ascorbic acid, atropine, azathioprine, aztreonam, benztropine, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, chloramphenicol, clindamycin, cyanocobalamin, cyclosporine, dexamethasone, digoxin, diphenhydramine, dopamine, enalaprilat, ephedrine, epinephrine, epoetin alfa, esmolol, famotidine, fentanyl, fluconazole, folic acid, furosemide, glycopyrrolate, heparin, hydrocortisone, imipenem/cilastatin, indomethacin, insulin, isoproterenol, ketamine, ketorolac, levofloxacin, lidocaine, magnesium sulfate, mannitol, meperidine, methoxamine, methyldopate, methylprednisolone, metoclopramide, metoprolol, morphine, multivitamins, nafcillin, naloxone, nitroglycerin, nitroprusside, norepinephrine, ondansetron,

oxacillin, oxytocin, penicillin G potassium, phenylephrine, phytonadione, potassium chloride, procainamide, prochlorperazine, propranolol, pyridoxime, ranitidine, sodium bicarbonate, sodium citrate, streptokinase, sufentanil, theophylline, thiamine, ticarcillin/clavulanate, tolazoline, trimetaphan, vancomycin, vasopressin, verapamil.

- **Y-Site Incompatibility:** If aminoglycosides and penicillins must be administered concurrently, administer in separate sites at least 1 hr apart, aminophylline, amphotericin B colloidal, dantrolene, diazepam, diazoxide, dobutamine, doxycycline, erythromycin, ganciclovir, haloperidol, labetalol, papaverine, pentamidine, pentazocine, pentobarbital, phenobarbital, phentolamine, phenytoin, promethazine, protamine, succinylcholine, tranexamic acid, trimethoprim/sulfamethoxazole.
- **Additive Incompatibility:** Incompatible with aminoglycosides; do not admix.

Patient/Family Teaching

- Instruct patient to take medication around the clock and to finish drug completely as directed, even if feeling better. Advise patient that sharing this medication may be dangerous.
- Advise patient to report signs of superinfection (black, furry overgrowth on tongue; vaginal itching or discharge; loose or foul-smelling stools) and allergy.
- **Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.**
- Instruct patient to notify health care professional if symptoms do not improve.
- Advise patient taking oral contraceptives to use an additional nonhormonal method of contraception during therapy with penicillin and until next menstrual period.
- **Patient with an allergy to penicillin should be instructed to always carry an identification card with this information.**

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

PENICILLINS, PENICILLINASE RESISTANT

dicloxacillin (dye-klox-a-sill-in)
Nallpen

nafcillin (naf-sill-in)

oxacillin (ox-a-sill-in)
Bactocill

Classification

Therapeutic: anti-infectives

Pharmacologic: penicillinase resistant penicillins

Pregnancy Category B**Indications**

Treatment of the following infections due to penicillinase-producing staphylococci: Respiratory tract infections, Sinusitis, Skin and skin structure infections. **Dicloxacillin:** Osteomyelitis. **Nafcillin, oxacillin:** Are also used to treat: Bone and joint infections, Urinary tract infections, Endocarditis, Septicemia, Meningitis.

Action

Bind to bacterial cell wall, leading to cell death. Not inactivated by penicillinase enzymes. **Therapeutic Effects:** Bactericidal action. **Spectrum:** Active against most gram-positive aerobic cocci but less so than penicillin. Spectrum is notable for activity against: Penicillinase-producing strains of *Staphylococcus aureus*, *Staphylococcus epidermidis*. Not active against methicillin-resistant staphylococci.

Pharmacokinetics

Absorption: *Dicloxacillin* — Rapidly but incompletely (35–76%) absorbed from the GI tract. *Nafcillin* and *oxacillin* — Completely absorbed following IV administration; well absorbed from IM sites.

Distribution: Widely distributed; penetration into CSF is minimal, but sufficient in the presence of inflamed meninges; cross the placenta and enter breast milk.

Metabolism and Excretion: *Dicloxacillin* — Some metabolism by the liver (6–10%) and some renal excretion of unchanged drug (60%); small amounts eliminated in the feces via the bile. *Nafcillin, oxacillin* — Partially metabolized by the liver (nafcillin 60%, oxacillin 49%), partially excreted unchanged by the kidneys.

Half-life: *Dicloxacillin* — 0.5–1.1 hr (↑ in severe hepatic and renal dysfunction); *Nafcillin* — Neonates: 1–5 hr; Children 1 mo – 14 yr: 0.75–1.9 hr; Adults: 0.5–1.5 hr (↑ in renal impairment); *Oxacillin* — Neonates: 1.6 hr; Children up to 2 yr: 0.9–1.8 hr; Adults: 0.3–0.8 hr (↑ in severe hepatic impairment).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
Dicloxacillin	30 min	30–120 min	6 hr
Nafcillin IM	30 min	60–120 min	4–6 hr
Nafcillin IV	rapid	end of infusion	4–6 hr
Oxacillin IM	rapid	30 min	4–6 hr
Oxacillin IV	rapid	end of infusion	4–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to penicillins (cross-sensitivity with cephalosporins may exist).

Use Cautiously in: Severe renal or hepatic impairment; **OB, Lactation:** Safety not established.

Adverse Reactions/Side Effects

CNS: SEIZURES (high doses). **GI:** PSEUDOMEMBRANOUS COLITIS, diarrhea, nausea, vomiting, drug-induced hepatitis. **GU:** interstitial nephritis. **Derm:** rashes, urticaria. **Hemat:** eosinophilia, leukopenia. **Local:** pain at IM sites, phlebitis at IV sites. **Misc:** allergic reactions including ANAPHYLAXIS and SERUM SICKNESS, superinfection.

Interactions

Drug-Drug: **Probenecid** ↓ renal excretion and ↑ blood levels (treatment may be combined for this purpose). May ↓ effectiveness of **oral contraceptive agents**. May ↓ elimination of **methotrexate** and ↑ risk of serious toxicity.

Route/Dosage**Dicloxacillin**

PO (Adults and Children ≥40 kg): 125–250 mg q 6 hr (up to 2 g/day).

PO (Children <40 kg): 6.25–12.5 mg/kg q 6 hr; (up to 12.25 mg/kg q 6 hr has been used for osteomyelitis), maximum: 2 g/day.

Nafcillin

IM (Adults): 500 mg q 4–6 hr.

IM, IV (Children and Infants): 50–200 mg/kg/day divided q 4–6 hr, maximum: 12 g/day.

IM, IV (Neonates 0–4 weeks, <1200 g): 25 mg/kg q 12 hr.

IM, IV (Neonates 1.2–2 kg): — 25 mg/kg q 12 hr for the first 7 days of life, then 25 mg/kg q 8 hr.

IM, IV (Neonates >2 kg): — 25 mg/kg q 8 hr for the first 7 days of life, then 25 mg/kg q 6 hr.

IV (Adults): 500–2000 mg q 4–6 hr.

Oxacillin

IM, IV (Adults and Children ≥40 kg): 250–2000 mg q 4–6 hr (up to 12 g/day).

IM, IV (Children <40 kg): 100–200 mg/kg/day divided q 4–6 hr, maximum: 12 g/day.

IM, IV (Neonates <1200 g): — 25 mg/kg q 12 hr.

IM, IV (Neonates ≥2 kg): — 25 mg/kg q 8 hr for the first 7 days of life, then 25 mg/kg q 6 hr.

IM, IV (Neonates 1.2–2 kg): — 25 mg/kg q 12 hr for the first 7 days of life, then 25 mg/kg q 8 hr.

Availability**Dicloxacillin (generic available)**

Capsules: 250 mg, 500 mg. **Oral suspension:** 62.5 mg/5 mL.

✳ = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Nafcillin (generic available)**Powder for injection:** 1 g/vial, 2 g/vial, 10 g/vial.**Oxacillin (generic available)****Powder for injection:** 1 g/vial, 2 g/vial, 10 g/vial.**NURSING IMPLICATIONS****Assessment**

- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain a history before initiating therapy to determine previous use of and reactions to penicillins, cephalosporins, or other beta-lactam antibiotics. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity prior to initiating therapy. First dose may be given before receiving results.
- **Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing, abdominal pain).** Discontinue the drug and notify health care professional immediately if these occur. **Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.**
- Assess vein for signs of irritation and phlebitis. Change IV site every 48 hr to prevent phlebitis.
- **Lab Test Considerations:** May cause leukopenia and neutropenia, especially with prolonged therapy or hepatic impairment.
- May cause positive direct Coombs' test result.
- May cause ↑ AST, ALT, LDH, and serum alkaline phosphatase concentrations.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)

Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** Administer around the clock on an empty stomach at least 1 hr before or 2 hr after meals. Take with a full glass of water; acidic juices may decrease absorption of penicillins.
- Use calibrated measuring device for liquid preparations. Shake well. Solution is stable for 14 days if refrigerated.

Nafcillin**IV Administration**

- **pH:** 6.0–8.5.
- **IV, IM:** To reconstitute, add 3.4 mL to each 1-g vial or 6.8 mL to each 2-g vial, for a concentration of 250 mg/mL. Stable for 2–7 days if refrigerated.
- **Direct IV:** **Diluent:** Dilute reconstituted solution with 15–30 mL of sterile water, 0.45% NaCl, or 0.9% NaCl for injection. **Concentration:** 100 mg/mL. **Rate:** Administer over 5–10 min.

- **Intermittent Infusion:** **Diluent:** Dilute with sterile water for injection, 0.9% NaCl, D5W, D10W, D5/0.25% NaCl, D5/0.45% NaCl, D5/0.9% NaCl, D5/LR, Ringer's or LR. Stable for 24 hr at room temperature, 96 hr if refrigerated. **Concentration:** 2–40 mg/mL. **Rate:** Infuse over at least 30–60 min to avoid vein irritation.
- **Y-Site Compatibility:** acyclovir, alfentanil, aminophylline, amphotericin B lipid complex, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, chlorpromazine, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, dactinomycin, daptomycin, dexamethasone, digoxin, dobutamine, docetaxel, dopamine, enalaprilat, ephedrine, epinephrine, epoetin alfa, erythromycin, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, foscarnet, furosemide, ganciclovir, glycopyrrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, imipenem/cilastatin, indomethacin, isoproterenol, ketorolac, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, methoxamine, methyl dopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, milrinone, morphine, multivitamins, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxytocin, paclitaxel, pamidronate, pnacuronium, pantoprazole, pemetrexed, penicillin G, pentobarbital, perphenazine, phenobarbital, phenolamine, phenylephrine, phytonadione, potassium acetate, potassium chloride, procainamide, prochlorperazine, propofol, propranolol, ranitidine, sodium bicarbonate, streptokinase, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tolazoline, trimethaphan, vasopressin, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** alemtuzumab, amphotericin B colloidal, ampicillin, azathioprine, caspofungin, chloramphenicol, dantrolene, diazoxide, doxycycline, droperidol, epirubicin, folic acid, gemcitabine, haloperidol, hydralazine, hydroxyzine, idarubicin, irinotecan, meperidine, metaraminol, mitoxantrone, mycophenolate, nesiritide, palonosetron, pentamidine, pentazocine, phenytoin, promethazine, protamine, pyridoxine, succinylcholine, trimethoprim/sulfamethoxazole, vecuronium, vincristine, vinorelbine. If penicillins and aminoglycosides must be administered concurrently, administer at separate sites.

Oxacillin

IV Administration

- **pH:** 6.0–8.5.
- **IV, IM:** To reconstitute for IM or IV use, add 1.4 mL of sterile water for injection to each 250-mg vial, 2.7 mL to each 500-mg vial, 5.7 mL to each 1-g vial, 11.5 mL to each 2-g vial, and 23 mL to each 4-g vial, for a concentration of 250 mg/1.5 mL. Stable for 3 days at room temperature or 7 days if refrigerated.
- **Direct IV: Diluent:** Further dilute each reconstituted 250-mg or 500-mg vial with 5 mL of sterile water or 0.9% NaCl for injection, 10 mL for each 1-g vial, 20 mL for each 2-g vial, and 40 mL for each 4-g vial. **Concentration:** 250 mg/mL. **Rate:** Administer slowly over 10 min.
- **Intermittent Infusion: Diluent:** Dilute with 0.9% NaCl, D5W, D5/0.9% NaCl, or LR. **Concentration:** 0.5–40 mg/mL. **Rate:** May be infused for up to 6 hr.
- **Y-Site Compatibility:** acyclovir, alfentanil, aminophylline, ascorbic acid, atracurium, atropine, aztreonam, benztrapine, bumetanide, butenorphine, butorphanol, chloramphenicol, chlorpromazine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, dexamethasone, digoxin, diltiazem, dopamine, doxapram, enalaprilat, ephedrine, epinephrine, epoetin alfa, erythromycin, famotidine, fentanyl, fluconazole, folic acid, foscarnet, furosemide, glycopyrrolate, heparin, hydrocortisone sodium succinate, hydromorphone, imipenem/cilastatin, insulin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, mannitol, methotrexate, methoxamine, methyldopate, metoclopramide, metoprolol, midazolam, milrinone, morphine, multivitamins, nafcillin, naloxone, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxytocin, papaverine, penicillin G, pentobarbital, perphenazine, phenobarbital, phenylephrine, phytonadione, potassium chloride, procainamide, prochlorperazine, propranolol, ranitidine, streptokinase, sufentanil, tacrolimus, theophylline, thiamine, ticarcillin/clavulanate, tolazoline, trimetaphan, vancomycin, vasopressin, vitamin B complex with C, zidovudine.
- **Y-Site Incompatibility:** amphotericin B colloidal, calcium chloride, calcium gluconate, dantrolene, diazepam, diazoxide, dobutamine, doxycycline, esmolol, haloperidol, hydralazine, metaraminol, pentamidine, pentazocine, phenytoin, promethazine, pyridoxime, succinylcholine, trimethoprim/sulfamethazole. If penicillins and aminoglycosides must be administered concurrently, administer at separate sites.

Patient/Family Teaching

- Instruct patient to take medication around the clock and to finish the drug completely as directed, even if feeling better. Missed doses should be taken as soon as remembered. Advise patient that sharing of this medication may be dangerous.
- Advise patient to report signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools) and allergy.
- **Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.**
- Instruct patient to notify health care professional if symptoms do not improve.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

pentamidine (pen-tam-i-deen) NebuPent, Pentam 300

Classification

Therapeutic: anti-infectives

Pregnancy Category C

Indications

IV, IM: Treatment of *Pneumocystis jirovecii* pneumonia (PJP). **Inhaln:** Prevention of PJP in AIDS or HIV-positive patients who have had PJP or who have a peripheral CD4 lymphocyte count of $\leq 200/\text{mm}^3$. **Unlabeled Use:** Inhaln: Treatment of PJP.

Action

Appears to disrupt DNA or RNA synthesis. Also has a direct toxic effect on pancreatic islet cells. **Therapeutic Effects:** Death of susceptible organism.

Pharmacokinetics

Absorption: Well absorbed parenterally; Minimal systemic absorption occurs following inhalation.

Distribution: Widely and extensively distributed but does not cross the blood-brain barrier. Concentrates in liver, kidneys, lungs, and spleen, with prolonged storage in some tissues.

Metabolism and Excretion: 1–30% excreted unchanged by the kidneys. Remainder of metabolic fate unknown.

Half-life: 5–11 hr ($\uparrow$ in renal impairment).

✳ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	end of infusion	24 hr
Inhaln	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: History of previous anaphylactic reaction to pentamidine.

Use Cautiously in: Hypotension; Hypertension; Hypoglycemia; Hyperglycemia; Hypocalcemia; Leukopenia; Thrombocytopenia; Anemia; Renal impairment (dose ↓ required); Diabetes mellitus; Liver impairment; Cardiovascular disease; Bone marrow depression, previous antineoplastic therapy, or radiation therapy; Asthma (aerosol can induce bronchospasm); **OB, Lactation:** Safety not established during pregnancy; breast feeding not recommended.

Adverse Reactions/Side Effects

For parenteral form, unless otherwise indicated.

CNS: anxiety, headache, confusion, dizziness, hallucinations. **EENT:** *inhalation*—burning in throat.

Resp: *inhalation*—bronchospasm, cough. **CV:** *AR-RHYTHMIAS*, *HYPOTENSION*, chest pain. **GI:** *PANCREATITIS*, abdominal pain, anorexia, drug-induced hepatitis, nausea, unpleasant metallic taste, vomiting. **GU:** *nephrotoxicity*. **Derm:** pallor, rash. **Endo:** *HYPOGLYCEMIA*, hyperglycemia. **F and E:** hyperkalemia, hypocalcemia. **Hemat:** anemia, leukopenia, thrombocytopenia. **Local:** *IV*—phlebitis, pruritus, urticaria at IV site; *IM*, sterile abscesses at IM sites. **Misc:** allergic reactions including *ANAPHYLAXIS*, *STEVENS-JOHNSON SYNDROME*, chills, fever.

Interactions

Interactions listed for parenteral administration.

Drug-Drug: Concurrent use with **erythromycin IV** may ↑ risk of potentially fatal arrhythmias. Additive nephrotoxicity with other **nephrotoxic agents**, including **aminoglycosides**, **amphotericin B**, and **vancomycin**. Additive bone marrow depression with **antineoplastics** or previous **radiation therapy**. ↑ risk of pancreatitis with **didanosine**. ↑ risk of nephrotoxicity, hypocalcemia, and hypomagnesemia with **foscarnet**.

Route/Dosage

IV, IM (Adults and Children >5 mo): 4 mg/kg once daily for 14–21 days (longer treatment may be required in AIDS patients; some patients may respond to 3 mg/kg/day).

Inhaln (Adults): *NebuPent*—300 mg q 4 wk, using a Respigard II jet nebulizer (150 mg q 2 wk has also been used).

Inhaln (Children >5 yr): *NebuPent*—300 mg q 4 wk, using a Respigard II jet nebulizer (for patients who cannot tolerate trimethoprim/sulfamethoxazole; unlabeled).

Renal Impairment

IV (Adults): CCr 10–30 mL/min- Administer normal dose q 24 hr; CCr <10 mL/min- Administer normal dose q 48 hr.

Availability (generic available)

Powder for injection: 300 mg/vial. **Solution for aerosol use (NebuPent):** 300 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for infection (vital signs, sputum, WBC) and monitor respiratory status (rate, character, lung sounds, dyspnea, sputum) at beginning of and throughout therapy.
- Obtain specimens for culture and sensitivity prior to initiating therapy. First dose may be given before receiving results.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome or toxic epidermal necrolysis. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.
- IV, IM:** Monitor BP frequently during and following IM or IV administration of pentamidine. Patient should be lying down during administration. Sudden, severe hypotension may occur following a single dose. Resuscitation equipment should be immediately available.
- Assess patient for signs of hypoglycemia (anxiety; chills; diaphoresis; cold, pale skin; headache; increased hunger; nausea; nervousness; shakiness) and hyperglycemia (drowsiness; flushed, dry skin; fruit-like breath odor; increased thirst; increased urination; loss of appetite), which may occur up to several months after therapy is discontinued.
- Pulse and ECG should be monitored prior to and periodically during therapy. Fatalities due to cardiac arrhythmias, tachycardia, and cardiotoxicity have been reported.
- Assess patient for signs of pancreatitis (nausea, vomiting, abdominal pain, increased serum lipase or amylase) periodically during therapy. May require discontinuation of therapy.
- Inhaln:** A tuberculin skin test, chest x-ray, and sputum culture should be performed prior to administration to rule out tuberculosis.
- Lab Test Considerations:** *IM, IV*—Monitor blood glucose concentrations prior to, daily during, and for several months following therapy. Severe hypoglycemia and permanent diabetes mellitus have occurred.
- Monitor BUN and serum creatinine prior to and daily during therapy to monitor for nephrotoxicity. Concentrations may be ↑.

- Monitor CBC and platelet count prior to and every 3 days during therapy. Pentamidine may cause leukopenia, anemia, and thrombocytopenia.
- May cause ↑ serum bilirubin, alkaline phosphatase, AST, and ALT concentrations. Monitor liver function tests prior to and every 3 days during therapy.
- Monitor serum calcium and magnesium concentrations prior to and every 3 days during therapy; may cause hypocalcemia and hypomagnesemia.
- May cause ↑ serum potassium concentrations.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)

Implementation

- Pentamidine must be given on a regular schedule for the full course of therapy. Administer missed doses as soon as remembered. If almost time for the next dose, skip the missed dose and return to the regular schedule. Do not double doses.
- **IM:** Dilute 300 mg of pentamidine with 3 mL of sterile water for injection for a concentration of 100 mg/mL. IM administration should be used only for patients with adequate muscle mass and given deep IM via Z-track technique. May cause sterile abscesses.

IV Administration

- **pH:** 4.3–5.4.
- **Intermittent Infusion:** **Diluent:** To reconstitute, add 3–5 mL of sterile water for injection or D5W to each 300-mg vial for a concentration of 100, 75, or 60 mg/mL, respectively. Withdraw dose and dilute further in 50–250 mL of D5W. Solution is stable for 48 hr at room temperature. Discard unused portions. **Concentration:** Not to exceed 6 mg/mL for administration. **Rate:** Administer slowly over 1–2 hr.
- **Y-Site Compatibility:** alemtuzumab, alfantanyl, aminocaproic acid, anidulafungin, argatroban, atracurium, atropine, benztrapine, bleomycin, buprenorphine, calcium gluconate, carboplatin, caspofungin, chlorpromazine, cisplatin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexmedetomidine, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxacurium, doxycycline, enalaprilat, epinephrine, epirubicin, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fludarabine, gemcitabine, glycopyrrolate, granisetron, hetastarch, hydromorphone, idarubicin, ifosfamide, irinotecan, isoproterenol, labetalol, levofloxacin, lidocaine, lorazepam, mannitol, mechlorethamine, meperidine, metaraminol, methoxamine, metoclopramide, metoprolol, metronidazole, miconazole, midazolam, milrinone, mi-

toxantrone, multivitamins, naloxone, nesiritide, nitroglycerin, nitroprusside norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, pamidronate, pancuronium, papaverine, pentazocine, phenoltamine, phytonadione, potassium acetate, procainamide, promethazine, propranolol, pyridoxime, quinupristin/dalfopristin, ranitidine, rituximab, rocuronium, sodium acetate, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, tigecycline, tolazoline, trastuzumab, trimetaphan, vancomycin, vasopressin, verapamil, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** acyclovir, aldesleukin, amikacin, aminophylline, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, ascorbic acid, azathioprine, aztreonam, bivalirudin, bumetanide, butorphanol, cefazolin, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, clindamycin, dantrolene, dexamethasone, diazepam, diazoxide, digoxin, doxorubicin, ephedrine, epoetin alfa, eptifibatide, etrapenem, fluorouracil, folic acid, foscarnet, furosemide, gentamicin, heparin, hydrocortisone, indomethacin, insulin, ketorolac, linezolid, magnesium sulfate, methotrexate, methylglutamate, methylprednisolone, morphine, nafcillin, nalbuphine, oxacillin, palonosetron, pantoprazole, pemetrexed, penicillin G, pentobarbital, phenobarbital, phenylephrine, phenytoin, piperacillin/tazobactam, potassium chloride, prochlorperazine, protamine, sodium bicarbonate, streptokinase, ticarcillin/clavulanate, tobramycin, trimethoprim/sulfamethoxazole, vecuronium.
- **Inhaln:** If using inhalation bronchodilator, administer bronchodilator 5–10 min prior to pentamidine administration.
- Administer in a well-ventilated area.
- Administration with patient in supine or recumbent position appears to provide a more uniform distribution of pentamidine.
- **NebuPent** Dilute 300 or 600 mg (for prophylaxis or treatment, respectively) in 6 mL of sterile water for injection. Place reconstituted solution into Respirgard II nebulizer. Do not dilute with 0.9% NaCl or admix with other medications, as solution will form a precipitate. Do not use Respirgard II nebulizer for other medications.
- Administer inhalation dose through nebulizer until chamber is empty, approximately 30–45 min.
- Administer with the flow rate of the nebulizer at the midflow mark (5–7 L/min) over approximately 15 min until the chamber is empty.

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Patient/Family Teaching

- Inform patient of the importance of completing the full course of pentamidine therapy, even if feeling better.
- IV:** Instruct patient to notify health care professional promptly if signs and symptoms of pancreatitis, rash, fever; sore throat; signs of infection; bleeding of gums; unusual bruising; petechiae; or blood in stool, urine, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Patient should not be given IM injections or rectal thermometers. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDs, as these may precipitate gastric bleeding.
- Caution patient to make position changes slowly to minimize orthostatic hypotension.
- Inhaln:** Advise patient that an unpleasant metallic taste may occur with pentamidine administration but is not significant.
- Inform patients who continue to smoke that bronchospasm and coughing during therapy are more likely.

Evaluation/Desired Outcomes

- Prevention or resolution of the signs and symptoms of PJP in HIV-positive patients.

pentosan (pen-toe-san)

Elmiron

Classification

Therapeutic: interstitial cystitis agents

Pharmacologic: heparin-like compounds

Pregnancy Category B

Indications

Management symptoms (bladder pain/discomfort) of chronic interstitial cystitis (IC).

Action

Adheres to uroepithelium, providing a protective barrier against irritating solutes in urine. Has anticoagulant and fibrinolytic properties. **Therapeutic Effects:** ↓ pain and discomfort in chronic IC.

Pharmacokinetics

Absorption: 6% absorbed following oral administrations.

Distribution: Distributes into uroepithelium of the genitourinary tract with less found in liver, spleen, lung, skin, peritoneum, and bone marrow.

Metabolism and Excretion: Metabolized by saturable enzyme systems in liver, spleen and kidney. Majority (58–84%) excreted in feces as unchanged (unabsorbed drug). Metabolites of absorbed drug are renally excreted; minimal renal excretion of unchanged drug.

Half-life: 27 hr.

TIME/ACTION PROFILE (↓ symptoms)

ROUTE	ONSET	PEAK	DURATION
PO	within 4 wk-6 mos	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Underlying coagulopathy, concurrent medications that ↑ bleeding risk, history of aneurysms, thrombocytopenia, hemophilia, GI ulceration/bleeding, polyps, diverticula; History of heparin-induced thrombocytopenia; risk of bleeding may be ↑; Hepatic insufficiency; **OB:** Use in pregnancy only if clearly needed; **Lactation:** Use cautiously in breast-feeding women; **Pedi:** Safe and effective use in children <16 yr has not been established.

Adverse Reactions/Side Effects

CNS: dizziness, headache. **EENT:** epistaxis. **GI:** abdominal pain, diarrhea, dyspepsia, gum bleeding, ↑ liver enzymes, nausea, rectal bleeding. **Derm:** alopecia, ecchymosis, rash. **Hemat:** bleeding, ↑ bleeding time.

Interactions

Drug-Drug: Concurrent use of coumarin anticoagulants, heparins, t-PA, streptokinase, high dose aspirin, or NSAIDs may ↑ risk of bleeding.

Route/Dosage

PO (Adults): 100 mg three times daily.

Availability

Capsules: 100 mg.

NURSING IMPLICATIONS

Assessment

- Assess pain intensity, frequency, and duration in patient with interstitial cystitis.
- Lab Test Considerations:** Doses of <1200 mg/day are unlikely to affect PT or PTT.
- May cause liver function abnormalities.
- May rarely cause anemia, ↑ PT, ↑PTT, leukopenia, and thrombocytopenia.

Potential Nursing Diagnoses

Chronic pain (Indications)

Implementation

- PO:** Administer on an empty stomach 3 times daily, at least 1 hr before or 2 hr after meals.

Patient/Family Teaching

- Instruct patient to take pentosan as directed, taking no more or no more frequently than prescribed.
- Advise patient to notify health care professional if surgery, anticoagulant therapy (warfarin, heparin), or therapy with high doses of aspirin or NSAIDs is planned.

- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- ↓ in pain and discomfort of interstitial cystitis. Reassess after 3 mo of therapy. If no improvement but no limiting adverse events are present, may be continued for 3 more mo.

perindopril, See ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS.

permethrin (per-meth-rin)

Acticin, Elimite, Nix

Classification

Therapeutic: pediculocides

Pregnancy Category B

Indications

1% lotion: Eradication of *Pediculus humanus capitis* (head lice and their eggs); Prevention of infestation of head lice during epidemics. **5% cream:** Eradication of *Sarcoptes scabiei* (scabies).

Action

Causes repolarization and paralysis in lice by disrupting sodium transport in normal nerve cells. **Therapeutic Effects:** Death of parasites.

Pharmacokinetics

Absorption: Small amounts (<2%) systemically absorbed. Remains on hair for 10 days.

Distribution: Unknown.

Metabolism and Excretion: Rapidly inactivated by enzymes.

Half-life: Unknown.

TIME/ACTION PROFILE (pediculocidal action)

ROUTE	ONSET	PEAK	DURATION
Topical	10 min	unknown	14 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity to permethrin, pyrethrins (insecticides or veterinary pesticides), chrysanthemums, or isopropyl alcohol; **Lactation:** Lactation.

Use Cautiously in: **OB:** Use only if clearly needed;

Pedi: Children <2 yr (1% lotion); Children <2 mo (5% cream).

Adverse Reactions/Side Effects

Derm: burning, itching, rash, redness, stinging, swelling. **Neuro:** numbness, tingling.

Interactions

Drug-Drug: No significant interactions.

Route/Dosage

Head Lice (Treatment and Prevention)

Topical (Adults and Children >2 yr): 1% lotion applied to the hair, left on for 10 min, then rinsed, for 1 application.

Scabies

Topical (Adults and Children): Massage 5% cream into all skin surfaces. Leave on for 8–14 hr, then wash off.

Topical (Infants >2 mo): Massage 5% cream into hairline, scalp, neck, temple, and forehead. Leave on for 8–14 hr, then wash off.

Availability (generic available)

Liquid cream rinse (lotion): 1%^{OTC}. **Cream:** 5%.

NURSING IMPLICATIONS

Assessment

- **Head Lice:** Assess scalp for presence of lice and their ova (nits) prior to and 1 wk after application of permethrin.
- **Scabies:** Assess skin for scabies prior to and following therapy.

Potential Nursing Diagnoses

Impaired home maintenance (Indications)

Bathing/hygiene self-care deficit (Indications)

Implementation

- **Topical:** For topical application only.

Patient/Family Teaching

- Instruct patient to notify health care professional if scalp itching, numbness, redness, or rash occurs.
- Instruct patient to avoid getting Elimite cream in eyes. If this occurs, eyes should be flushed thoroughly with water. Health care professional should be contacted if eye irritation persists.
- Advise patient that others residing in the home should also be checked for lice.
- Instruct patient on methods of preventing reinfestation. All clothes, including outdoor apparel and household linens, should be machine-washed using very hot water and dried for at least 20 min in a hot dryer. Dry-clean nonwashable clothes. Brushes and combs should be soaked in hot (130°F), soapy water for 5–10 min. Remind patient that brushes and combs should not be shared. Wigs and hairpieces should be shampooed. Rugs and upholstered furni-

✶ = Canadian drug name. ✶ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

ture should be vacuumed. Toys should be washed in hot, soapy water. Items that cannot be washed should be sealed in a plastic bag for 2 wk.

- If patient is a child, instruct parents to notify school nurse or day care center so that classmates and playmates can be checked.
- **Head Lice:** Instruct patient to wash hair with regular shampoo, rinse, and towel dry. Each container holds enough medication for one treatment. Shake the container well. Thoroughly wet scalp and hair with the lotion. The patient should use as much of the solution as needed to coat entire head of hair, then discard remainder of solution. Allow lotion to remain on hair for 10 min, then thoroughly rinse hair and towel dry with a clean towel. Comb hair with a fine-toothed comb to remove dead lice and eggs (not necessary but may be desired for cosmetic effects). Products are available for removal of nits (Rid Lice Egg Loosener Gel® Step 2). Schools usually require children to be nit-free prior to returning to school.
- Explain to patient that permethrin will protect from reinfestation for 2 wk. These effects continue even when the patient resumes regular shampooing.
- **Scabies:** Instruct patient to massage thoroughly into the skin from head to soles of feet. Treat infants on the hairline, neck, scalp, temple, and forehead. Remove the cream by washing after 8–14 hr. Usually 30 g (½ tube) is sufficient for adults. One application is curative.

Evaluation/Desired Outcomes

- The absence of lice and eggs 1 wk after therapy. A second application is indicated if lice are detected at this time.
- Prevention of infestation of head lice during epidemics.
- Eradication of scabies following one application.
- If resistance to permethrin develops, malathion may be used.

pertuzumab
(per-tue-zue-mab)
Perjeta

Classification

Therapeutic: antineoplastics
Pharmacologic: HER2/neu receptor antagonists, monoclonal antibodies

Pregnancy Category D

Indications

Treatment of HER2-positive metastatic breast cancer in patients who have not yet been treated with anti-HER2 agents or chemotherapy; used in combination with docetaxel and trastuzumab. Neoadjuvant treatment of HER2-positive locally advanced, inflammatory, or early

stage breast cancer (either >2 cm in diameter or node-positive); used in combination with docetaxel and trastuzumab.

Action

A monoclonal antibody that attaches to and blocks the human epidermal growth factor receptor 2 protein (HER2), resulting in cell growth arrest and apoptosis.

Therapeutic Effects: Decreased spread of metastatic breast cancer.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: 18 days.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	unknown	unknown	20 mo†

† Median duration of response.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **OB:** Avoid use during pregnancy; **Lactation:** Discontinue drug or discontinue breast feeding.

Use Cautiously in: HER2 testing is required prior to treatment; **⚠** Asian patients (↑ incidence of febrile neutropenia); **OB:** Women with reproductive potential; **Pedi:** Safe and effective use in pediatric patients has not been established.

Adverse Reactions/Side Effects

May reflect combination treatment with docetaxel and trastuzumab.

CNS: dizziness, fatigue, headache, insomnia, weakness. **EENT:** ↑ lacrimation. **Resp:** dyspnea. **CV:** ↓ left ventricular ejection fraction (LVEF), peripheral edema. **GI:** ↓ appetite, diarrhea, dysgeusia, nausea, vomiting. **Derm:** alopecia, rash, dry skin, itching, nail disorder. **Hemat:** **ANEMIA, LEUKOPENIA, NEUTROPENIA.** **MS:** **athralgia, myalgia.** **Neuro:** peripheral neuropathy. **Misc:** allergic reactions including **ANAPHYLAXIS**, chills, infusion reactions, fever, hypersensitivity reactions.

Interactions

Drug-Drug: ↑ risk of bone marrow depression/immunosuppression with other **bone marrow depressants/immunosuppressants** or **radiation therapy**.

Route/Dosage

Metastatic Breast Cancer

IV (Adults): 840 mg initially, then 420 mg every 3 wk. If less than 6 wk passes between infusions, continue with 420 mg dosing, if 6 wk or more passes between infusions, restart with initial 840 mg dose followed by 420 mg every 3 wk.

Neoadjuvant Treatment of Breast Cancer

IV (Adults): 840 mg initially, then 420 mg every 3 wk for 3–6 cycles given preoperatively. If less than 6 wk passes between infusions, continue with 420 mg dosing, if 6 wk or more passes between infusions, restart with initial 840 mg dose followed by 420 mg every 3 wk.

Availability

Solution for intravenous injection requires dilution: 420 mg/14 mL vial.

NURSING IMPLICATIONS

Assessment

- Monitor left ventricular ejection fraction (LVEF) prior to and every 3 mo with metastatic disease and every 6 wk in neoadjuvant setting during therapy. If LVEF drops to <40% or LVEF of 45–49% with a $\geq 10\%$ absolute decrease below pretreatment values withhold pertuzumab and trastuzumab and repeat LVEF within 3 wks. Pertuzumab may be resumed if LVEF >45% or to 40–45% associated with a <10% absolute decrease below pretreatment values. If after a repeat assessment LVEF has not improved or further declined, discontinue pertuzumab and trastuzumab, unless benefits outweigh risks. Patients who received anthracyclines are at increased risk for $\downarrow$ LVEF.
- If trastuzumab is withheld or discontinued, withhold or discontinue pertuzumab. If docetaxel is discontinued, pertuzumab and trastuzumab therapy may continue. Dose reductions are not recommended for pertuzumab.
- Assess patient closely for 60 min after initial infusion and 30 min after subsequent infusions for signs and symptoms of infusion-associated reactions (pyrexia, chills, fatigue, headache, asthenia, hypersensitivity, vomiting). If a significant infusion-associated reaction occurs, slow or interrupt infusion and administer appropriate medical therapies. Monitor until complete resolution of signs and symptoms. If severe infusion reactions occur, consider discontinuation of pertuzumab.
- **Lab Test Considerations:**  Determine HER protein overexpression prior to therapy.
- Verify pregnancy status prior to initiation of pertuzumab.
- Monitor CBC with differential periodically during therapy.

Potential Nursing Diagnoses

Decreased cardiac output (Adverse Reactions)

Implementation

IV Administration

- When administered with pertuzumab, initial dose of trastuzumab is 8 mg/kg infused over 90 min, followed every 3 wks by 6 mg/kg infused over 30–90 min.
- When administered with pertuzumab, initial dose of docetaxel is 75 mg/m² as an IV infusion. Dose of docetaxel may be $\uparrow$ to 100 mg/m² every 3 wks if initial dose is tolerated.
- Administer pertuzumab, trastuzumab, and docetaxel. Administer pertuzumab and trastuzumab in any order. Administer docetaxel after pertuzumab and trastuzumab. Observe patient for 30 to 60 min after pertuzumab infusion and before any subsequent infusion of trastuzumab or docetaxel.
- **Intermittent Infusion:** **Diluent:** 0.9% NaCl; do not use D5W. Withdraw appropriate volume of pertuzumab and dilute in 250 mL using a PVC or non-PVC polyolefin infusion bag. Gently invert to mix; do not shake. If not administered immediately, may be refrigerated for 24 hrs. **Rate:** Infuse initial 840 mg over 60 min, followed every 3 wks by 420 mg over 30–60 min.
- For delayed or missed doses, if time between 2 sequential infusions is <6 wk, administer 420 mg dose of pertuzumab; do not wait until next planned dose. If time between 2 sequential infusions ≥ 6 wk, re-administer initial 840 mg dose over 60 min, followed every 3 wk by 420 mg dose over 30–60 min.

Patient/Family Teaching

- Explain purpose of medication to patient.
- Advise patient to report signs and symptoms of infusion-associated reactions immediately.
- Instruct patient to notify health care professional promptly if fever; chills; cough; hoarseness; sore throat; signs of infection; lower back or side pain; painful or difficult urination; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDs; may precipitate gastric bleeding.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise female patient that pertuzumab is teratogenic and to notify health care professional immediately if pregnancy is planned or suspected or if breast feed-

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

ing. Caution patient to use effective contraception during and for 6 mo following the last dose. Women who are breast feeding should be advised to discontinue nursing or discontinue pertuzumab. Encourage women who may be exposed during pregnancy to enroll in the MoTHER Pregnancy Registry by contacting 1-800-690-6720 and report exposure to the Genentech Adverse Event Line at 1-888-835-2555. Monitor patients who become pregnant for oligohydramnios.

Evaluation/Desired Outcomes

- Decreased spread of metastatic breast cancer.

phenazopyridine

(fen-az-oh-peer-i-deen)

Azo-Standard, Baridium, ★ Phenazo, Prodim, Pyridium, Pyridium Plus, UTI Relief

Classification

Therapeutic: nonopioid analgesics

Pharmacologic: urinary tract analgesics

Pregnancy Category B

Indications

Provides relief from the following urinary tract symptoms, which may occur in association with infection or following urologic procedures: Pain, Itching, Burning, Urgency, Frequency.

Action

Acts locally on the urinary tract mucosa to produce analgesic or local anesthetic effects. Has no antimicrobial activity. **Therapeutic Effects:** Diminished urinary tract discomfort.

Pharmacokinetics

Absorption: Appears to be well absorbed following oral administration.

Distribution: Unknown. Small amounts cross the placenta.

Metabolism and Excretion: Rapidly excreted unchanged in the urine.

Half-life: Unknown.

TIME/ACTION PROFILE (urinary analgesia)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	5–6 hr	6–8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Glomerulonephritis; Severe hepatitis, uremia, or renal failure; Renal insufficiency; Glucose-6-phosphate dehydrogenase (G6PD) deficiency.

Use Cautiously in: Hepatitis; **OB, Lactation:** Safety not established.

Adverse Reactions/Side Effects

CNS: headache, vertigo. **GI:** hepatotoxicity, nausea.

GU: bright-orange urine, renal failure. **Derm:** rash.

Hemat: hemolytic anemia, methemoglobinemia.

Interactions

Drug-Drug: None significant.

Route/Dosage

PO (Adults): 200 mg 3 times daily for 2 days.

PO (Children): 4 mg/kg 3 times daily for 2 days.

Availability (generic available)

Tablets: 95 mg^{OTC}, 100 mg, ★ 100 mg^{OTC}, ★ 200 mg^{OTC}, 200 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for urgency, frequency, and pain on urination prior to and throughout therapy.
- Lab Test Considerations:** Renal function should be monitored periodically during course of therapy.
- Interferes with urine tests based on color reactions (glucose, ketones, bilirubin, steroids, protein).

Potential Nursing Diagnoses

Acute pain (Indications)

Impaired urinary elimination (Indications)

Implementation

- Medication should be discontinued after pain or discomfort is relieved (usually 2 days for treatment of urinary tract infection). Concurrent antibiotic therapy should continue for full prescribed duration.
- PO:** Administer medication with or following meals to decrease GI irritation. **Do not crush, break, or chew tablet.**

Patient/Family Teaching

- Instruct patient to take medication exactly as directed. If a dose is missed, take as soon as remembered unless almost time for next dose.
- Advise patient that while phenazopyridine administration is stopped once pain or discomfort is relieved, concurrent antibiotic therapy must be continued for full duration of therapy. Do not save unused portion of phenazopyridine without consulting health care professional.
- Inform patient that drug causes reddish-orange discoloration of urine that may stain clothing or bedding. Sanitary napkin may be worn to avoid clothing stains. May also cause staining of soft contact lenses.
- Instruct patient to notify health care professional if rash, skin discoloration, or unusual tiredness occurs.

Evaluation/Desired Outcomes

- Decrease in pain and burning on urination.

phenelzine, See MONOAMINE OXIDASE (MAO) INHIBITORS.

PHENobarbital (fee-noe-bar-bi-tal)

★ Ancafixir, Luminal

Classification

Therapeutic: anticonvulsants, sedative/hypnotics

Pharmacologic: barbiturates

Schedule IV

Pregnancy Category D

Indications

Anticonvulsant in tonic-clonic (grand mal), partial, and febrile seizures in children. Preoperative sedative and in other situations in which sedation may be required. Hypnotic (short-term). **Unlabeled Use:** Prevention/treatment of hyperbilirubinemia in neonates.

Action

Produces all levels of CNS depression. Depresses the sensory cortex, decreases motor activity, and alters cerebellar function. Inhibits transmission in the nervous system and raises the seizure threshold. Capable of inducing (speeding up) enzymes in the liver that metabolize drugs, bilirubin, and other compounds.

Therapeutic Effects: Anticonvulsant activity. Sedation.

Pharmacokinetics

Absorption: Absorption is slow but relatively complete (70–90%).

Distribution: Unknown.

Metabolism and Excretion: 75% metabolized by the liver, 25% excreted unchanged by the kidneys.

Half-life: Neonates: 1.8–8.3 days; Infants: 0.8–5.5 days; Children: 1.5–3 days; Adults: 2–6 days.

TIME/ACTION PROFILE (sedation†)

ROUTE	ONSET	PEAK	DURATION
PO	30–60 min	unknown	>6 hr
IM, subcut	10–30 min	unknown	4–6 hr
IV	5 min	30 min	4–6 hr

†Full anticonvulsant effects occur after 2–3 wk of chronic dosing unless a loading dose has been used

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Comatose patients or those with pre-existing CNS depression; Severe respiratory disease with dyspnea or obstruction; Uncontrolled severe pain; Known alcohol intolerance (elixir only); **Lactation:** Discontinue drug or bottle feed.

Use Cautiously in: Hepatic dysfunction; Severe renal impairment; History of suicide attempt or drug abuse; Hypnotic use should be short-term. Chronic use may lead to dependence; **OB:** Chronic use during pregnancy results in drug dependency in the infant; may result in coagulation defects and fetal malformation; acute use at term may result in respiratory depression in the newborn; **Geri:** Initial dose ↓ recommended.

Adverse Reactions/Side Effects

CNS: hangover, delirium, depression, drowsiness, excitation, lethargy, vertigo. **Resp:** respiratory depression; **IV, LARYNGOSPASM,** bronchospasm. **CV:** **IV**—hypotension. **GI:** constipation, diarrhea, nausea, vomiting. **Derm:** photosensitivity, rashes, urticaria.

Local: phlebitis at IV site. **MS:** arthralgia, myalgia, neuralgia. **Misc:** hypersensitivity reactions including **ANGIOEDEMA** and **SERUM SICKNESS**, physical dependence, psychological dependence.

Interactions

Drug-Drug: Additive CNS depression with other CNS depressants, including alcohol, antihistamines, opioid analgesics, and other sedative/hypnotics. May induce hepatic enzymes that metabolize other drugs, ↓ their effectiveness, including hormonal contraceptives, warfarin, chloramphenicol, cyclosporine, dacarbazine, corticosteroids, tricyclic antidepressants, felodipine, clonazepam, carbamazepine, verapamil, theophylline, metronidazole, and quinidine. May ↑ risk of hepatic toxicity of acetaminophen. MAO inhibitors, valproic acid, or divalproex may ↓ metabolism of phenobarbital, ↑ sedation. Rifampin may ↑ metabolism of and ↓ effects of phenobarbital. May ↑ risk of hematologic toxicity with cyclophosphamide.

Drug-Natural Products: Concomitant use of kava-kava, valerian, chamomile, or hops can ↑ CNS depression. St. John's wort may ↓ effects.

Route/Dosage

Status Epilepticus

IV (Adults and Children >1 mo): 15–18 mg/kg in a single or divided dose, maximum loading dose 20 mg/kg.

IV (Neonates): 15–20 mg/kg in a single or divided dose.

★ = Canadian drug name. ⚠ = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Maintenance Anticonvulsant

IV, PO (Adults and Children >12 yr): 1–3 mg/kg/day as a single dose or 2 divided doses.

IV, PO (Children 5–12 yr): 4–6 mg/kg/day in 1–2 divided doses.

IV, PO (Children 1–5 yr): 6–8 mg/kg/day in 1–2 divided doses.

IV, PO (Infants): 5–6 mg/kg/day in 1–2 divided doses.

IV, PO (Neonates): 3–4 mg/kg/day once daily, may need to increase up to 5 mg/kg/day by 2nd week of therapy.

Sedation

PO, IM (Adults): 30–120 mg/day in 2–3 divided doses. *Preoperative sedation*—100–200 mg IM 1–1.5 hours before the procedure.

PO (Children): 2 mg/kg 3 times daily. *Preoperative sedation*—1–3 mg/kg PO/IM/IV 1–1.5 hours before the procedure.

Hypnotic

PO, Subcut, IV, IM (Adults): 100–320 mg at bedtime.

IV, IM, Subcut (Children): 3–5 mg/kg at bedtime.

Hyperbilirubinemia

PO (Adults): 90–180 mg/day in 2–3 divided doses.

PO (Children <12 yr): 3–8 mg/kg/day in 2–3 divided doses, doses up to 12 mg/kg/day have been used.

Availability (generic available)

Tablets: 15 mg, 30 mg, 60 mg, 100 mg. **Elixir:** 20 mg/5 mL. **Injection:** 65 mg/mL, 130 mg/mL.

NURSING IMPLICATIONS

Assessment

- **Monitor respiratory status, pulse, and BP and signs and symptoms of angioedema** (swelling of lips, face, throat, dyspnea) frequently in patients receiving phenobarbital IV. Equipment for resuscitation and artificial ventilation should be readily available. Respiratory depression is dose-dependent.
- Prolonged therapy may lead to psychological or physical dependence. Restrict amount of drug available to patient, especially if depressed, suicidal, or with a history of addiction.
- **Geri:** Elderly patients may react to phenobarbital with marked excitement, depression, and confusion. Monitor for these adverse reactions.
- **Seizures:** Assess location, duration, and characteristics of seizure activity.
- **Sedation:** Assess level of consciousness and anxiety when used as a preoperative sedative.
- Assess postoperative patients for pain with a pain scale. Phenobarbital may increase sensitivity to painful stimuli.

- **Lab Test Considerations:** Patients on prolonged therapy should have hepatic and renal function and CBC evaluated periodically.
- Monitor serum folate concentrations periodically during therapy because of increased folate requirements of patients on long-term anticonvulsant therapy with phenobarbital.
- May cause ↓ serum bilirubin concentrations in neonates, in patients with congenital nonhemolytic unconjugated hyperbilirubinemia, and in epileptics.
- **Toxicity and Overdose:** Serum phenobarbital levels may be monitored when used as an anticonvulsant. Therapeutic blood levels are 10–40 mcg/mL. Symptoms of toxicity include confusion, drowsiness, dyspnea, slurred speech, and staggering.

Potential Nursing Diagnoses

Risk for injury (Indications, Side Effects)

Acute confusion (Side Effects)

Implementation

- **Do not confuse phenobarbital with pentobarbital.**
- Supervise ambulation and transfer of patients following administration. Two side rails should be raised and call bell within reach at all times. Keep bed in low position. Institute seizure and fall precautions.
- When changing from phenobarbital to another anticonvulsant, gradually decrease phenobarbital dose while concurrently increasing dose of replacement medication to maintain anticonvulsant effects.
- **PO:** Tablets may be crushed and mixed with food or fluids (do not administer dry) for patients with difficulty swallowing. Oral solution may be taken undiluted or mixed with water, milk, or fruit juice. Use calibrated measuring device for accurate measurement of liquid doses.
- **IM:** Injections should be given deep into the gluteal muscle to minimize tissue irritation. Do not inject >5 mL into any one site, because of tissue irritation.

IV Administration

- **pH:** 9.2–10.2.
- **IV:** Doses may require 15–30 min to reach peak concentrations in the brain. Administer minimal dose and wait for effectiveness before administering 2nd dose to prevent cumulative barbiturate-induced depression.
- **Direct IV: Diluent:** Reconstitute sterile powder for IV dose with a minimum of 3 mL of sterile water for injection. Dilute further with 10 mL of sterile water. Do not use solution that is not absolutely clear within 5 min after reconstitution or that contains a precipitate. Discard powder or solution that has been exposed to air for longer than 30 min.
- Solution is highly alkaline; avoid extravasation, which may cause tissue damage and necrosis. If extravasation occurs, injection of 5% procaine solu-

tion into affected area and application of moist heat may be ordered.

- **Concentration:** 130 mg/mL (undiluted). **Rate:** Do not inject IV faster than 1 mg/kg/min with a maximum of 30 mg over 1 min in infants and children and 60 mg over 1 min in adults. Titrate slowly for desired response. Rapid administration may result in respiratory depression.
- **Y-Site Compatibility:** acyclovir, alfentanil, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid, atropine, azathioprine, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, butorphanol, calcium chloride, calcium gluconate, carboplatin, cefazolin, cefoperazone, ceftazidime, ceftriaxone, chloramphenicol, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, digoxin, docetaxel, dopamine, doripenem, doxacurium, doxapram, enalaprilat, ephedrine, epoetin alfa, eptifibatide, ertapenem, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, flucanazole, fludarabine, fluorouracil, folic acid, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, ifosfamide, indomethacin, insulin, irinotecan, ketorolac, labetalol, linezolid, lorazepam, magnesium sulfate, mannitol, meropenem, metaraminol, methadone, methotrexate, methoxamine, methylprednisolone, metoclopramide, metoprolol, metronidazole, milrinone, mitoxandrone, morphine, multivitamins, nafcillin, naloxone, nesiritide, nitroglycerin, nitroprusside, octreotide, oxacillin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, pentobarbital, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, propofol, propranolol, ranitidine, rocuronium, sodium acetate, sodium bicarbonate, streptokinase, sufentanil, teniposide, theophylline, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimetaphan, vancomycin, vasopressin, vecuronium, vincristine, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** alemtuzumab, amphotericin B cholesteryl, ampicillin, atracurium, buprenorphine, carmustine, caspofungin, cefotaxime, cefotetan, cefoxitin, cefuroxime, chlorpromazine, cyclophosphamide, dantrolene, diazepam, diazoxide, diltiazem, diphenhydramine, dobutamine, doxorubicin, doxycycline, epinephrine, erythromycin, esmolol, haloperidol, hydroxyzine, idarubicin, isoproterenol, lidocaine, mechlorethamine, mepredine, methyl dopate, midazolam, mycophenolate,

nalbuphine, norepinephrine, ondansetron, papaverine, penicillin G, pentamidine, pentazocine, phenolamine, phenytoin, prochlorperazine, promethazine, protamine, pyridoxime, quinuapristin/dalfopristin, succinylcholine, thiamine, trimethoprim/sulfamethoxazole, verapamil, vinorelbine.

Patient/Family Teaching

- Advise patient to take medication as directed. Take missed doses as soon as remembered if not almost time for next dose; do not double doses.
- Advise patients on prolonged therapy not to discontinue medication without consulting health care professional. Abrupt withdrawal may precipitate seizures or status epilepticus.
- Medication may cause daytime drowsiness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known. Do not resume driving until physician gives clearance based on control of seizure disorder.
- Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Advise patient to notify health care professional if signs and symptoms of angioedema, fever, sore throat, mouth sores, unusual bleeding or bruising, nosebleeds, or petechiae occur.
- Teach sleep hygiene techniques (dark room, quiet, bedtime ritual, limit daytime napping, avoid nicotine and caffeine).
- Advise female patients using oral contraceptives to use an additional nonhormonal contraceptive during therapy and until next menstrual period. Instruct patient to contact health care professional immediately if pregnancy is planned or suspected.
- **Pedi:** Advise parents or caregivers that child may experience irritability, hyperactivity, and/or sleep disturbances, which may diminish in a few days to a few weeks or may persist until drug is stopped. An alternative medication can be considered. Instruct parents to monitor for skin rash occurring 7–20 days after treatment begins and to contact a health care provider if rash occurs. Teach family about symptoms of toxicity (staggering, drowsiness, slurred speech).

Evaluation/Desired Outcomes

- Decrease or cessation of seizure activity without excessive sedation. Several weeks may be required to achieve maximum anticonvulsant effects.
- Preoperative sedation.
- Improvement in sleep patterns.
- Decrease in serum bilirubin levels.

★ = Canadian drug name. ⚠ = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

phentermine/topiramate (fen-ter-meen/toe-pyre-a-mate) Qsymia

Classification

Therapeutic: weight control agents
Pharmacologic: appetite suppressants

Schedule IV

Pregnancy Category X

Indications

Weight management as part of a program including caloric restriction and increased exercise in patients with an initial body mass index (BMI) of ≥ 30 kg/m² or a BMI of ≥ 27 kg/m² with at least one other risk factor (hypertension, type 2 diabetes mellitus or dyslipidemia).

Action

Phentermine—↓ appetite and food consumption;

Topiramate—↓ appetite and enhances satiety.

Therapeutic Effects: Weight loss.

Pharmacokinetics

Absorption: *Phentermine*—Unknown; *Topiramate*—80% absorbed following oral administration.

Distribution: *Phentermine*—Unknown; *Topiramate*—Unknown.

Metabolism and Excretion: *Phentermine*—metabolized by the liver; *Topiramate*—70% excreted unchanged in urine.

Half-life: *Phentermine*—19–24 hr; *Topiramate*—21 hr.

TIME/ACTION PROFILE (phentermine—appetite suppression, topiramate—blood levels)

ROUTE	ONSET	PEAK	DURATION
PO (weight loss)	within 8 wk	16–32 wk	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity/idiosyncrasy to sympathomimetics; **OB:** Pregnancy (may cause fetal harm); **Lactation:** Breast feeding should be avoided; Glaucoma; Hyperthyroidism; During/within 14 days of MAO inhibitors; Severe renal impairment (CCr < 30 mL/min); Severe hepatic impairment; History of suicidal thought/active suicidal ideation.

Use Cautiously in: Diabetes (weight loss may ↑ risk of hypoglycemia); Females with reproductive potential (negative pregnancy test and contraception required); History of substance abuse; **Geri:** ↑ risk of adverse effects, consider age-related decrease in cardiac, renal and hepatic function, concurrent chronic dis-

ease states and medications; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: SEIZURES (FOLLOWING ABRUPT DISCONTINUATION), headache, insomnia, cognitive impairment, dizziness, mood disorders, suicidal ideation. **EENT:** acute myopia, blurred vision, eye pain, secondary angle closure glaucoma. **CV:** tachycardia, hypotension, palpitations. **GI:** HEPATOTOXICITY, altered taste, constipation, dry mouth. **GU:** ↑ creatinine, kidney stones. **Derm:** serious skin reactions including ERYTHEMA MULTIFORME, STEVENS-JOHNSON SYNDROME and TOXIC EPIDERMAL NECROLYSIS, alopecia, oligohydrosis (↓ sweating).

Endo: hypoglycemia. **F and E:** metabolic acidosis, hypokalemia. **Neuro:** paraesthesia. **Misc:** hyperthermia.

Interactions

Drug-Drug: ↑ risk of hypokalemia with non-potassium sparing diuretics. ↑ risk of CNS depression with other CNS depressants including alcohol, some antihistamines, sedative/hypnotics, antipsychotics, and opioid analgesics; avoid concurrent use of alcohol. Altered exposure to oral contraceptives may ↑ risk of irregular bleeding. Blood levels of topiramate may be ↓ by carbamazepine or phenytoin. Concurrent use of topiramate with valproic acid may ↑ risk of hyperammonemia. Concurrent use of topiramate with carbonic anhydrase inhibitors may ↑ risk of metabolic acidosis and kidney stones. ↑ risk of hypotension with antihypertensive and diuretics.

Route/Dosage

PO (Adults): Initial dose—one phentermine 3.75 mg/topiramate 23 mg capsule daily for 14 days, then increase to one phentermine 7.5 mg/topiramate 46 mg capsule daily for 12 wk, then assess weight loss. If weight loss has not exceeded 3% of baseline, discontinue or escalate dose to one phentermine 11.25 mg/topiramate 69 mg capsule daily for 14 days, then one phentermine 15 mg/topiramate 92 mg capsule daily for 12 wk, if weight loss has not exceeded 5% of baseline, discontinue as success is unlikely. Discontinuation should proceed by taking the phentermine 15 mg/topiramate 92 mg capsule every other day for 1 wk.

Renal Impairment

PO (Adults): CCr ≥ 30 mL/min— < 50 mL/min—daily dose should not exceed one phentermine 7.5 mg/topiramate 46 mg capsule daily.

Hepatic Impairment

PO (Adults): Child-Pugh score 7–9—daily dose should not exceed one phentermine 7.5 mg/topiramate 46 mg capsule daily.

Availability

Phentermine immediate-release/topiramate extended-release capsules: phentermine 3.75 mg/to-

piramate 23 mg (for titration only), phentermine 7.5 mg/topiramate 46 mg, phentermine 11.25 mg/topiramate 69 mg (for titration only), phentermine 15 mg/topiramate 92 mg. **Cost:** 3.75 mg/23 mg \$163.24/30, 7.5 mg/46 mg \$184.49/30, 11.25 mg/69 mg \$221.38/30, 15 mg/92 mg \$239.40/30.

NURSING IMPLICATIONS

Assessment

- Monitor patients for weight loss and adjust concurrent medications (antihypertensives, antidiabetics, lipid-lowering agents) as needed. Evaluate weight loss after each 12 wks of therapy.
- **Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression. Discontinue phentermine/topiramate if these occur.**
- Monitor BP and heart rate periodically during therapy; may cause increase in resting heart rate. May cause hypotension in patients treated with antihypertensives.
- **Lab Test Considerations:** Obtain a pregnancy test prior to starting therapy and monthly during therapy.
- May cause hypoglycemia; monitor blood glucose closely in diabetic patients.
- May cause metabolic acidosis; monitor serum bicarbonate, prior to starting and periodically during therapy.
- May cause ↑ serum creatinine; peak increases observed after 4–8 wks of therapy. Monitor serum creatinine prior to and periodically during therapy; if persistent elevations occur, decrease dose or discontinue therapy.
- May cause hypokalemia; monitor serum potassium periodically during therapy.

Potential Nursing Diagnoses

Disturbed body image (Indications)

Imbalanced nutrition: more than body requirements (Indications)

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- Qsymia is only available through certified pharmacies that are enrolled in the Qsymia certified pharmacy network. Information can be obtained at www.QsymiaREMS.com or by calling 1-888-998-4887.
- **PO:** Administer once daily in the morning without regard to food. Avoid dosing in the evening; may cause insomnia.

Patient/Family Teaching

- Instruct patient to take phentermine/topiramate as directed. Do not stop taking without consulting health care professional. Discontinue gradually taking 1 dose every other day for at least 1 wk to prevent seizures.
- Advise patient to notify health care professional if sustained periods of heart pounding or racing while at rest; severe and persistent eye pain or significant changes in vision; changes in attention, concentration, memory, and/or difficulty finding words; factors that can increase risk or acidosis (prolonged diarrhea, surgery, high protein/low carbohydrate diet, and/or concomitant medications).
- **Inform patients and families of risk of suicidal thoughts and behavior (behavioral changes, emergency or worsening signs and symptoms of depression, unusual changes in mood, or emergence of suicidal thoughts, behavior, or thoughts of self-harm). Advise that these should be reported to health care professional immediately.**
- May cause changes in mental performance, motor performance, and/or vision. Caution patients to avoid driving and other activities requiring alertness until response to medication is known.
- Instruct patient to increase fluid intake to increase urinary output and decrease risk of kidney stones.
- Advise patient to monitor for decreased sweating and increased body temperature during physical activity, especially in hot weather.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications. Advise patient to avoid taking other CNS depressants or alcohol.
- Phentermine/topiramate is teratogenic. Advise female patient to use effective contraception during therapy. Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in weight and BMI. If 3% of baseline body weight is not lost by Week 12, increase dose or discontinue phentermine/topiramate. Evaluate after second 12 wk of therapy. If 5% of baseline body weight is not lost by second 12 wks of therapy, as it is unlikely patient will achieve and sustain clinically meaningful weight loss with continued treatment.

phentolamine

(fen-tole-a-meen)

Oraverse, Regitine,  Rogitine

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Classification

Therapeutic: agents for pheochromocytoma
 Pharmacologic: alpha-adrenergic blockers

Pregnancy Category C**Indications**

IV: Control of BP during surgical removal of a pheochromocytoma. **IV, Infiltration:** Prevention and treatment of dermal necrosis and sloughing following extravasation of norepinephrine, phenylephrine, or dopamine. **Local:** Reversal of soft-tissue anesthesia (of lip and tongue) resulting from an intraoral submucosal injection of a local anesthetic containing a vasoconstrictor. **Unlabeled Use: IM, IV:** Treatment of hypertension associated with pheochromocytoma or adrenergic (sympathetic) excess, such as administration of phenylephrine, tyramine-containing foods in patients on MAO inhibitor therapy, or clonidine withdrawal.

Action

Produces incomplete and short-lived blockade of alpha-adrenergic receptors located primarily in smooth muscle and exocrine glands. Induces hypotension by direct relaxation of vascular smooth muscle and by alpha blockade. Increases blood flow to submucosal tissue through blockade of alpha receptors. **Therapeutic Effects:** Reduction of BP in situations in which hypertension is due to adrenergic (sympathetic) excess. When infiltrated locally, reverses vasoconstriction caused by norepinephrine or dopamine. Reverses local anesthetic effects (restores normal lip and tongue sensation).

Pharmacokinetics

Absorption: Well absorbed following IM administration; completely available after local injection.

Distribution: Unknown.

Metabolism and Excretion: 10% excreted unchanged by kidneys.

Half-life: 19 min (IV); 2–3 hr (local injection).

TIME/ACTION PROFILE (alpha-adrenergic blockade)

ROUTE	ONSET	PEAK	DURATION
IM	unknown	20 min	30–45 min
IV	immediate	2 min	15–30 min
Local	rapid	10–20 min	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Coronary or cerebral arteriosclerosis; Renal impairment.

Use Cautiously in: Peptic ulcer disease; **OB, Lactation:** Safety not established; **Pedi:** Children <6 yr or <15 kg (Oraverse) (safety not established); **Geri:** More susceptible to hypotensive effects; ↓ dose recommended.

Adverse Reactions/Side Effects

With parenteral use.

CNS: CEREBROVASCULAR SPASM, dizziness, weakness.

EENT: nasal stuffiness. **CV:** HYPOTENSION, MI, angina, arrhythmias, tachycardia. **GI:** abdominal pain, diarrhea, nausea, vomiting, aggravation of peptic ulcer.

Derm: flushing. **Local:** injection site pain (local).

Interactions

Drug-Drug: Antagonizes the effects of alpha-adrenergic stimulants. May ↓ pressor response to ephedrine or phenylephrine. Severe hypotension may occur with concurrent use of epinephrine or methoxamine. ↓ peripheral vasoconstriction from high doses of dopamine.

Route/Dosage**Hypertension Associated with Pheochromocytoma—Before/During Surgery**

IV (Adults): 5 mg given 1–2 hr preop, repeated as necessary. May be infused at a rate of 0.5–1 mg/min during surgery.

IV, IM (Children): 1 mg or 0.1 mg/kg (3 mg/m²) given 1–2 hr preop, repeated IV as necessary during surgery.

Prevention of Dermal Necrosis during Infusion of Norepinephrine, Phenylephrine, or Dopamine

IV (Adults): Add 10 mg phentolamine to every 1000 mL of fluid containing norepinephrine.

Treatment of Dermal Necrosis Following Extravasation of Norepinephrine, Phenylephrine, or Dopamine

Infiltrate (Adults): 5–10 mg.

Infiltrate (Children): 0.1–0.2 mg/kg (up to 10 mg).

Reversal of Intraoral Submucosal Anesthesia Following Dental Procedures (Oraverse)

Infiltrate or Block Injection (Adults and Children ≥6 yr and >30 kg): Dose administered is based on number of cartridges of local anesthetic with vasoconstrictor administered: 1/2 cartridge local anesthetic — 0.2 mg phentolamine (1/2 cartridge); 1 cartridge local anesthetic — 0.4 mg phentolamine (1 cartridge); 2 cartridges local anesthetic — 0.8 mg phentolamine (2 cartridges).

Infiltrate or Block Injection (Children ≥6 yr and 15–30 kg): Do not exceed dose of 0.2 mg (1/2 cartridge).

Availability (generic available)

Powder for injection: 5 mg/vial. **Injection for local infiltration/block injection:** 0.4 mg/cartridge.

NURSING IMPLICATIONS

Assessment

- **Monitor BP, pulse, and ECG every 2 min until stable during IV administration.** If hypotensive crisis occurs, epinephrine is contraindicated and may cause paradoxical further decrease in BP; norepinephrine may be used.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)

Risk for injury (Indications)

Implementation

- Patient should remain supine throughout parenteral administration.

IV Administration

- **pH:** 4.5–6.5.
- **IV: Diluent:** Reconstitute each 5 mg with 1 mL of sterile water for injection or 0.9% NaCl. Discard unused solution. **Concentration:** 5 mg/mL. **Rate:** Inject each 5 mg over 1 min.
- **Continuous Infusion:** Dilute 5–10 mg in 500 mL of D5W.
- **Rate:** Titrate infusion rate according to patient response.
- May also add 10 mg to every 1000 mL of fluid containing norepinephrine for prevention of dermal necrosis and sloughing. Does not affect pressor effect of norepinephrine.
- **Syringe Compatibility:** papaverine.
- **Y-Site Compatibility:** alfentanil, amikacin, aminophylline, amiodarone, ascorbic acid, atropine, aztreonam, benztrapine, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, ceftazidime, ceftriaxone, chlorpromazine, cimetidine, cyanocobalamin, cyclosporine, dactinomycin, daptomycin, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dobutamine, docetaxel, dopamine, doxycycline, enalaprilat, epinephrine, epoetin, ertapenem, erythromycin, esmolol, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludrabine, folic acid, gemcitabine, gentamicin, glycopyrrrolate, granisetron, heparin, hydrocortisone sodium succinate, imipenem-cilastatin, isoproterenol, labetalol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, metaraminol, methoxamine, methyldopa, metoclopramide, metoprolol, metronidazole, midazolam, minocycline, mitoxantrone, morphine, multivitamin injection, nafcillin, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pantoprazole, pemetrexed, pentamidine,

pentazocine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxime, quinidine, ranitidine, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tirofiban, tobramycin, tolazoline, trimethopran, vancomycin, vasopressin, verapamil, vinorelbine, voriconazole.

- **Y-Site Incompatibility:** amphotericin B colloidal, cefazolin, cefoperazone, cefotetan, cefoxitin, cefuroxime, chloramphenicol, clindamycin, dantrolene, dexamethasone, diazepam, diazoxide, furosemide, ganciclovir, insulin, ketorolac, moxalactam, penicillin G, pentobarbital, phenobarbital, phenytoin, trimethoprim/sulfamethoxazole.
- **Additive Compatibility:** dobutamine, norepinephrine.
- **Infiltration:** Dilute 5–10 mg of phentolamine in 10 mL of 0.9% NaCl. For children, use 0.1–0.2 mg/kg up to a maximum of 10 mg. Infiltrate site of extravasation promptly. Must be given within 12 hr of extravasation to be effective.

Patient/Family Teaching

- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Instruct patient to notify health care professional if chest pain occurs during IV infusion.

Evaluation/Desired Outcomes

- Decrease in BP.
- Prevention of dermal necrosis and sloughing in extravasation of norepinephrine, dopamine, and phenylephrine.
- Restoration of normal lip and tongue sensation following local anesthesia.

HIGH ALERT

phenylephrine (fen-il-eff-rin) Neo-Synephrine

Classification

Therapeutic: vasopressors

Pharmacologic: adrenergics, alpha adrenergic agonists, vasopressors

Pregnancy Category B, C (Ophth, Parenteral)

For ophthalmic use see Appendix C

Indications

Management of hypotension associated with shock that may persist after adequate fluid replacement. Management of hypotension associated with anesthesia. **Anesthesia adjunct:** Prolongation of the duration of spinal

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

anesthesia, Localization of the effect of regional anesthesia.

Action

Constricts blood vessels by stimulating alpha-adrenergic receptors. **Therapeutic Effects:** Increased BP.

Pharmacokinetics

Absorption: Well absorbed from IM sites.

Distribution: Unknown.

Metabolism and Excretion: Metabolized by the liver and other tissues.

Half-life: 2.5 hr.

TIME/ACTION PROFILE (vasopressor effects)

ROUTE	ONSET	PEAK	DURATION
IV	immediate	unknown	15–20 min
IM	10–15 min	unknown	0.5–2 hr
Subcut	10–15 min	unknown	50–60 min

Contraindications/Precautions

Contraindicated in: Uncorrected fluid volume deficits; Tachyarrhythmias; Pheochromocytoma; Angle-closure glaucoma; Acute pancreatitis; Hepatitis; Hypersensitivity to bisulfites.

Use Cautiously in: Occlusive vascular diseases; Cardiovascular disease; Diabetes mellitus; **OB, Lactation:** Safety not established.

Exercise Extreme Caution in: **Geri:** More likely to experience adverse reactions, which result in hallucinations, convulsions, CNS depression, and death; **Hypert thyroidism;** Bradycardia; Partial heart block; Severe cardiovascular disease.

Adverse Reactions/Side Effects

CNS: anxiety, dizziness, headache, insomnia, nervousness, restlessness, trembling, weakness. **Resp:** dyspnea, respiratory distress. **CV:** **ARRHYTHMIAS**, bradycardia, chest pain, hypertension, tachycardia, vasoconstriction. **Derm:** blanching, pallor, piloerection, sweating. **Local:** phlebitis, sloughing at IV sites. **Neuro:** tremor.

Interactions

Drug-Drug: Use with **general anesthetics** may result in myocardial irritability; use with extreme caution. Use with **MAO inhibitors**, **ergot alkaloids (ergonovine, methylegonovine)**, or **oxytocics** results in severe hypertension. **Alpha-adrenergic blockers (phentolamine)** may antagonize vasopressor effects. **Atropine** blocks bradycardia from phenylephrine and enhances pressor effects.

Route/Dosage

Hypotension

Subcut, IM (Adults): 2–5 mg.

Subcut, IM (Children): 0.1 mg/kg/dose q 1–2 hr as needed, maximum dose 5 mg.

IV (Adults): 0.2 mg (range 0.1–0.5 mg), may be repeated q 10–15 min or as an infusion at 100–180 mcg/min initially, 40–60 mcg/min maintenance.

IV (Children): 5–20 mcg/kg/dose q 10–15 min as needed or 0.1–0.5 mcg/kg/min infusion, titrate to effect.

Hypotension during Spinal Anesthesia

Subcut, IM (Adults): 2–3 mg has been used 3–4 min before spinal anesthesia to prevent hypotension.

IM, Subcut (Children): —0.5–1 mg/25 lb body weight.

IV (Adults): 0.2 mg; may repeat q 10–15 min and may be ↑ by 0.1–0.2 mg/dose (not to exceed 0.5 mg/dose).

Vasoconstrictor for Regional Anesthesia

Local (Adults): Add 1 mg to every 20 mL of local anesthetic (yields a 1:20,000 solution).

Prolongation of Spinal Anesthesia

Spinal (Adults): 2–5 mg added to anesthetic solution.

Availability (generic available)

Injection: 10 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor BP every 2–3 min until stabilized and every 5 min thereafter during IV administration.
- **Monitor ECG continuously for arrhythmias during IV administration.**
- Assess IV site frequently throughout infusion. Antecubital or other large vein should be used to minimize risk of extravasation, which may cause tissue necrosis. If extravasation occurs, the site should be infiltrated promptly with 10–15 mL of 0.9% NaCl solution containing 5–10 mg of phentolamine to prevent necrosis and sloughing.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)
Ineffective tissue perfusion (Indications)

Implementation

- **High Alert:** Patient harm and fatalities have occurred from medication errors with phenylephrine. Prior to administration, have second practitioner independently check original order, dose calculations, concentration, route of administration and infusion pump settings.

IV Administration

- **IV:** Blood volume depletion should be corrected, if possible, before initiation of IV phenylephrine.
- **Direct IV:** **Diluent:** Dilute each 1 mg with 9 mL of sterile water for injection. **Rate:** Administer each single dose over 1 min.

- **Continuous Infusion:** **Diluent:** Dilute 10 mg in 250 or 500 mL of dextrose/Ringer's or lactated Ringer's combination, dextrose/saline combinations, D5W, D10W, Ringer's or LR, 0.45% NaCl, or 0.9% NaCl. **Concentration:** 125,000 or 150,000 solution, respectively. **Rate:** Titrate rate according to patient response. Infuse via infusion pump to ensure accurate dose rate.
- **Y-Site Compatibility:** alfentanil, amikacin, aminophylline, amiodarone, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid, atropine, aztreonam, benztrapine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefonocid, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, cephalothin, chloramphenicol, cisatracurium, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doripenem, doxorubicin hydrochloride, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, eripapenem, erythromycin, esmolol, etomidate, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, irinotecan, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, methotraxate, methoxamine, methyldopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, micafungin, miconazole, midazolam, milrinone, mitoxantrone, morphine, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pantoprazole, papaverine, penicillin G, pentobarbital, phenobarbital, phenolamine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxime, quinupristin/dalfopristin, ranitidine, remifentanyl, rocuronium, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, telavancin, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, vancomycin, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** acyclovir, amphotericin B colloidal, azathioprine, dantrolene, diazepam, diazoxide, furosemide, ganciclovir, indomethacin, insulin, pentamidine, phenytoin, trimethoprim/sulfamethoxazole, thiopental.
- **Anesthesia:** Phenylephrine 2–5 mg may be added to spinal anesthetic solution to prolong anesthesia.
- Phenylephrine 1 mg may be added to each 20 mL of local anesthetic to produce vasoconstriction.

Patient/Family Teaching

- **IV:** Instruct patient to report headache, dizziness, dyspnea, or pain at IV infusion site promptly.

Evaluation/Desired Outcomes

- Increase in BP to normal range.
- Prolonged duration of spinal anesthesia.
- Localization of regional anesthesia.

phenytoin (fen-i-toyn) Dilantin, Phenytek, Tremytoine

Classification

Therapeutic: antiarrhythmics (group IB), anticonvulsants
Pharmacologic: hydantoins

Pregnancy Category D

Indications

Treatment/prevention of tonic-clonic (grand mal) seizures and complex partial seizures. **Unlabeled Use:** As an antiarrhythmic, particularly for ventricular arrhythmias associated with digoxin toxicity, prolonged QT interval, and surgical repair of congenital heart diseases in children. Management of neuropathic pain, including trigeminal neuralgia.

Action

Limits seizure propagation by altering ion transport. May also decrease synaptic transmission. Antiarrhythmic properties as a result of shortening the action potential and decreasing automaticity. **Therapeutic Effects:** Diminished seizure activity. Termination of ventricular arrhythmias.

Pharmacokinetics

Absorption: Absorbed slowly from the GI tract. Bioavailability differs among products; the Dilantin and Phenytek preparations are considered to be "extended" products. Other products are considered to be prompt release.

Distribution: Distributes into CSF and other body tissues and fluids. Enters breast milk; crosses the placenta, achieving similar maternal/fetal levels. Preferentially distributes into fatty tissue.

Protein Binding: Adults 90–95%; ↓ protein binding in neonates (up to 20% free fraction available), in-

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

fants (up to 15% free), and patients with hyperbilirubinemia, hypoalbuminemia, severe renal dysfunction or uremia.

Metabolism and Excretion: Mostly metabolized by the liver; minimal amounts excreted in the urine.

Half-life: 22 hr (range 7–42 hr).

TIME/ACTION PROFILE (anticonvulsant effect)

ROUTE	ONSET	PEAK	DURATION
PO	2–24 hr (1 wk)*	1.5–3 hr	6–12 hr
PO-ER	2–24 hr (1 wk)	4–12 hr	12–36 hr
IV	0.5–1 hr (1 wk)	rapid	12–24 hr

*() = time required for onset of action without a loading dose

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity to propylene glycol (phenytoin injection only); Alcohol intolerance (phenytoin injection and liquid only); Sinus bradycardia, sinoatrial block, 2nd- or 3rd-degree heart block, or Stokes-Adams syndrome (phenytoin injection only); Concurrent use of delavirdine.

Use Cautiously in: All patients (may ↑ risk of suicidal thoughts/behaviors); Hepatic or renal disease (↑ risk of adverse reactions; dose reduction recommended for hepatic impairment); Patients with severe cardiac or respiratory disease (use of IV phenytoin may result in an ↑ risk of serious adverse reactions); **OB:** Safety not established; may result in fetal hydatin syndrome if used chronically or hemorrhage in the newborn if used at term; use with extreme caution; **Lactation:** Safety not established; **Pedi:** Suspension contains sodium benzoate, a metabolite of benzyl alcohol that can cause potentially fatal gasping syndrome in neonates; **Geri:** Use of IV phenytoin may result in an ↑ risk of serious adverse reactions.

Exercise Extreme Caution in: **H:** Patients positive for HLA-B*1502 allele (unless exceptional circumstances exist where benefits clearly outweigh the risks).

Adverse Reactions/Side Effects

Most listed are for chronic use of phenytoin.

CNS: **SUICIDAL THOUGHTS,** ataxia, agitation, confusion, dizziness, drowsiness, dysarthria, dyskinesia, extrapyramidal syndrome, headache, insomnia, weakness.

EENT: diplopia, nystagmus. **CV:** hypotension (↑ with IV phenytoin), tachycardia. **GI:** gingival hyperplasia, nausea, constipation, drug-induced hepatitis, vomiting. **Derm:** **STEVENS-JOHNSON SYNDROME,** **TOXIC EPIDERMAL NECROLYSIS,** hypertrichosis, rash, exfoliative dermatitis, pruritus, purple glove syndrome. **Hemat:** **AGRANULOCYTOSIS,** **APLASTIC ANEMIA,** leukopenia, megaloblastic anemia, thrombocytopenia. **MS:** osteomalacia, osteoporosis. **Misc:** fever, lymphadenopathy.

Interactions

Drug-Drug: May ↓ the effects of **delavirdine**, resulting in loss of virologic response and potential resistant (concurrent use contraindicated). Acute ingestion of alcohol, amiodarone, benzodiazepines, capecitabine, chloramphenicol, cimetidine, disulfiram estrogens, ethosuximide, felbamate, fluconazole, fluorouracil, fluoxetine, fluvastatin, fluvoxamine, gabapentin, halothane, isoniazid, itraconazole, ketoconazole, methylphenidate, oxcarbazepine, omeprazole, phenothiazines, salicylates, sertraline, succinamides, sulfonamides, ticlopidine, tolbutamide, topiramate, trazodone, voriconazole, and warfarin may ↑ levels. Chronic ingestion of alcohol, barbiturates, carbamazepine, fosamprenavir, nelfinavir, reserpine, ritonavir, and vigabatrin may ↓ levels. May ↓ the effects of amiodarone, atorvastatin, benzodiazepines, carbamazepine, corticosteroids, cyclosporine, digoxin, doxycycline, efavirenz, estrogens, fluvastatin, indinavir, lopinavir/ritonavir, methadone, mexiletine, nelfinavir, nisoldipine, oral contraceptives, paroxetine, quinidine, rifampin, ritonavir, saquinavir, simvastatin, tacrolimus, theophylline, topiramate, and warfarin. IV phenytoin and dopamine may cause additive hypotension. Additive CNS depression with other CNS depressants, including alcohol, antihistamines, antidepressants, opioids, and sedative/hypnotics. Antacids may ↓ absorption of orally administered phenytoin. ↑ systemic clearance of antileukemic drugs **teniposide** and **methotrexate** which has been associated with a worse event free survival, phenytoin use is not recommended in children undergoing chemotherapy for acute lymphocytic leukemia. **Calcium** and **sucralfate** ↓ phenytoin absorption.

Drug-Natural Products: **St. John's Wort** may ↓ levels.

Drug-Food: Phenytoin may ↓ absorption of **folic acid**. Concurrent administration of **enteral tube feedings** may ↓ phenytoin absorption. **Folic acid** may ↓ levels.

Route/Dosage

IM administration is not recommended due to erratic absorption and pain on injection. Oral route should be used whenever possible.

Anticonvulsant

PO (Adults): Loading dose of 15–20 mg/kg as extended capsules in 3 divided doses given every 2–4 hr; maintenance dose 5–6 mg/kg/day given in 1–3 divided doses; usual dosing range = 200–1200 mg/day.

PO (Children 10–16 yr): 6–7 mg/kg/day in 2–3 divided doses.

PO (Children 7–9 yr): 7–8 mg/kg/day in 2–3 divided doses.

PO (Children 4–6 yr): 7.5–9 mg/kg/day in 2–3 divided doses.

PO (Children 0.5–3 yr): 8–10 mg/kg/day in 2–3 divided doses.

PO (Neonates up to 6 mo): 5–8 mg/kg/day in 2 divided doses, may require q 8 hr dosing.

IV (Adults): *Status epilepticus loading dose*—15–20 mg/kg. Rate not to exceed 25–50 mg/min. *Maintenance dose*—same as PO dosing above.

IV (Children): *Status epilepticus loading dose*—15–20 mg/kg at 1–3 mg/kg/min. *Maintenance dose*—same as PO dosing above.

Antiarrhythmic

IV (Adults): 50–100 mg q 10–15 min until arrhythmia is abolished, or a total of 15 mg/kg has been given, or toxicity occurs.

PO (Adults): Loading dose: 250 mg 4 times daily for 1 day, then 250 mg twice daily for 2 days, then maintenance at 300–400 mg/day in divided doses 1–4 times/day.

IV (Children): 1.25 mg/kg q 5 min, may repeat up to total loading dose of 15 mg/kg. *Maintenance dose*—5–10 mg/kg/day in 2–3 divided doses IV or PO.

Availability (generic available)

Chewable tablets: 50 mg. **Cost:** *Generic*—\$52.63/100. **Oral suspension:** 125 mg/5 mL. **Cost:** \$36.97/237 mL.

Extended-release capsules: 30 mg, 100 mg, 200 mg, 300 mg. **Cost:** *Generic*—100 mg \$33.90/100, 200 mg \$24.00/30, 300 mg \$34.94/30.

Injection: 50 mg/mL.

NURSING IMPLICATIONS

Assessment

- **Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.**
- Assess oral hygiene. Vigorous cleaning beginning within 10 days of initiation of phenytoin therapy may help control gingival hyperplasia.
- **Assess patient for phenytoin hypersensitivity syndrome (fever, skin rash, lymphadenopathy).** Rash usually occurs within the first 2 wk of therapy. Hypersensitivity syndrome usually occurs at 3–8 wk but may occur up to 12 wk after initiation of therapy. May lead to renal failure, rhabdomyolysis, or hepatic necrosis; may be fatal.
- Observe patient for development of rash. Discontinue phenytoin at the first sign of skin reactions. Serious adverse reactions such as exfoliative, purpuric, or bullous rashes or the development of lupus erythematosus, Stevens-Johnson syndrome, or

toxic epidermal necrolysis preclude further use of phenytoin or fosphenytoin. ⚠ Stevens-Johnson syndrome and toxic epidermal necrolysis are significantly more common in patients with a particular human leukocyte antigen (HLA) allele, HLA-B*1502 (occurs almost exclusively in patients with Asian ancestry, including including Han Chinese, Filipinos, Malaysians, South Asian Indians, and Thais). Avoid using phenytoin or fosphenytoin as alternatives to carbamazepine for patients who test positive. If less serious skin eruptions (measles-like or scarlatiniform) occur, phenytoin may be resumed after complete clearing of the rash. If rash reappears, further use of fosphenytoin or phenytoin should be avoided.

- **Assess mental status (orientation, mood, behavior) before and periodically during therapy. Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.**
- **Seizures:** Assess location, duration, frequency, and characteristics of seizure activity. EEG may be monitored periodically throughout therapy.
- Monitor BP, ECG, and respiratory function continuously during administration of IV phenytoin and throughout period when peak serum phenytoin levels occur (15–30 min after administration).
- **Arrhythmias:** Monitor ECG continuously during treatment of arrhythmias.
- **Lab Test Considerations:** Monitor CBC, serum calcium, albumin, and hepatic function tests prior to and monthly for the first several months, then periodically during therapy.
- May cause ↑ serum alkaline phosphatase, GGT, and glucose levels.
- Monitor serum folate concentrations periodically during prolonged therapy.
- **Toxicity and Overdose:** Monitor serum phenytoin levels routinely. Therapeutic blood levels are 10–20 mcg/mL (8–15 mcg/mL in neonates) in patients with normal serum albumin and renal function. In patients with altered protein binding (neonates, patients with renal failure, hypoalbuminemia, acute trauma), free phenytoin serum concentrations should be monitored. Therapeutic serum free phenytoin levels are 1–2 mcg/mL.
- Progressive signs and symptoms of phenytoin toxicity include nystagmus, ataxia, confusion, nausea, slurred speech, and dizziness.

Potential Nursing Diagnoses

Risk for injury (Indications)

Impaired oral mucous membrane (Side Effects)

☼ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Implementation

- Implement seizure precautions.
- When transferring from phenytoin to another anti-convulsant, dosage adjustments are made gradually over several weeks.
- When substituting *fospphenytoin* for oral *phenytoin* therapy, the same total daily dose may be given as a single dose. Unlike parenteral phenytoin, fosphenytoin may be given safely by the IM route.
- **PO:** Administer with or immediately after meals to minimize GI irritation. Shake liquid preparations well before pouring. Use a calibrated measuring device for accurate dose. Chewable tablets must be crushed or chewed well before swallowing. Capsules may be opened and mixed with food or fluids for patients with difficulty swallowing. To prevent direct contact of alkaline drug with mucosa, have patient swallow a liquid first, follow with mixture of medication, then follow with a full glass of water or milk or with food.
- If patient is receiving enteral tube feedings, 2 hr should elapse between feeding and phenytoin administration. If phenytoin is administered via nasogastric tube, flush tube with 2–4 oz water before and after administration.
- Do not interchange chewable phenytoin tablets with phenytoin sodium capsules, because they are not bioequivalent.
- Capsules labeled “extended” may be used for once-a-day dose; those labeled “prompt” may result in toxic serum levels if used for once-a-day dose.

IV Administration

- **IV:** Slight yellow color will not alter solution potency. If refrigerated, may form precipitate, which dissolves after warming to room temperature. Discard solution that is not clear.
- To prevent precipitation and minimize local venous irritation, follow infusion with 0.9% NaCl through the same needle or catheter. Avoid extravasation; phenytoin is caustic to tissues; may lead to purple glove syndrome. Monitor infusion site closely.
- **Direct IV:** Administer undiluted. **Rate:** Administer at a rate not to exceed 50 mg over 1 min in adults or 1–3 mg/kg/min in neonates. Rapid administration may result in severe hypotension, cardiovascular collapse, or CNS depression.
- **Intermittent Infusion:** **Diluent:** Administer by mixing with no more than 50 mL of 0.9% NaCl.
Concentration: 1–10 mg/mL. Administer immediately following admixture. Use tubing with a 0.45- to 0.22-micron in-line filter. **Rate:** Complete infusion within 1 hr at a rate not to exceed 50 mg/min. In patients who may develop hypotension, patients with cardiovascular disease, or geriatric patients maximum rate of 25 mg/min [may be as low as 5–10 mg/min]. Maximum rate in neonates is 1–3 mg/

kg/min. Monitor cardiac function and BP throughout infusion.

- **Y-Site Compatibility:** cisplatin.
- **Y-Site Incompatibility:** acyclovir, alemtuzumab, alfantanil, amikacin, aminocaproic acid, aminophylline, amphotericin B cholesteryl, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, azathioprine, aztreonam, benztropine, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefoperazone, cefotaxime, cefotetan, ceftioxin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, dantrolene, daptomycin, dexamethasone, dexmedetomidine, dextrazoxane, diltiazem, diazoxide, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxacurium, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, epifibatide, ertapenem, erythromycin, etoposide, etoposide phosphate, fenoldopam, fentanyl, fludarabine, fluorouracil, folic acid, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, griseofulvin, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone sodium succinate, hydromorphone, hydroxyzine, idarubicin, ifosfamide, imipenem/cilastatin, indomethacin, insulin, irinotecan, isoproterenol, ketamine, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meclizolamine, meperidine, metaraminol, methadone, methotrexate, methylprednisolone, metoclopramide, micafungin, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, multivitamin infusion, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nifedipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxytocin, paclitaxel, palonosetron, pamidronate, pantoprazole, papaverine, pemetrexed, penicillin G, pentamidine, pentazocine, propofol, propranolol, phenobarbital, phenolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, procaine, pyridoxime, quinuapristin/dalfopristin, ranitidine, rocuronium, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuro-

nium, verapamil, vinblastine, vincristine, vinorelbine, vitamin B complex with C, voriconazole, zoledronic acid.

- **Additive Incompatibility:** Do not admix with other solutions or medications, especially dextrose, because precipitation will occur.

Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day. If a dose is missed from a once-a-day schedule, take as soon as possible and return to regular dosing schedule. If taking several doses a day, take missed dose as soon as possible within 4 hr of next scheduled dose; do not double doses. Consult health care professional if doses are missed for 2 consecutive days. Abrupt withdrawal may lead to status epilepticus.
- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known. Do not resume driving until physician gives clearance based on control of seizure disorder.
- Caution patient to avoid alcohol and CNS depressants. Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications and alcohol.
- Instruct patient on importance of maintaining good dental hygiene and seeing dentist frequently for teeth cleaning to prevent tenderness, bleeding, and gingival hyperplasia. Institution of oral hygiene program within 10 days of initiation of phenytoin therapy may minimize growth rate and severity of gingival enlargement. Patients under 23 yr of age and those taking doses >500 mg/day are at increased risk for gingival hyperplasia.
- Advise patient that brands of phenytoin may not be equivalent. Check with health care professional if brand or dose form is changed.
- Advise diabetic patients to monitor blood glucose carefully and to notify health care professional of significant changes.
- Instruct patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient not to take phenytoin within 2–3 hr of antacids.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- **Instruct patients that behavioral changes, skin rash, fever, sore throat, mouth ulcers, easy bruising, petechiae, unusual bleeding, abdominal pain, chills, pale stools, dark urine, jaundice, severe nausea or vomiting, drowsiness, slurred speech, unsteady gait, swollen glands, or persistent headache should**

be reported to health care professional immediately. Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking, other unusual changes in behavior or mood occur.

- Advise female patients to use an additional nonhormonal method of contraception during therapy and until next menstrual period. Instruct patient to notify health care professional if pregnancy is planned or suspected. Encourage patients who become pregnant to enroll in the North American Antiepileptic Drug (NAAED) Pregnancy Registry by calling 1-888-233-2334 or on the web at www.aedpregnancyregistry.org. Enrollment must be done by patients themselves.
- Emphasize the importance of routine exams to monitor progress. Patient should have routine physical exams, especially monitoring skin and lymph nodes, and EEG testing.

Evaluation/Desired Outcomes

- Decrease or cessation of seizures without excessive sedation.
- Suppression of arrhythmias.
- Relief of neuropathic pain.

phosphate/biphosphate (foss-fate/bye-foss -fate)

Fleet Enema, OsmoPrep, Visicol

Classification

Therapeutic: laxatives (saline)

Pregnancy Category C

Indications

Intermittent treatment of chronic constipation. **Visicol and OsmoPrep:** Cleansing of the bowel as a preparation for colonoscopy in adults 18 yr of age or older.

Action

Osmotically active in the lumen of the GI tract. Produces laxative effect by causing water retention and stimulation of peristalsis. Stimulates motility and inhibits fluid and electrolyte absorption from the small intestine. **Therapeutic Effects:** Relief of constipation. Emptying of the bowel.

Pharmacokinetics

Absorption: 1–20% of rectally administered sodium and phosphate may be absorbed; some absorption follows oral administration.

☼ = Canadian drug name. ⚠ = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Distribution: Unknown.

Metabolism and Excretion: Excreted by the kidneys.

Half-life: Unknown.

TIME/ACTION PROFILE (laxative effect)

ROUTE	ONSET	PEAK	DURATION
PO	0.5–3 hr	unknown	unknown
Rect	2–5 min	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Abdominal pain, nausea, or vomiting, especially when associated with fever or other signs of an acute abdomen; Severe renal or cardiovascular disease; Intestinal obstruction; **OB:** Not recommended for use at term; *Visicol* and *OsmoPrep*—HF, ascites, unstable angina, acute colitis, toxic megacolon, or hypomotility syndrome; **Pedi:** Children <2 yr.

Use Cautiously in: Excessive or chronic use (may lead to dependence); Renal or cardiovascular disease, dehydration or concurrent use of diuretics or other drugs known to alter electrolytes (correct abnormalities prior to administration); Dehydration, renal dysfunction, bowel obstruction, active colitis, or concurrent use of diuretics, ACE inhibitors, ARBs, or NSAIDs (↑ risk of acute phosphate nephropathy); **OB:** May cause sodium retention and edema; **Geri:** May be more sensitive to effects; *Visicol*—use cautiously within 3 mo of MI or cardiac surgery or in patients with acute exacerbations of inflammatory bowel disease.

Adverse Reactions/Side Effects

CNS: *Visicol*—dizziness, headache. **CV:** **ARRHYTHMIAS.** **GI:** cramping, nausea, colonic aphthous ulcerations, ischemic colitis; *Visicol* and *OsmoPrep*, abdominal bloating, abdominal pain, vomiting. **F and E:** hyperphosphatemia, hypocalcemia, hypokalemia, sodium retention. **GU:** renal dysfunction.

Interactions

Drug-Drug: *Visicol* and *OsmoPrep*—Concurrently administered oral medications may not be absorbed due to rapid peristalsis and diarrhea.

Route/Dosage

Each Fleet Enema contains 4.4 g sodium/118 mL.

PO (Adults): *Visicol*—evening before colonoscopy: 3 tablets every 15 min (with at least 8 oz of water), last dose will be 2 tablets (total of 20 tablets); on morning of colonoscopy starting 3–5 hr before procedure, 3 tablets every 15 min (with at least 8 oz of clear liquids), last dose will be 2 tablets (total of 20 tablets); should not be repeated in less than 7 days; *OsmoPrep*—evening before colonoscopy: 4 tablets every 15 min (with at least 8 oz of water) for a total of 20 tablets; on morning of colonoscopy starting 3–5 hr before procedure, 4 tablets every 15 min (with at least 8

oz of clear liquids), for a total of 12 tablets; should not be repeated in less than 7 days.

Rect (Adults and Children >12 yr): 118 mL Fleet Enema.

Rect (Children >2 yr): ½ of the adult dose.

Availability (generic available)

Enema: 7 g sodium phosphate and 19 g sodium biphosphate/118 mL. **Tablets (Visicol):** 1.5 g. **Tablets (OsmoPrep):** 1.5 g.

NURSING IMPLICATIONS

Assessment

- Assess patient for fever, abdominal distention, presence of bowel sounds, and usual pattern of bowel function.
- Assess color, consistency, and amount of stool produced.
- May rarely cause arrhythmias. Monitor patients with underlying cardiovascular disease, renal disease, bowel perforation, misuse or overdose.
- **Lab Test Considerations:** May cause ↑ serum sodium and phosphorus levels, ↓ serum calcium and potassium levels, and acidosis. Electrolyte changes are transient, self-limiting, do not require treatment and are not usually associated with adverse clinical events.

Potential Nursing Diagnoses

Constipation (Indications)

Implementation

- Do not administer at bedtime or late in the day.
- **PO:** Administer on an empty stomach for more rapid results. Mix dose in at least ½ glass cold water. May be followed by carbonated beverage or fruit juice to improve flavor.
- See Route and Dose section for dosing of *Visicol* and *OsmoPrep*. Undigested *Visicol* tablets may appear in the stool or be visualized during colonoscopy.
- *Osmoprep*: Do not drink any red—or purple-colored liquids.
- **Rect:** Position patient on left side with knee slightly flexed. Insert prelubricated tip about 2 inches into rectum, aiming toward the umbilicus. Gently squeeze bottle until empty. Discontinue if resistance is met, because perforation may occur if contents are forced into rectum.

Patient/Family Teaching

- Advise patient that laxatives should be used only for short-term therapy. Long-term therapy may cause electrolyte imbalance and dependence.
- Caution patient on sodium restriction that this product has a high sodium content.
- Advise patient not to take oral form of this medication within 2 hr of other medications.
- Encourage patient to use other forms of bowel regulation, such as increasing bulk in the diet, fluid in-

take, and mobility. Normal bowel habits may vary from 3 times/day to 3 times/wk.

- Advise patient to notify health care professional if unrelieved constipation, rectal bleeding, or symptoms of electrolyte imbalance (muscle cramps or pain, weakness, dizziness, and so forth) occur.

Evaluation/Desired Outcomes

- Soft, formed bowel movement.
- Evacuation of the bowel.

phytonadione (fye-toe-na-dye-one)

Mephyton, vitamin K

Classification

Therapeutic: antidotes, vitamins

Pharmacologic: fat-soluble vitamins

Pregnancy Category C

Indications

Prevention and treatment of hypoprothrombinemia, which may be associated with: Excessive doses of oral anticoagulants, Salicylates, Certain anti-infective agents, Nutritional deficiencies, Prolonged total parenteral nutrition. Prevention of hemorrhagic disease of the newborn.

Action

Required for hepatic synthesis of blood coagulation factors II (prothrombin), VII, IX, and X. **Therapeutic Effects:** Prevention of bleeding due to hypoprothrombinemia.

Pharmacokinetics

Absorption: Well absorbed following oral or subcut administration. Oral absorption requires presence of bile salts. Some vitamin K is produced by bacteria in the GI tract.

Distribution: Crosses the placenta; does not enter breast milk.

Metabolism and Excretion: Rapidly metabolized by the liver.

Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK†	DURATION‡
PO	6–12 hr	unknown	unknown
Subcut	1–2 hr	3–6 hr	12–14 hr
IV	1–2 hr	3–6 hr	12 hr

†Control of hemorrhage

‡Normal PT achieved

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity or intolerance to benzyl alcohol (injection only).

Use Cautiously in: Impaired liver function.

Exercise Extreme Caution in: Severe life-threatening reactions have occurred following IV administration, use other routes unless risk is justified.

Adverse Reactions/Side Effects

GI: gastric upset, unusual taste. **Derm:** flushing, rash, urticaria. **Hemat:** hemolytic anemia. **Local:** erythema, pain at injection site, swelling. **Misc:** allergic reactions, hyperbilirubinemia (large doses in very premature infants), kernicterus.

Interactions

Drug-Drug: Large doses will counteract the effect of warfarin. Large doses of salicylates or broad-spectrum anti-infectives may ↑ vitamin K requirements. **Bile acid sequestrants, mineral oil, and sucralfate** may ↓ vitamin K absorption from the GI tract.

Route/Dosage

IV use of phytonadione should be reserved for patients with serious or life-threatening bleeding and elevated INR. Oral route is preferred in patients with elevated INRs and no serious or life-threatening bleeding. IM route should generally be avoided because of risk of hematoma formation.

Treatment of Hypoprothrombinemia due to Vitamin K Deficiency (from factors other than warfarin)

Subcut, IV (Adults): 10 mg.

PO (Adults): 2.5–25 mg/day.

Subcut, IV (Children >1 mo): 1–2 mg single dose.

PO (Children >1 mo): 2.5–5 mg/day.

Vitamin K Deficiency (Supratherapeutic INR) Secondary to Warfarin

PO (Adults): *INR* ≥5 and <9 (no significant bleeding)—Hold warfarin and give 1–2.5 mg vitamin K; if more rapid reversal required, given ≤5 mg vitamin K; *INR* >9 (no significant bleeding)—Hold warfarin and give 2.5–5 mg vitamin K.

IV (Adults): Elevated INR with serious or life-threatening bleeding—10 mg slow infusion.

Prevention of Hypoprothrombinemia during Total Parenteral Nutrition

IV (Adults): 5–10 mg once weekly.

IV (Children): 2–5 mg once weekly.

Prevention of Hemorrhagic Disease of Newborn

IM (Neonates): 0.5–1 mg, within 1 hr of birth, may repeat in 6–8 hr if needed. May be repeated in 2–3 wk if mother received previous anticonvulsant/anticoagulant/anti-infective/antitubercular therapy. 1–5 mg may be given IM to mother 12–24 hr before delivery.

☼ = Canadian drug name. ⚡ = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Treatment of Hemorrhagic Disease of Newborn

IM, Subcut (Neonates): 1–2 mg/day.

Availability (generic available)

Tablets: 5 mg. **Injection:** 1 mg/0.5 mL, 10 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor for frank and occult bleeding (guaiac stools, Hematest urine, and emesis). Monitor pulse and BP frequently; notify health care professional immediately if symptoms of internal bleeding or hypovolemic shock develop. Inform all personnel of patient's bleeding tendency to prevent further trauma. Apply pressure to all venipuncture sites for at least 5 min; avoid unnecessary IM injections.
- **Pedi:** Monitor for side effects and adverse reactions. Children may be especially sensitive to the effects and side effects of vitamin K. Neonates, especially premature neonates, may be more sensitive than older children.
- **Lab Test Considerations:** Monitor prothrombin time (PT) prior to and throughout vitamin K therapy to determine response to and need for further therapy.

Potential Nursing Diagnoses

Imbalanced nutrition: less than body requirements (Indications)

Ineffective tissue perfusion (Indications)

Implementation

- **Do not confuse Mephyton (phytonadione) with methadone.**
- The parenteral route is preferred for phytonadione therapy but, because of severe, potentially fatal hypersensitivity reactions, IV vitamin K is not recommended.
- Administration of whole blood or plasma may also be required in severe bleeding because of the delayed onset of this medication.
- Phytonadione is an antidote for warfarin overdose but does not counteract the anticoagulant activity of heparin.

IV Administration

- **pH:** 3.5–7.0.
- **Intermittent Infusion:** **Diluent:** Dilute in 0.9% NaCl, D5W, or D5/0.9% NaCl. **Rate:** Administer over 30–60 min. Rate should not exceed 1 mg/min.
- **Y-Site Compatibility:** alfentanil, amikacin, aminophylline, ascorbic acid, atracurium, atropine, azathioprine, aztreonam, benztrapine, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cefazolin, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorproma-

zine, clindamycin, cyanocobalamin, cyclosporine, dexamethasone sodium phosphate, digoxin, diphenhydramine, dopamine, doxycycline, enalaprilat, ephedrine, epinephrine, epoetin alfa, erythromycin, esmolol, famotidine, fentanyl, fluconazole, folic acid, furosemide, ganciclovir, gentamicin, glycopyrronate, heparin, hydrocortisone sodium succinate, imipenem/cilastatin, indomethacin, insulin, isoproterenol, ketorolac, labetalol, lidocaine, mannitol, meperidine, metaraminol, methoxamine, methylglucate, metoclopramide, metoprolol, metronidazole, midazolam, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxacillin, oxytocin, papaverine, penicillin G, pentamidine, pentazocine, pentobarbital, phenobarbital, phenolamine, phenylephrine, potassium chloride, procainamide, prochlorperazine, propranolol, pyridoxime, ranitidine, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, theophylline, thiamine, ticarcillin/clavulanate, tobramycin, tolazoline, trimetaphan, vancomycin, vasopressin, verapamil, vitamin B complex with C.

- **Y-Site Incompatibility:** dantrolene, diazepam, diazoxide, magnesium sulfate, phenytoin, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Instruct patient to take phytonadione as directed. Take missed doses as soon as remembered unless almost time for next dose. Notify health care professional of missed doses.
- Cooking does not destroy substantial amounts of vitamin K. Patient should not drastically alter diet while taking vitamin K. See Appendix M for foods high in vitamin K.
- Caution patient to avoid IM injections and activities leading to injury. Use a soft toothbrush, do not floss, and shave with an electric razor until coagulation defect is corrected.
- Advise patient to report any symptoms of unusual bleeding or bruising (bleeding gums; nosebleed; black, tarry stools; hematuria; excessive menstrual flow).
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications and alcohol.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Advise patient to carry identification at all times describing disease process.
- Emphasize the importance of frequent lab tests to monitor coagulation factors.

Evaluation/Desired Outcomes

- Prevention of spontaneous bleeding or cessation of bleeding in patients with hypoprothrombinemia

secondary to impaired intestinal absorption or oral anticoagulant, salicylate, or anti-infective therapy.

- Prevention of hemorrhagic disease in the newborn.

pilocarpine (oral)† (pye-loe-kar-peen)

Salagen

Classification

Therapeutic: none assigned
Pharmacologic: cholinergics

Pregnancy Category C

†For ophthalmic use of pilocarpine, see Appendix C

Indications

Management of xerostomia, which may occur as a consequence of radiation therapy for cancer of the head and neck. Treatment of dry mouth in patients with Sjögren's syndrome.

Action

Stimulates cholinergic receptors, resulting in primarily muscarinic action, including stimulation of exocrine glands. Other effects include: Increased sweating, gastric secretions, Increased bronchial secretions, Increased tone and motility of the urinary tract, gallbladder, and biliary duct smooth muscle. **Therapeutic Effects:** Increased salivary gland secretion.

Pharmacokinetics

Absorption: Well absorbed after oral administration.

Distribution: Unknown.

Metabolism and Excretion: Inactivated at neuronal synapses and in plasma. Some unchanged pilocarpine and metabolites are excreted in urine.

Half-life: After 5-mg dose for 2 days—0.8 hr; after 10-mg dose for 2 days—1.3 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	20 min	1 hr	3–5 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Uncontrolled asthma; Angle-closure glaucoma; Iritis.

Use Cautiously in: History of pulmonary disease (asthma, bronchitis, or chronic obstructive pulmonary disease); Biliary tract disease or cholelithiasis; Cardiovascular disease; Retinal disease; Nephrolithiasis; History of psychiatric or cognitive disorders; **OB, Lactation, PEDI:** Safety not established.

Adverse Reactions/Side Effects

CNS: dizziness, headache, weakness. **EENT:** amblyopia, epistaxis, rhinitis. **CV:** edema, hypertension, tachycardia. **GI:** nausea, vomiting, dyspepsia, dysphagia. **GU:** urinary frequency. **Derm:** flushing, sweating. **Neuro:** tremors. **Misc:** chills, voice change.

Interactions

Drug-Drug: Concurrent use of **anticholinergics** will ↓ the effectiveness of pilocarpine. Concurrent use of **bethanechol** or **ophthalmic cholinergics** may result in ↑ cholinergic effects. Concurrent use with **beta blockers** may ↑ the risk of adverse cardiovascular reactions (conduction disturbances).

Route/Dosage

Head and Neck Cancer Patients

PO (Adults): 5 mg three times daily initially, then titrated to need/response, usual range 15–30 mg/day (no single should exceed 10 mg).

Patients with Sjögren's Syndrome

PO (Adults): 5 mg four times daily.

Availability

Tablets: 5 mg, 7.5 mg.

NURSING IMPLICATIONS

Assessment

- Assess oral mucosa for dryness and ulceration periodically during therapy.

Potential Nursing Diagnoses

Impaired oral mucous membrane (Indications)

Implementation

- **Do not confuse Salagen (pilocarpine) with selegiline.**
- **PO:** Use lowest dose that is tolerated and effective for maintenance.

Patient/Family Teaching

- Instruct patient to take medication as directed.
- Caution patient that pilocarpine may cause visual changes, especially at night; avoid driving or other activities requiring alertness until effects of medication are known.
- Advise patient to drink adequate daily fluids (1500–2000 mL/day), especially if sweating occurs. Less than adequate fluid intake may lead to dehydration.

Evaluation/Desired Outcomes

- Increased salivary gland secretion in patients with xerostomia.
- Decrease in dry mouth in patients with Sjögren's syndrome. Full effects in cancer patients may not be

✳ = Canadian drug name. ⚡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

seen for up to 12 wk or 6 wk in patients with Sjögren's syndrome.

pimecrolimus (pi-me-cro-li-mus) Elidel

Classification

Therapeutic: immunosuppressants (topical)

Indications

Short-term and intermittent long-term management of mild to moderate atopic dermatitis unresponsive to or in patients intolerant of conventional treatment.

Action

Inhibits T-cell and mast cell activation by interfering with production of inflammatory cytokines. **Therapeutic Effects:** Decreased severity of atopic dermatitis.

Pharmacokinetics

Absorption: Minimally absorbed through intact skin.

Distribution: Local distribution after topical administration.

Metabolism and Excretion: Systemic metabolism and excretion is negligible with local application.

Half-life: Not applicable.

TIME/ACTION PROFILE (improvement in symptoms)

ROUTE	ONSET	PEAK	DURATION
topical	within 6 days	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Should not be applied to areas of active cutaneous viral infections (↑ risk of dissemination); Concurrent use of occlusive dressings; Netherton's syndrome (↑ absorption of pimecrolimus); **Lactation:** Discontinue breast feeding.

Use Cautiously in: Possible risk of cancer. Do not use as first-line therapy; Clinical infection at treatment site (infection should be treated/cleared prior to use); Skin papillomas (warts); allow treatment/resolution prior to use; Natural/artificial sunlight (minimize exposure); **OB:** Use only if clearly needed; **Pedi:** Children <2 yr (safety not established); use only if other treatments have failed.

Adverse Reactions/Side Effects

Local: burning. **Misc:** ↑ risk of lymphoma/skin cancer.

Interactions

Drug-Drug: None significant as systemic absorption is negligible.

Route/Dosage

Topical (Adults and Children ≥2 yr): Apply thin film twice daily; rub in gently and completely.

Availability

Cream: 1%.

NURSING IMPLICATIONS

Assessment

- Assess skin lesions prior to and periodically during therapy. Discontinue therapy after signs and symptoms of atopic dermatitis have resolved. Resume treatment at the first signs and symptoms of recurrence.

Potential Nursing Diagnoses

Impaired skin integrity (Indications)

Implementation

- Topical:** Apply a thin layer to affected area twice daily and rub in gently and completely. May be used on all skin areas including head, neck, and intertriginous areas. Do not use with occlusive dressings.

Patient/Family Teaching

- Instruct patient on correct technique for application. Apply only as directed to external areas. Wash hands following application, unless hands are areas of application. Advise patient to read *Medication Guide* before starting and with each Rx refill in case of changes.
- Caution patient to avoid exposure to natural or artificial sunlight, including tanning beds, while using cream.
- Advise patient that pimecrolimus may cause skin burning. This occurs most commonly during first few days of application, is of mild to moderate severity, and improves within 5 days or as atopic dermatitis resolves.
- Advise patient to notify health care provider if no improvement is seen following 6 wk of treatment or at any time if condition worsens.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of atopic dermatitis.

pioglitazone (pi-o-glitz-a-zone) Actos

Classification

Therapeutic: antidiabetics (oral)

Pharmacologic: thiazolidinediones

Pregnancy Category C

Indications

Type 2 diabetes mellitus (with diet and exercise); may be used with metformin, sulfonylureas, or insulin.

Action

Improves sensitivity to insulin by acting as an agonist at receptor sites involved in insulin responsiveness and subsequent glucose production and utilization. Requires insulin for activity. **Therapeutic Effects:** Decreased insulin resistance, resulting in glycemic control without hypoglycemia.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Unknown.

Protein Binding: >99% bound to plasma proteins. Active metabolites are also highly (>99%) bound.

Metabolism and Excretion: Extensively metabolized by the liver (primarily by CYP2C8); at least two metabolites have pharmacologic activity. Minimal renal excretion of unchanged drug.

Half-life: *Pioglitazone*—3–7 hr; *total pioglitazone (pioglitazone plus metabolites)*—16–24 hr.

TIME/ACTION PROFILE (effects on blood glucose)

ROUTE	ONSET	PEAK	DURATION
PO	30 min	2–4 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Type 1 diabetes; Diabetic ketoacidosis; Clinical evidence of active liver disease or ↑ ALT (>2.5 times upper limit of normal); Active bladder cancer; **OB, Lactation:** Insulin should be used to control blood glucose levels; **Pedi:** Children.

Use Cautiously in: Edema; HF (avoid use in moderate to severe HF); Hepatic impairment; History of bladder cancer; Women (may ↑ distal upper and lower limb fractures); Women with childbearing potential (may restore ovulation and ↑ risk of pregnancy).

Adverse Reactions/Side Effects

CV: CHF, edema. **EENT:** macular edema. **GI:** **LIVER FAILURE**, ↑ liver enzymes. **GU:** **BLADDER CANCER** (especially after >1 yr). **Hemat:** anemia. **MS:** **RHABDOMYOLYSIS**. **Misc:** fractures (arm, hand, foot) in female patients.

Interactions

Drug-Drug: May ↓ efficacy of **hormonal contraceptives**. Strong **CYP2C8 inhibitors**, including **gemfibrozil** may ↑ levels. **Ketoconazole** may ↑ effects of pioglitazone. Concurrent use with **insulin** may ↑ risk of fluid retention and worsening HF.

Drug-Natural Products: **Glucosamine** may worsen blood glucose control. **Chromium**, and **coenzyme Q-10** may produce ↑ hypoglycemic effects.

Route/Dosage

PO (Adults): *No heart failure*—15–30 mg once daily, may be ↑ in increments of 15 mg/day to 45 mg/day if needed; *NYHA class I-II heart failure*—15 mg once daily; may be ↑ in increments of 15 mg/day to 45 mg/day if needed; *Concurrent use of gemfibrozil*—do not exceed 15 mg once daily.

Availability (generic available)

Tablets: 15 mg, 30 mg, 45 mg. **Cost:** *Generic*—15 mg \$25.49/90, 30 mg \$22.75/90, 45 mg \$38.12/90.

In combination with: metformin (Actoplus Met, Actoplus Met XR), glimepiride (Duetact), alogliptin (Oseni); see Appendix B.

NURSING IMPLICATIONS

Assessment

- Observe patient taking concurrent insulin for signs and symptoms of hypoglycemic reactions (sweating, hunger, weakness, dizziness, tremor, tachycardia, anxiety).
- **Assess for signs and symptoms of heart failure** (edema, dyspnea, rapid weight gain, unusual tiredness) after initiation and with dose increases.
- **Lab Test Considerations:** Monitor serum glucose and Hb A_{1c} periodically during therapy to evaluate effectiveness.
- Monitor CBC with differential periodically during therapy. May cause ↓ in hemoglobin and hematocrit, usually during the first 4–12 wk of therapy; then levels stabilize.
- Monitor serum AST, ALT, alkaline phosphatase, and total bilirubin levels before starting therapy and periodically thereafter or if jaundice or symptoms of hepatic dysfunction occur. Pioglitazone should not be started in patients with active liver disease or ALT levels >2.5 times the upper limit of normal. Patients with mild ALT ↑ should have more frequent monitoring. If ALT ↑ to >3 times the upper limit of normal, recheck ALT promptly. Discontinue pioglitazone if ALT remains >3 times normal.
- May cause transient ↑ in CPK levels.

Potential Nursing Diagnoses

Imbalanced nutrition: more than body requirements (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- **Do not confuse Actos (pioglitazone) with Actonel (risedronate).**
- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- **PO:** May be administered with or without meals.

★ = Canadian drug name. † = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Patient/Family Teaching

- Instruct patient to take medication as directed. If dose for 1 day is missed, do not double dose the next day.
- Explain to patient that this medication controls hypoglycemia but does not cure diabetes. Therapy is long-term.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water and notify health care professional.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hypoglycemic or hyperglycemic episodes.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness, and health care professional should be notified if significant changes occur.
- Advise patient to notify health care professional immediately if signs of hepatic dysfunction (nausea, vomiting, upper right abdominal pain, fatigue, anorexia, dark urine, jaundice), bladder cancer (hematuria, dysuria, urinary urgency), or HF (edema, shortness of breath, rapid weight gain, tiredness) occur.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- Insulin is the preferred method of controlling blood glucose during pregnancy. Counsel female patients that higher doses of oral contraceptives or a form of contraception other than oral contraceptives may be required and to notify health care professional promptly if pregnancy is planned or suspected.
- Advise patient to carry a form of sugar (sugar packets, candy) and identification describing disease process and medication regimen at all times.
- Emphasize the importance of routine follow-up exams.

Evaluation/Desired Outcomes

- Control of blood glucose levels.

piperacillin/tazobactam (pi-per-a-sill-in/tay-zoe-bak-tam)

★ Tazocin, Zosyn

Classification

Therapeutic: anti-infectives

Pharmacologic: extended spectrum penicillins

Pregnancy Category B

Indications

Appendicitis and peritonitis. Skin and skin structure infections. Gynecologic infections. Community-ac-

quired and nosocomial pneumonia caused by piperacillin-resistant, beta-lactamase–producing bacteria.

Action

Piperacillin: Binds to bacterial cell wall membrane, causing cell death. Spectrum is extended compared with other penicillins. **Tazobactam:** Inhibits beta-lactamase, an enzyme that can destroy penicillins. **Therapeutic Effects:** Death of susceptible bacteria.

Spectrum: Active against piperacillin-resistant, beta-lactamase–producing: *Bacteroides fragilis*, *E. coli*, *Acinetobacter baumannii*, *Klebsiella pneumoniae*, *Pseudomonas aeruginosa*, *Staphylococcus aureus*, *Haemophilus influenzae*.

Pharmacokinetics

Absorption: Piperacillin is well absorbed (80%) from IM sites.

Distribution: Widely distributed. Enter CSF well only when meninges are inflamed. Crosses the placenta and enters breast milk in low concentrations.

Metabolism and Excretion: Piperacillin (68%) and tazobactam (80%) are mostly excreted unchanged by the kidneys.

Half-life: Adults: 0.7–1.2 hr; Children 6 mo–12 yr: 0.7–0.9 hr; Infants 2–5 mo: 1.4 hr.

TIME/ACTION PROFILE (piperacillin blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	4–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to penicillins, beta-lactams, cephalosporins, or tazobactam (cross-sensitivity may occur).

Use Cautiously in: Renal impairment (dosage reduction or increased interval recommended if CCr <40 mL/min); Sodium restriction; **OB, Lactation:** Safety not established.

Adverse Reactions/Side Effects

CNS: **SEIZURES** (higher doses), confusion, dizziness, headache, insomnia, lethargy. **GI:** **PSEUDOMEMBRANOUS COLITIS**, diarrhea, constipation, drug-induced hepatitis, nausea, vomiting. **GU:** interstitial nephritis.

Derm: **STEVENS-JOHNSON SYNDROME**, **TOXIC EPIDERMAL NECROLYSIS**, rashes (↑ in cystic fibrosis patients), urticaria. **Hemat:** bleeding, leukopenia, neutropenia, thrombocytopenia. **Local:** pain, phlebitis at IV site.

Misc: hypersensitivity reactions, including **ANAPHYLAXIS** and **SERUM SICKNESS**, fever (↑ in cystic fibrosis patients), superinfection.

Interactions

Drug-Drug: **Probenecid** ↓ renal excretion and ↑ blood levels. May alter excretion of **lithium**. **Potassium-losing diuretics**, **corticosteroids**, or **am-**

photericin B may ↑ risk of hypokalemia. ↑ risk of hepatotoxicity with other **hepatotoxic agents**. May ↓ levels/effects of **aminoglycosides** in patients with renal impairment. May ↑ levels and risk of toxicity from **methotrexate**.

Route/Dosage

Contains 2.79 mEq (64 mg) sodium/g of piperacillin; adult doses below expressed as combined piperacillin/tazobactam content.

IV (Adults): *Most infections*—3.375 g q 6 hr. *Nosocomial pneumonia*—4.5 g q 6 hr.

IV (Adults): *Nosocomial pneumonia*—4.5 g q 6 hr.

IV (Adults and Children >40 kg): *Appendicitis and/or peritonitis*—3.375 g q 6 hr.

IV (Children ≥9 mo and ≤40 kg): *Appendicitis and/or peritonitis*—300 mg piperacillin component/kg/day divided q 8 hr.

IV (Infants 2–9 mo): *Appendicitis and/or peritonitis*—240 mg piperacillin component/kg/day divided q 8 hr.

IV (Infants and Children ≥6 mo): 240–400 mg/piperacillin component/kg/day divided q 6–8 hr (higher end of dosing range for serious pseudomonal infections); Max dose: 16 g piperacillin/day.

IV (Infants <6 mo): 150–300 mg/piperacillin component/kg/day divided q 6–8 hr.

Renal Impairment

IV (Adults): *CCr 20–40 mL/min*—2.25 g q 6 hr (3.375 g q 6 hr for nosocomial pneumonia); *CCr <20 mL/min*—2.25 g q 8 hr (2.25 g q 6 hr for nosocomial pneumonia); *Hemodialysis*—2.25 g q 12 h (2.25 g q 8 hr for nosocomial pneumonia).

Availability (generic available)

Powder for injection: 2-g piperacillin/0.25-g tazobactam vials and 50-mL premixed frozen containers, 3-g piperacillin/0.375-g tazobactam vials and 50-mL premixed frozen containers, 4-g piperacillin/0.5-g tazobactam vials and 50-mL premixed frozen containers, 36-g piperacillin/4.5-g tazobactam bulk vials.

NURSING IMPLICATIONS

Assessment

- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy.
- Obtain a history before initiating therapy to determine previous use of and reactions to penicillins or cephalosporins. Persons with a negative history of penicillin sensitivity may still have an allergic response.

- Obtain specimens for culture and sensitivity prior to initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify health care professional immediately if these occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of pseudomembranous colitis. May begin up to several weeks following cessation of therapy.
- Assess for skin reactions (rash, fever, edema, mucosal erosions or ulcerations, red or inflamed eyes). Monitor patient with mild to moderate rash for progression. If rash becomes severe or systemic symptoms occur, discontinue piperacillin/tazobactam.
- Lab Test Considerations:** Evaluate renal and hepatic function, CBC, serum potassium, and bleeding times prior to and routinely during therapy.
- May cause positive direct Coombs' test result.
- May cause ↑ BUN, creatinine, AST, ALT, serum bilirubin, alkaline phosphatase, and LDH.
- May cause leukopenia and neutropenia, especially with prolonged therapy or hepatic impairment.
- May cause prolonged prothrombin and partial thromboplastin time.
- May cause ↓ hemoglobin and hematocrit and thrombocytopenia, eosinophilia, leukopenia, and neutropenia. It also may cause proteinuria; hematuria; pyuria; hyperglycemia; ↓ total protein or albumin; and abnormalities in sodium, potassium, and calcium levels.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

IV Administration

- pH:** 4.5–6.8.
- Intermittent Infusion:** Reconstitute each 1 g of piperacillin with at least 5 mL of 0.9% NaCl, sterile water for injection, or D5W. **Diluent:** Dilute further in 50–100 mL of 0.9% NaCl, D5W, D5/0.9% NaCl, or LR. Reconstituted vials stable for 24 hr at room temperature or 48 hr if refrigerated. Infusion stable for 24 hr at room temperature or 7 days if refrigerated. **Rate:** Infuse over 30 min.
- Y-Site Compatibility:** alfentanil, allopurinol, amifostine, aminocaproic acid, aminophylline, amphi-

☼ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

tericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium acetate, calcium chloride, calcium gluconate, carboplatin, carmustine, cefepime, chloramphenicol, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dextrazoxane, diazepam, digoxin, diphenhydramine, docetaxel, dopamine, doxacurium, enalaprilat, ephedrine, epinephrine, eptifibatide, erythromycin, esmolol, etoposide, etoposide phosphate, fenoldopam, fentanyl, flouxuridine, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, isoproterenol, ketamine, ketorolac, leucovorin calcium, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, mesna, metaraminol, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, milrinone, morphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxytocin, paclitaxel, palonosetron, pancuronium, pantoprazole, pemetrexed, pentobarbital, phenobarbital, phentolamine, phenylephrine, potassium acetate, potassium chloride, potassium phosphates, procainamide, ranitidine, remifentanyl, rituximab, sargramostim, sodium acetate, sodium bicarbonate, sodium phosphates, succinylcholine, sufentanil, tacrolimus, telavancin, teniposide, theophylline, thiotepa, tigecycline, tirofiban, trimethoprim/sulfamethoxazole, vasopressin, vinblastine, vincristine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** acyclovir, alemtuzumab, amiodarone, amphotericin B cholesteryl, amphotericin B colloidal, azithromycin, caspofungin, chlorpromazine, ciprofloxacin, cisplatin, dacarbazine, dantrolene, daunorubicin, diltiazem, dobutamine, doxorubicin, doxorubicin liposome, doxycycline, droperidol, epirubicin, famotidine, ganciclovir, gemcitabine, glycopyrrolate, haloperidol, hydralazine, hydroxyzine, idarubicin, insulin, irinotecan, labetalol, levofloxacin, methyl dopate, midazolam, mitomycin, mitoxantrone, nalbuphine, nesiritide, nicardipine, pentamidine, pentazocine, phenytoin, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, rocuronium, streptozocin, thiopental, tobramycin, tranexamic acid, trastuzumab, vecuronium, verapamil, vinorelbine.

Patient/Family Teaching

- Advise patient to report rash and signs of superinfection (black furry overgrowth on tongue, vaginal itching or discharge, loose or foul-smelling stools) and allergy.

- **Caution patient to notify health care professional if fever and diarrhea occur, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional. May occur up to several weeks after discontinuation of medication.**

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

pitavastatin, See HMG-CoA REDUCTASE INHIBITORS (statins).

polyethylene glycol

(po-lee-eth-e-leen glye-kole)

★ ClearLax, GlycoLax, ★ Lax-a-Day, MiraLax, ★ PegaLax, ★ PolyLax, ★ Relaxa, ★ Restoralax

Classification

Therapeutic: laxatives

Pharmacologic: osmotics

Pregnancy Category C

Indications

Treatment of occasional constipation.

Action

Polyethylene glycol (PEG) in solution acts as an osmotic agent, drawing water into the lumen of the GI tract. **Therapeutic Effects:** Evacuation of the GI tract without water or electrolyte imbalance.

Pharmacokinetics

Absorption: Nonabsorbable.

Distribution: Unknown.

Metabolism and Excretion: Excreted in fecal contents.

Half-life: Unknown.

TIME/ACTION PROFILE (bowel movement)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–3 days	unknown

Contraindications/Precautions

Contraindicated in: GI obstruction; Gastric retention; Toxic colitis; Megacolon; Bowel perforation.

Use Cautiously in: Abdominal pain of uncertain cause, particularly if accompanied by fever; **OB, Pedi:** Safety not established.

Adverse Reactions/Side Effects

Derm: urticaria. **GI:** abdominal bloating, cramping, flatulence, nausea.

Interactions

Drug-Drug: None significant.

Route/Dosage

PO (Adults): 17 g (heaping tablespoon) in 8 oz of water; may be used for up to 2 wk.

PO (Children >6 mo): 0.5–1.5 g/kg daily, titrate to effect (maximum: 17 g/day).

Availability (generic available)

Powder: 14-oz, 24-oz, and 26-oz containers.

NURSING IMPLICATIONS

Assessment

- Assess patient for abdominal distention, presence of bowel sounds, and usual pattern of bowel function.
- Assess color, consistency, and amount of stool produced.

Potential Nursing Diagnoses

Constipation (Indications)

Diarrhea (Side Effects)

Implementation

- Do not confuse Miralax (polyethylene glycol) with Mirapex (pramipexole).**
- PO:** Dissolve powder in 8 oz of water prior to administration.

Patient/Family Teaching

- Inform patient that 2–4 days may be required to produce a bowel movement. PEG should not be used for more than 2 wk. Prolonged, frequent, or excessive use may result in electrolyte imbalance and laxative dependence.
- Advise patient to notify health care professional if unusual cramps, bloating, or diarrhea occurs.

Evaluation/Desired Outcomes

- A soft, formed bowel movement.

polyethylene glycol/ electrolyte

(po-lee-eth-e-leen glye-kole/e-lek-troe-lite)

Colyte, GoLYTELY,  Klean-Prep, MoviPrep, NuLyte, Suclear, TriLyte

Classification

Therapeutic: laxatives

Pharmacologic: osmotics

Pregnancy Category C

Indications

Bowel cleansing in preparation for GI examination.

Unlabeled Use: Treatment of acute iron overdose in children.

Action

Polyethylene glycol (PEG) in solution acts as an osmotic agent, drawing water into the lumen of the GI tract. **Therapeutic Effects:** Evacuation of the GI tract without water or electrolyte imbalance.

Pharmacokinetics

Absorption: Ions in the solution are nonabsorbable.

Distribution: Unknown.

Metabolism and Excretion: Solution is excreted in fecal contents.

Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	1 hr	unknown	4 hr

Contraindications/Precautions

Contraindicated in: GI obstruction; Bowel perforation; Gastric retention; Toxic colitis; Toxic megacolon.

Use Cautiously in: Patients with absent or diminished gag reflex; Unconscious or semicomatose states, in which administration is via NG tube; History of ulcerative colitis (↑ risk of hypoglycemia, dehydration, and hypokalemia); Barium enema using double-contrast technique (may not allow proper barium coating of mucosa); Seizure disorders; Abdominal pain of uncertain cause, particularly if accompanied by fever; **Geri:** May be more sensitive to effects; **Pedi:** Children (safety not established; children <2 yr more prone to hypoglycemia, dehydration, and hypokalemia).

Adverse Reactions/Side Effects

GI: abdominal fullness, diarrhea, bloating, cramps, ischemic colitis, nausea, vomiting **F and E:** fluid and electrolyte abnormalities. **Misc:** allergic reactions (rare).

Interactions

Drug-Drug: Interferes with the absorption of **orally administered medications** by decreasing transit time (do not administer within 1 hr of start of therapy).

Route/Dosage

PO (Adults): 240 mL q 10 min (up to 4 L) until fecal discharge appears clear and has no solid material; may be given through NG tube at 20–30 mL/min (up to 4 L); **Moviprep**—On evening before colonoscopy, give 240 mL q 15 min for 1 hr followed by 480 mL of clear liquid before going to bed; on morning of colonoscopy, give 240 mL q 15 min for 1 hr, followed by 480 mL of clear liquid at least 2 hr before test (alternative regimen is 240 mL q 15 min for 1 hr at least 3

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

hr before bedtime on evening before colonoscopy, then 1.5 hr later, give 240 mL q 15 min for 1 hr; may drink clear fluids up to 2 hr before test); **Suclear**—On evening before colonoscopy, dilute 6-oz oral solution by pouring entire contents into 16-oz mixing container and then filling container with cool water to fill line. Drink entire container within 20 min. Refill container with 480 mL of water and drink over next 2 hr. Refill container with 480 mL of water and finish drinking before going to bed. On morning of colonoscopy (≥ 3.5 hr before exam), dissolve powder of Dose 2 by adding water to fill line. Drink 480 mL every 20 min completing the dose ≥ 2 hr before test.

PO (Children ≥ 6 mo): 25 mL/kg/hr until fecal discharge is clear and has no solid material; may also be given through an NG tube (unlabeled).

Availability (generic available)

Powder for oral solution (regular, pineapple, citrus berry, lemon lime, orange, cherry flavor): CoLyte, NuLyte, TriLyte—powder in bottles for reconstitution, GoLYTLEY—powder in packets and bottles for reconstitution, MoviPrep—powder in pouches for reconstitution, Suclear—oral solution in bottle and powder for reconstitution in bottle.

NURSING IMPLICATIONS

Assessment

- Assess color, consistency, and amount of stool produced.
- Monitor semiconscious or unconscious patients closely for regurgitation when administering via NG tube.

Potential Nursing Diagnoses

Diarrhea (Side Effects)

Implementation

- Do not add extra flavorings or additional ingredients to solution prior to administration.
- Avoid solid food and milk within 1–2 hr of administration, but should be adequately hydrated prior to, during, and after administration.
- Patient should be allowed only clear liquids after administration.
- May be administered on the morning of the examination as long as time is allotted to drink solution (3 hr) and evacuate bowel (1 additional hr). For barium enema, administer solution early evening (6 PM) prior to exam to allow proper mucosal coating by barium.
- PO:** Solution may be reconstituted with tap water. Shake vigorously until powder is dissolved.
- Follow 2 dose regimen for **Suclear**[™].
- May be administered via NG tube at a rate of 20–30 mL/min.

Patient/Family Teaching

- Instruct patient to drink 240 mL every 10 min until 4 L have been consumed or fecal discharge is clear

and free of solid matter. Rapidly drinking each 240 mL is preferred over drinking small amounts continuously.

- Advise patient to avoid alcohol during prep.

Evaluation/Desired Outcomes

- Diarrhea, which cleanses the bowel within 4 hr. The first bowel movement usually occurs within 1 hr of administration.

posaconazole

(po-sa-kon-a-zole)

Noxafil,  Posanol

Classification

Therapeutic: antifungals

Pharmacologic: triazoles

Pregnancy Category C

Indications

Prevention of invasive aspergillus and candida infections in severely immunocompromised patients. Treatment of oropharyngeal candidiasis (including candidiasis unresponsive to itraconazole or fluconazole).

Action

Blocks ergosterol synthesis, a major component of fungal plasma membrane. **Therapeutic Effects:** Fungistatic/fungicidal action against susceptible fungi.

Pharmacokinetics

Absorption: Well absorbed following oral administration; absorption is optimized by food.

Distribution: Extensive extravascular distribution and penetration into body tissues.

Protein Binding: $>98\%$.

Metabolism and Excretion: Some metabolism via UDP glucuronidation; 66% eliminated unchanged in feces, 13% in urine (mostly as metabolites).

Half-life: 35 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	3–5 hr	8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to posaconazole or other azole antifungals; Concurrent use of pimozide, quinidine, ergot alkaloids, sirolimus, simvastatin, atorvastatin, or lovastatin.

Use Cautiously in: History of/predisposition to QTc prolongation including congenital QTc prolongation, concurrent medications that prolong QTc, high cumulative anthracycline history or electrolyte abnormalities (hypokalemia, hypomagnesemia); correct pre-existing abnormalities prior to administration; Severe diarrhea, vomiting, or renal impairment (monitor for breakthrough fungal infections); **OB, Lactation:**

Use only if maternal benefit outweighs risk to child;
Pedi: Children <13 yr (safety not established).

Adverse Reactions/Side Effects

CNS: headache. **CV:** **TORSADES DE POINTES**, QT interval prolongation. **GI:** **HEPATOCELLULAR DAMAGE**, diarrhea, nausea, vomiting. **Endo:** adrenal insufficiency.

Resp: cough. **Metab:** **ALLERGIC REACTIONS**. **Misc:** fever.

Interactions

Drug-Drug: Posaconazole inhibits the CYP3A4 enzyme systems and should be expected to interact with other drugs affected by this system. ↑ **cyclosporine**, **sirolimus**, and **tacrolimus** levels and risk of toxicity; use with sirolimus contraindicated; for cyclosporine and tacrolimus, ↓ dose initially and monitor levels frequently. May ↑ **quinidine** and **pimozide** levels and the risk for arrhythmias; concurrent use contraindicated. May ↑ levels and risk of toxicity from **ergot alkaloids**, including **ergotamine** and **dihydroergotamine**; concurrent use contraindicated. May ↑ levels of **simvastatin**, **atorvastatin**, or **lovastatin** and the risk for rhabdomyolysis; concurrent use contraindicated. **Rifabutin**, **phenytoin**, **cimetidine**, and **efavirenz** ↓ levels and may ↓ antifungal effectiveness; avoid concurrent use. **Fosamprenavir** ↓ levels and may ↓ antifungal effectiveness; monitor for breakthrough antifungal infections. **Esomeprazole** and **metoclopramide** may ↓ levels and may ↓ antifungal effectiveness. ↑ **rifabutin** levels; avoid concurrent use. May ↑ **digoxin** levels; monitor levels frequently. ↑ **phenytoin**, **midazolam**, **ritonavir**, and **atazanavir** levels; monitor for excess clinical effect. ↑ levels and risk of neurotoxicity of **vinca alkaloids**, including **vincristine** and **vinblastine**; consider dose adjustment. ↑ levels and risk of toxicity of **HMG CoA reductase inhibitors (statins)**; consider ↓ statin dose. May ↑ levels and risk of adverse cardiovascular reactions to **calcium channel blockers**; consider dosage reduction.

Route/Dosage

PO (Adults and Children ≥13 yr): *Prophylaxis of invasive fungal infections*—200 mg 3 times daily.

PO (Adults): *Oropharyngeal candidiasis*—100 mg 2 times daily for 1 day, then 100 mg daily for 13 days; *Refractory oropharyngeal candidiasis*—400 mg 2 times daily.

Availability

Oral suspension (cherry): 40 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess for signs and symptoms of fungal infection.
- **Lab Test Considerations:** Monitor liver function tests prior to and periodically during therapy. May cause ↑ **ALT**, ↑ **AST**, ↑ **alkaline phosphatase** and ↑ **total bilirubin** levels; generally reversible on discontinuation. Discontinue posaconazole if clinical signs and symptoms of liver disease develop.

Potential Nursing Diagnoses

Risk for infection (Indications)

Implementation

- **PO:** Shake suspension well before use. Administer with a full meal, liquid nutritional supplement or an acidic carbonated beverage (ginger ale) to enhance absorption. Rinse spoon for administration with water after each use. Alternative therapy or close monitoring for breakthrough fungal infections should be considered for patients unable to eat a full meal or tolerate a nutritional supplement.

P

Patient/Family Teaching

- Instruct patient to take posaconazole during or immediately (within 20 min) following a full meal or liquid nutritional supplement in order to enhance absorption. Take missed doses as soon as remembered. Instruct patient to read the *Patient Information* before taking posaconazole and with each Rx refill; may be new information.
- Advise patient to notify health care professional if severe diarrhea or vomiting occur; may decrease posaconazole blood levels and allow breakthrough fungal infections or if signs and symptoms of liver injury (itching, yellow eyes or skin, fatigue, flu-like symptoms) occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Resolution of clinical and laboratory indications of fungal infections. Duration of therapy is based on recovery from infection or neutropenia or immunosuppression.

☼ = Canadian drug name. ☼ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

potassium and sodium phosphates

(po-tas-e-um/soe-dee-um foss-fates)

K-Phos M.F., K-Phos Neutral, K-Phos No. 2, Neutra-Phos, Uro-KP Neutral

Classification

Therapeutic: antidiuretics, mineral and electrolyte replacements/supplements

Pregnancy Category C

Indications

Treatment and prevention of phosphate depletion in patients who are unable to ingest adequate dietary phosphate. Adjunct therapy of urinary tract infections with methenamine hippurate or mandelate. Prevention of calcium urinary stones. Phosphate salts of potassium may be used in hypokalemic patients with metabolic acidosis or coexisting phosphorus deficiency.

Action

Phosphate is present in bone and is involved in energy transfer and carbohydrate metabolism. Serves as a buffer for the excretion of hydrogen ions by the kidneys. Dibasic potassium phosphate is converted in renal tubule to monobasic salt, resulting in urinary acidification, which is required for methenamine hippurate or mandelate to be active as urinary anti-infectives. Acidification of urine increases solubility of calcium, decreasing calcium stone formation. **Therapeutic Effects:** Replacement of phosphorus in deficiency states. Urinary acidification. Increased efficacy of methenamine. Decreased formation of calcium urinary tract stones.

Pharmacokinetics

Absorption: Well absorbed following oral administration. Vitamin D promotes GI absorption of phosphates.

Distribution: Phosphates enter extracellular fluids and are then actively transported to sites of action.

Metabolism and Excretion: Excreted mainly (>90%) by the kidneys.

Half-life: Unknown.

TIME/ACTION PROFILE (effects on serum phosphate levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hyperkalemia (potassium salts); Hyperphosphatemia; Hypocalcemia; Severe renal impairment; Untreated Addison's disease (potassium salts).

Use Cautiously in: Hyperparathyroidism; Cardiac disease; Hyponatremia (sodium phosphate only); Hypertension (sodium phosphate only); Renal impairment.

Adverse Reactions/Side Effects

Related to hyperphosphatemia, unless otherwise indicated.

CNS: confusion, dizziness, headache, weakness. **CV:** **ARRHYTHMIAS**, **CARDIAC ARREST**, bradycardia, ECG changes (absent P waves, widening of the QRS complex with biphasic curve, peaked T waves), edema.

GI: diarrhea, abdominal pain, nausea, vomiting. **F and E:** hyperkalemia, hypernatremia, hyperphosphatemia, hypocalcemia, hypomagnesemia. **MS:** *hypocalcemia*, *hyperkalemia*—muscle cramps. **Neuro:** flaccid paralysis, heaviness of legs, paresthesias, tremors.

Interactions

Drug-Drug: Concurrent use of **potassium-sparing, diuretics, ACE inhibitors, or angiotensin II receptor blockers** with potassium phosphates may result in hyperkalemia. Concurrent use of **corticosteroids** with sodium phosphate may result in hypernatremia. Concurrent administration of **calcium-, magnesium-, or aluminum-containing compounds** ↓ absorption of phosphates by formation of insoluble complexes. **Vitamin D** enhances the absorption of phosphates.

Drug-Food: **Oxalates** (in spinach and rhubarb) and **phytates** (in bran and whole grains) may ↓ absorption of phosphates by binding them in the GI tract.

Route/Dosage

Phosphorous Supplementation

PO (Adults and Children >4 yr): 250–500 mg (8–16 mmol) phosphorus (1–2 packets) 4 times daily.

PO (Children <4 yr): 250 mg (8 mmol) phosphorus (1 packet) 4 times daily.

Urinary Acidification

PO (Adults): 2 tablets 4 times/day.

Maintenance Phosphorus

PO (Adults): 50–150 mmol/day in divided doses.

PO (Children): 2–3 mmol/kg/day in divided doses.

Availability

Potassium and Sodium Phosphates

Tablets (K-Phos MF): elemental phosphorus 125.6 mg (4 mmol), sodium 67 mg (2.9 mEq), and potassium 44.5 mg (1.1 mEq). **Tablets (K-Phos Neutral):** elemental phosphorus 250 mg (8 mmol), sodium 298 mg (13 mEq), and potassium 45 mg (1.1 mEq). **Tablets (K-Phos No.2):** elemental phosphorus 250 mg (8 mmol), sodium 134 mg (5.8 mEq), and potassium 88 mg (2.3 mEq). **Tablets (Uro-KP**

Neutral): elemental phosphorus 258 mg, sodium 262.4 mg (10.8 mEq), and potassium 49.4 mg (1.3 mEq). **Powder for oral solution (Neutra-Phos):** elemental phosphorus 250 mg (8 mmol), sodium 164 mg (7.1 mEq), and potassium 278 mg (7.1 mEq)/packet.

NURSING IMPLICATIONS

Assessment

- **Assess patient for signs and symptoms of hypokalemia** (weakness, fatigue, arrhythmias, presence of U waves on ECG, polyuria, polydipsia) and hypophosphatemia (anorexia, weakness, decreased reflexes, bone pain, confusion, blood dyscrasias) throughout therapy.
- Monitor intake and output ratios and daily weight. Report significant discrepancies.
- **Lab Test Considerations:** Monitor serum phosphate, potassium, sodium, and calcium levels prior to and periodically throughout therapy. Increased phosphate may cause hypocalcemia.
- Monitor renal function studies prior to and periodically throughout therapy.
- Monitor urinary pH in patients receiving potassium and sodium phosphate as a urinary acidifier.

Potential Nursing Diagnoses

Imbalanced nutrition: less than body requirements (Indications)

Implementation

- **PO:** Tablets should be dissolved in a full glass of water. Allow mixture to stand for 2–5 min to ensure it is fully dissolved. Solutions prepared by pharmacy should not be further diluted.
- Medication should be administered after meals to minimize gastric irritation and laxative effect.
- Do not administer simultaneously with antacids containing aluminum, magnesium, or calcium.

Patient/Family Teaching

- Explain to the patient the purpose of the medication and the need to take as directed. Take missed doses as soon as remembered unless within 1 or 2 hr of the next dose. Explain that the tablets should not be swallowed whole. Tablets should be dissolved in water.
- Instruct patients in low-sodium diet (see Appendix M).
- Advise patient of the importance of maintaining a high fluid intake (drinking at least one 8-oz glass of water each hr) to prevent kidney stones.
- Instruct the patient to promptly report diarrhea, weakness, fatigue, muscle cramps, unexplained weight gain, swelling of lower extremities, shortness of breath, unusual thirst, or tremors.

Evaluation/Desired Outcomes

- Prevention and correction of serum phosphate and potassium deficiencies.
- Maintenance of acid urine.
- Decreased urine calcium, which prevents formation of renal calculi.

potassium iodide, See IODINE, IODIDE.

HIGH ALERT

POTASSIUM SUPPLEMENTS (poe-tass-ee-um)

potassium acetate

potassium bicarbonate/potassium chloride

potassium bicarbonate/potassium citrate
Effer-K, K-Lyte DS

potassium chloride
Klor-Con, Klor-Con M10, Klor-Con M15, Klor-Con M20, K-Tab, Micro-K, Micro-K 10

potassium gluconate

Classification

Therapeutic: mineral and electrolyte replacements/supplements

Pregnancy Category C

Indications

PO, IV: Treatment/prevention of potassium depletion.
IV: Arrhythmias due to digoxin toxicity.

Action

Maintain acid-base balance, isotonicity, and electro-physiologic balance of the cell. Activator in many enzymatic reactions; essential to transmission of nerve impulses; contraction of cardiac, skeletal, and smooth muscle; gastric secretion; renal function; tissue synthesis; and carbohydrate metabolism. **Therapeutic Effects:** Replacement. Prevention of deficiency.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Enters extracellular fluid; then actively transported into cells.

Metabolism and Excretion: Excreted by the kidneys.

Half-life: Unknown.

✳ = Canadian drug name. ⚠ = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

TIME/ACTION PROFILE (↑ in serum potassium levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–2 hr	unknown
IV	rapid	end of infusion	unknown

Contraindications/Precautions

Contraindicated in: Hyperkalemia; Severe renal impairment; Untreated Addison's disease; Severe tissue trauma; Hyperkalemic familial periodic paralysis; Some products may contain tartrazine (FDC yellow dye #5) or alcohol; avoid using in patients with known hypersensitivity or intolerance; Potassium acetate injection contains aluminum, which may become toxic with prolonged use to high risk groups (renal impairment, premature neonates).

Use Cautiously in: Cardiac disease; Renal impairment; Diabetes mellitus (liquids may contain sugar); Hypomagnesemia (may make correction of hypokalemia more difficult); GI hypomotility including dysphagia or esophageal compression from left atrial enlargement (tablets, capsules); Patients receiving potassium-sparing drugs.

Adverse Reactions/Side Effects

CNS: confusion, restlessness, weakness. **CV:** **AR-RHYTHMIAS**, ECG changes. **GI:** abdominal pain, diarrhea, flatulence, nausea, vomiting; *tablets, capsules only*, GI ulceration, stenotic lesions. **Local:** irritation at IV site. **Neuro:** paralysis, paresthesia.

Interactions

Drug-Drug: Use with **potassium-sparing diuretics** or **ACE inhibitors** or **angiotensin II receptor antagonists** may lead to hyperkalemia. **Anticholinergics** may ↑ GI mucosal lesions in patients taking wax-matrix potassium chloride preparations.

Route/Dosage

Expressed as mEq of potassium. Potassium acetate contains 10.2 mEq/g; potassium bicarbonate contains 10 mEq potassium/g; potassium chloride contains 13.4 mEq potassium/g; potassium gluconate contains 4.3 mEq/g.

Normal Daily Requirements

PO, IV (Adults): 40–80 mEq/day.

PO, IV (Children): 2–3 mEq/kg/day.

PO, IV (Neonates): 2–6 mEq/kg/day.

Prevention of Hypokalemia during Diuretic Therapy

PO (Adults): 20–40 mEq/day in 1–2 divided doses; single dose should not exceed 20 mEq.

PO (Neonates, Infants, and Children): 1–2 mEq/kg/day in 1–2 divided doses.

Treatment of Hypokalemia

PO (Adults): 40–100 mEq/day in divided doses.

PO (Neonates, Infants, and Children): 2–5 mEq/kg/day in divided doses.

IV (Adults): *Serum potassium* >2.5 mEq/L—Up to 20 mEq/day as an infusion (not to exceed 10 mEq/hr) or a concentration of 40 mEq/L via peripheral line (up to 100 mEq/L have been used via central line [unlabeled]). *Serum potassium* <2 mEq/L with symptoms—Up to 40 mEq/day as an infusion (rate should generally not exceed 20 mEq/hr).

IV (Neonates, Infants, and Children): 0.5–1 mEq/kg/dose (maximum 30 mEq/dose) as an infusion to infuse at 0.3–0.5 mEq/kg/hr (maximum infusion rate 1 mEq/kg/hr).

Availability

Potassium Acetate (generic available)

Concentrate for injection (contains aluminum): 2 mEq/mL, 4 mEq/mL.

Potassium Bicarbonate/Potassium Chloride (generic available)

Tablets for effervescent oral solution: ♦ 12 mEq, 25 mEq.

Potassium Bicarbonate/Potassium Citrate (generic available)

Tablets for effervescent oral solution: 10 mEq, 20 mEq, 25 mEq, 50 mEq.

Potassium Chloride (generic available)

Extended-release tablets: 8 mEq, 10 mEq, 15 mEq, 20 mEq. **Cost:** *Generic*—8 mEq \$53.64/100, 10 mEq \$45.97/100, 20 mEq \$45.97/100. **Extended-release capsules:** 8 mEq, 10 mEq. **Cost:** *Generic*—8 mEq \$70.40/100, 10 mEq \$72.62/100. **Oral solution:** 20 mEq/15 mL, 40 mEq/15 mL. **Cost:** *Generic*—20 mEq/15 mL \$14.51/473 mL, 40 mEq/15 mL \$27.11/473 mL. **Powder/packets for oral solution:** 20-mEq/packet, 25-mEq/packet. **Cost:** 20 mEq \$58.21/30 pkts, 25 mEq \$69.20/30 pkts. **Concentrate for injection:** 0.1 mEq/mL in 10-mEq ampules and vials, 0.2 mEq/mL in 10- and 20-mEq ampules and vials, 0.3 mEq/mL in 30-mEq ampules and vials, 0.4 mEq/mL in 20- and 40-mEq ampules and vials, 1.5 mEq/mL, 2 mEq/mL, 3 mEq/mL. **Solution for IV infusion:** 10 mEq/L in various dextrose and saline solutions in 250-, 500-, and 100-mL containers, 20 mEq/L in dextrose/saline/LRs in 250-, 500-, and 100-mL containers, 30 mEq/L in various dextrose and saline solutions in 250-, 500-, and 100-mL containers, 40 mEq/L in various dextrose and saline solutions in 250-, 500-, and 100-mL containers.

Potassium Gluconate (generic available)

Tablets: 2 mEq, 5 mEq. **Elixir:** 20 mEq/15 mL.

NURSING IMPLICATIONS

Assessment

- Assess for signs and symptoms of hypokalemia (weakness, fatigue, U wave on ECG, arrhythmias, polyuria, polydipsia) and hyperkalemia (see Toxicity and Overdose).
- **Monitor pulse, BP, and ECG periodically during IV therapy.**
- **Lab Test Considerations:** Monitor serum potassium before and periodically during therapy. Monitor renal function, serum bicarbonate, and pH. Determine serum magnesium level if patient has refractory hypokalemia; hypomagnesemia should be corrected to facilitate effectiveness of potassium replacement. Monitor serum chloride because hypochloremia may occur if replacing potassium without concurrent chloride.
- **Toxicity and Overdose:** Symptoms of toxicity are those of hyperkalemia (slow, irregular heart-beat; fatigue; muscle weakness; paresthesia; confusion; dyspnea; peaked T waves; depressed ST segments; prolonged QT segments; widened QRS complexes; loss of P waves; and cardiac arrhythmias).
- Treatment includes discontinuation of potassium, administration of sodium bicarbonate to correct acidosis, dextrose and insulin to facilitate passage of potassium into cells, calcium salts to reverse ECG effects (in patients who are not receiving digoxin), sodium polystyrene used as an exchange resin, and/or dialysis for patient with impaired renal function.

Potential Nursing Diagnoses

Imbalanced nutrition: less than body requirements (Indications)

Implementation

- **High Alert:** Medication errors involving too rapid infusion or bolus IV administration of potassium chloride have resulted in fatalities. See IV administration guidelines below.
- For most purposes, potassium chloride should be used, except for renal tubular acidosis (hyperchloremic acidosis), in which other salts are more appropriate (potassium bicarbonate, potassium citrate, or potassium gluconate).
- If hypokalemia is secondary to diuretic therapy, consideration should be given to decreasing the dose of diuretic, unless there is a history of significant arrhythmias or concurrent digitalis glycoside therapy.
- **PO:** Administer with or after meals to decrease GI irritation.
- Use of tablets and capsules should be reserved for patients who cannot tolerate liquid preparations.

- Dissolve effervescent tablets in 3–8 oz of cold water. Ensure that effervescent tablet is fully dissolved. Powders and solutions should be diluted in 3–8 oz of cold water or juice (do not use tomato juice if patient is on sodium restriction). Instruct patient to drink slowly over 5–10 min.
- Tablets and capsules should be taken with a meal and full glass of water. Do not chew or crush enteric-coated or extended-release tablets or capsules. Micro-K ExtenCaps capsules can be opened and sprinkled on soft food (pudding, applesauce) and swallowed immediately with a glass of cool water or juice.
- **IV:** Assess for extravasation; severe pain and tissue necrosis may occur. **High Alert:** Never administer potassium IV push or bolus.

Potassium Acetate

- **Continuous Infusion: High Alert:** Do not administer undiluted. Each single dose *must* be diluted and thoroughly mixed in 100–1000 mL of dextrose, saline, Ringer's or LR, dextrose/saline, dextrose/Ringer's, or LR combinations. Usually limited to 80 mEq/L via peripheral line (200 mEq/L via central line).
- **Rate: High Alert:** Infuse slowly, at a rate up to 10 mEq/hr in adults or 0.5 mEq/kg/hr in children on general care areas. Check hospital policy for maximum infusion rates (maximum rate in monitored setting 40 mEq/hr in adults or 1 mEq/kg/hr in children).
- **Y-Site Compatibility:** ciprofloxacin.

Potassium Chloride

- **Continuous Infusion: High Alert:** Do not administer concentrations of ≥ 1.5 mEq/mL undiluted; fatalities have occurred. Concentrated products have black caps on vials or black stripes above constriction on ampules and are labeled with a warning about dilution requirement. Each single dose must be diluted and thoroughly mixed in 100–1000 mL of IV solution. Usually limited to 80 mEq/L via peripheral line (200 mEq/L via central line).
- Concentrations of 0.1 and 0.4 mEq/mL are intended for administration via calibrated infusion device and do not require dilution.
- **Rate: High Alert:** Infuse slowly, at a rate up to 10 mEq/hr in adults or 0.5 mEq/kg/hr in children in general care areas. Check hospital policy for maximum infusion rates (maximum rate in monitored setting 40 mEq/hr in adults or 1 mEq/kg/hr in children). Use an infusion pump.
- **Solution Compatibility:** May be diluted in dextrose, saline, Ringer's solution, LR, dextrose/saline, dextrose/Ringer's solution, and dextrose/LR combi-

☼ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

nations. Commercially available premixed with many of the above IV solutions.

- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, alprostadil, amifostine, amikacin, aminophylline, amiodarone, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid, atropine, aztreonam, benzotropine, betamethasone, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefoperazone, cefotaxime, cefotetan, ceftiofite, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone sodium phosphate, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doripenem, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, droperidol, edrophonium, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, esmolol, conjugated estrogens, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid, furosemide, ganaciclovir, gemcitabine, gentamicin, granisetron, heparin, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, indomethacin, insulin, irinotecan, isoproterenol, ketamine, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meprobamate, methotrexate, methoxamine, methylglutathione, methylergonovine, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, mitoxandron, morphine, multivitamin, mycophenolate, nafcillin, nalbuphine, naloxone, neostigmine, nesiritide, nifedipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, papaverine, pemetrexed, penicillin G, pentazocine, pentobarbital, phenobarbital, phenolamine, phenylephrine, phytonadione, piperacillin/tazobactam, procainamide, prochlorperazine, propofol, propranolol, protamine, pyridostigmine, pyridoxine, quinupristin/dalfopristin, ranitidine, remifentanyl, rituximab, rocuronium, sargramostim, scopalamine, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, tacrolimus, telavancin, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tirofiban, tobramycin, tolazoline, trastuzumab, trimetaphan, vancomycin, vasopressin, verapamil, vincristine, vinorelbine, voriconazole, warfarin, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** amphotericin B cholesteryl, amphotericin B colloidal, azithromycin, dantrolene, diazepam, diazoxide, haloperidol, hydralazine, pentamidine, phenytoin, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Explain to patient purpose of the medication and the need to take as directed, especially when concurrent digoxin or diuretics are taken. Take missed doses as soon as remembered within 2 hr; if not, return to regular dose schedule. Do not double dose.
- Emphasize correct method of administration. GI irritation or ulceration may result from chewing enteric-coated tablets or insufficient dilution of liquid or powder forms.
- Some extended-release tablets are contained in a wax matrix that may be expelled in the stool. This occurrence is not significant.
- Instruct patient to avoid salt substitutes or low-salt milk or food unless approved by health care professional. Patient should be advised to read all labels to prevent excess potassium intake.
- Advise patient regarding sources of dietary potassium (see Appendix M). Encourage compliance with recommended diet.
- Instruct patient to report dark, tarry, or bloody stools; weakness; unusual fatigue; or tingling of extremities. Notify health care professional if nausea, vomiting, diarrhea, or stomach discomfort persists. Dosage may require adjustment.
- Emphasize the importance of regular follow-up exams to monitor serum levels and progress.

Evaluation/Desired Outcomes

- Prevention and correction of serum potassium depletion.
- Cessation of arrhythmias caused by digoxin toxicity.

pramipexole (pra-mi-pex-ole) Mirapex, Mirapex ER

Classification

Therapeutic: antiparkinson agents
Pharmacologic: dopamine agonists

Pregnancy Category C

Indications

Management of Parkinson's disease. Restless leg syndrome (immediate-release only).

Action

Stimulates dopamine receptors in the striatum of the brain. **Therapeutic Effects:** Decreased tremor and rigidity in Parkinson's disease. Decreased leg restlessness.

Pharmacokinetics

Absorption: >90% absorbed following oral administration.

Distribution: Widely distributed.

Metabolism and Excretion: 90% excreted unchanged in urine.

Half-life: 8 hr (↑ in geriatric patients and patients with renal impairment).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2 hr	8 hr
PO-ER	unknown	6 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Renal impairment (↑ dosing interval recommended if $\text{CCr} < 60 \text{ mL/min}$ [immediate-release] or $\text{CCr} < 50 \text{ mL/min}$ [extended-release]); **OB,**

Lactation, PEDI: Safety not established; **GERI:** ↑ risk of hallucinations.

Adverse Reactions/Side Effects

CNS: **SLEEP ATTACKS,** amnesia, dizziness, drowsiness, hallucinations, weakness, abnormal dreams, confusion, dyskinesia, extrapyramidal syndrome, headache, insomnia, urges (gambling, sexual). **CV:** orthostatic hypotension. **DERM:** melanoma, pruritis. **ENDO:** SIADH. **GI:** constipation, dry mouth, dyspepsia, nausea, tooth disease. **GU:** urinary frequency. **MS:** leg cramps. **NEURO:** hypertonia, unsteadiness/falling.

Interactions

Drug-Drug: Concurrent levodopa ↑ risk of hallucinations and dyskinesia. Effectiveness may be ↑ by **ci-metidine**. Effectiveness may be ↓ by **dopamine antagonists**, including **butyrophenones**, **metoclopramide**, **phenothiazines**, or **thioxanthenes**.

Route/Dosage

When switching from immediate-release to extended-release product, the same total daily dose can be used.

Parkinson's Disease

PO (Adults): Immediate-release—0.125 mg 3 times daily initially; may be ↑ q 5–7 days (range 1.5–4.5 mg/day in 3 divided doses); **Extended-release**—0.375 mg once daily; may be ↑ to 0.75 mg once daily in 5–7 days, and then ↑ q 5–7 days by 0.75 mg/day (max dose = 4.5 mg/day).

Renal Impairment

PO (Adults Immediate-release): *CCr 35–59 mL/min*—0.125 mg twice daily initially, may be ↑ q 5–7 days up to 1.5 mg twice daily; *CCr 15–34 mL/min*—

0.125 mg daily initially, may be ↑ q 5–7 days up to 1.5 mg daily.

Renal Impairment

PO (Adults Extended-release): *CCr 30–50 mL/min*—0.375 mg every other day; may consider ↑ dose to 0.375 mg once daily after 1 wk based on response and tolerability; may ↑ in 0.375 mg increments after 1 wk (max dose = 2.25 mg/day).

Restless Leg Syndrome

PO (Adults): 0.125 mg daily 1–3 hr before bedtime. May be ↑ at 4–7 day intervals to 0.25 mg daily, then up to 0.5 mg daily.

Renal Impairment

PO (Adults Immediate-release): *CCr 20–60 mL/min*—0.125 mg daily 1–3 hr before bedtime. May be ↑ at 14-day intervals to 0.25 mg daily, then up to 0.5 mg daily.

Availability (generic available)

Immediate-release tablets: 0.125 mg, 0.25 mg, 0.5 mg, 0.75 mg, 1 mg, 1.5 mg. **Cost:** *Generic*—0.125 mg \$265.47/90, 0.25 mg \$277.55/90, 0.5 mg \$265.47/90, 0.75 mg \$265.47/90, 1 mg \$277.55/90, 1.5 mg \$277.55/90. **Extended-release tablets:** 0.375 mg, 0.75 mg, 1.5 mg, 2.25 mg, 3 mg, 3.75 mg, 4.5 mg. **Cost:** 0.375 mg \$103.92/7, 0.75 mg \$103.92/7, 1.5 mg \$103.92/7, 2.25 mg \$445.40/30, 3 mg \$445.40/30, 3.75 mg \$445.40/30, 4.5 mg \$445.40/30.

NURSING IMPLICATIONS

Assessment

- Assess patient for confusion or hallucinations. Notify health care professional if these occur.
- Monitor ECG and BP frequently during dosage adjustment and periodically throughout therapy.
- Assess patient for drowsiness and sleep attacks. Drowsiness is a common side effect of pramipexole, but sleep attacks or episodes of falling asleep during activities that require active participation may occur without warning. Assess patient for concomitant medications that have sedating effects or may increase serum pramipexole levels (see Interactions). May require discontinuation of therapy.
- **Parkinson's Disease:** Assess patient for signs and symptoms of Parkinson's disease (tremor, muscle weakness and rigidity, ataxia) before and throughout therapy.
- **Restless Leg Syndrome:** Assess sleep patterns and frequency of restless leg disturbances.

Potential Nursing Diagnoses

Impaired physical mobility (Indications)
Risk for injury (Indications, Side Effects)

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Implementation

- **Do not confuse Mirapex (pramipexole) with Miralax (polyethylene glycol).**
- An attempt to reduce the dose of levodopa/carbidopa may be made cautiously during pramipexole therapy.
- **PO:** Administer with meals to minimize nausea; usually resolves with continued therapy. Swallow extended-release tablets whole; do not crush, break, or chew.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses or immediate-release product as soon as remembered if it is not almost time for next dose. If extended release tablets are missed, skip dose and take next regular dose. Do not double doses. Consult health care professional before reducing dose or discontinuing medication. Advise patient to read the *Patient Information* sheet before taking and with each Rx refill, changes may occur.
- **May cause drowsiness and unexpected episodes of falling asleep. Caution patient to avoid driving or other activities requiring alertness until response to medication is known. Advise patient to notify health care professional if episodes of falling asleep occur.**
- Advise patient to change position slowly to minimize orthostatic hypotension. May occur more frequently during initial therapy.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise patient to have periodic skin exams to check for lesions that may be melanoma.
- Advise patient to notify health care professional if new or increased gambling, sexual, or other intense urges occur.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding or planning to breast feed.

Evaluation/Desired Outcomes

- Decreased tremor and rigidity in Parkinson's disease.
- Decrease in restless legs and improved sleep.

HIGH ALERT

pramlintide (pram-lin-tide)
Symlin

Classification

Therapeutic: antidiabetics
Pharmacologic: hormones

Pregnancy Category C

Indications

Used with mealtime insulin in the management of diabetics whose blood sugar cannot be controlled by optimal insulin therapy; can be used with other agents (sulfonylureas, metformin).

Action

Acts as a synthetic analogue of amylin, an endogenous pancreatic hormone that helps to control postprandial hyperglycemia; effects include slowed gastric emptying, suppression of glucagon secretion and regulation of food intake. **Therapeutic Effects:** Improved control of postprandial hyperglycemia.

Pharmacokinetics

Absorption: 30–40% absorbed following subcutaneous administration.

Distribution: Does not appear to significantly cross the placenta.

Metabolism and Excretion: Metabolized by the kidneys; major metabolite has pharmacologic properties similar to the parent compound.

Half-life: 48 min.

TIME/ACTION PROFILE (effect on blood sugar*)

ROUTE	ONSET	PEAK	DURATION
Subcut	rapid	20 min	3 hr

*Blood level

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Inability to identify hypoglycemia; Gastroparesis or need for medications to stimulate gastric motility; Poor compliance with current insulin regimen or self-monitoring; HbA1c >9%; Recurring severe hypoglycemia within the last 6 mo, requiring treatment; **OB:** Insulin is the drug of choice for blood glucose control during pregnancy; **Pedi:** Safety not established.

Use Cautiously in: **Lactation:** Lactation.

Adverse Reactions/Side Effects

Noted for concurrent use with insulin.

CNS: dizziness, fatigue, headache. **Resp:** cough. **GI:** nausea, abdominal pain, anorexia, vomiting. **Endo:** **HYPOGLYCEMIA.** **Derm:** local allergy. **MS:** arthralgia.

Misc: injection site reactions, systemic allergic reactions.

Interactions

Drug-Drug: ↑ likelihood of hypoglycemia with short-acting **insulin**; ↓ dose of short-acting pre-meal insulin by 50%. Avoid concurrent use with other agents that ↓ GI motility, including **atropine** and other **anticholinergics**. Avoid concurrent use with other agents that ↓ GI absorption of nutrients, including **α-glucosidase inhibitors** including **acarbose** and **miglitol**. May delay oral absorption of concurrently administered drugs; if prompt absorption is desired, administer 1 hr before or 2 hr after pramlintide.

Route/Dosage

Insulin-using Type 2 Diabetes

Subcut (Adults): 60 mcg, immediately prior to major meals initially, if no significant nausea occurs, dose may be ↑ to 120 mcg.

Type 1 Diabetes

Subcut (Adults): 15 mcg, immediately prior to major meals initially, if no significant nausea occurs, dose may be ↑ by 15 mcg every 3 days up to 60 mcg.

Availability

Pen-injector: 1000 mcg/mL. **Solution for injection:** 600 mcg/mL.

NURSING IMPLICATIONS

Assessment

- Assess hemoglobin A1c, recent blood glucose monitoring data, history of insulin-induced hypoglycemia, current insulin regimen, and body weight prior to initiation of therapy.
- Assess for signs and symptoms of hypoglycemia (hunger, headache, sweating, tremor, irritability, difficulty concentrating, loss of consciousness, coma, seizure), occurs within 3 hr of injection. Pramlintide alone does not cause hypoglycemia, may increase risk when administered with insulin.
- **Lab Test Considerations:** Monitor blood glucose frequently, including pre- and post-meals and at bedtime.

Potential Nursing Diagnoses

Noncompliance (Patient/Family Teaching)

Implementation

- **High Alert:** Dose errors are a potential problem with administration of pramlintide. Pramlintide is available in a concentration of 0.6 mg/mL, dosing is in mcg, and insulin syringe for administration is in units. Carefully review dosing and conversion table prior to administration.
- Administer pramlintide and insulin as separate injections; do not mix.
- Adjust insulin doses to optimize glycemic control once target dose of pramlintide is achieved and nausea has subsided.
- **Subcut:** Administer immediately prior to major meals ≥ 250 kcal or containing ≥ 30 g of carbohydrate. Reduce preprandial rapid-acting, short-acting, and fixed-mix insulin doses by 50%. Use a U-100 syringe (preferably a 0.3 mL size) for optimal accuracy. Administer into abdomen or thigh, rotating injection sites. Do not administer solutions that are cloudy. Store unopened vials in refrigerator. Opened vials may be refrigerated or kept at room temperature for up to 28 days.

Patient/Family Teaching

- Instruct patient in proper use of pramlintide (injection technique, timing of doses, storage, and disposal of equipment). **Make sure patient understands dosing and preparation of correct dose.** Emphasize importance of adherence to meal planning, physical activity, recognition and management of hypoglycemia and hyperglycemia, and assessment of diabetes complications. Advise patient to read the *Medication Guide* before use and with each refill for new information.
- Review with patient how to handle illness or stress, inadequate or omitted insulin dose, inadvertent administration of increased dose of insulin or pramlintide, inadequate food intake or missed meals. If a dose is missed, wait until the next meal and take usual dose; do not give an additional injection.
- Instruct patient to contact health care professional at least once a week until target dose of pramlintide is achieved, pramlintide is well-tolerated, and blood glucose concentrations are stable.
- May cause difficulty concentrating. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Inform patient that signs of local allergy (redness, swelling, itching at site of injection) usually resolve within a few days to a few weeks; may be related to pramlintide, irritants in skin cleansing agent or improper injection technique.
- Advise patient to contact health care professional if recurrent nausea or hypoglycemia occur; may lead to increased risk of severe hypoglycemia. Discontinue pramlintide therapy if recurrent unexplained hypoglycemia requiring medical assistance, persistent clinically significant nausea, or noncompliance with self-monitoring of blood glucose concentrations, insulin dose adjustments, or scheduled health care professional contacts or recommended clinic visits occur.
- Advise patient to contact health care professional before taking other Rx, OTC, vitamins, or herbal products with pramlintide and to avoid concurrent alcohol use.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Reduction in postprandial glucose concentrations.

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

prasugrel (pra-soo-grel)

Effient

Classification

Therapeutic: antiplatelet agents

Pharmacologic: thienopyridines

Pregnancy Category B**Indications**

Reduction of thrombotic cardiovascular events (including stent thrombosis) in patients with acute coronary syndrome who will be managed with PCI including patients with unstable angina or non-ST-elevation myocardial infarction (NSTEMI). Reduction of thrombotic cardiovascular events (including stent thrombosis) in patients with STEMI when managed with either primary/delayed PCI.

Action

Acts by irreversibly binding its active metabolite to the P2Y₁₂ class of ADP receptors on platelets; inhibiting platelet activation and aggregation. **Therapeutic Effects:** Decreased thrombotic events including cardiovascular death, nonfatal myocardial infarction (MI) and nonfatal stroke.

Pharmacokinetics

Absorption: Well absorbed following oral administration (79%), then rapidly converted to an active metabolite.

Distribution: Unknown.

Protein Binding: Active metabolite—98%.

Metabolism and Excretion: Active metabolite is metabolized to two inactive compounds; 68% excreted in the urine and 27% in feces as inactive metabolites.

Half-life: Active metabolite—7 hr (range 2–15 hr).

TIME/ACTION PROFILE (effect on platelet function)

ROUTE	ONSET	PEAK	DURATION
PO	within 1 hr	2 hr	5–9 days†

† Following discontinuation.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Active pathological bleeding; History of transient ischemic attack or stroke.

Use Cautiously in: Patients about to undergo coronary artery bypass grafting (CABG) (↑ risk of bleeding; discontinue at least 7 days prior to surgery); Premature discontinuation (↑ risk of stent thrombosis, MI, and death); Body weight <60 kg, propensity to bleed, severe hepatic impairment, concurrent use of medications that ↑ the risk of bleeding (↑ risk of bleeding); Hypotension in the setting of recent coronary angiography, PCI, CABG, or other surgical procedure (sus-

pect bleeding but do not discontinue prasugrel); **Geri:** Use in patients ≥75 yr of age generally not recommended (↑ risk of fatal/intracranial bleeding and questionable benefit, except in high-risk patients such as diabetes or prior MI); **OB:** Use only if potential benefit to mother justifies potential risk to fetus; **Lactation:** Use only if potential benefit to the mother justifies potential risk to nursing infant; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: dizziness, fatigue, headache. **Resp:** cough, dyspnea. **CV:** atrial fibrillation, bradycardia, hypertension, hypotension, peripheral edema. **GI:** diarrhea, nausea. **Derm:** rash. **Hemat:** BLEEDING, THROMBOTIC THROMBOCYTOPENIC PURPURA, leukopenia. **Metab:** hyperlipidemia. **MS:** back pain, extremity pain. **Misc:** allergic reactions including ANGIOEDEMA, fever, non-cardiac chest pain.

Interactions

Drug-Drug: ↑ risk of bleeding with warfarin and NSAIDs.

Route/Dosage

Aspirin 75–325 mg/daily should be taken concurrently.

PO (Adults ≥60 kg): 60 mg initially as a loading dose, then 10 mg once daily.

PO (Adults < 60 kg): Consider maintenance dose of 5 mg once daily.

Availability

Tablets: 5 mg, 10 mg.

NURSING IMPLICATIONS**Assessment**

- Assess patient for symptoms of stroke, peripheral vascular disease, or MI periodically during therapy.
- Monitor patient for signs of thrombotic thrombocytopenic purpura (thrombocytopenia, microangiopathic hemolytic anemia, neurologic findings, renal dysfunction, fever). May rarely occur, even after short exposure (<2 wk). Requires prompt treatment.
- **Lab Test Considerations:** Monitor bleeding time during therapy. Prolonged bleeding time, which is time- and dose-dependent, is expected.
- Monitor CBC with differential and platelet count periodically during therapy. Thrombocytopenia and anemia may rarely occur.

Potential Nursing Diagnoses

Risk for injury (Indications, Side Effects)

Implementation

- Discontinue prasugrel 7 days before planned surgical procedures.
- Patients should take aspirin 75–325 mg daily with prasugrel.

- **PO:** Administer once daily without regard to food.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as possible unless almost time for next dose; do not double doses. Do not discontinue without consulting health care professional. Advise patient to read *Medication Guide* before taking and with each Rx refill; new information may be available.
- Advise patient to notify health care professional promptly if fever, weakness, skin paleness, purple skin patches, yellowing of skin or eyes, chills, sore throat, neurological changes, or unusual bleeding or bruising, swelling of lips, difficulty breathing, rash, or hives occurs.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially NSAIDs.

Evaluation/Desired Outcomes

- Prevention of stroke, MI, and vascular death in patients at risk.

pravastatin, See HMG-CoA REDUCTASE INHIBITORS (statins).

prazosin (pra-zoe-sin)

Minipress

Classification

Therapeutic: antihypertensives

Pharmacologic: peripherally acting antiadrenergics

Pregnancy Category C

Indications

Mild to moderate hypertension. **Unlabeled Use:** Management of urinary outflow obstruction in patients with benign prostatic hyperplasia.

Action

Dilates both arteries and veins by blocking postsynaptic alpha₁-adrenergic receptors. Decreases contractions in smooth muscle of prostatic capsule. **Therapeutic Effects:** Lowering of BP. Decreased cardiac preload and afterload. Decreased symptoms of prostatic hyperplasia (urinary urgency, urinary hesitancy, nocturia).

Pharmacokinetics

Absorption: 60% absorbed following oral administration.

Distribution: Widely distributed.

Protein Binding: 97%.

Metabolism and Excretion: Extensively metabolized by the liver. Minimal (5–10%) renal excretion of unchanged drug.

Half-life: 2–3 hr.

TIME/ACTION PROFILE (antihypertensive effects)

ROUTE	ONSET	PEAK	DURATION
PO	2 hr	2–4 hr†	10 hr

†Following single dose; maximal antihypertensive effects occur after 3–4 wk of chronic dosing

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Renal insufficiency (↑ sensitivity to effects; dose ↓ may be required); **OB, Lactation, Pedi:** Safety not established; Angina pectoris; When adding diuretics (↓ dose of prazosin); Patients undergoing cataract surgery (↑ risk of intraoperative floppy iris syndrome).

Adverse Reactions/Side Effects

CNS: dizziness, headache, weakness, drowsiness, mental depression, syncope. **EENT:** blurred vision, intraoperative floppy iris syndrome. **CV:** first-dose or-thostatic hypotension, palpitations, angina, edema. **GI:** abdominal cramps, diarrhea, dry mouth, nausea, vomiting. **GU:** erectile dysfunction, priapism.

Interactions

Drug-Drug: Additive hypotension with acute ingestion of alcohol, other antihypertensives, or nitrates. Antihypertensive effects may be ↓ by NSAIDs.

Route/Dosage

Hypertension

PO (Adults): 1 mg 2–3 times daily (give first dose at bedtime) for initial 3 days of therapy, then ↑ gradually to maintenance dose of 6–15 mg/day in 2–3 divided doses (not to exceed 20–40 mg/day).

PO (Children): 50–400 mcg (0.05–0.4 mg)/kg/day in 2–3 divided doses (not to exceed 7 mg/dose or 15 mg/day).

Benign Prostatic Hyperplasia

PO (Adults): 1–5 mg twice daily.

Availability (generic available)

Capsules: 1 mg, 2 mg, 5 mg. **Tablets:** ★ 1 mg, ★ 2 mg, ★ 5 mg.

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

NURSING IMPLICATIONS

Assessment

- Assess for first-dose orthostatic reaction (dizziness, weakness) and syncope. May occur 30 min–2 hr after initial dose and occasionally thereafter. Incidence may be dose related. Volume-depleted or sodium-restricted patients may be more sensitive. Observe patient closely during this period; take precautions to prevent injury. First dose may be given at bedtime to minimize this reaction.
- Monitor intake and output ratios and daily weight; assess for edema daily, especially at beginning of therapy.
- **Hypertension:** Monitor BP and pulse frequently during initial dosage adjustment and periodically throughout therapy. Report significant changes.
- Monitor frequency of prescription refills to determine adherence.
- **Benign Prostatic Hyperplasia:** Assess patient for symptoms of prostatic hyperplasia (urinary hesitancy, feeling of incomplete bladder emptying, interruption of urinary stream, impairment of size and force of urinary stream, terminal urinary dribbling, straining to start flow, dysuria, urgency) before and periodically during therapy.
- Rule out prostatic carcinoma before therapy; symptoms are similar.

Potential Nursing Diagnoses

Risk for injury (Side Effects)

Noncompliance (Patient/Family Teaching)

Implementation

- May be used in combination with diuretics or beta blockers to minimize sodium and water retention. If these are added to prazosin therapy, reduce dose of prazosin initially and titrate to effect.
- **PO:** Administer daily dose at bedtime. If necessary, dose may be increased to twice daily.

Patient/Family Teaching

- Instruct patient to take medication at the same time each day. Take missed doses as soon as remembered. If not remembered until next day, omit; do not double doses.
- Advise patient to weigh self twice weekly and assess feet and ankles for fluid retention.
- May cause dizziness or drowsiness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Caution patient to avoid sudden changes in position to decrease orthostatic hypotension. Alcohol, CNS depressants, standing for long periods, hot showers, and exercising in hot weather should be avoided because of enhanced orthostatic effects.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health

care professional before taking other medications, especially cough, cold, or allergy remedies.

- Instruct patient to notify health care professional of medication regimen before any surgery.
- Advise patient to notify health care professional if frequent dizziness, fainting, or swelling of feet or lower legs occurs.
- Emphasize the importance of follow-up exams to evaluate effectiveness of medication.
- **Hypertension:** Emphasize the importance of continuing to take this medication as directed, even if feeling well. Medication controls but does not cure hypertension.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol consumption, regular exercise, and stress management).
- Instruct patient and family on proper technique for BP monitoring. Advise them to check BP at least weekly and to report significant changes.

Evaluation/Desired Outcomes

- Decrease in BP without appearance of side effects.
- Decrease in symptoms of prostatic hyperplasia.

prednicarbate, See CORTICOSTEROIDS (TOPICAL/LOCAL).

prednisoLONE, See CORTICOSTEROIDS (SYSTEMIC).

predniSONE, See CORTICOSTEROIDS (SYSTEMIC).

pregabalin (pre-gab-a-lin)

Lyrica

Classification

Therapeutic: analgesics, anticonvulsants
Pharmacologic: gamma aminobutyric acid (GABA) analogues, nonopioid analgesics

Schedule V

Pregnancy Category C

Indications

Neuropathic pain associated with diabetic peripheral neuropathy. Postherpetic neuralgia. Fibromyalgia. Neuropathic pain associated with spinal cord injury. Adjunctive therapy of partial-onset seizures in adults.

Action

Binds to calcium channels in CNS tissues which regulate neurotransmitter release. Does not bind to opioid receptors. **Therapeutic Effects:** Decreased neuropathic or post-herpetic pain. Decreased partial-onset seizures.

Pharmacokinetics

Absorption: Well absorbed (90%) following oral administration.

Distribution: Probably crosses the blood-brain barrier.

Metabolism and Excretion: Minimally metabolized, 90% excreted unchanged in urine.

Half-life: 6 hr.

TIME/ACTION PROFILE (↓ post-herpetic pain)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–4 wk	unknown

Contraindications/Precautions

Contraindicated in: Myopathy (known/suspected); **Lactation:** Lactation.

Use Cautiously in: All patients (may ↑ risk of suicidal thoughts/behaviors); Renal impairment (dose alteration recommended for $\text{CCr} < 60 \text{ mL/min}$); HF; History of drug dependence/drug-seeking behavior; **OB:** Use only if maternal benefit outweighs fetal risk; may ↑ risk of male-mediated teratogenicity; **Pedi:** Safety not established; **Ger:** Consider age-related ↓ in renal function when determining dose.

Adverse Reactions/Side Effects

CNS: SUICIDAL THOUGHTS, dizziness, drowsiness, impaired attention/concentration/thinking. **CV:** edema.

EENT: blurred vision. **GI:** dry mouth, abdominal pain, constipation, ↑ appetite, vomiting. **Hemat:** thrombocytopenia. **Metab:** weight gain. **Misc:** allergic reactions, fever.

Interactions

Drug-Drug: Concurrent use with thiazolidinediones (pioglitazone, rosiglitazone) may ↑ risk of fluid retention. ↑ risk of CNS depression with other CNS depressants including opioids, alcohol, benzodiazepines, or other sedatives/hypnotics.

Route/Dosage

Diabetic Neuropathic Pain

PO (Adults): 50 mg 3 times daily, ↑ over 7 days up to 100 mg 3 times daily.

Postherpetic Neuralgia

PO (Adults): 75 mg twice daily or 50 mg 3 times daily initially, may be ↑ over 7 days to 300 mg/day in 2–3

divided doses; after 2–4 wk may be ↑ to 600 mg/day in 2–3 divided doses.

Fibromyalgia

PO (Adults): 75 mg twice daily initially, may be ↑ to 150 mg twice daily within 1 wk based on efficacy and tolerability. May be ↑ to 225 twice daily.

Spinal Cord Injury Neuropathic Pain

PO (Adults): 75 mg twice daily initially, may be ↑ to 150 mg twice daily within 1 wk based on efficacy and tolerability; if insufficient pain relief after 2–3 wk, may ↑ to 300 twice daily.

Partial Onset Seizures

PO (Adults): 75 mg twice daily or 50 mg 3 times daily initially; may be gradually ↑ to 600 mg/day.

Renal Impairment

PO (Adults): *CCr 30–60 mL/min*—75–300 mg/day in 2–3 divided doses; *CCr 15–30 mL/min*—25–150 mg/day in 1–2 divided doses; *CCr < 15 mL/min*—25–75 mg/day as a single daily dose.

Availability (generic available)

Capsules: 25 mg, 50 mg, 75 mg, 100 mg, 150 mg, 200 mg, 225 mg, 300 mg. **Cost:** 25 mg \$411.71/100, 50 mg \$409.80/100, 75 mg \$409.80/100, 100 mg \$409.80/100, 150 mg \$409.80/100, 200 mg \$411.71/100, 225 mg \$411.71/100. **Oral solution:** 20 mg/mL. **Cost:** \$553.82/473 mL.

NURSING IMPLICATIONS

Assessment

- Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- **Diabetic Peripheral Neuropathy, Postherpetic Neuralgia, Fibromyalgia, and Spinal Cord Injury Pain:** Assess location, characteristics, and intensity of pain periodically during therapy.
- **Seizures:** Assess location, duration, and characteristics of seizure activity.
- **Lab Test Considerations:** May cause ↑ creatine kinase levels.
- May cause ↓ platelet count.

Potential Nursing Diagnoses

Risk for injury (Adverse Reactions)

Implementation

- Do not confuse Lyrica (pregabalin) with Lopressor (metoprolol).
- Pregabalin should be discontinued gradually over at least 1 wk. Abrupt discontinuation may cause insomnia, nausea, headache, anxiety, sweating, and diarrhea when used for pain and may cause increase in seizure frequency when treating seizures.

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- **PO:** May be administered without regard to meals. Oral solution may be stored at room temperature.

Patient/Family Teaching

- Instruct patient to take medication as directed. If a dose is missed take as soon as remembered unless almost time for next dose; do not double doses. Do not discontinue abruptly; may cause insomnia, nausea, headache, or diarrhea or increase in frequency of seizures. Advise patient to read the *Patient Information Leaflet* prior to taking pregabalin.
- May cause dizziness, drowsiness, and blurred vision. Caution patient to avoid driving or activities requiring alertness until response to medication is known. Advise patient to notify health care professional if changes in vision occur. Patients with seizures should not resume driving until health care professional gives clearance based on control of seizure disorder.
- Instruct patient to promptly report unexplained muscle pain, tenderness, or weakness, especially if accompanied by malaise or fever. Discontinue therapy if myopathy is diagnosed or suspected or if markedly elevated creatine kinase levels occur.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking, other unusual changes in behavior or mood occur.
- Inform patient that pregabalin may cause edema and weight gain.
- Caution patient to avoid alcohol or other CNS depressants with pregabalin.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding. Inform male patients who plan to father a child of the potential risk of male-mediated teratogenicity. Encourage patients who become pregnant to enroll in the NAEED Pregnancy Registry by calling 1-800-233-2334.
- Advise patient to carry identification describing disease process and medication regimen at all times.

Evaluation/Desired Outcomes

- Decrease in intensity of chronic pain.
- Decrease in the frequency or cessation of seizures.

**procaine penicillin G, See
PENICILLINS.**

procarbazine (proe-kar-ba-zeen) Matulane, Natulan

Classification

Therapeutic: antineoplastics
Pharmacologic: alkylating agents

Pregnancy Category D

Indications

Hodgkin's disease (with other treatment modalities).

Unlabeled Use: Other lymphomas. Brain and lung tumors. Multiple myeloma. Malignant melanoma. Polycythemia vera.

Action

Appears to inhibit DNA, RNA, and protein synthesis (cell-cycle S-phase-specific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Widely distributed; crosses the blood-brain barrier.

Metabolism and Excretion: Metabolized by the liver; <5% excreted unchanged by the kidneys; some respiratory elimination as methane and carbon dioxide.

Half-life: 1 hr.

TIME/ACTION PROFILE (effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
PO	14 days	2–8 wk	28 days or more (up to 6 wk)

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Alcoholism; Severe renal or liver impairment; Pheochromocytoma; HF; **OB, Lactation:** Pregnancy or lactation.

Use Cautiously in: Infection; ↓ bone marrow reserve; Headache; Psychiatric illness; Liver impairment; Cardiovascular disease; **OB:** Women with childbearing potential should be advised to avoid pregnancy; **Pedi:** Very close clinical monitoring required due to potential for toxicity.

Adverse Reactions/Side Effects

CNS: **SEIZURES**, confusion, dizziness, drowsiness, hallucinations, headache, mania, mental depression, nightmares, psychosis, syncope, tremor. **EENT:** nystagmus, photophobia, retinal hemorrhage. **Resp:** cough, pleural effusions. **CV:** edema, hypotension, tachycardia. **GI:** nausea, vomiting, anorexia, diarrhea, dry mouth, dysphagia, hepatic dysfunction, stomatitis.

GU: gonadal suppression. **Derm:** alopecia, photosensitivity, pruritus, rashes. **Endo:** gynecomastia. **Hemat:** anemia, leukopenia, thrombocytopenia. **Neuro:** neuropathy, paresthesia. **Misc:** ascites, secondary malignancy.

Interactions

Drug-Drug: Concurrent use with **sympathomimetics** including **methylphenidate** may produce life-threatening hypertension (avoid concurrent use during and for 14 days following procarbazine). Deep coma and death may result from concurrent use of **opioid analgesics**; avoid **meperidine**. Use small incremental doses of other agents and titrate to effect. ↑ bone marrow depression may occur with other **antineoplastics** or **radiation therapy**. Seizures and hyperpexia may occur with concurrent use of **MAO inhibitors**, **tricyclic antidepressants**, **SSRI antidepressants** (should not be used within 5 wk of **fluoxetine**), or **carbamazepine**. May ↓ serum **digoxin** levels. Concurrent use with **levodopa** may result in flushing and hypertension. ↑ CNS depression with other **CNS depressants**, including **alcohol**, **antidepressants**, **antihistamines**, **opioid analgesics**, **phenothiazines**, and **sedative/hypnotics**. Disulfiram-like reaction may occur with **alcohol**.

Cigarette smoking may ↑ the risk of secondary lung cancer.

Drug-Food: Ingestion of foods high in **tyramine** content (see Appendix M) may result in hypertension. Ingestion of foods high in **caffeine** content may result in arrhythmias.

Route/Dosage

PO (Adults): 2–4 mg/kg/day as a single dose or in divided doses for 1 wk, then 4–6 mg/kg/day until response is obtained; then maintenance dose of 1–2 mg/kg/day. Dosage should be rounded off to the nearest 50 mg.

PO (Children): 50 mg/m²/day for 7 days, then 100 mg/m²/day, maintenance dose of 50 mg/m²/day.

Availability

Capsules: 50 mg.

NURSING IMPLICATIONS

Assessment

- Monitor BP, pulse, and respiratory rate periodically during therapy. Report significant changes to health care professional.
- Assess nutritional status (appetite, intake and output ratios, weight, frequency and amount of emesis). Anorexia and weight loss can be decreased by feeding light, frequent meals. Nausea and vomiting can be minimized by administering an antiemetic at

least 1 hr prior to receiving medication. Phenothiazine antiemetics should be avoided.

- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Concurrent ingestion of tyramine-rich foods and many medications may result in life-threatening hypertensive crisis. Signs and symptoms of hypertensive crisis include chest pain, severe headache, nausea and vomiting, photosensitivity, and enlarged pupils. Treatment includes IV phenolamine.
- Procarbazine should be discontinued until side effects clear and then resumed at a lower dose if leukopenia, thrombocytopenia, hypersensitivity reaction, stomatitis (first small ulceration or persistent soreness), diarrhea, hemorrhage, or bleeding tendencies occur.
- **Lab Test Considerations:** Monitor hemoglobin, hematocrit, WBC, differential, reticulocytes, and platelet count prior to and every 3–4 days during therapy. Notify physician if WBC <4000/mm³ or platelet count <100,000/mm³. Therapy should be discontinued and resumed at a lower dose when counts improve. The nadir of leukopenia and thrombocytopenia occurs in approximately 2–8 wk, and recovery usually occurs in about 6 wk. Anemia also may occur.
- Assess hepatic and renal function prior to therapy. Monitor urinalysis, AST, ALT, alkaline phosphatase, and BUN at least weekly during therapy.
- Closely monitor serum glucose in diabetic patients. Oral hypoglycemics or insulin dosage may need to be reduced, because hypoglycemic effects are enhanced.
- Bone marrow aspiration studies are recommended prior to initiation of therapy and at time of maximum hematologic response to ensure adequate bone marrow reserve.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)

Imbalanced nutrition: less than body requirements (Adverse Reactions)

Implementation

- **PO:** Administer with food or fluids if GI irritation occurs. Confer with pharmacist regarding opening of capsules if patient has difficulty swallowing.

Patient/Family Teaching

- Emphasize the need to take medication as directed. Take missed doses as soon as remembered within a

☼ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

few hours but not if several hours have passed or if almost time for next dose. Health care professional should be consulted if vomiting occurs shortly after a dose is taken.

- Instruct patient to notify health care professional promptly if signs of infection (fever, sore throat, chills, cough, thickened bronchial secretions, hoarseness, pain in lower back or side, difficult or painful urination); bleeding gums; bruising; petechiae; or blood in stool, urine, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Patient should not receive IM injections or rectal temperatures. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDs; may precipitate gastric bleeding.
- Caution patient to avoid alcohol, caffeinated beverages, CNS depressants, OTC drugs, and foods or beverages containing tyramine (see Appendix M for foods included) during therapy and for at least 2 wk after therapy has been discontinued, because they may precipitate a hypertensive crisis.
- Advise patient that an additional interaction of alcohol with procarbazine is a disulfiram-like reaction (flushing, nausea, vomiting, headache, abdominal cramps).
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to notify health care professional and to use sponge brush and rinse mouth with water after eating and drinking. Topical agents may be used if mouth pain interferes with eating. Stomatitis pain may require treatment with opioid analgesics.
- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities that require alertness until response to medication is known.
- Advise patient that this medication may have teratogenic effects. Contraception should be practiced during therapy and for at least 4 mo after therapy is concluded.
- Discuss the possibility of hair loss with patient. Explore methods of coping.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery. This therapy usually should be withdrawn at least 2 wk prior to surgery.
- Instruct patient to inform health care professional if muscle or joint pain, nausea, vomiting, sweating, tiredness, weakness, constipation, headache, difficulty swallowing, or loss of appetite becomes pronounced.
- Advise patient to carry identification describing medication regimen at all times.

- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in size and spread of malignant tissue in Hodgkin's disease.

prochlorperazine

(proe-klor-pair-a-zeen)

Compazine, Compro,  Prochlorazine

Classification

Therapeutic: antiemetics, antipsychotics

Pharmacologic: phenothiazines

Pregnancy Category C

Indications

Management of nausea and vomiting. Treatment of psychoses. Treatment of anxiety.

Action

Alters the effects of dopamine in the CNS. Possesses significant anticholinergic and alpha-adrenergic blocking activity. Depresses the chemoreceptor trigger zone (CTZ) in the CNS. **Therapeutic Effects:** Diminished nausea and vomiting. Diminished signs and symptoms of psychoses or anxiety.

Pharmacokinetics

Absorption: Absorption from tablet is variable; may be better with oral liquid formulations. Well absorbed after IM administration.

Distribution: Widely distributed, high concentrations in the CNS. Crosses the placenta and probably enters breast milk.

Protein Binding: $\geq 90\%$.

Metabolism and Excretion: Highly metabolized by the liver and GI mucosa. Converted to some compounds with antipsychotic activity.

Half-life: Unknown.

TIME/ACTION PROFILE (antiemetic effect)

ROUTE	ONSET	PEAK	DURATION
PO	30–40 min	unknown	3–4 hr
Rect	60 min	unknown	3–4 hr
IM	10–20 min	10–30 min	3–4 hr
IV	rapid (min)	10–30 min	3–4 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with other phenothiazines may exist; Angle-closure glaucoma; Bone marrow depression; Severe liver or cardiovascular disease; Hypersensitivity to bisulfites or benzyl alcohol (some parenteral products); **Pedi:** Children < 2 yr or < 9.1 kg.

Use Cautiously in: Diabetes mellitus; Respiratory disease; Prostatic hypertrophy; CNS tumors; Epilepsy; Intestinal obstruction; **OB, Lactation:** Safety not estab-

lished; **Geri:** Dose ↓ recommended; ↑ risk of mortality in elderly patients treated for dementia-related psychosis.

Adverse Reactions/Side Effects

CNS: **NEUROLEPTIC MALIGNANT SYNDROME**, extrapyramidal reactions, sedation, tardive dyskinesia. **EENT:** blurred vision, dry eyes, lens opacities. **CV:** ECG changes, hypotension, tachycardia. **GI:** constipation, dry mouth, anorexia, drug-induced hepatitis, ileus. **GU:** pink or reddish-brown discoloration of urine, urinary retention. **Derm:** photosensitivity, pigment changes, rashes. **Endo:** galactorrhea. **Hemat:** **AGRANULOCYTOSIS**, leukopenia. **Metab:** hyperthermia. **Misc:** allergic reactions.

Interactions

Drug-Drug: Additive hypotension with **anti-hypertensives**, **nitrates**, or acute ingestion of **alcohol**. Additive CNS depression with other **CNS depressants**, including **alcohol**, **antidepressants**, **antihistamines**, **opioid analgesics**, **sedative/hypnotics**, or **general anesthetics**. Additive anticholinergic effects with other **drugs possessing anticholinergic properties**, including **antihistamines**, some **antidepressants**, **atropine**, **haloperidol**, and other **phenothiazines**. **Lithium** ↑ risk of extrapyramidal reactions. May mask early signs of **lithium** toxicity. ↑ risk of **agranulocytosis** with **antithyroid agents**. ↓ beneficial effects of **levodopa**. **Antacids** may ↓ absorption.

Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, **chamomile**, or **hops** can ↑ CNS depression. ↑ anticholinergic effects with **angel's trumpet**, **jimson weed**, and **scopolia**.

Route/Dosage

Pediatric dose should not exceed 10 mg on the 1st day and then should not exceed 20 mg/day in children 2–5 yr or 25 mg/day in children 6–12 yr.

Antiemetic

PO (Adults and Children ≥12 yr): 5–10 mg 3–4 times daily (not to exceed 40 mg/day).

PO (Children 18–39 kg): 2.5 mg 3 times daily or 5 mg twice daily (not to exceed 15 mg/day).

PO (Children 14–17 kg): 2.5 mg 2–3 times daily (not to exceed 10 mg/day).

PO (Children 9–13 kg): 2.5 mg 1–2 times daily (not to exceed 7.5 mg/day).

IM (Adults and Children ≥12 yr): 5–10 mg q 3–4 hr as needed. *Nausea/vomiting associated with surgery*—5–10 mg; may be repeated once.

IM (Children 2–12 yr): 132 mcg (0.132 mg)/kg; usually only 1 dose is required.

IV (Adults and Children ≥12 yr): 2.5–10 mg (not to exceed 40 mg/day). *Nausea/vomiting associated with surgery*—5–10 mg; may be repeated once.

Rect (Adults): 25 mg twice daily.

Rect (Children 18–39 kg): 2.5 mg 3 times daily or 5 mg twice daily (not to exceed 15 mg/day).

Rect (Children 14–17 kg): 2.5 mg 2–3 times daily (not to exceed 10 mg/day).

Rect (Children 9–13 kg): 2.5 mg 1–2 times daily (not to exceed 7.5 mg/day).

Antipsychotic

PO (Adults and Children ≥12 yr): 5–10 mg 3–4 times daily; may be ↑ q 2–3 days (up to 150 mg/day).

PO (Children 2–12 yr): 2.5 mg 2–3 times daily.

IM (Adults): 10–20 mg q 2–4 hr for up to 4 doses, then 10–20 mg q 4–6 hr (up to 200 mg/day).

IM (Children 2–12 yr): 132 mcg (0.132 mg)/kg (not to exceed 10 mg/dose).

IV (Adults and Children ≥12 yr): 2.5–10 mg (up to 40 mg/day).

Rect (Adults): 10 mg 3–4 times daily; may be ↑ by 5–10 mg q 2–3 days as needed.

Antianxiety

PO (Adults and Children ≥12 yr): 5 mg 3–4 times daily (not to exceed 20 mg/day or longer than 12 wk).

IM (Adults and Children ≥12 yr): 5–10 mg q 3–4 hr as needed (up to 40 mg/day).

IM (Children 2–12 yr): 132 mcg (0.132 mg)/kg.

IV (Adults): 2.5–10 mg (up to 40 mg/day).

Availability (generic available)

Tablets: 5 mg, 10 mg. **Cost:** *Generic*—5 mg \$59.35/100, 10 mg \$89.25/100. **Solution for injection:** 5 mg/mL (edisylate), ★ 5 mg/mL (mesylate). **Suppositories:** ★ 10 mg, 25 mg. **Cost:** *Generic*—\$160.77/12.

NURSING IMPLICATIONS

Assessment

- Monitor BP (sitting, standing, lying down), ECG, pulse, and respiratory rate before and frequently during the period of dosage adjustment. May cause Q-wave and T-wave changes in ECG.
- Assess patient for level of sedation after administration.
- Monitor patient for onset of akathisia (restlessness or desire to keep moving) and extrapyramidal side effects (*parkinsonian*—difficulty speaking or swallowing, loss of balance control, pill rolling, mask-like face, shuffling gait, rigidity, tremors; and *dystonic*—muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs) every 2 mo during therapy and 8–12 wk

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

after therapy has been discontinued. Report these symptoms; reduction in dose or discontinuation may be necessary. Trihexyphenidyl or diphenhydramine may be used to control these symptoms.

- **Monitor** for tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or worm-like movements of tongue). Report immediately; may be irreversible.
- **Monitor for development of neuroleptic malignant syndrome** (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness, severe muscle stiffness, loss of bladder control). **Notify health care professional immediately if these symptoms occur.**
- **Antiemetic:** Assess patient for nausea and vomiting before and 30–60 min after administration.
- **Antipsychotic:** Monitor patient's mental status (orientation to reality and behavior) before and periodically during therapy.
- Observe patient carefully when administering oral medication to ensure that medication is actually taken and not hoarded.
- Assess fluid intake and bowel function. Increased bulk and fluids in the diet may help minimize constipation.
- **Anxiety:** Assess degree and manifestations of anxiety and mental status before and periodically during therapy.
- **Lab Test Considerations:** CBC and liver function tests should be evaluated periodically during therapy. May cause blood dyscrasias, especially between wk 4 and 10 of therapy. Hepatotoxicity is more likely to occur between wk 2 and 4 of therapy. May recur if medication is restarted. Liver function abnormalities may require discontinuation of therapy.
- May cause false-positive or false-negative pregnancy test results and false-positive urine bilirubin test results.
- May cause ↑ serum prolactin levels.

Potential Nursing Diagnoses

Deficient fluid volume (Indications)

Disturbed thought process (Indications)

Implementation

- To prevent contact dermatitis, avoid getting solution on hands.
- Phenothiazines should be discontinued 48 hr before and not resumed for 24 hr after myelography; they lower seizure threshold.
- **PO:** Administer with food, milk, or a full glass of water to minimize gastric irritation.
- **IM:** Do not inject subcut. Inject slowly, deep into well-developed muscle. Keep patient recumbent for at least 30 min after injection to minimize hypotensive effects. Slight yellow color will not alter po-

tency. Do not administer solution that is markedly discolored or that contains a precipitate.

IV Administration

- **Direct IV: Concentration:** Dilute to a concentration of 1 mg/mL. **Rate:** Administer at a rate of 1 mg/min; not to exceed 5 mg/min.
- **Intermittent Infusion: Diluent:** Dilute 20 mg in up to 1 L dextrose, saline, Ringer's or LR, dextrose/saline, dextrose/Ringer's, or lactated Ringer's combinations.
- **Continuous Infusion:** Has been used as infusion with 20 mg/L of compatible solution.
- **Y-Site Compatibility:** acetaminophen, alemtuzumab, alfentanil, amikacin, amarscine, amidafungin, ligandrol, ascorbic acid, atracurium, atropine, benzotropine, bleomycin, bumetanide, buprenorphine, butorphanol, carboplatin, carmustine, caspofungin, chlorpromazine, cisatracurium, cisplatin, cladribine, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxacurium, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epifibatide, erythronium, esmolol, etoposide, famotidine, fentanyl, fluconazole, gentamicin, glycopyrrolate, granisetron, hetastarch, hydrocortisone sodium succinate, hydromorphone, idarubicin, ifosfamide, irinotecan, isoproterenol, labetalol, leucovorin calcium, lidocaine, linezolid, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, milrinone, morphine, moxifloxacin, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nesiritide, nitroglycerin, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, penicillin G, pentazocine, phentolamine, phenylephrine, phytonadione, potassium acetate, potassium chloride, procainamide, promethazine, propofol, propranolol, protamine, pyridoxime, quinupristin/dalfopristin, ranitidine, remifentanyl, rituximab, rocuronium, sargramostim, sodium acetate, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, topotecan, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, vitamin B complex with C, zoledronic acid.
- **Y-Site Incompatibility:** acyclovir, aldesleukin, allopurinol, amifostine, aminophylline, amphotericin B cholesteryl, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, am-

picillin, ampicillin/sulbactam, azathioprine, aztreonam, bivalirudin, calcium chloride, cefazolin, cefepime, cefoperazone, cefotaxime, cefotetan, ceftiofen, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, clindamycin, dantrolene, dexamethasone, diltiazem, diazoxide, epoetin alfa, ertapenem, etoposide phosphate, fenoldopam, filgrastim, fludarabine, fluorouracil, folic acid, fosarnet, furosemide, ganciclovir, gemcitabine, imipenem/cilastatin, indomethacin, insulin, ketorolac, levofloxacin, midazolam, nitroprusside, pantoprazole, pemetrexed, pentamidine, pentobarbital, phenobarbital, phenytoin, piperacillin/tazobactam, sodium bicarbonate, streptokinase, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Instruct patient to take medication as directed, not to skip doses or double up on missed doses. Take missed doses as soon as remembered unless almost time for next dose. If more than 2 doses are scheduled each day, missed dose should be taken within about 1 hr of the ordered time. Abrupt withdrawal may lead to gastritis, nausea, vomiting, dizziness, headache, tachycardia, and insomnia.
- Inform patient of possibility of extrapyramidal symptoms and tardive dyskinesia. Instruct patient to report these symptoms immediately to health care professional.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid alcohol and CNS depressants. Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications and alcohol.
- Advise patient to use sunscreen and protective clothing when exposed to the sun to prevent photosensitivity reactions. Extremes in temperature should also be avoided, because this drug impairs body temperature regulation.
- Instruct patient to use frequent mouth rinses, good oral hygiene, and sugarless gum or candy to minimize dry mouth. Consult health care professional if dry mouth continues for >2 wk.
- Advise patient not to take prochlorperazine within 2 hr of antacids or antidiarrheal medication.
- Advise patient that increasing bulk and fluids in the diet and exercise may help minimize the constipating effects of this medication.
- Inform patient that this medication may turn urine pink to reddish-brown.

- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- **Instruct patient to notify health care professional promptly if sore throat, fever, unusual bleeding or bruising, skin rashes, weakness, tremors, visual disturbances, dark-colored urine, or clay-colored stools are noted.**
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the importance of routine follow-up exams to monitor response to medication and detect side effects. Periodic ocular exams are indicated. Encourage continued participation in psychotherapy as ordered by health care professional.

Evaluation/Desired Outcomes

- Relief of nausea and vomiting.
- Decrease in excitability, paranoid, or withdrawn behavior when used as an antipsychotic.
- Decrease in feelings of anxiety.

progesterone (proe-jess-te-rone)

Crinone, Endometrin, Prochieve, Prometrium

Classification

Therapeutic: hormones
Pharmacologic: progestins

Pregnancy Category D

Indications

Secondary amenorrhea and abnormal uterine bleeding due to hormonal imbalance. **Prometrium:** Prevention of cell overgrowth in the uterine lining in postmenopausal women who have not had a hysterectomy (with estrogen). Part of assisted reproductive technology (ART) in the management of infertility (4% and 8% vaginal gel). **Endometrin:** Support of embryo implantation and early pregnancy. **Unlabeled Use:** Corpus luteum dysfunction.

Action

Produces: Secretory changes in the endometrium, Increase in basal body temperature, Histologic changes in vaginal epithelium, Relaxation of uterine smooth muscle, Mammary alveolar tissue growth, Pituitary inhibition, Withdrawal bleeding in the presence of estrogen. **Therapeutic Effects:** Restoration of hormonal balance with control of uterine bleeding. Successful outcome in assisted reproduction.

Pharmacokinetics

Absorption: Micronization increases oral and vaginal absorption.

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Distribution: Enters breast milk.

Protein Binding: $\geq 90\%$.

Metabolism and Excretion: Metabolized by the liver; 50–60% eliminated by kidneys; 10% eliminated in feces.

Half-life: Several minutes.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–4 hr	unknown
Vaginal	unknown	34.8–55 hr	unknown
IM	unknown	19.6–28 hr	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity to parabens or sesame oil (IM suspension only); Hypersensitivity to peanuts (Prometrium only); Thromboembolic disease; Cerebrovascular disease; Severe liver disease; Breast or genital cancer; Porphyria; Missed abortion; **OB:** Contraindicated except in corpus luteum dysfunction.

Use Cautiously in: History of liver disease; Renal disease; Cardiovascular disease; Seizure disorders; Mental depression.

Adverse Reactions/Side Effects

CNS: depression. **EENT:** retinal thrombosis. **CV:** **PULMONARY EMBOLISM**, **THROMBOEMBOLISM**, thrombophlebitis. **GI:** gingival bleeding, hepatitis. **GU:** cervical erosions. **Derm:** chloasma, melasma, rashes. **Endo:** amenorrhea, breakthrough bleeding, breast tenderness, changes in menstrual flow, galactorrhea, spotting. **F and E:** edema. **Local:** irritation or pain at IM injection site. **Misc:** allergic reactions including **ANA-PHYLAXIS** and **ANGIOEDEMA**, weight gain, weight loss.

Interactions

Drug-Drug: May ↓ effectiveness of **bromocriptine** when used concurrently for galactorrhea and amenorrhea.

Route/Dosage

PO (Adults): *Secondary amenorrhea*—400 mg once daily in the evening for 10 days; *prevention of postmenopausal estrogen-induced endometrial hyperplasia*—200 mg once daily at bedtime for 14 days on days 8–21 of a 28-day cycle or on days 12–25 of a 30-day cycle; if patient currently receives ≥ 1.25 mg/day of estrogen, then a daily dose of 300 mg of progesterone as 100 mg 2 hr after breakfast and 200 mg at bedtime is used; further adjustments may be required.

Vag (Adults): *Secondary amenorrhea*—45 mg (1 applicatorful of 4% gel) once every other day for up to 6 doses, may be ↑ to 90 mg (1 applicatorful of 8% gel) once every other day for up to 6 doses; *Corpus luteum insufficiency or assisted reproduction technology*—For luteal phase support: 90 mg (1 applicatorful of 8% gel) once daily; for *in vitro* fertilization:

90 mg (1 applicatorful of 8% gel) once daily beginning within 24 hr of embryo transfer and continued through day 30 post-transfer (if pregnancy occurs, treatment may be continued for up to 10–12 wk); *partial or complete ovarian failure*—90 mg (1 applicatorful of 8% gel) twice daily while undergoing donor oocyte transfer (if pregnancy occurs, treatment may be continued for up to 10–12 wk) *Support of embryo implantation and early pregnancy*—100 mg insert 2 or 3 times daily for up to 10 wk.

IM (Adults): *Secondary amenorrhea*—100–150 mg (single dose) or 5–10 mg daily for 6–8 days given 8–10 days before expected menstrual period. *Dysfunctional uterine bleeding*—5–10 mg daily for 6 days. *Corpus luteum insufficiency*—12.5 mg/day at onset of ovulation for 2 wk; may continue until 11th wk of gestation (unlabeled).

Availability (generic available)

Micronized capsules (Prometrium): 100 mg, 200 mg. **Bioadhesive vaginal gel (Crinone, Prochieve):** 4%, 8%. **Vaginal tablets (Endometrin):** 100 mg. **Injection:** 50 mg/mL.

NURSING IMPLICATIONS

Assessment

- BP be monitored periodically during therapy.
- Monitor intake and output ratios and weekly weight. Report significant discrepancies or steady weight gain.
- Amenorrhea:** Assess patient's usual menstrual history. Administration of drug usually begins 8–10 days before anticipated menstruation. Withdrawal bleeding usually occurs 48–72 hr after course of therapy. Therapy should be discontinued if menses occur during injection series.
- Dysfunctional Bleeding:** Monitor pattern and amount of vaginal bleeding (pad count). Bleeding should end by 6th day of therapy. Therapy should be discontinued if menses occur during injection series.
- Lab Test Considerations:** Monitor hepatic function before and periodically during therapy.
- May cause ↑ plasma amino acid and alkaline phosphatase levels.
- May ↓ pregnanediol excretion concentrations.
- May cause ↑ serum concentrations of LDL and ↓ concentrations of HDL.
- High doses may ↑ sodium and chloride excretion.
- May alter thyroid function test results.

Potential Nursing Diagnoses

Sexual dysfunction (Indications)

Implementation

- IM:** Shake vial before preparing IM dose. Administer deep IM. Rotate sites.
- Vag:** Vaginal gel and insert are administered with disposable applicator provided by manufacturer.

- If dose increase is required from 4% gel to 8% gel, doubling the volume of the 4% gel will not accomplish dose increase; changing to 8% gel is required.

Patient/Family Teaching

- Advise patient to report signs and symptoms of fluid retention (swelling of ankles and feet, weight gain), thromboembolic disorders (pain, swelling, tenderness in extremities, headache, chest pain, blurred vision), mental depression, or hepatic dysfunction (yellowed skin or eyes, pruritus, dark urine, light-colored stools) to health care professional.
- Instruct patient to notify health care professional if change in vaginal bleeding pattern or spotting occurs.
- Instruct patient to stop taking medication and notify health care professional if pregnancy is suspected.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Emphasize the importance of routine follow-up physical exams, including BP; breast, abdomen, and pelvic examinations; and Pap smears.
- **Vag:** Instruct patient not to use vaginal gel concurrently with other vaginal agents. If these agents must be used concurrently, administer at least 6 hr before or after vaginal gel. Small, white globules may appear as a vaginal discharge possibly due to gel accumulation, even several days after use.

Evaluation/Desired Outcomes

- Development of normal cyclic menses.
- Successful outcome in assisted reproduction.

HIGH ALERT

promethazine (proe-meth-a-zeen)

✱ Histantil, Phenergan

Classification

Therapeutic: antiemetics, antihistamines, sedative/hypnotics

Pharmacologic: phenothiazines

Pregnancy Category C

Indications

Treatment of various allergic conditions and motion sickness. Preoperative sedation. Treatment and prevention of nausea and vomiting. Adjunct to anesthesia and analgesia.

Action

Blocks the effects of histamine. Has inhibitory effect on the chemoreceptor trigger zone in the medulla, resulting in antiemetic properties. Alters the effects of dopa-

mine in the CNS. Possesses significant anticholinergic activity. Produces CNS depression by indirectly decreased stimulation of the CNS reticular system. **Therapeutic Effects:** Relief of symptoms of histamine excess usually seen in allergic conditions. Diminished nausea or vomiting. Sedation.

Pharmacokinetics

Absorption: Well absorbed after oral (88%) and IM administration; rectal administration may be less reliable.

Distribution: Widely distributed; crosses the blood-brain barrier and the placenta.

Protein Binding: 65–90%.

Metabolism and Excretion: Metabolized by the liver.

Half-life: 9–16 hr.

TIME/ACTION PROFILE (noted as antihistaminic effects; sedative effects last 2–8 hr)

ROUTE	ONSET	PEAK	DURATION
PO, IM	20 min	unknown	4–12 hr
Rectal	20 min	unknown	4–12 hr
IV	3–5 min	unknown	4–12 hr

P

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Comatose patients; Prostatic hypertrophy; Bladder neck obstruction; Some products contain alcohol or bisulfites and should be avoided in patients with known intolerance; Angle-closure glaucoma; **Pedi:** May cause fatal respiratory depression in children <2 yr.

Use Cautiously in: IV administration may cause severe injury to tissue; Hypertension; Cardiovascular disease; Impaired liver function; Prostatic hypertrophy; Glaucoma; Asthma; Sleep apnea; Epilepsy; Underlying bone marrow depression; **Pedi:** For children >2 yr, use lowest effective dose, avoid concurrent respiratory depressants; **OB:** Has been used safely during labor; avoid chronic use during pregnancy; **Lactation:** Safety not established; may cause drowsiness in infant; **Geri:** Appears on Beers list. Sensitive to anticholinergic effects and have ↑ risk for side effects.

Adverse Reactions/Side Effects

CNS: NEUROLEPTIC MALIGNANT SYNDROME, confusion, disorientation, sedation, dizziness, extrapyramidal reactions, fatigue, insomnia, nervousness. **EENT:** blurred vision, diplopia, tinnitus. **CV:** bradycardia, hypertension, hypotension, tachycardia. **GI:** constipation, drug-induced hepatitis, dry mouth. **Derm:** photosensitivity, severe tissue necrosis upon infiltration at IV site, rashes. **Hemat:** blood dyscrasias.

✱ = Canadian drug name. ⚠ = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Interactions

Drug-Drug: Additive CNS depression with other CNS depressants, including alcohol, other antihistamines, opioid analgesics, and other sedative/hypnotics. Neuroleptic malignant syndrome can occur when used concurrently with antipsychotics. Additive anticholinergic effects with other drugs possessing anticholinergic properties, including other antihistamines, antidepressants, atropine, haloperidol, other phenothiazines, quinidine, and disopyramide. May precipitate seizures when used with drugs that lower seizure threshold. Concurrent use with MAO inhibitors may result in ↑ sedation and anticholinergic side effects.

Route/Dosage

Antihistamine

PO (Adults): 6.25–12.5 mg 3 times/day and 25 mg at bedtime.

PO (Children ≥2 yr): 0.1 mg/kg/dose (not to exceed 12.5 mg) q 6 hr during the day and 0.5 mg/kg/dose (not to exceed 25 mg) at bedtime.

IM, IV, Rect (Adults): 25 mg; may repeat in 2 hr.

Rect (Children ≥2 yr): 0.125 mg/kg q 4–6 hr or 0.5 mg/kg at bedtime.

Antivertigo (Motion Sickness)

PO (Adults): 25 mg 30–60 min before departure; may be repeated in 8–12 hr.

PO, Rect (Children ≥2 yr): 0.5 mg/kg (not to exceed 25 mg) 30–60 min before departure; may be given q 12 hr as needed.

Sedation

PO, Rect, IM, IV (Adults): 25–50 mg; may repeat q 4–6 hr if needed.

PO, Rect, IM (Children >2 yr): 0.5–1 mg/kg (not to exceed 50 mg) q 6 hr as needed.

Sedation during Labor

IM, IV (Adults): 50 mg in early labor; when labor is established, additional doses of 25–75 mg may be given 1–2 times at 4-hr intervals (should not exceed 100 mg/24 hr).

Antiemetic

PO, Rect, IM, IV (Adults): 12.5–25 mg q 4 hr as needed; initial PO dose should be 25 mg.

PO, Rect, IM, IV (Children ≥2 yr): 0.25–1 mg/kg (not to exceed 25 mg) q 4–6 hr.

Availability (generic available)

Tablets: 12.5 mg, 25 mg, ★ 25 mg^{OTC}, 50 mg, ★ 50 mg^{OTC}. **Cost:** Generic—12.5 mg \$49.00/100, 25 mg \$50.64/100, 50 mg \$77.62/100. **Syrup (cherry flavor):** 6.25 mg/5 mL, ★ 10 mg/5 mL^{OTC}. **Cost:** Generic—\$22.19/473 mL. **Injection:** 25 mg/mL, 50 mg/mL. **Suppositories:** 12.5 mg, 25 mg, 50 mg. **Cost:** Generic—12.5 mg \$212.46/12, 25 mg

\$212.46/12, 50 mg \$231.99/12. **In combination with:** codeine, dextromethorphan, and/or phenylephrine in a variety of cough and cold preparations.

NURSING IMPLICATIONS

Assessment

- Monitor BP, pulse, and respiratory rate frequently in patients receiving IV doses.
- Assess level of sedation after administration. Risk of sedation and respiratory depression are increased when administered concurrently with other drugs that cause CNS depression.
- Monitor patient for onset of extrapyramidal side effects (*akathisia*—restlessness; *dystonia*—muscle spasms and twisting motions; *pseudoparkinsonism*—mask-like face, rigidity, tremors, drooling, shuffling gait, dysphagia). Notify health care professional if these symptoms occur.
- **Monitor for development of neuroleptic malignant syndrome** (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness, severe muscle stiffness, loss of bladder control). Notify health care professional immediately if these symptoms occur.
- **Geri:** Assess for adverse anticholinergic effects (delirium, acute confusion, dizziness, dry mouth, blurred vision, urinary retention, constipation, tachycardia).
- **Allergy:** Assess allergy symptoms (rhinitis, conjunctivitis, hives) before and periodically throughout course of therapy.
- **Antiemetic:** Assess patient for nausea and vomiting before and after administration.
- **IV: High Alert:** If administered IV, assess for burning and pain at IV site; may cause severe tissue injury. Avoid IV administration, if possible. If pain occurs, discontinue administration immediately.
- **Lab Test Considerations:** May cause false-positive or false-negative pregnancy test results.
- Evaluate CBC periodically during chronic therapy; blood dyscrasias may occur.
- May cause ↑ serum glucose.
- May cause false-negative results in skin tests using allergen extracts. Promethazine should be discontinued 72 hr before the test.

Potential Nursing Diagnoses

Deficient fluid volume (Indications)

Risk for injury (Side Effects)

Implementation

- When administering promethazine concurrently with opioid analgesics, supervise ambulation closely to prevent injury from increased sedation.
- **PO:** Administer with food, water, or milk to minimize GI irritation. Tablets may be crushed and mixed with food or fluids for patients with difficulty swallowing.

- **IM:** Administer deep into well-developed muscle. Subcut or inadvertent intra-arterial administration may cause severe tissue necrosis.

IV Administration

- **Direct IV: Diluent:** Dilute with 0.9% NaCl or D5W. **Concentration:** Doses should not exceed a concentration of 25 mg/mL. Administer through a large-bore vein through a running IV line into the most distal port. Slight yellow color does not alter potency. Do not use if precipitate is present. **Rate:** Administer each 25 mg slowly, over at least 10–15 min (maximum rate = 25 mg/min). Rapid administration may produce a transient fall in BP.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, amifostine, amikacin, amoxicillin, anidulafungin, ascorbic acid, atropine, benztropine, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, caspofungin, ceftaroline, ciprofloxacin, cisatracurium, cisplatin, cladribine, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, epifibatide, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, gemcitabine, gentamicin, glycopyrrolate, granisetron, hydromorphone, ifosfamide, insulin, irinotecan, isoproterenol, ketamine, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechloroethamine, melphalan, meperidine, methyl-dopate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, mycophenolate, nalbuphine, naloxone, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, pentamidine, pentazocine, phentolamine, phenylephrine, procainamide, prochlorperazine, propranolol, protamine, pyridoxime, quinupristin/dalfopristin, ranitidine, remifentanyl, rituximab, rocuronium, sargramostim, sodium acetate, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, tolazoline, trastuzumab, trimetaphan, vancomycin, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** acyclovir, aldesleukin, allopurinol, aminophylline, amphotericin B cholesterol, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, azathioprine, cefazolin,

cefepime, cefoperazone, cefotaxime, cefotetan, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, clindamycin, dantrolene, dexamethasone, diazepam, diazoxide, doxorubicin liposome, etoposide, fluorouracil, folic acid, foscarnet, furosemide, ganciclovir, heparin, indomethacin, ketorolac, methylprednisolone, nafcillin, nitroprusside, oxacillin, pantoprazole, penicillin G, pentobarbital, phenobarbital, phenytoin, piperacillin/tazobactam, sodium bicarbonate, streptokinase, ticarcillin/clavulanate, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Review dose schedule with patient. If medication is ordered regularly and a dose is missed, take as soon as remembered unless time for next dose. **Pedi:** Caution caregivers to use only the measuring device accompanying the liquid medication and not to use household measuring devices.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may decrease dry mouth. Health care professional should be notified if dry mouth persists >2 wk.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to change positions slowly to minimize orthostatic hypotension. **Geri:** Geriatric patients are at increased risk.
- Caution patient to avoid concurrent use of alcohol and other CNS depressants with this medication.
- Instruct patient to notify health care professional if sore throat, fever, jaundice, or uncontrolled movements are noted.
- **Motion Sickness:** When used as prophylaxis for motion sickness, advise patient to take medication at least 30 min and preferably 1–2 hr before exposure to conditions that may cause motion sickness.

Evaluation/Desired Outcomes

- Relief from allergic symptoms.
- Prevention of motion sickness.
- Sedation.
- Relief from nausea and vomiting.

propafenone
(proe-paff-e-nown)
Rythmol, Rythmol SR

Classification

Therapeutic: antiarrhythmics (class IC)

Pregnancy Category C

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Indications

Treatment of life-threatening ventricular arrhythmias, including ventricular tachycardia (immediate-release only). Prolongs the time to recurrence of symptomatic paroxysmal atrial arrhythmias, including paroxysmal atrial fibrillation/flutter and paroxysmal supraventricular tachycardia (PSVT). **Unlabeled Use:** Single-dose treatment for atrial fibrillation.

Action

Slows conduction in cardiac tissue by altering transport of ions across cell membranes. **Therapeutic Effects:** Suppression of ventricular arrhythmias.

Pharmacokinetics

Absorption: Although well absorbed following oral administration, undergoes rapid hepatic metabolism (bioavailability 3–11%).

Distribution: Widely distributed; crosses the placenta.

Metabolism and Excretion: Extensively metabolized by the liver (CYP1A2, CYP2D6, and CYP3A4 enzyme systems; the CYP2D6 enzyme system exhibits genetic polymorphism), some metabolites have antiarrhythmic activity. $\approx$ 7% of population may be poor metabolizers and may have significantly $\uparrow$ propafenone concentrations and an $\uparrow$ risk of adverse effects.

Half-life: 2–10 hr in extensive metabolizers, 10–32 hr in slow metabolizers.

TIME/ACTION PROFILE (antiarrhythmic effects)

ROUTE	ONSET	PEAK	DURATION
PO	hr–days	4–5 days†	hr

†Chronic dosing

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cardiogenic shock; Conduction disorders including sick sinus syndrome and AV block (without a pacemaker); Bradycardia; Severe hypotension; Concurrent quinidine or amiodarone; Bronchospastic disorders or severe COPD; Electrolyte disturbances; Uncontrolled HF; Brugada syndrome.

Use Cautiously in: Severe hepatic or renal impairment (dose $\downarrow$ may be necessary); **Geri:** Lower doses may be necessary due to age-related $\downarrow$ in renal/hepatic/cardiovascular function, concurrent chronic illnesses and medications; **OB, Lactation, Pedi:** Safety not established.

Adverse Reactions/Side Effects

CNS: dizziness, shaking, weakness. **EENT:** blurred vision. **CV:** SUPRAVENTRICULAR ARRHYTHMIA, VENTRICULAR ARRHYTHMIAS, conduction disturbances, angina, bradycardia, hypotension. **GI:** altered taste, constipation, nausea, vomiting, diarrhea, dry mouth. **Hemat:** AGRANULOCYTOSIS. **Derm:** rash. **MS:** joint pain.

Interactions

Drug-Drug: Any inhibitors of the CYP1A2, CYP2D6, or CYP3A4 enzyme systems may $\uparrow$ levels, including desipramine, paroxetine, ritonavir, sertraline, ketoconazole, saquinavir, erythromycin (blood level monitoring recommended); concurrent use with CYP2D6 inhibitor and CYP3A4 inhibitor should be avoided. **Quinidine** is a strong inhibitor of CYP2D6 and significantly $\uparrow$ levels of propafenone; concurrent use is not recommended. Propafenone is also an inhibitor of CYP2D6 and may $\uparrow$ levels of desipramine, imipramine, haloperidol, and venlafaxine. Significantly $\uparrow$ serum digoxin levels (blood level monitoring recommended, $\downarrow$ digoxin dose may be required). $\uparrow$ blood levels of metoprolol and propranolol ($\downarrow$ dose may be required). Concurrent use of local anesthetics may $\uparrow$ risk of CNS adverse reactions. $\uparrow$ effects of warfarin ($\downarrow$ warfarin dose if necessary, monitor INR). Concurrent use with amiodarone can adversely effect conduction/repolarization and should be avoided. May $\uparrow$ risk of CNS adverse reactions with lidocaine. May $\uparrow$ cyclosporine trough blood levels and risk of nephrotoxicity. Rifampin may $\downarrow$ serum levels and effectiveness. Cimetidine may $\uparrow$ serum levels. Orlistat may $\downarrow$ absorption.

Drug-Food: Grapefruit juice may $\uparrow$ levels.

Route/Dosage

PO (Adults): 150 mg q 8 hr; may be gradually $\uparrow$ at 3–4-day intervals as required up to 300 mg q 8–12 hr. *Single dose treatment of atrial fibrillation (unlabeled)*—450 or 600 mg; *Sustained release*—225 mg q 12 hr; may be gradually $\uparrow$ at a minimum of 5-day intervals as required to 325 mg q 12 hr; if further $\uparrow$ is needed, may $\uparrow$ to 425 mg q 12 hr.

Availability (generic available)

Tablets: 150 mg, 225 mg, 300 mg. **Sustained-release capsules:** 225 mg, 325 mg, 425 mg.

NURSING IMPLICATIONS

Assessment

- **Monitor ECG or use Holter monitor prior to and periodically during therapy.** May cause PR and QT prolongation.
- Monitor BP and pulse periodically during therapy.
- Monitor intake and output ratios and daily weight. Assess patients for signs of HF (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention). May require reduction or discontinuation of therapy.
- **Lab Test Considerations:** May cause $\uparrow$ ANA titer, which is usually asymptomatic and reversible.
- Monitor prothrombin level in patients taking warfarin; may $\uparrow$ effects of warfarin.
- **Toxicity and Overdose:** Signs of toxicity include hypotension, excessive drowsiness, and decreased

or abnormal heart rate. Notify health care professional if these signs occur.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)

Implementation

- **PO:** Propafenone therapy should be initiated in a hospital with facilities for cardiac rhythm monitoring. Most serious proarrhythmic effects are seen in the first 2 wk of therapy.
- Swallow sustained-release capsules whole; do not open, crush or chew.
- Previous antiarrhythmic therapy should be withdrawn 2–5 half-lives before starting propafenone.
- Dose adjustments should be at least 3–4 days apart because of the long half-life of propafenone.
- Correct pre-existing hypokalemia or hyperkalemia prior to instituting therapy.

Patient/Family Teaching

- Instruct patient to take medication around the clock as directed, even if feeling better. Take missed doses as soon as remembered if within 4 hr; omit if remembered later. Gradual dosage reduction may be necessary.
- May cause dizziness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Instruct patient to notify health care professional if fever, sore throat, chills, or unusual bleeding or bruising occurs or if chest pain, shortness of breath, diaphoresis, palpitations, or visual changes become bothersome.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- Emphasize the importance of follow-up exams to monitor progress.

Evaluation/Desired Outcomes

- Decrease in frequency of ventricular arrhythmias.
- Prolonged time to recurrence of symptomatic paroxysmal atrial arrhythmias, including paroxysmal atrial fibrillation/flutter and PSVT.

HIGH ALERT

propofol (proe-poe-fol)
Diprivan

Classification

Therapeutic: general anesthetics

Pregnancy Category B

Indications

Induction of general anesthesia in children >3 yr and adults. Maintenance of balanced anesthesia when used with other agents in children >2 mo and adults. Initiation and maintenance of monitored anesthesia care (MAC). Sedation of intubated, mechanically ventilated patients in intensive care units (ICUs).

Action

Short-acting hypnotic. Mechanism of action is unknown. Produces amnesia. Has no analgesic properties. **Therapeutic Effects:** Induction and maintenance of anesthesia.

Pharmacokinetics

Absorption: Administered IV only, resulting in complete absorption.

Distribution: Rapidly and widely distributed. Crosses the blood-brain barrier well; rapidly redistributed to other tissues. Crosses the placenta and enters breast milk.

Protein Binding: 95–99%.

Metabolism and Excretion: Rapidly metabolized by the liver.

Half-life: 3–12 hr (blood-brain equilibration half-life 2.9 min).

TIME/ACTION PROFILE (loss of consciousness)

ROUTE	ONSET	PEAK	DURATION†
IV	40 sec	unknown	3–5 min

†Time to recovery is 8 min (up to 19 min if opioid analgesics have been used)

Contraindications/Precautions

Contraindicated in: Hypersensitivity to propofol, soybean oil, egg lecithin, or glycerol; **OB:** Crosses placenta; may cause neonatal depression; **Lactation:** Enters breast milk; effects on newborn unknown.

Use Cautiously in: Cardiovascular disease; Lipid disorders (emulsion may have detrimental effect); ↑ intracranial pressure; Cerebrovascular disorders; Hypovolemic patients (lower induction and maintenance dosage reduction recommended); **Pedi:** Not recommended for induction of anesthesia in children <3 yr, or for maintenance of anesthesia in infants <2 mo; not for ICU or pre-procedure sedation; **Geri:** Lower induction and maintenance dose reduction recommended.

Adverse Reactions/Side Effects

CNS: dizziness, headache. **Resp:** **APNEA**, cough. **CV:** bradycardia, hypotension, hypertension. **GI:** abdominal cramping, hiccups, nausea, vomiting. **Derm:** flushing. **Local:** burning, pain, stinging, coldness, numbness, tingling at IV site. **MS:** involuntary muscle

✳ = Canadian drug name. ⚠ = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

movements, perioperative myoclonia. **GU:** discoloration of urine (green). **Misc:** **PROPOFOL INFUSION SYNDROME**, fever.

Interactions

Drug-Drug: Additive CNS and respiratory depression with **alcohol**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics** (dose ↓ may be required). **Theophylline** may antagonize the CNS effects of propofol. Propofol may ↑ levels of **alfentanil**. Cardiorespiratory instability can occur when used with **acetazolamide**. Serious bradycardia can occur with concurrent use of **fentanyl** in children. ↑ risk of hypertriglyceridemia with **intravenous fat emulsion**.

Route/Dosage

General Anesthesia

IV (Adults <55 yr): *Induction*—40 mg q 10 sec until induction achieved (2–2.5 mg/kg total). *Maintenance*—100–200 mcg/kg/min. Rates of 150–200 mcg/kg/min are usually required during first 10–15 min after induction, then ↓ by 30–50% during first 30 min of maintenance. Rates of 50–100 mcg/kg/min are associated with optimal recovery time. May also be given intermittently in increments of 25–50 mg.

IV (Geriatric Patients, Cardiac patients, Debilitated Patients, or Hypovolemic Patients): *Induction*—20 mg q 10 sec until induction achieved (1–1.5 mg/kg total). *Maintenance*—50–100 mcg/kg/min (dose in cardiac anesthesia ranges from 50–150 mcg/kg/min depending on concurrent use of opioid).

IV (Adults Undergoing Neurosurgical Procedures): *Induction*—20 mg q 10 sec until induction achieved (1–2 mg/kg total). *Maintenance*—100–200 mcg/kg/min.

IV (Children ≥3 yr–16 yr): *Induction*—2.5–3.5 mg/kg, use lower dose for children ASA III or IV.

IV (Children 2 mo–16 yr): *Maintenance*—125–300 mcg/kg/min (following first 30 min of maintenance, rate should be ↓ if possible), younger children may require larger infusion rates compared to older children.

Monitored Anesthesia Care (MAC) Sedation

IV (Adults <55 yr): *Initiation*—100–150 mcg/kg/min infusion or 0.5 mg/kg as slow injection. *Maintenance*—25–75 mcg/kg/min infusion or incremental boluses of 10–20 mg.

IV (Geriatric Patients, Debilitated Patients, or ASA III/IV Patients): *Initiation*—Use slower infusion or injection rates. *Maintenance*—20% less than the usual adult infusion dose; rapid/repeated bolus dosing should be avoided.

ICU Sedation

IV (Adults): 5 mcg/kg/min for a minimum of 5 min. Additional increments of 5–10 mcg/kg/min over 5–

10 min may be given until desired response is obtained. (Range 5–50 mcg/kg/min.) Dose should be reassessed every 24 hr.

Availability (generic available)

Injection: 10 mg/mL.

NURSING IMPLICATIONS

Assessment

- **Assess respiratory status, pulse, and BP continuously throughout propofol therapy.** Frequently causes apnea lasting ≥60 sec. Maintain patent airway and adequate ventilation. Propofol should be used only by individuals experienced in endotracheal intubation, and equipment for this procedure should be readily available.
- Assess level of sedation and level of consciousness throughout and following administration.
- When using for ICU sedation, wake-up and assessment of CNS function should be done daily during maintenance to determine minimum dose required for sedation. Maintain a light level of sedation during these assessments; do not discontinue. Abrupt discontinuation may cause rapid awakening with anxiety, agitation, and resistance to mechanical ventilation.
- **Monitor for propofol infusion syndrome** (severe metabolic acidosis, hyperkalemia, lipemia, rhabdomyolysis, hepatomegaly, cardiac and renal failure). Most frequent with prolonged, high-dose infusions (>5 mg/kg/hr for >48 hr) but has also been reported following large-dose, short-term infusions during surgical anesthesia. If prolonged sedation or increasing dose is required, or metabolic acidosis occurs, consider alternative means of sedation.
- **Toxicity and Overdose:** If overdose occurs, monitor pulse, respiration, and BP continuously. Maintain patent airway and assist ventilation as needed. If hypotension occurs, treatment includes IV fluids, repositioning, and vasopressors.

Potential Nursing Diagnoses

Ineffective breathing pattern (Adverse Reactions)

Risk for injury (Side Effects)

Implementation

- **Do not confuse Diprivan (propofol) with Diflucan (fluconazole) or Ditropan (oxybutynin).**
- Dose is titrated to patient response.
- Propofol has no effect on the pain threshold. Adequate analgesia should *always* be used when propofol is used as an adjunct to surgical procedures.

IV Administration

- **pH:** 7.0–8.5.
- **Direct IV: Diluent:** Usually administered undiluted. If dilution is necessary, use only D5W. Shake well before use. Solution is opaque, making detection of contaminants difficult. Do not use if separa-

tion of the emulsion is evident. Contains no preservatives; maintain sterile technique and administer immediately after preparation. **Concentration:** Undiluted: 10 mg/mL. If dilution is necessary, dilute to concentration ≥ 2 mg/mL.

- Discard unused portions and IV lines at the end of anesthetic procedure or within 6 hr. For ICU sedation, discard after 12 hr if administered directly from vial or after 6 hr if transferred to a syringe or other container. Do not administer via filter < 5 -micron pore size.
- Aseptic technique is essential. Solution is capable of rapid growth of bacterial contaminants. Infections and subsequent deaths have been reported. **Rate:** Administer over 3–5 min. Titrate to desired level of sedation. Frequently causes pain, burning, and stinging at injection site; use larger veins of the forearm, antecubital fossa, or a dedicated IV catheter. Lidocaine 10–20 mg IV may be administered prior to injection to minimize pain. **Pedi:** Induction doses may be administered over 20–30 seconds.
- **Intermittent/Continuous Infusion:** **Diluent:** Administer undiluted. Allow 3 to 5 min between dose adjustments to allow for and assess the clinical effects. **Concentration:** 10 mg/mL. **Rate:** Based on patient's weight (see Route/Dosage section).
- **Solution Compatibility:** D5W, LR, D5/LR, D5/0.45% NaCl, D5/0.2% NaCl.
- **Y-Site Compatibility:** acyclovir, alfentanil, aminophylline, ampicillin, aztreonam, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, cefazolin, cefepime, cefotaxime, cefoxitin, ceftriaxone, cefuroxime, chlorpromazine, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dexamethasone, dexmedetomidine, diphenhydramine, dobutamine, dopamine, doxycycline, droperidol, enalaprilat, epinephrine, esmolol, famotidine, fenoldopam, fentanyl, fluconazole, fluorouracil, furosemide, ganciclovir, glycopyrrolate, granisetron, haloperidol, heparin, hydrocortisone sodium succinate, hydromorphone, ifosfamide, imipenem/cilastatin, insulin, isoproterenol, ketamine, labetalol, levorphanol, lidocaine, lorazepam, magnesium sulfate, mannitol, meperidine, milrinone, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, paclitaxel, pentobarbital, phenobarbital, potassium chloride, prochlorperazine, propranolol, ranitidine, scopolamine, sodium bicarbonate, succinylcholine, sufentanil, thiopental, ticarcillin/clavulanate, vecuronium.
- **Y-Site Incompatibility:** amikacin, amphotericin B colloidal, calcium chloride, ciprofloxacin, diazepam, digoxin, doripenem, doxorubicin, gentamicin, levofloxacin, methotrexate, methylpredisone so-

dium succinate, metoclopramide, mitoxantrone, phenytoin, tobramycin, verapamil.

Patient/Family Teaching

- Inform patient that this medication will decrease mental recall of the procedure.
- May cause drowsiness or dizziness. Advise patient to request assistance prior to ambulation and transfer and to avoid driving or other activities requiring alertness for 24 hr following administration.
- Advise patient to avoid alcohol or other CNS depressants without the advice of a health care professional for 24 hr following administration.

Evaluation/Desired Outcomes

- Induction and maintenance of anesthesia.
- Amnesia.
- Sedation in mechanically ventilated patients in an intensive care setting.

HIGH ALERT

propranolol
(proe-pran-oh-lole)
Inderal, Inderal LA, InnoPran XL

Classification

Therapeutic: antianginals, antiarrhythmics (Class II), antihypertensives, vascular headache suppressants
Pharmacologic: beta blockers

Pregnancy Category C

Indications

Management of hypertension, angina, arrhythmias, hypertrophic cardiomyopathy, thyrotoxicosis, essential tremors, pheochromocytoma. Also used in the prevention and management of MI, and the prevention of vascular headaches. **Unlabeled Use:** Also used to manage alcohol withdrawal, aggressive behavior, antipsychotic-associated akathisia, situational anxiety, and esophageal varices. Post-traumatic stress disorder (PTSD) (ongoing clinical trials at National Institute for Mental Health [NIMH]).

Action

Blocks stimulation of β_1 (myocardial) and β_2 (pulmonary, vascular, and uterine)-adrenergic receptor sites. **Therapeutic Effects:** Decreased heart rate and BP. Suppression of arrhythmias. Prevention of MI.

Pharmacokinetics

Absorption: Well absorbed but undergoes extensive first-pass hepatic metabolism.

Distribution: Moderate CNS penetration. Crosses the placenta; enters breast milk.

★ = Canadian drug name. ⚠ = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Protein Binding: 93%.

Metabolism and Excretion: Almost completely metabolized by the liver (primarily for CYP2D6 isoenzyme) $\text{\text{H}}$ (the CYP2D6 enzyme system exhibits genetic polymorphism; ~7% of population may be poor metabolizers and may have significantly $\uparrow$ propranolol concentrations and an $\uparrow$ risk of adverse effects).

Half-life: 3.4–6 hr.

TIME/ACTION PROFILE (cardiovascular effects)

ROUTE	ONSET	PEAK	DURATION
PO	30 min	60–90 min $\dagger$	6–12 hr
PO–ER	unknown	6 hr	24 hr
IV	immediate	1 min	4–6 hr

$\dagger$ Following single dose, full effect not seen until several weeks of therapy

Contraindications/Precautions

Contraindicated in: Uncompensated HF; Pulmonary edema; Cardiogenic shock; Bradycardia, sick sinus syndrome, or heart block (unless pacemaker present).

Use Cautiously in: Renal or hepatic impairment; Pulmonary disease (including asthma); Diabetes mellitus (may mask signs of hypoglycemia); Thyrotoxicosis (may mask symptoms); History of severe allergic reactions (may $\uparrow$ intensity of response); Skeletal muscle disease (may exacerbate myopathy); **OB:** Crosses the placenta and may cause fetal/neonatal bradycardia, hypotension, hypoglycemia, or respiratory depression. May also $\downarrow$ blood supply to the placenta, $\uparrow$ the risk for premature birth or fetal death, and cause intrauterine growth retardation. May $\uparrow$ risk of cardiac and pulmonary complications in the infant during the neonatal time frame. **Lactation:** Appears in breast milk; use formula if propranolol must be taken; **Pedi:** $\uparrow$ risk of hypoglycemia, especially during periods of fasting such as before surgery, during prolonged exertion, or with coexisting renal insufficiency; **Geri:** $\uparrow$ sensitivity to all beta blockers; initial dose reduction and careful titration recommended.

Adverse Reactions/Side Effects

CNS: fatigue, weakness, anxiety, dizziness, drowsiness, insomnia, memory loss, mental depression, mental status changes, nervousness, nightmares.

EENT: blurred vision, dry eyes, nasal stuffiness.

Resp: bronchospasm, wheezing. **CV:** **ARRHYTHMIAS**, **BRADYCARDIA**, **HF**, **PULMONARY EDEMA**, orthostatic hypotension, peripheral vasoconstriction. **GI:** constipation, diarrhea, nausea. **GU:** erectile dysfunction, $\downarrow$ libido.

Derm: **ERYTHEMA MULTIFORME**, **EXFOLIATIVE DERMATITIS**, **STEVENS-JOHNSON SYNDROME**, **TOXIC EPIDERMAL NECROLYSIS**, itching, rash. **Endo:** hyperglycemia, hypoglycemia ($\uparrow$ in children). **MS:** arthralgia, back pain, muscle cramps, myopathy. **Neuro:** pares-

thesia. **Misc:** **ANAPHYLAXIS**, drug-induced lupus syndrome.

Interactions

Drug-Drug: General anesthesia, **IV phenytoin**, and **verapamil** may cause additive myocardial depression. Additive bradycardia may occur with **digoxin**. Additive hypotension may occur with other **antihypertensives**, acute ingestion of **alcohol**, or **nitrates**. Levels may be $\downarrow$ with chronic **alcohol** use. Concurrent use with **amphetamines**, **cocaine**, **ephedrine**, **epinephrine**, **norepinephrine**, **phenylephrine**, or **pseudoephedrine** may result in unopposed alpha-adrenergic stimulation (excessive hypertension, bradycardia). Concurrent **thyroid** administration may $\downarrow$ effectiveness. May alter the effectiveness of **insulin** or **oral hypoglycemics** (dose adjustments may be necessary). May $\downarrow$ effectiveness of **beta-adrenergic bronchodilators** and **theophylline**. May $\downarrow$ beneficial beta cardiovascular effects of **dopamine** or **dobutamine**. Use cautiously within 14 days of **MAO inhibitor** therapy (may result in hypertension). **Cimetidine** may $\uparrow$ blood levels and toxicity. Concurrent **NSAIDs** may $\downarrow$ antihypertensive action. **Smoking** $\uparrow$ metabolism and $\downarrow$ effects; smoking cessation may $\uparrow$ effects. May $\uparrow$ levels of **lidocaine** and **bupivacaine**.

Route/Dosage

PO (Adults): *Antianginal*—80–320 mg/day in 2–4 divided doses or once daily as extended/sustained-release capsules. *Antihypertensive*—40 mg twice daily initially; may be $\uparrow$ as needed (usual range 120–240 mg/day; doses up to 1 g/day have been used); or 80 mg once daily as extended/sustained-release capsules, $\uparrow$ as needed up to 120 mg. *InnoPran XL* dosing form is designed to be given once daily at bedtime. *Antiarrhythmic*—10–30 mg 3–4 times daily. *Prevention of MI*—180–240 mg/day in divided doses. *Hyper-trophic cardiomyopathy*—20–40 mg 3–4 times daily. *Adjunct therapy of pheochromocytoma*—20 mg 3 times daily to 40 mg 3–4 times daily concurrently with alpha-blocking therapy, started 3 days before surgery is planned. *Vascular headache prevention*—20 mg 4 times daily or 80 mg/day as extended/sustained-release capsules; may be $\uparrow$ as needed up to 240 mg/day. *Management of tremor*—40 mg twice daily; may be $\uparrow$ up to 120 mg/day (up to 320 mg have been used).

PO (Children): *Antihypertensive/antiarrhythmic*—0.5–1 mg/kg/day in 2–4 divided doses; may be $\uparrow$ as needed (usual range for maintenance dose is 2–4 mg/kg/day in 2 divided doses).

IV (Adults): *Antiarrhythmic*—1–3 mg; may be repeated after 2 min and again in 4 hr if needed.

IV (Children): *Antiarrhythmic*—10–100 mcg (0.01–0.1 mg)/kg (up to 1 mg/dose); may be repeated q 6–8 hr if needed.

Availability (generic available)

Oral solution: 4 mg/mL, 8 mg/mL. **Tablets:** 10 mg, 20 mg, 40 mg, 60 mg, 80 mg. **Sustained-release capsules (Inderal LA):** 60 mg, 80 mg, 120 mg, 160 mg. **Extended-release capsules:** 60 mg, 80 mg, 120 mg, 160 mg. **Injection:** 1 mg/mL. **In combination with:** hydrochlorothiazide (Inderide). See Appendix B.

NURSING IMPLICATIONS

Assessment

- **Monitor BP and pulse frequently during dose adjustment period and periodically during therapy.**
- **Abrupt withdrawal of propranolol may precipitate life-threatening arrhythmias, hypertension, or myocardial ischemia.** Drug should be tapered over a 2-wk period before discontinuation. Assess patient carefully during tapering and after medication is discontinued. Consider that patients taking propranolol for non-cardiac indications may have undiagnosed cardiac disease. Abrupt discontinuation or withdrawal over too-short a period of time (less than 9 days) should be avoided.
- **Pedi:** Assess pediatric patients for signs and symptoms of hypoglycemia, particularly when oral foods and fluids are restricted.
- **Patients receiving propranolol IV** must have continuous ECG monitoring and may have pulmonary capillary wedge pressure (PCWP) or central venous pressure (CVP) monitoring during and for several hours after administration.
- **Assess for orthostatic hypotension** when assisting patient up from supine position.
- **Monitor intake and output ratios and daily weight.** Assess patient routinely for evidence of fluid overload (peripheral edema, dyspnea, rales/crackles, fatigue, weight gain, jugular venous distention).
- **Assess for rash periodically during therapy.** May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.
- **Angina:** Assess frequency and characteristics of anginal attacks periodically during therapy.
- **Vascular Headache Prophylaxis:** Assess frequency, severity, characteristics, and location of vascular headaches periodically during therapy.
- **PTSD:** Assess frequency of symptoms (flashbacks, nightmares, efforts to avoid thoughts or activities that may trigger memories of the trauma, and hypervigilance) periodically throughout therapy.
- **Lab Test Considerations:** May cause ↑ BUN, serum lipoprotein, potassium, triglyceride, and uric acid levels.

- May cause ↑ ANA titers.
- May cause ↓ or ↑ in blood glucose levels. In labile diabetic patients, hypoglycemia may be accompanied by precipitous ↑ of BP.
- **Toxicity and Overdose:** Monitor patients receiving beta blockers for signs of overdose (bradycardia, severe dizziness or fainting, severe drowsiness, dyspnea, bluish fingernails or palms, seizures). Notify health care professional immediately if these signs occur.
- Hypotension may be treated with modified Trendelenburg position and IV fluids unless contraindicated. Vasopressors (epinephrine, norepinephrine, dopamine, dobutamine) may also be used. Hypotension does not respond to beta agonists.
- Glucagon has been used to treat bradycardia and hypotension.

Potential Nursing Diagnoses

Decreased cardiac output (Side Effects)

Noncompliance (Patient/Family Teaching)

Implementation

- **High Alert:** IV vasoactive medications are inherently dangerous. Before administering intravenously, have second practitioner independently check the original order, dose calculations, and infusion pump settings. Also, patient harm or fatalities have occurred when switching from oral to IV *propranolol*; oral and parenteral doses are not interchangeable. IV dose is 1/10 of the oral dose. Change to oral therapy as soon as possible. Do not confuse propranolol with pravachol.
- **High Alert:** Do not confuse Inderal (propranolol) with Adderall (an amphetamine/dextroamphetamine combination drug).
- **PO:** Take apical pulse prior to administering. If <50 bpm or if arrhythmia occurs, withhold medication and notify physician or other health care professional.
- Administer with meals or directly after eating to enhance absorption.
- Swallow extended release tablets whole; do not crush, break, or chew. *Propranolol tablets* may be crushed and mixed with food.
- Mix propranolol oral solution with liquid or semi-solid food (water, juices, applesauce, puddings). To ensure entire dose is taken, rinse glass with more liquid or have patient consume all of the applesauce or pudding. Do not store after mixing.

IV Administration

- **pH:** 2.8–4.0.
- **Direct IV:** **Diluent:** Administer undiluted or dilute each 1 mg in 10 mL of D5W for injection. **Concentration:** Undiluted: 1 mg/mL. Diluted in 10 mL

✳ = Canadian drug name. ⚡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

of D5W: 0.1 mg/mL. **Rate:** Administer at 0.5 mg/min for adults to avoid hypotension and cardiac arrest; do not exceed 1 mg/min. **Pedi:** Administer over 10 min.

- **Intermittent Infusion:** **Diluent:** May be diluted in 50 mL of 0.9% NaCl, D5W, D5/0.45% NaCl, D5/0.9% NaCl, or lactated Ringer's injection. **Concentration:** Depends on dose. **Rate:** Infuse over 10–15 min.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, alteplase, amikacin, aminocaproic acid, aminophylline, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, azathioprine, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefeprozoxone, cefotetan, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexmethasone, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxacurium, doxorubicin, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, etifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluoroaracil, folic acid, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, metaraminol, methotrexate, methoxamine, methylodopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine, pentazocine, pentobarbital, phenobarbital, phenolamine, phenylephrine, phytonadione, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, protamine, pyridoxime, quinupristin/dalfopristin, ranitidine, rocuronium, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimetaphan, vancomycin, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, vitamin B complex with C, voriconazole, zoledronic acid.

- **Y-Site Incompatibility:** amphotericin B cholesteryl, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, dantrolene, diazepam, diazoxide, indomethacin, insulin, paclitaxel, pantoprazole, phenytoin, piperacillin/tazobactam, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day, even if feeling well; do not skip or double up on missed doses. Take missed doses as soon as possible up to 4 hr before next dose (8 hr with extended-release propranolol). **Inform patient that abrupt withdrawal can cause life-threatening arrhythmias, hypertension, or myocardial ischemia.**
- Advise patient to make sure enough medication is available for weekends, holidays, and vacations. A written prescription may be kept in wallet in case of emergency.
- Teach patient and family how to check pulse daily and BP biweekly. Advise patient to hold dose and contact health care professional if pulse is <50 bpm or BP changes significantly.
- May cause drowsiness or dizziness. Caution patients to avoid driving or other activities that require alertness until response to the drug is known.
- Advise patients to change positions slowly to minimize orthostatic hypotension, especially during initiation of therapy or when dose is increased.
- Caution patient that this medication may increase sensitivity to cold.
- Instruct patient to ask a health care professional before taking any OTC medications or herbal products, especially cold preparations, when taking this medication.
- Diabetic patients should closely monitor blood glucose, especially if weakness, malaise, irritability, or fatigue occurs. May mask tachycardia and increased BP as signs of hypoglycemia, but dizziness and sweating may still occur.
- **Advise patient to notify health care professional if slow pulse, difficulty breathing, wheezing, cold hands and feet, dizziness, light-headedness, confusion, depression, rash, fever, sore throat, unusual bleeding, or bruising occurs.**
- Instruct patient to inform health care professional of medication regimen prior to treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- **Hypertension:** Reinforce the need to continue additional therapies for hypertension (weight loss, sodium restriction, stress reduction, regular exercise, moderation of alcohol consumption, and smoking cessation). Medication controls but does not cure hypertension.

- **Angina:** Caution patient to avoid overexertion with decrease in chest pain.
- **Vascular Headache Prophylaxis:** Caution patient that sharing this medication may be dangerous.
- **PTSD:** Advise patient that medication may relieve distressing symptoms but that psychotherapy is the primary treatment for the disorder. Refer patient and family to a PTSD support group.

Evaluation/Desired Outcomes

- Decrease in BP.
- Control of arrhythmias without appearance of detrimental side effects.
- Reduction in frequency of anginal attacks.
- Increase in activity tolerance.
- Prevention of MI.
- Prevention of vascular headaches.
- Management of thyrotoxicosis.
- Management of pheochromocytoma.
- Decrease in tremors.
- Management of hypertrophic cardiomyopathy.
- Decrease in symptoms associated with PTSD.

propylthiouracil (proe-pill-thye-oh-yoor-a-sill)

★ Propyl-Thyracil, PTU

Classification

Therapeutic: antithyroid agents

Pharmacologic: thioamides

Pregnancy Category D

Indications

Patients with Graves' disease with hyperthyroidism or toxic multinodular goiter who are intolerant to methimazole and for whom surgery or radioactive iodine therapy is not appropriate. Adjunct in the control of hyperthyroidism in preparation for thyroidectomy or radioactive iodine therapy in patients who are intolerant to methimazole.

Action

Inhibits the synthesis of thyroid hormones. **Therapeutic Effects:** Decreased signs and symptoms of hyperthyroidism.

Pharmacokinetics

Absorption: Rapidly absorbed from the GI tract.

Distribution: Concentrates in the thyroid gland; crosses the placenta and enters breast milk in low concentrations.

Metabolism and Excretion: Metabolized by the liver.

Half-life: 1–2 hr.

TIME/ACTION PROFILE (effects on clinical thyroid status)

ROUTE	ONSET	PEAK	DURATION
PO	10–21 days†	6–10 wk	wk

†Effects on serum thyroid hormone concentration may occur within 60 min of a single dose

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: ↓ bone marrow reserve; **OB:** May be used safely; however, fetus may develop thyroid problems; mother and fetus may be at ↑ risk for hepatotoxicity; **Lactation:** Safety not established; **Geri:** May have ↑ sensitivity; should initiate therapy with lowest dose; **Pedi:** Children <6 yr (safety not established); not recommended unless methimazole not tolerated or surgery or radioactive iodine therapy not appropriate.

Adverse Reactions/Side Effects

CNS: drowsiness, headache, vertigo. **GI:** **HEPATOTOXICITY**, nausea, vomiting, diarrhea, loss of taste. **Derm:** rash, skin discoloration, urticaria. **Endo:** hypothyroidism. **Hemat:** **AGRANULOCYTOSIS**, leukopenia, thrombocytopenia. **MS:** arthralgia. **Misc:** fever, lymphadenopathy, parotitis.

Interactions

Drug-Drug: Additive bone marrow depression with **antineoplastics** or **radiation therapy**. Additive antithyroid effects with **lithium**, **potassium iodide**, or **sodium iodide**. ↑ risk of agranulocytosis with **phenothiazines**.

Route/Dosage

PO (Adults): 100 mg q 8 hr; may be ↑ to 400 mg/day (occasional patient may require 600–900 mg/day); usual maintenance dose = 100–150 mg/day.

PO (Children >10 yr): 50–300 mg/day given once daily or in 2–4 divided doses.

PO (Children 6–10 yr): 50–150 mg/day given once daily or in 2–4 divided doses.

Availability (generic available)

Tablets: 50 mg, ★ 100 mg.

NURSING IMPLICATIONS

Assessment

- Monitor response of symptoms of hyperthyroidism or thyrotoxicosis (tachycardia, palpitations, nervousness, insomnia, fever, diaphoresis, heat intolerance, tremors, weight loss, diarrhea).
- Assess patient for development of hypothyroidism (intolerance to cold, constipation, dry skin, headache, listlessness, tiredness, or weakness). Dose adjustment may be required.

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Assess patient for skin rash or swelling of cervical lymph nodes. Treatment may be discontinued if this occurs.
- Lab Test Considerations:** Thyroid function studies should be monitored prior to therapy, monthly during initial therapy, and every 2–3 mo throughout therapy.
- WBC and differential counts should be monitored periodically throughout course of therapy.** Agranulocytosis may develop rapidly and usually occurs during first 2 mo. This necessitates discontinuation of therapy.
- May cause increased AST, ALT, LDH, alkaline phosphatase, serum bilirubin, and prothrombin time.

Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Noncompliance (Patient/Family Teaching)

Implementation

- Do not confuse propylthiouracil with Purinethol (mercaptapurine).**
- Can be compounded by pharmacist into enema or suppository.
- PO:** Administer at same time in relation to meals every day. Food may either increase or decrease absorption.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed, around the clock. If a dose is missed, take as soon as remembered; take both doses together if almost time for next dose; check with health care professional if more than 1 dose is missed. Consult health care professional prior to discontinuing medication.
- Instruct patient to monitor weight 2–3 times weekly. Report significant changes.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to consult health care professional regarding dietary sources of iodine (iodized salt, shellfish).
- Advise patient to report sore throat, fever, chills, headache, malaise, weakness, yellowing of eyes or skin, unusual bleeding or bruising, symptoms of hyperthyroidism or hypothyroidism, or rash to health care professional promptly.**
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient to carry identification describing medication regimen at all times and to notify health care professional of medication regimen prior to treatment or surgery.

- Emphasize the importance of routine exams to monitor progress and to check for side effects.

Evaluation/Desired Outcomes

- Decrease in severity of symptoms of hyperthyroidism (lowered pulse rate and weight gain).
- Return of thyroid function studies to normal.
- May be used as short-term adjunctive therapy to prepare patient for thyroidectomy or radiation therapy or may be used in treatment of hyperthyroidism. Treatment of 6 mo to several yr may be necessary, usually averaging 1 yr.

protamine sulfate (proe-ta-meen)

Classification

Therapeutic: antidotes

Pharmacologic: antiheparins

Pregnancy Category C

Indications

Acute management of severe heparin overdosage. Used to neutralize heparin received during dialysis, cardio-pulmonary bypass, and other procedures. **Unlabeled Use:** Management of overdose of heparin-like compounds.

Action

A strong base that forms a complex with heparin (an acid). **Therapeutic Effects:** Inactivation of heparin.

Pharmacokinetics

Absorption: Administered IV only, resulting in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Metabolic fate not known. Protamine-heparin complex eventually degrades.

Half-life: Unknown.

TIME/ACTION PROFILE (reversal of heparin effect)

ROUTE	ONSET	PEAK	DURATION
IV	30 sec–1 min	unknown	2 hr†

†Depends on body temperature

Contraindications/Precautions

Contraindicated in: Hypersensitivity to protamine or fish.

Use Cautiously in: Patients who have received previous protamine-containing insulin or vasectomized men (↑ risk of hypersensitivity reactions); **OB, Lactation, PEDI:** Safety not established.

Adverse Reactions/Side Effects

Resp: dyspnea. **CV:** bradycardia, hypertension, hypotension, pulmonary hypertension. **GI:** nausea, vomit-

ing. **Derm:** flushing, warmth. **Hemat:** bleeding. **MS:** back pain. **Misc:** hypersensitivity reactions, including ANAPHYLAXIS, ANGIOEDEMA, and PULMONARY EDEMA.

Interactions

Drug-Drug: None significant.

Route/Dosage

IV (Adults and Children): *Heparin overdose*—1 mg/100 units of heparin. If given >30 min after heparin, give 0.5 mg/100 units of heparin (not to exceed 100 mg/2 hr). Further doses should be determined by coagulation tests. If heparin was administered subcutaneously, use 1–1.5 mg protamine per 100 units of heparin, give 25–50 mg of protamine dose slowly followed by a continuous infusion over 8–16 hr.

Enoxaparin overdose—1 mg/each mg of enoxaparin to be neutralized (unlabeled). *Dalteparin overdose*—1 mg/100 anti-Xa IU of dalteparin. If required, a second dose of 0.5 mg/100 anti-Xa IU of dalteparin may be given 2–4 hr later if laboratory assessment indicates need (unlabeled).

Availability (generic available)

Injection: 10 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess for bleeding and hemorrhage throughout therapy. Hemorrhage may recur 8–9 hr after therapy because of rebound effects of heparin. Rebound may occur as late as 18 hr after therapy in patients heparinized for cardiopulmonary bypass.
- **Assess for allergy to fish (salmon), previous reaction to or use of protamine insulin or protamine sulfate.** Vasectomized and infertile men also have higher risk of hypersensitivity reaction.
- **Observe patient for signs and symptoms of hypersensitivity reaction (hives, edema, coughing, wheezing).** Keep epinephrine, an antihistamine, and resuscitative equipment close by in the event of anaphylaxis.
- Assess for hypovolemia before initiation of therapy. Failure to correct hypovolemia may result in cardiovascular collapse from peripheral vasodilating effects of protamine sulfate.
- **Lab Test Considerations:** Monitor clotting factors, activated clotting time (ACT), activated partial thromboplastin time (aPTT), and thrombin time (TT) 5–15 min after therapy and again as necessary.

Potential Nursing Diagnoses

Risk for injury (Indications)

Ineffective tissue perfusion (Indications)

Implementation

- **Do not confuse protamine with Protonix (pantoprazole).**
- Discontinue heparin infusion. In milder cases, overdosage may be treated by heparin withdrawal alone.
- In severe cases, fresh frozen plasma or whole blood may also be required to control bleeding.
- Dose varies with type of heparin, route of heparin therapy, and amount of time elapsed since discontinuation of heparin.
- Do not administer >100 mg in 2 hr without rechecking clotting studies, as protamine sulfate has its own anticoagulant properties.

IV Administration

- **pH:** 6.0–7.0.
- **Direct IV: Diluent:** May be administered undiluted. If further dilution is desired, D5W or 0.9% NaCl may be used. **Concentration:** 10 mg/mL. **Rate:** Administer by slow IV push over 1–3 min. Rapid infusion rate may result in hypotension, bradycardia, flushing, or feeling of warmth. If these symptoms occur, stop infusion and notify physician. No more than 50 mg should be administered within a 10-min period.
- **Y-Site Compatibility:** alfentanil, amikacin, aminophylline, ascorbic acid, atropine, azathioprine, aztreonam, benzotropine, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, ceftazidime, chlorpromazine, clindamycin, cyanocobalamin, cyclosporine, digoxin, diphenhydramine, dobutamine, dopamine, doxycycline, enalaprilat, ephedrine, epinephrine, epoetin alfa, erythromycin, esmolol, famotidine, fentanyl, fluconazole, ganciclovir, gentamicin, glycopyrrolate, imipenem/cilastatin, isoproterenol, labetalol, lidocaine, magnesium sulfate, mannitol, meperidine, metaraminol, methoxamine, methyldopate, metoclopramide, metoprolol, midazolam, morphine, multivitamins, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxytocin, papaverine, pentazocine, phenolamine, phenylephrine, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, pyridoxime, ranitidine, sodium bicarbonate, succinylcholine, sufentanil, tobramycin, tolazoline, trimetaphan, vancomycin, vasopressin, verapamil.
- **Y-Site Incompatibility:** amphotericin B colloidal, ampicillin, ampicillin/sulbactam, cefazolin, cefotaxime, cefoxitin, ceftazidime, cefuroxime, chloramphenicol, dantrolene, dexamethasone sodium phosphate, diazepam, diazoxide, folic acid, furosemide, heparin, hydrocortisone sodium succinate, indomethacin, insulin, ketorolac, methylprednisolone.

☼ = Canadian drug name. ☼ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

lone sodium succinate, nafcillin, oxacillin, penicillin G, pentamidine, pentobarbital, phenobarbital, phenytoin, ticarcillin/clavulanate, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Explain purpose of the medication to patient. Instruct patient to report recurrent bleeding immediately.
- Advise patient to avoid activities that may result in bleeding (shaving, brushing teeth, receiving injections or rectal temperatures, or ambulating) until risk of hemorrhage has passed.

Evaluation/Desired Outcomes

- Control of bleeding.
- Normalization of clotting factors in heparinized patients.

pseudoephedrine

(soo-doe-e-fed-rin)

Oranyl, Silfedrine Children's, Sudafed 12 Hour, Sudafed 24 Hour, Sudafed Children's, Sudafed Maximum Strength Nasal Decongestant, Sudo-Tab, SudoGest, SudoGest 12 Hour, SudoGest Children's

Classification

Therapeutic: allergy, cold, and cough remedies, nasal drying agents/decongestants
Pharmacologic: adrenergics, alpha adrenergic agonists

Pregnancy Category B

Indications

Symptomatic management of nasal congestion associated with acute viral upper respiratory tract infections. Used in combination with antihistamines in the management of allergic conditions. Used to open obstructed eustachian tubes in chronic otic inflammation or infection.

Action

Stimulates alpha- and beta-adrenergic receptors. Produces vasoconstriction in the respiratory tract mucosa (alpha-adrenergic stimulation) and possibly bronchodilation (beta₂-adrenergic stimulation). **Therapeutic Effects:** Reduction of nasal congestion, hyperemia, and swelling in nasal passages.

Pharmacokinetics

Absorption: Well absorbed after oral administration.

Distribution: Appears to enter the CSF; probably crosses the placenta and enters breast milk.

Metabolism and Excretion: Partially metabolized by the liver. 55–75% excreted unchanged by the kidneys (depends on urine pH).

Half-life: Children: 3.1 hr; Adults: 9–16 hr (depends on urine pH).

TIME/ACTION PROFILE (decongestant effects)

ROUTE	ONSET	PEAK	DURATION
PO	15–30 min	unknown	4–6 hr
PO-ER	60 min	unknown	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to sympathomimetic amines; Hypertension, severe coronary artery disease; Concurrent MAO inhibitor therapy; Known alcohol intolerance (some liquid products).

Use Cautiously in: Hyperthyroidism; Diabetes mellitus; Prostatic hyperplasia; Ischemic heart disease; Glaucoma; **OB, Lactation:** Safety not established; **Pedi:** Avoid OTC cough and cold products containing this medication in children <4 yr.

Adverse Reactions/Side Effects

CNS: **SEIZURES**, anxiety, nervousness, dizziness, drowsiness, excitability, fear, hallucinations, headache, insomnia, restlessness, weakness. **Resp:** respiratory difficulty. **CV:** **CARDIOVASCULAR COLLAPSE**, palpitations, hypertension, tachycardia. **GI:** **anorexia**, dry mouth. **GU:** dysuria. **Misc:** diaphoresis.

Interactions

Drug-Drug: **Concurrent use with MAO inhibitors may cause hypertensive crisis.** Additive adrenergic effects with other **adrenergics**. Concurrent use with **beta blockers** may result in hypertension or bradycardia. **Drugs that acidify the urine** may ↓ effectiveness. **Phenothiazines and tricyclic antidepressants** potentiate pressor effects. **Drugs that alkalinize the urine (sodium bicarbonate, high-dose antacid therapy)** may intensify effectiveness. **Drug-Food:** **Foods that acidify the urine** may ↓ effectiveness. **Foods that alkalinize the urine** may intensify effectiveness (see lists in Appendix M).

Route/Dosage

PO (Adults and Children >12 yr): 60 mg q 6 hr as needed (not to exceed 240 mg/day) *or* 120 mg extended-release preparation q 12 hr *or* 240 mg extended-release preparation q 24 hr.

PO (Children 6–12 yr): 30 mg q 6 hr as needed (not to exceed 120 mg/day).

PO (Children 4–5 yr): 15 mg q 6 hr (not to exceed 60 mg/day).

Availability (generic available)

Tablets: 30 mg^{OTC}, 60 mg^{OTC}. **Extended-release tablets:** 120 mg^{OTC}. **Controlled-release tablets:** 240 mg^{OTC}. **Capsules:** ★ 60 mg^{OTC}. **Extended-release capsules:** ★ 240 mg^{OTC}. **Softgel capsules:** 30 mg^{OTC}. **Liquid (grape and others):** 15 mg/5 mL^{OTC}, 30 mg/5 mL^{OTC}. **Drops (cherry and fruit flavor):** 7.5 mg/0.8 mL^{OTC}. **In combination with:** antihista-

mines, acetaminophen, cough suppressants, and expectorants^{OTC}. See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess congestion (nasal, sinus, eustachian tube) before and periodically during therapy.
- Monitor pulse and BP before beginning therapy and periodically during therapy.
- Assess lung sounds and character of bronchial secretions. Maintain fluid intake of 1500–2000 mL/day to decrease viscosity of secretions.

Potential Nursing Diagnoses

Ineffective airway clearance (Indications)

Implementation

- **Do not confuse Sudafed with sotalol or Sudafed PE.**
- Administer pseudoephedrine at least 2 hr before bedtime to minimize insomnia.
- **PO:** Extended-release tablets and capsules should be swallowed whole; do not crush, break, or chew. Contents of the capsule can be mixed with jam or jelly and swallowed without chewing for patients with difficulty swallowing.

Patient/Family Teaching

- Instruct patient to take medication as directed and not to take more than recommended. Take missed doses within 1 hr; if remembered later, omit. Do not double doses. **Caution parents to avoid OTC cough and cold products while breast feeding or to children <4 yr.**
- Instruct patient to notify health care professional if nervousness, slow or fast heart rate, breathing difficulties, hallucinations, or seizures occur, because these symptoms may indicate overdose.
- Instruct patient to contact health care professional if symptoms do not improve within 7 days or if fever is present.

Evaluation/Desired Outcomes

- Decreased nasal, sinus, or eustachian tube congestion.

psyllium (sill-i-yum)

Airamucil, Cillum, Effer-Syllum, Fiberall, Fibrepur, Hydrocil, ★Karacil, Konsyl, Metamucil, Modane Bulk, Mylanta Natural Fiber Supplement, Naturacil Caramels, ★Natural Source Fibre Laxative, Perdiem, ★Prodiem, Pro-Lax, Reguloid Natural, Serutan, Sibilin, Syllact, Vitalax, V-Lax

Classification

Therapeutic: laxatives

Pharmacologic: bulk-forming agents

Pregnancy Category UK

Indications

Management of simple or chronic constipation, particularly if associated with a low-fiber diet. Useful in situations in which straining should be avoided (after MI, rectal surgery, prolonged bed rest). Used in the management of chronic watery diarrhea.

Action

Combines with water in the intestinal contents to form an emollient gel or viscous solution that promotes peristalsis and reduces transit time. **Therapeutic Effects:** Relief and prevention of constipation.

Pharmacokinetics

Absorption: Not absorbed from the GI tract.

Distribution: No distribution occurs.

Metabolism and Excretion: Excreted in feces.

Half-life: Unknown.

TIME/ACTION PROFILE (laxative effect)

ROUTE	ONSET	PEAK	DURATION
PO	12–24 hr	2–3 days	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Abdominal pain, nausea, or vomiting (especially when associated with fever); Serious adhesions; Dysphagia.

Use Cautiously in: Some dosage forms contain sugar, aspartame, or excessive sodium and should be avoided in patients on restricted diets; **OB: Lactation:** Has been used safely.

Adverse Reactions/Side Effects

Resp: bronchospasm. **GI:** cramps, intestinal or esophageal obstruction, nausea, vomiting.

Interactions

Drug-Drug: May ↓ absorption of warfarin, salicylates, or digoxin.

Route/Dosage

PO (Adults): 1–2 tsp/packet/wafer (3–6 g psyllium) in or with a full glass of liquid 2–3 times daily. Up to 30 g daily in divided doses.

PO (Children >6 yr): 1 tsp/packet/wafer (1.5–3 g psyllium) in or with 4–8 oz glass of liquid 2–3 times daily. Up to 15 g daily in divided doses.

Availability (generic available)

Powder: 3.3–3.5 g/dose or packet^{OTC}. **Effervescent powder:** 3–3.5 g/dose or packet^{OTC}. **Granules:** 2.5 g/dose^{OTC}. **Wafers:** 3.4 g/dose^{OTC}.

★ = Canadian drug name. ⚡ = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

NURSING IMPLICATIONS

Assessment

- Assess patient for abdominal distention, presence of bowel sounds, and usual pattern of bowel function.
- Assess color, consistency, and amount of stool produced.
- **Lab Test Considerations:** May cause elevated blood glucose levels with prolonged use of preparations containing sugar.

Potential Nursing Diagnoses

Constipation (Indications)

Implementation

- Packets are not standardized for volume, but each contains 3–3.5 g of psyllium.
- **PO:** Administer with a full glass of water or juice, followed by an additional glass of liquid. Solution should be taken immediately after mixing; it will congeal. Do not administer without sufficient fluid and do not chew granules.

Patient/Family Teaching

- Encourage patient to use other forms of bowel regulation, such as increasing bulk in the diet, increasing fluid intake, and increasing mobility. Normal bowel habits are individualized and may vary from 3 times/day to 3 times/wk.
- May be used for long-term management of chronic constipation.
- Instruct patients with cardiac disease to avoid straining during bowel movements (Valsalva maneuver).
- Advise patient not to use laxatives when abdominal pain, nausea, vomiting, or fever is present.

Evaluation/Desired Outcomes

- A soft, formed bowel movement, usually within 12–24 hr. May require 3 days of therapy for results.

pyrazinamide

(peer-a-zin-a-mide)

★ PMS Pyrazinamide, ★ Tebrazid

Classification

Therapeutic: antituberculars

Pregnancy Category C

Indications

Used in combination with other agents in the treatment of active tuberculosis.

Action

Converted to pyrazinoic acid in susceptible strains of *Mycobacterium* which lowers the pH of the environment. **Therapeutic Effects:** Bacteriostatic action against susceptible mycobacteria. **Spectrum:** Active against mycobacteria only.

Pharmacokinetics

Absorption: Well absorbed after oral administration.

Distribution: Widely distributed. Reaches high concentrations in the CNS (same as plasma). Excreted in breast milk.

Protein Binding: 50%.

Metabolism and Excretion: Mostly metabolized by the liver. Metabolite (pyrazinoic acid) has antimycobacterial activity; 3–4% excreted unchanged by the kidneys.

Half-life: *Pyrazinamide*—9.5 hr. *Pyrazinoic acid*—12 hr. Both are prolonged in renal impairment.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–2 hr (4–5 hr†)	24 hr

†For pyrazinoic acid

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with ethionamide, isoniazid, niacin, or nicotinic acid may exist; Severe liver impairment.

Use Cautiously in: Gout; Renal failure; Diabetes mellitus; Acute intermittent porphyria; **OB:** Safety not established.

Adverse Reactions/Side Effects

GI: **HEPATOTOXICITY**, anorexia, diarrhea, nausea, vomiting.

GU: dysuria. **Derm:** acne, itching, photosensitivity, skin rash. **Hemat:** anemia, thrombocytopenia.

Metab: hyperuricemia. **MS:** arthralgia, gouty arthritis.

Interactions

Drug-Drug: Concurrent use with **rifampin** may result in life-threatening hepatotoxicity and should be avoided. May ↓ blood levels and effectiveness of **cyclosporine**. May ↓ effectiveness of **antigout agents**.

Route/Dosage

PO (Adults and Children): 15–30 mg/kg/day as a single dose. Up to 60 mg/kg/day has been used in isoniazid-resistant tuberculosis (not to exceed 2 g/day as a single dose or 3 g/day in divided doses). May also be given as 50–70 mg/kg 2–3 times weekly (not to exceed 2 g/dose on daily regimen, 3 g/dose for 3-times-weekly regimen, or 4 g/dose for twice-weekly regimen). *Patients with HIV*—20–40 mg/kg/day for first 2 mo of therapy (maximum: 2 g/day); further dosing depends on regimen employed.

Availability (generic available)

Tablets: 500 mg. **In combination with:** rifampin and isoniazid (Rifater). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Perform mycobacterial studies and susceptibility tests before and periodically during therapy to detect possible resistance.
- **Lab Test Considerations:** Evaluate hepatic function before and every 2–4 wk during therapy. Increased AST and ALT may not be predictive of clinical hepatitis and may return to normal levels during treatment. Patients with impaired liver function should receive pyrazinamide therapy only if crucial to treatment.
- Monitor serum uric acid concentrations during therapy. May cause ↑ resulting in precipitation of acute gout.
- May interfere with urine ketone determinations.

Potential Nursing Diagnoses

Risk for infection (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** May be given concurrently with isoniazid.

Patient/Family Teaching

- Advise patient to take medication as directed and not to skip doses or double up on missed doses. Take missed doses as soon as remembered unless almost time for next dose. Emphasize the importance of continuing therapy even after symptoms have subsided. Length of therapy depends on regimen being used and underlying disease states.
- Inform diabetic patients that pyrazinamide may interfere with urine ketone measurements.
- Advise patients to notify health care professional if no improvement is noticed after 2–3 wk of therapy or if fever, anorexia, malaise, nausea, vomiting, darkened urine, yellowish discoloration of the skin and eyes, pain, or swelling of the joints occurs.
- Advise patients to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Emphasize the importance of regular follow-up exams to monitor progress and check for side effects.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of tuberculosis.
- Negative sputum cultures.

pyridostigmine (peer-id-oh-stig-meen)

Mestinon,  Mestinon SR, Mestinon Timespan, Regonol

Classification

Therapeutic: antimuscarinics

Pharmacologic: cholinergics

Pregnancy Category C

Indications

Used to increase muscle strength in the symptomatic treatment of myasthenia gravis. Reversal of nondepolarizing neuromuscular blocking agents. Prophylaxis of lethal effects of poisoning with the nerve agent soman.

Action

Inhibits the breakdown of acetylcholine and prolongs its effects (anticholinesterase). Effects include: Miosis, Increased intestinal and skeletal muscle tone, Bronchial and ureteral constriction, Bradycardia, Increased salivation, Lacrimation, Sweating. **Therapeutic Effects:** Improved muscular function in patients with myasthenia gravis. Reversal of paralysis from nondepolarizing neuromuscular blocking agents. Prevention of Soman nerve gas toxicity.

Pharmacokinetics

Absorption: Poorly absorbed after oral administration, necessitating large oral doses compared with parenteral doses.

Distribution: Appears to cross the placenta.

Metabolism and Excretion: Metabolized by plasma cholinesterases and the liver.

Half-life: *PO*—3.7 hr; *IV*—1.9 hr.

TIME/ACTION PROFILE (cholinergic effects)

ROUTE	ONSET	PEAK	DURATION
PO	30–35 min	unknown	3–6 hr
PO-SR	30–60 min	unknown	6–12 hr
IM	15 min	unknown	2–4 hr
IV	2–5 min	unknown	2–3 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to pyridostigmine or bromides; Mechanical obstruction of the GI or GU tract; Known alcohol intolerance (syrup only).

Use Cautiously in: History of asthma; Ulcer disease; Cardiovascular disease; Epilepsy; Hyperthyroidism; **OB:** May cause uterine irritability after IV administration near term; 20% of newborns display transient muscle weakness; **Lactation:** **Pedi:** Safety not established.

Adverse Reactions/Side Effects

CNS: **SEIZURES,** dizziness, weakness. **EENT:** lacrimation, miosis. **Resp:** bronchospasm, excessive secretions. **CV:** bradycardia, hypotension. **GI:** abdominal cramps, diarrhea, excessive salivation, nausea, vomiting. **Derm:** sweating, rashes.

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

***CAPITALS** indicates life-threatening; underlines indicate most frequent.

Interactions

Drug-Drug: Cholinergic effects may be antagonized by other **drugs possessing anticholinergic properties**, including **antihistamines, antidepressants, atropine, haloperidol, phenothiazines, procainamide, quinidine, or disopyramide**. Prolongs the action of **depolarizing muscle-relaxing agents and cholinesterase inhibitors (succinylcholine, decamethonium)**. ↑ toxicity with other **cholinesterase inhibitors**, including **echothiophate**.

Route/Dosage

Myasthenia Gravis

PO (Adults): *Tablets/syrup*—30–60 mg q 3–4 hr initially; then adjusted as required; usual maintenance dose is 600 mg/day in divided doses (range 60–1500 mg/day). *Extended-release tablets*—180–540 mg 1–2 times daily (dosing interval should be at least 6 hr; may be associated with increased risk of cholinergic crisis; concurrent immediate-release products may be required).

PO (Children): 7 mg/kg (200 mg/m²)/day in 5–6 divided doses.

IM, IV (Adults): 2 mg (1/30 of oral dose); may be repeated q 2–3 hr. *During labor/delivery*—1 mg before second stage of labor is complete.

IM (Neonates Born to Myasthenic Mothers): 50–150 mcg/kg q 4–6 hr.

Antidote for Nondepolarizing Neuromuscular Blocking Agents

IV (Adults): 10–20 mg; pretreat with 0.6–1.2 mg atropine IV.

Prevention of Soman Nerve Gas Effects

PO (Adults): 30 mg every 8 hr before exposure, stopped on exposure to gas.

Availability (generic available)

Tablets: 60 mg. **Extended-release tablets:** 180 mg.

Syrup: 60 mg/5 mL. **Injection:** 5 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess pulse, respiratory rate, and BP before administration. Report significant changes in heart rate.
- Myasthenia Gravis:** Assess neuromuscular status, including vital capacity, ptosis, diplopia, chewing, swallowing, hand grasp, and gait before administering and at peak effect. Patients with myasthenia gravis may be advised to keep a daily record of their condition and the effects of this medication.
- Assess patient for overdose, underdose, or resistance. Both have similar symptoms (muscle weakness, dyspnea, dysphagia), but symptoms of overdose usually occur within 1 hr of administration, whereas symptoms of underdose occur ≥3 hr after

administration. Overdose (cholinergic crisis) symptoms may also include increased respiratory secretions and saliva, bradycardia, nausea, vomiting, cramping, diarrhea, and diaphoresis. A Tensilon test (edrophonium chloride) may be used to differentiate between overdosage and underdosage.

- Antidote to Nondepolarizing Neuromuscular Blocking Agents:** Monitor reversal of effect of neuromuscular blocking agents with a peripheral nerve stimulator. Recovery usually occurs consecutively in the following muscles: diaphragm, intercostal muscles, muscles of the glottis, abdominal muscles, limb muscles, muscles of mastication, and levator muscles of eyelids. Closely observe patient for residual muscle weakness and respiratory distress throughout the recovery period. Maintain airway patency and ventilation until recovery of normal respirations occurs.

- Toxicity and Overdose:** Atropine is the antidote.

Potential Nursing Diagnoses

Impaired physical mobility (Indications)

Ineffective breathing pattern (Indications)

Implementation

- For patients who have difficulty chewing, pyridostigmine may be administered 30 min before meals.
- Oral dose is not interchangeable with IV dose. Parenteral form is 30 times more potent.
- When used as an antidote to nondepolarizing neuromuscular blocking agents, atropine may be ordered before or currently with large doses of pyridostigmine to prevent or to treat bradycardia and other side effects.
- PO:** Administer with food or milk to minimize side effects. **Extended-release tablets should be swallowed whole; do not crush, break, or chew.** Regular tablets or syrup may be administered with extended-release tablets for optimum control of symptoms. Mottled appearance of sustained-release tablet does not affect potency.

IV Administration

- pH:** 6.0–7.0.
- Direct IV:** Administer undiluted. Do not add to IV solutions. May be given through Y-site of infusion of D5W, 0.9% NaCl, LR, D5/Ringer's solution, or D5/LR. **Concentration:** 5 mg/mL. **Rate:** For myasthenia gravis, administer each 0.5 mg over 1 min. For reversal of nondepolarizing neuromuscular blocking agents, administer each 5 mg over 1 min.
- Syringe Compatibility:** glycopyrrolate.
- Y-Site Compatibility:** heparin, hydrocortisone sodium succinate, potassium chloride, vitamin B complex with C.

Patient/Family Teaching

- Instruct patient to take medication as directed. Do not skip or double up on missed doses. Patients

with a history of dysphagia should have a nonelectric or battery-operated back-up alarm clock to remind them of exact dose time. Patients with dysphagia may not be able to swallow medication if the dose is not taken exactly on time. Taking dose late may result in myasthenic crisis. Taking dose early may result in cholinergic crisis. Patients with myasthenia gravis must continue this regimen as a life-long therapy.

- Advise patient to carry identification describing disease and medication regimen at all times.
- Instruct patient to space activities to avoid fatigue.

Evaluation/Desired Outcomes

- Relief of ptosis and diplopia; improved chewing, swallowing, extremity strength, and breathing without the appearance of cholinergic symptoms.
- Reversal of nondepolarizing neuromuscular blocking agents in general anesthesia.
- Prevention of Soman nerve gas toxicity.

pyridoxine (peer-i-dox-een)

Beesix, Doxine, Nestrex, Pyri, Rodex, Vitabee 6, vitamin B₆

Classification

Therapeutic: vitamins

Pharmacologic: water soluble vitamins

Pregnancy Category A

Indications

Treatment and prevention of pyridoxine deficiency (may be associated with poor nutritional status or chronic debilitating illnesses). Treatment of pyridoxine-dependent seizures in infants. Treatment and prevention of neuropathy, which may develop from isoniazid, penicillamine, or hydralazine therapy. Management of isoniazid overdose >10 g.

Action

Required for amino acid, carbohydrate, and lipid metabolism. Used in the transport of amino acids, formation of neurotransmitters, and synthesis of heme.

Therapeutic Effects: Prevention of pyridoxine deficiency. Prevention or reversal of neuropathy associated with hydralazine, penicillamine, or isoniazid therapy.

Pharmacokinetics

Absorption: Well absorbed from the GI tract.

Distribution: Stored in liver, muscle, and brain. Crosses the placenta and enters breast milk.

Metabolism and Excretion: Converted in RBCs to pyridoxal phosphate and another active metabolite. Amounts in excess of requirements are excreted unchanged by the kidneys.

Half-life: 15–20 days.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO, IM, IV	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to pyridoxine or any component.

Use Cautiously in: Parkinson's disease (treatment with levodopa only); **OB:** Chronic ingestion of large doses may produce pyridoxine-dependency syndrome in newborn.

Adverse Reactions/Side Effects

Adverse reactions listed are seen with excessive doses only.

Neuro: sensory neuropathy, paresthesia. **Misc:** pyridoxine-dependency syndrome.

Interactions

Drug-Drug: Interferes with the therapeutic response to **levodopa** when used without carbidopa. Requirements are increased by **isoniazid**, **hydralazine**, **chloramphenicol**, **penicillamine**, **estrogens**, and **immunosuppressants**. Decreases serum levels of **phenobarbital** and **phenytoin**.

Route/Dosage

Prevention of Deficiency (Recommended Daily Allowance)

PO (Adults and Children >14 yr): 1.2–1.7 mg/day (larger doses required with cycloserine, ethionamide, hydralazine, immunosuppressants, isoniazid, penicillamine, and estrogen-containing oral contraceptives).

PO (Children 9–13 yr): 1 mg/day (larger doses required with cycloserine, ethionamide, hydralazine, immunosuppressants, isoniazid, and penicillamine).

PO (Children 1–8 yr): 0.5–0.6 mg/day (larger doses required with cycloserine, ethionamide, hydralazine, immunosuppressants, isoniazid, and penicillamine).

PO (Infants 6–12 mo): 0.3 mg/day.

PO (Infants <6 mo): 0.1 mg/day.

Treatment of Deficiency

PO (Adults): 2.5–10 mg/day until clinical signs are corrected, then 2–5 mg/day.

PO (Children): 5–25 mg/day for 3 weeks, then 1.5–2.5 mg/day.

Pyridoxine-Dependent Seizures

PO, IM, IV (Neonates and Infants): 10–100 mg initially then 50–100 mg/day orally.

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Drug-Induced Neuritis

PO (Adults): Treatment—100–300 mg/day; Prophylaxis—25–100 mg/day.

PO (Children): Treatment—10–50 mg/day; Prophylaxis—1–2 mg/kg/day.

Isoniazid Overdose (>10 g)

IM, IV (Adults and Children): Amount in mg equal to amount of isoniazid ingested given as 1–4 g IV, then 1 g IM q 30 min.

Availability (generic available)

Tablets: 20 mg^{OTC}, 25 mg^{OTC}, 50 mg^{OTC}, 100 mg^{OTC}, 250 mg^{OTC}, 500 mg^{OTC}. **Extended-release tablets:** 100 mg^{OTC}, 200 mg^{OTC}, 500 mg^{OTC}. **Extended-release capsules:** 150 mg^{OTC}. **Injection:** 100 mg/mL in 10- and 30-mL vials. **In combination with:** vitamins, minerals, and trace elements in a variety of multivitamin preparations^{OTC}.

NURSING IMPLICATIONS

Assessment

- Assess patient for signs of vitamin B₆ deficiency (anemia, dermatitis, cheilosis, irritability, seizures, nausea, and vomiting) before and periodically throughout therapy. Institute seizure precautions in pyridoxine-dependent infants.
- **Lab Test Considerations:** May cause false elevations in urobilinogen concentrations.

Potential Nursing Diagnoses

Imbalanced nutrition: less than body requirements (Indications)

Implementation

- Because of infrequency of single B-vitamin deficiencies, combinations are commonly administered.
- Administration of parenteral vitamin B₆ is limited to patients who are NPO or who have nausea and vomiting or malabsorption syndromes.

- Protect parenteral solution from light; decomposition will occur.
- **PO:** **Extended-release capsules and tablets should be swallowed whole, without crushing, breaking, or chewing.** For patients unable to swallow capsule, contents of capsules may be mixed with jam or jelly.
- **IM:** Rotate sites; burning or stinging at site may occur.
- **IV:** May be administered slowly by direct IV or as infusion in standard IV solutions. Monitor respiratory rate, heart rate, and BP when administering large IV doses.
- Pyridoxine-dependent seizures should cease within 2–3 min of IV administration.
- **Rate:** Infusion rates of 15–30 min and up to 3 hr have been used.
- **Additive Incompatibility:** alkaline solutions, riboflavin.

Patient/Family Teaching

- Instruct patient to take medication as directed. If a dose is missed, it may be omitted because an extended period of time is required to become deficient in vitamin B₆.
- Encourage patient to comply with diet recommended by health care professional. Explain that the best source of vitamins is a well-balanced diet with foods from the four basic food groups. Foods high in vitamin B₆ include bananas, whole-grain cereals, potatoes, lima beans, and meats.
- Patients self-medicating with vitamin supplements should be cautioned not to exceed RDA. The effectiveness of megadoses for treatment of various medical conditions is unproved and may cause side effects, such as unsteady gait, numbness in feet, and difficulty with hand coordination.
- Emphasize the importance of follow-up exams to evaluate progress.

Evaluation/Desired Outcomes

- Decrease in the symptoms of vitamin B₆ deficiency.

QUetiapine (kwet-eye-a-peen) SEROquel, SEROquel XR

Classification

Therapeutic: antipsychotics, mood stabilizers

Pregnancy Category C

Indications

Schizophrenia. Depressive episodes with bipolar disorder. Acute manic episodes associated with bipolar I disorder (as monotherapy [for adults or adolescents] or with lithium or divalproex [adults only]). Maintenance treatment of bipolar I disorder (with lithium or divalproex). Adjunctive treatment of depression.

Action

Probably acts by serving as an antagonist of dopamine and serotonin. Also antagonizes histamine H₁ receptors and alpha₁-adrenergic receptors. **Therapeutic Effects:** Decreased manifestations of psychoses, depression, or acute mania.

Pharmacokinetics

Absorption: Well absorbed after oral administration.

Distribution: Widely distributed.

Metabolism and Excretion: Extensively metabolized by the liver (mostly by P450 CYP3A4 enzyme system); <1% excreted unchanged in the urine.

Half-life: 6 hr.

TIME/ACTION PROFILE (antipsychotic effects)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	8–12 hr
PO-XR	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **Lactation:** Lactation; Concurrent use of agents that prolong the QT interval, including dofetilide, sotalol, quinidine, disopyramide, amiodarone, dronedarone, thioridazine, chlorpromazine, droperidol, moxifloxacin, mefloquine, pentamidine, arsenic trioxide, dolasetron, tacrolimus, ziprasidone, erythromycin, citalopram, escitalopram, and clarithromycin (↑ risk of serious arrhythmias); History of arrhythmias, including bradycardia; Hypokalemia or hypomagnesemia (↑ risk of serious arrhythmias); Congenital long QT syndrome (↑ risk of serious arrhythmias).

Use Cautiously in: Cardiovascular disease, cerebrovascular disease, dehydration or hypovolemia (↑ risk of hypotension); History of seizures, Alzheimer's dementia; Diabetes (may ↑ risk of hyperglycemia); Pa-

tients at risk for aspiration pneumonia; Hepatic impairment (dose ↓ may be necessary); Hypothyroidism (may be exacerbated); History of suicide attempt; **OB:** Neonates at ↑ risk for extrapyramidal symptoms and withdrawal after delivery when exposed during the 3rd trimester; use only if maternal benefit outweighs risk to fetus; **Pedi:** May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; risk may be greater in children or adolescents; **Geri:** May require ↓ doses; ↑ risk of mortality and stroke in elderly patients treated for dementia-related psychosis.

Adverse Reactions/Side Effects

CNS: **NEUROLEPTIC MALIGNANT SYNDROME, SEIZURES, dizziness**, cognitive impairment, extrapyramidal symptoms, sedation, tardive dyskinesia. **EENT:** ear pain, rhinitis, pharyngitis. **Resp:** cough, dyspnea. **CV:** ↑ BP (children), palpitations, peripheral edema, postural hypotension. **GI:** **PANCREATITIS**, anorexia, constipation, dry mouth, dyspepsia. **Derm:** **STEVENS-JOHNSON SYNDROME**, sweating. **Hemat:** ↓ hemoglobin, leukopenia. **Endo:** weight gain, hyperglycemia, hyperlipidemia, hyperprolactinemia, hypertriglyceridemia, hypothyroidism. **MS:** rhabdomyolysis. **Misc:** flu-like syndrome.

Interactions

Drug-Drug: **Concurrent use of macrolide anti-infectives (erythromycin, clarithromycin), dofetilide, sotalol, quinidine, disopyramide, procainamide, thioridazine, chlorpromazine, droperidol, gemifloxacin, moxifloxacin, mefloquine, pentamidine, arsenic trioxide, dolasetron, citalopram, escitalopram, tacrolimus, and ziprasidone** ↑ the risk of serious ventricular arrhythmias and should be avoided. ↑ CNS depression may occur with **alcohol, antihistamines, opioid analgesics, and sedative/hypnotics**. ↑ risk of hypotension with acute ingestion of **alcohol** or **anti-hypertensives**. **Phenytin** and **thioridazine** ↑ clearance and ↓ effectiveness of quetiapine (dose change may be necessary); similar effects may occur with **carbamazepine, barbiturates, rifampin, or corticosteroids**. Effects may be ↑ by **ketoconazole, itraconazole, fluconazole, protease inhibitors, or erythromycin**, as well as by other agents that inhibit the cytochrome P450 CYP3A4 enzyme.

Route/Dosage

Schizophrenia

PO (Adults): Immediate-release—25 mg twice daily on Day 1, ↑ by 25–50 mg 2–3 times daily on Days 2 and 3, up to 300–400 mg/day in 2–3 divided doses by Day 4 (not to exceed 800 mg/day); **Extended-release**—300 mg once daily, ↑ by 300 mg/day (not to exceed 800 mg/day); elderly patients or

✳ = Canadian drug name. ✳ = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Q

patients with hepatic impairment should be started on immediate-release product and converted to extended-release product once effective dose is reached.

PO (Children 13–17 yr): Immediate-release—25 mg twice daily on Day 1, ↑ to 50 mg twice daily on Day 2, then ↑ to 100 mg twice daily on Day 3, then ↑ to 150 mg twice daily on Day 4, then ↑ to 200 mg twice daily on Day 5; may then ↑ by no more than 100 mg/day (not to exceed 800 mg/day).

Acute Manic Episodes Associated with Bipolar I Disorder

PO (Adults): Immediate-release—50 mg twice daily on Day 1, then ↑ to 100 mg twice daily on Day 2, then ↑ to 150 mg twice daily on Day 3, then ↑ to 200 mg twice daily on Day 4; may then ↑ by no more than 200 mg/day up to 400 mg twice daily on Day 6 if needed; **Extended-release**—300 mg once daily on Day 1, then 600 mg once daily on Day 2, then 400–800 mg once daily starting on Day 3.

PO (Children 10–17 yr): Immediate-release—25 mg twice daily on Day 1, then ↑ to 50 mg twice daily on Day 2, then ↑ to 100 mg twice daily on Day 3, then ↑ to 150 mg twice daily on Day 4, then ↑ to 200 mg twice daily on Day 5; may then ↑ by no more than 100 mg/day (not to exceed 600 mg/day).

Acute Depressive Episodes Associated with Bipolar Disorder

PO (Adults): Immediate-release or extended-release—50 mg once daily at bedtime on Day 1, then ↑ to 100 mg daily at bedtime on Day 2, then ↑ to 200 mg daily at bedtime on Day 3, then ↑ to 300 mg daily at bedtime thereafter.

Maintenance Treatment of Bipolar I Disorder

PO (Adults): Continue at the dose required to maintain symptom remission (usual dosage: 400–800 mg/day given as once daily dose [extended-release] or in two divided doses [immediate-release]).

PO (Children 10–17 yr): Continue at the lowest dose required to maintain symptom remission.

Depression

PO (Adults): Extended-release—50 mg once daily on Days 1 and 2, then ↑ to 150 mg once daily starting on Day 3 (not to exceed 300 mg/day).

Availability (generic available)

Tablets: 25 mg, 50 mg, 100 mg, 200 mg, 300 mg, 400 mg. **Cost: Generic**—25 mg \$17.59/100, 100 mg \$26.94/100, 200 mg \$39.30/100. **Extended-release Tablets:** 50 mg, 150 mg, 200 mg, 300 mg, 400 mg. **Cost:** 50 mg \$460.84/60, 150 mg \$827.50/60, 200 mg \$910.78/60, 300 mg \$1,194.14/60, 400 mg \$1,403.42/60.

NURSING IMPLICATIONS

Assessment

- Monitor mental status (mood, orientation, behavior) before and periodically during therapy.
- **Assess for suicidal tendencies, especially during early therapy.** Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤ 24 yr.
- Assess weight and BMI initially and throughout therapy.
- Monitor BP (sitting, standing, lying) and pulse before and frequently during initial dose titration. If hypotension occurs during dose titration, return to the previous dose.
- Observe patient carefully when administering to ensure medication is swallowed and not hoarded or cheeked.
- Monitor for onset of extrapyramidal side effects (*akathisia*—restlessness; *dystonia*—muscle spasms and twisting motions; or *pseudoparkinsonism*—mask-like faces, rigidity, tremors, drooling, shuffling gait, dysphagia). Report these symptoms; reduction of dose or discontinuation may be necessary. Trihexphenidyl or benztropine may be used to control these symptoms.
- Monitor for tardive dyskinesia (involuntary rhythmic movement of mouth, face, and extremities). Report immediately; may be irreversible.
- **Monitor for development of neuroleptic malignant syndrome** (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness). Notify health care professional immediately if these symptoms occur.
- **Assess for rash periodically during therapy.** May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- **Monitor for signs of pancreatitis** (nausea, vomiting, anorexia, persistent severe abdominal pain, sometimes radiating to the back) during therapy.
- Monitor for symptoms related to hyperprolactinemia (menstrual abnormalities, galactorrhea, sexual dysfunction).
- **Lab Test Considerations:** May cause asymptomatic ↑ in AST and ALT.
- May also cause anemia, thrombocytopenia, leukocytosis, and leukopenia.
- May cause ↑ total cholesterol and triglycerides.
- Obtain fasting blood glucose and cholesterol levels initially and throughout therapy.
- Monitor serum prolactin prior to and periodically during therapy. May cause ↑ serum prolactin levels.

Potential Nursing Diagnoses

Risk for self-directed violence (Indications)
Disturbed thought process (Indications)

Imbalanced nutrition: risk for more than body requirements (Side Effects)

Implementation

- **Do not confuse** quetiapine with olanzapine. **Do not confuse** Seroquel with Seroquel XR, Serzone (nefazodone), or Sinequan (doxepin).
- If therapy is reinstituted after an interval of ≥ 1 wk off, follow initial titration schedule.
- **PO:** May be administered without regard to food. Extended-release tablets should be swallowed whole, do not break, crush, or chew.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as remembered unless almost time for next dose; do not double doses. Consult health care professional prior to stopping quetiapine; should be discontinued gradually. Stopping abruptly may cause insomnia, nausea, and vomiting.
- Advise patient and caregiver that quetiapine should not be given to elderly patients with dementia-related psychosis; may ↑ risk of death.
- Inform patient of the possibility of extrapyramidal symptoms. Instruct patient to report symptoms immediately to health care professional.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid extremes in temperature; this drug impairs body temperature regulation.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications and alcohol, especially other CNS depressants.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking; other unusual changes in behavior or mood occur.
- Refer patient for nutritional, weight, or medical management of dyslipidemia as indicated.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Instruct patient to notify health care professional promptly of sore throat, fever, unusual bleeding or bruising, or rash.

- Advise female patients to notify health care professional if pregnancy is planned or suspected or if they are breast feeding or planning to breast feed.
- Emphasize importance of routine follow-up exams to monitor side effects and continued participation in psychotherapy as indicated to improve coping skills. Ophthalmologic exams should be performed before and every 6 mo during therapy.

Evaluation/Desired Outcomes

- Decrease in excited, manic, behavior.
- Decrease in signs of depression in patients with bipolar disorder.
- Decrease in manic episodes in patients with bipolar I disorder.
- Decrease in positive symptoms (delusions, hallucinations) of schizophrenia.
- Decrease in negative symptoms (social withdrawal, flat, blunt affect) of schizophrenia.

quinapril, See ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS.

QUINIDINE (kwin-i-deen)

quiNIDine gluconate
(kwin-i-deen glue-con-ate)
Quinaglute

quiNIDine sulfate
(kwin-i-deen sul-fate)
Quinidex

Classification

Therapeutic: antiarrhythmics (class IA)

Pregnancy Category C

Indications

Restoration and maintenance of sinus rhythm in patients with atrial fibrillation or flutter. Prevention of recurrent ventricular arrhythmias. Treatment of malaria.

Action

Decrease myocardial excitability. Slow conduction velocity. **Therapeutic Effects:** Suppression of arrhythmias.

Pharmacokinetics

Absorption: Bioavailability of oral formulations is 70–80%. Extended-release preparations are absorbed slowly following oral administration.

Distribution: Widely distributed. Cross the placenta; enter breast milk.

✳ = Canadian drug name. ⚠ = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Metabolism and Excretion: Metabolized by the liver; 5–20% excreted unchanged by the kidneys.

Half-life: 6–8 hr (↑ in HF or severe liver impairment).

TIME/ACTION PROFILE (antiarrhythmic effects)

ROUTE	ONSET	PEAK	DURATION
PO (sulfate)	30 min	1–1.5 hr	6–8 hr
PO (sulfate-ER)	unknown	4 hr	8–12 hr
PO (glucuronate)	unknown	3–4 hr	6–8 hr
IV	1–5 min	rapid	6–8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Conduction defects (in the absence of a pacemaker); Myasthenia gravis.

Use Cautiously in: HF (dose reduction recommended); Severe liver disease (dose ↓ recommended); Hypokalemia or hypomagnesemia (↑ risk of torsades de pointes); Bradycardia (↑ risk of torsades de pointes); Renal impairment; **OB, Lactation, PEDI:** Safety not established; extended-release preparations should not be used in children.

Adverse Reactions/Side Effects

CNS: dizziness, confusion, fatigue, headache, syncope, vertigo. **EENT:** blurred vision, diplopia, mydriasis, photophobia, tinnitus. **CV:** **HYPOTENSION**, **TORSADES DE POINTES**, arrhythmias, palpitations, tachycardia. **GI:** anorexia, abdominal cramping, diarrhea, nausea, vomiting, drug-induced hepatitis.

Derm: rash. **Hemat:** **AGRANULOCYTOSIS**, hemolytic anemia, thrombocytopenia. **Neuro:** ataxia, tremor.

Misc: fever.

Interactions

Drug-Drug: May ↑ risk of QT interval prolongation when used with **tricyclic antidepressants**, **erythromycin**, **clarithromycin**, **haloperidol**, **sotalol**, or **fluoroquinolones**. ↑ serum **digoxin** levels and may cause toxicity (dose reduction recommended). **Phenytoin**, **phenobarbital**, **carbamazepine**, or **rifampin** may ↓ metabolism and ↓ effectiveness. **Cimetidine**, **diltiazem**, **verapamil**, **amiodarone**, **ketoconazole**, **itraconazole**, and **protease inhibitors** ↓ metabolism and may ↑ blood levels. Excretion is delayed and effects ↑ by drugs that alkalize the urine, including **carbonic anhydrase inhibitors**, **thiazide diuretics**, and **sodium bicarbonate**. Potentiates the effects of **neuromuscular blocking agents** and **warfarin**. Additive hypotension with **anti-hypertensives**, **nitrate**s, and acute ingestion of **alcohol**. May increase **procainamide**, **haloperidol**, **mexiletine**, or **tricyclic antidepressant** levels and risk of toxicity. May antagonize **anticholinesterase therapy** in patients with myasthenia gravis. Additive

anticholinergic effects may occur with **agents having anticholinergic properties** (including **antihistamines**, **tricyclic antidepressants**).

Drug-Food: **Grapefruit juice** ↑ serum levels and effect (avoid concurrent use). **Foods that alkalize the urine** (see Appendix M) may ↑ serum quinidine levels and the risk of toxicity.

Route/Dosage

Quinidine Gluconate (62% Quinidine)

PO (Adults): 324–972 mg q 8–12 hr.

IV (Adults): 200–400 mg given at a rate ≤10 mg/min until arrhythmia is suppressed, QRS complex widens, bradycardia or hypotension occurs.

Quinidine Sulfate (83% Quinidine)

PO (Adults): *Atrial/ventricular arrhythmias*—200–400 mg q 4–6 hr; may be ↑ to achieve therapeutic response (not to exceed 3–4 g/day).

PO (Children): 6 mg/kg 4–5 times daily.

Availability (generic available)

Quinidine Gluconate

Extended-release tablets: 324 mg. **Solution for Injection:** 80 mg/mL.

Quinidine Sulfate

Tablets: 200 mg, 300 mg. **Extended-release tablets:** 300 mg. **In combination with:** dextromethorphan hydrobromide (Nuedextra); see Appendix B.

NURSING IMPLICATIONS

Assessment

- **Monitor ECG, pulse, and BP periodically during therapy.**
- **Lab Test Considerations:** Monitor hepatic and renal function, CBC, and serum potassium and magnesium levels periodically during prolonged therapy.
- **Toxicity and Overdose:** Serum quinidine levels may be monitored periodically during dose adjustment. Therapeutic serum concentrations are 2–6 mcg/mL. Toxic effects usually occur at concentrations >8 mcg/mL.
- Signs and symptoms of toxicity or cinchonism include tinnitus, hearing loss, visual disturbances, headache, nausea, and dizziness. These may occur after a single dose.
- Cardiac signs of toxicity include QRS widening, cardiac asystole, ventricular ectopic beats, idioventricular rhythms (ventricular tachycardia, ventricular fibrillation), paradoxical tachycardia, and torsades de pointes.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)

Implementation

- **Do not confuse quinidine with quinine.**
- **PO:** Administer with a full glass of water on an empty stomach either 1 hr before or 2 hr after meals for faster absorption. If GI irritation becomes a problem, may be administered with or immediately after meals. **Extended-release preparations should be swallowed whole; do not break, crush, or chew.**

IV Administration

- **pH:** 5.5–7.0.
- **IV:** Use only clear, colorless solution.
- **Intermittent Infusion:** **Diluent:** Dilute 800 mg of quinidine gluconate (10 mL) in 50 mL of D5W. Infusion is stable for 24 hr at room temperature or 48 hr if refrigerated. **Concentration:** 16 mg/mL. **Rate:** Administer quinidine gluconate at a rate not to exceed 0.25 mg/kg/min. Administer via infusion pump to ensure accurate dose. **Rapid administration may cause peripheral vascular collapse and severe hypotension.**
- **Y-Site Compatibility:** amikacin, atropine, bumetanide, calcium gluconate, caspofungin, cimetidine, cyclosporine, digoxin, diltiazem, diphenhydramine, dobutamine, dopamine, doxycycline, enalaprilat, epinephrine, erythromycin, esmolol, famotidine, fenoldopam, fentanyl, fluconazole, gentamicin, granisetron, hydromorphone, imipenem, isoproterenol, labetalol, lidocaine, linezolid, lorazepam, meperidine, metoclopramide, metoprolol, milrinone, morphine, nesiritide, nitroglycerin, norepinephrine, ondansetron, palonosetron, phenylephrine, phytonadione, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, ranitidine, succinylcholine, tacrolimus, tirofiban, tobramycin, vancomycin, vasopressin, verapamil, voriconazole.
- **Y-Site Incompatibility:** acyclovir, aminophylline, ampicillin, ampicillin/sulbactam, aztreonam, cefazolin, cefotaxime, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, clindamycin, daptomycin, dexamethasone, ertapenem, furosemide, ganciclovir, hydrocortisone sodium succinate, insulin, ketorolac, methylprednisolone sodium succinate, metronidazole, nafcillin, nitroprusside, pantoprazole, penicillin G potassium, phenytoin, piperacillin/tazobactam, sodium bicarbonate, sulfamethoxazole/trimethoprim, ticarcillin/clavulanate.

Patient/Family Teaching

- Instruct patient to take medication around the clock, exactly as directed, even if feeling well. Take missed doses as soon as remembered if within 2 hr; if remembered later, omit. Do not double doses.

- Instruct patient or family member on how to take pulse. Advise patient to report changes in pulse rate or rhythm to health care professional.
- May cause dizziness or blurred vision. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Inform patient that quinidine may cause increased sensitivity to light. Dark glasses may minimize this effect.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise patient to consult health care professional if symptoms of cinchonism, rash, or dyspnea occur or if diarrhea is severe or persistent.
- Advise patient to carry identification at all times describing disease process and medication regimen.
- Emphasize the importance of routine follow-up exams to monitor progress.

Evaluation/Desired Outcomes

- Decrease or cessation of cardiac arrhythmia.
- Resolution of malarial infection.

Q

quinupristin/dalfopristin (kwin-oo-pris-tin/dal-foe-pris-tin) Synercid

Classification

Therapeutic: anti-infectives

Pharmacologic: streptogramins

Pregnancy Category B

Indications

Complicated skin/skin structure infections caused by *Staphylococcus aureus* (methicillin, susceptible) or *Streptococcus pyogenes*.

Action

Quinupristin inhibits the late phase of protein synthesis at the level of the bacterial ribosome; dalfopristin inhibits the early phase. **Therapeutic Effects:** Bacteriostatic effect against susceptible organisms. **Spectrum:** Active against, *S. aureus* (methicillin-susceptible) and *S. pyogenes*. Not active against *Enterococcus faecalis* or *Enterococcus faecium*.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Protein Binding: Moderate.

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Metabolism and Excretion: Both are converted to compounds with additional anti-infective activity; parent drugs and metabolites are mostly excreted in feces (75–77%); 15% of quinupristin and 17% of dalfopristin excreted in urine.

Half-life: *Quinupristin*—0.85 hr; *dalfopristin*—0.7 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	8–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Concurrent use of other drugs metabolized by the cytochrome P450 3A4 enzyme system (serious interactions may occur); Hepatic impairment (dose adjustment may be necessary); Patients with a history of GI disease, especially colitis; **OB, Lactation, PEDI:** Pregnancy, lactation, or children <12 yr (safety not established).

Adverse Reactions/Side Effects

CNS: headache. **CV:** thrombophlebitis. **GI:** **PSEUDOMEMBRANOUS COLITIS**, diarrhea, nausea, vomiting.

Derm: pruritus, rash. **Local:** edema/inflammation/pain at infusion site, infusion site reactions. **Misc:** allergic reactions including **ANAPHYLAXIS**, pain.

Interactions

Drug-Drug: Inhibits the cytochrome P450 3A4 drug metabolizing enzyme system; inhibits metabolism of cyclosporine, midazolam, and nifedipine and ↑ risk of toxicity (careful monitoring required). Similar effects may be expected with concurrent use of **delavirdine**, **nevirapine**, **indinavir**, **ritonavir**, **vinca alkaloids**, **docetaxel**, **paclitaxel**, **diazepam**, **verapamil**, **diltiazem**, **HMG CoA reductase inhibitors**, **tacrolimus**, **methylprednisolone**, **carbamazepine**, **quinidine**, **lidocaine**, and **disopyramide**.

Route/Dosage

IV (Adults and Children 12–17 yr): 7.5 mg/kg q 12 hr for at least 7 days.

Availability

Powder for injection: 500 mg/vial (150 mg quinupristin and 350 mg dalfopristin), 600 mg/vial (180 mg quinupristin and 420 mg dalfopristin).

NURSING IMPLICATIONS

Assessment

- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.

- Monitor patient for pain or inflammation at the infusion site frequently throughout infusion. Increasing the volume of diluent from 250 mL to 500 mL or 750 mL or infusing via a peripherally inserted central catheter or central venous catheter may be required.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue drug and notify physician or other health care professional immediately if these problems occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in case of an anaphylactic reaction.
- Assess patient for myalgia and arthralgia after infusion. May be severe. Reducing dose frequency to every 12 hr may decrease pain. Symptoms usually resolve upon discontinuation of medication.
- Lab Test Considerations:** May cause ↑ serum total bilirubin concentrations.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Diarrhea (Adverse Reactions)

Implementation

IV Administration

- pH:** 5.0.
- Intermittent Infusion:** Reconstitute the 500-mg vial with 5 mL and the 600-mg vial with 6 mL of D5W or sterile water for injection, respectively, for a concentration of 100 mg/mL. Avoid shaking to prevent foam formation. Allow solution to sit until all foam has disappeared. **Diluent:** Dilute further with 250 mL of D5W (100 mL can be used for central line administration). May dilute in 500 mL or 750 mL of D5W if severe venous irritation occurs after peripheral administration. Reconstituted vials should be used within 30 min. Infusion is stable for 5 hr at room temperature or 54 hr if refrigerated. **Rate:** Infuse over 60 min. Flush line before and after infusion with D5W.
- Y-Site Compatibility:** alemtuzumab, alfentanil, amikacin, amiodarone, anidulafungin, argatroban, aztreonam, bleomycin, buprenorphine, busulfan, butorphanol, carboplatin, carmustine, caspofungin, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, daptomycin, daunorubicin, dexmedetomidine, dexrazoxane, diltiazem, diphenhydramine, docetaxel, dolasetron, doxacurium, doxorubicin, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, esmolol, etoposide, etoposide phosphate, fenoldopam, fentanyl, fluconazole, gemcitabine, granisetron, haloperidol, hydromorphone, idarubicin, ifosfamide, isoproterenol, labetalol, levofloxacin, levorphanol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, metoclo-

pramidine, metoprolol, midazolam, milrinone, mitomycin, mitoxantrone, morphine, mycophenolate, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pentamidine, phenylephrine, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, rocuronium, sodium phosphates, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiotepa, tirofiban, tobramycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** acyclovir, amifostine, aminophylline, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, azithromycin, bivalirudin, bumetanide, calcium chloride, calcium gluconate, cefazolin, cefepime, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, clindamycin, dexamethasone sodium phosphate, diazepam, digoxin, ertapenem,

fludarabine, fluorouracil, fosphenytoin, furosemide, ganciclovir, heparin, hydrocortisone, imipenem/cilastatin, insulin, ketorolac, leucovorin, meropenem, mesna, methotrexate, methylprednisolone sodium succinate, metronidazole, nitroprusside, pantoprazole, pemetrexed, pentobarbital, phenobarbital, phenytoin, piperacillin/tazobactam, potassium acetate, potassium phosphates, ranitidine, rituximab, sodium acetate, sodium bicarbonate, thiopental, ticarcillin/clavulanate, tigecycline, trimethoprim/sulfamethoxazole.

- **Solution Incompatibility:** 0.9% NaCl.

Patient/Family Teaching

- Instruct patient to notify health care professional if signs and symptoms of anaphylaxis, fever, and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

RABeprazole (ra-bep-ra-zole)

Aciphex, Aciphex Sprinkle,  Pariet

Classification

Therapeutic: antiulcer agents

Pharmacologic: proton-pump inhibitors

Pregnancy Category B

Indications

Gastroesophageal reflux disease (GERD). Duodenal ulcers (including combination therapy with clarithromycin and amoxicillin to eradicate *Helicobacter pylori* and prevent recurrence). Pathological hypersecretory conditions, including Zollinger-Ellison syndrome.

Action

Binds to an enzyme in the presence of acidic gastric pH, preventing the final transport of hydrogen ions into the gastric lumen. **Therapeutic Effects:** Diminished accumulation of acid in the gastric lumen, with lessened acid reflux. Healing of duodenal ulcers and esophagitis. Decreased acid secretion in hypersecretory conditions.

Pharmacokinetics

Absorption: Delayed-release tablet is designed to allow rabeprazole, which is not stable in gastric acid, to pass through the stomach intact. Subsequently 52% is absorbed after oral administration.

Distribution: Unknown.

Protein Binding: 96.3%.

Metabolism and Excretion: Mostly metabolized by the liver (hepatic cytochrome P450 3A and 2C19 enzyme systems)  (the CYP2C19 enzyme system exhibits genetic polymorphism; 15–20% of Asian patients and 3–5% of Caucasian and Black patients may be poor metabolizers and may have significantly ↑ rabeprazole concentrations and an ↑ risk of adverse effects); 10% excreted in feces; remainder excreted in urine as inactive metabolites.

Half-life: 1–2 hr.

TIME/ACTION PROFILE (acid suppression)

ROUTE	ONSET	PEAK	DURATION
PO	within 1 hr	unknown	24 hr†

†Suppression continues to increase over the first week of therapy

Contraindications/Precautions

Contraindicated in: Hypersensitivity to rabeprazole or related drugs (benzimidazoles).

Use Cautiously in: Severe hepatic impairment (dose reduction may be necessary); Patients using high-doses for >1 yr (↑ risk of hip, wrist, or spine fractures);

OB, Lactation, Pedi: Pregnancy, lactation, or children <12 yr (breast feeding not recommended; use in pregnancy only if needed; safety not established).

Adverse Reactions/Side Effects

CNS: dizziness, headache, malaise. **GI:** **PSEUDOMEMBRANOUS COLITIS**, abdominal pain, constipation, diarrhea, nausea. **Derm:** photosensitivity, rash. **F and E:** hypomagnesemia (especially if treatment duration ≥3 mo). **MS:** bone fracture, neck pain. **Misc:** allergic reactions, chills, fever.

Interactions

Drug-Drug: Rabeprazole is metabolized by the CYP450 enzyme system and may interact with other drugs metabolized by this system. May ↓ absorption of drugs requiring acid pH, including **ketoconazole**, **itraconazole**, **atazanavir** ampicillin esters, and **iron salts**. May ↑ levels of **digoxin** and **methotrexate**. Hypomagnesemia ↑ risk of **digoxin** toxicity. May ↑ the risk of bleeding with **warfarin** (monitor INR/PT).

Route/Dosage

Gastroesophageal Reflux Disease

PO (Adults): *Healing of erosive or ulcerative GERD*—20 mg once daily for 4–8 wk; *Maintenance of healing of erosive or ulcerative GERD*—20 mg once daily; *Symptomatic GERD*—20 mg once daily for 4 wk (additional 4 wk may be considered for non-responders).

PO (Children ≥12 yr): *Short-term treatment of symptomatic GERD*—20 mg once daily for up to 8 wk.

PO (Children 1–11 yr): ≥15 kg—10 mg once daily for up to 12 wk (given as sprinkle); <15 kg—5 mg once daily for up to 12 wk (given as sprinkle); may ↑ up to 10 mg once daily if inadequate response.

Duodenal Ulcers

PO (Adults): *Healing of duodenal ulcers*—20 mg once daily for up to 4 wk.

H. pylori Eradication to Reduce the Risk of Duodenal Ulcer Recurrence (Triple Therapy)

PO (Adults): 20 mg twice daily for 7 days with amoxicillin 1000 mg twice daily for 7 days and clarithromycin 500 mg twice daily for 7 days.

Pathological Hypersecretory Conditions Including Zollinger-Ellison Syndrome

PO (Adults): 60 mg once daily initially, may be adjusted as needed and continued as necessary; doses up to 100 mg daily or 60 mg twice daily have been used.

Availability (generic available)

Delayed-release capsules (Sprinkle): 5 mg, 10 mg. **Delayed-release tablets:**  10 mg, 20 mg.

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

R

NURSING IMPLICATIONS

Assessment

- Assess routinely for epigastric or abdominal pain and frank or occult blood in the stool, emesis, or gastric aspirate.
- **Monitor bowel function.** Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of pseudomembranous colitis. May begin up to several weeks following cessation of therapy.
- **Lab Test Considerations:** Monitor CBC with differential periodically during therapy.
- May cause hypomagnesemia. Monitor serum magnesium prior to and periodically during therapy.

Potential Nursing Diagnoses

Acute pain (Indications)

Implementation

- **Do not confuse** rabeprazole with aripiprazole. **Do not confuse** Aciphex with Accupril or Aricept.
- **PO:** Administer doses before meals, preferably in the morning. Tablets should be swallowed whole; do not break, crush, or chew.
- **Aciphex Sprinkle:** open capsule and sprinkle granule contents on a small amount of soft food (apple sauce, fruit, or vegetable-based baby food, yogurt) or empty contents into small amount of liquid (infant formula, apple juice, pediatric electrolyte solution). Food or liquid should be at or below room temperature. Whole dose should be taken within 15 min of being sprinkled. Granules should not be chewed or crushed. Dose should be taken 30 min before a meal. Do not store mixture for future use.

Patient/Family Teaching

- Instruct patient to take medication as directed for the full course of therapy, even if feeling better. Take missed doses as soon as remembered but not if almost time for next dose. Do not double doses.
- May cause occasional drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid alcohol, products containing aspirin or NSAIDs, and foods that may cause an increase in GI irritation.
- Caution patients to wear sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to report onset of black, tarry stools; diarrhea; abdominal pain; or persistent headache to health care professional promptly.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- **Instruct patient to notify health care professional of onset of black, tarry stools; diarrhea; abdominal**

pain; or persistent headache or if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.

- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in abdominal pain or prevention of gastric irritation and bleeding. Healing of duodenal ulcers can be seen on x-ray examination or endoscopy.
- Decrease in symptoms of GERD. Therapy is continued for 4–8 wk after initial episode.

raloxifene (ra-lox-i-feen)

Evista

Classification

Therapeutic: bone resorption inhibitors
Pharmacologic: selective estrogen receptor modulators

Pregnancy Category X

Indications

Treatment and prevention of osteoporosis in postmenopausal women. Reduction of the risk of breast cancer in postmenopausal women with osteoporosis and those at high risk for invasive breast cancer.

Action

Binds to estrogen receptors, producing estrogen-like effects on bone, resulting in reduced resorption of bone and decreased bone turnover. **Therapeutic**

Effects: Prevention of osteoporosis in patients at risk. Decreased risk of breast cancer.

Pharmacokinetics

Absorption: Although well absorbed (>60%), after oral administration, extensive first-pass metabolism results in 2% bioavailability.

Distribution: Highly bound to plasma proteins; remainder of distribution unknown.

Protein Binding: Highly bound to plasma proteins.

Metabolism and Excretion: Extensively metabolized by the liver; undergoes enterohepatic cycling; excreted primarily in feces.

Half-life: 27.7 hr.

TIME/ACTION PROFILE (effects on bone turnover)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	3 mo	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; History of thromboembolic events; **OB, Lactation:** Not indicated

for women with childbearing potential or who are breast feeding; **Pedi:** Safety not established.

Use Cautiously in: Potential immobilization (↑ risk of thromboembolic events); History of stroke or transient ischemic attack; Atrial fibrillation; Hypertension; Cigarette smoking.

Adverse Reactions/Side Effects

CNS: **STROKE**. **CV:** **THROMBOEMBOLISM**. **EENT:** retinal vein thrombosis. **MS:** leg cramps. **Misc:** hot flashes.

Interactions

Drug-Drug: Cholestyramine ↓ absorption (avoid concurrent use). May alter effects of **warfarin** and other **highly protein-bound drugs**. Concurrent systemic **estrogen** therapy is not recommended.

Route/Dosage

PO (Adults): 60 mg once daily.

Availability

Tablets: 60 mg. **Cost:** \$630.76/100.

NURSING IMPLICATIONS

Assessment

- Assess patient for bone mineral density with x-ray, serum, and urine bone turnover markers (bone-specific alkaline phosphatase, osteocalcin, and collagen breakdown products) before and periodically during therapy.
- Lab Test Considerations:** May cause ↑ apolipoprotein A-I and reduced serum total cholesterol, LDL cholesterol, fibrinogen, apolipoprotein B, and lipoprotein.
- May cause ↑ hormone-binding globulin (sex steroid-binding globulin, thyroxine-binding globulin, corticosteroid-binding globulin) with ↑ total hormone concentrations.
- May cause small ↓ in serum total calcium, inorganic phosphate, total protein, and albumin.
- May also cause slight decrease in platelet count.

Potential Nursing Diagnoses

Risk for injury (Indications)

Implementation

- Do not confuse Evista (raloxifene) with Avinza (morphine sulfate, extended release).**
- PO:** May be administered without regard to meals.
- Calcium supplementation should be added to diet if daily intake is inadequate.

Patient/Family Teaching

- Instruct patient to take raloxifene as directed. Discuss the importance of adequate calcium and vitamin D intake or supplementation. Instruct patient to read the *Medication Guide* when initiating therapy and again with each prescription refill in case of changes.

- Advise patient to discontinue smoking and alcohol consumption.
- Emphasize the importance of regular weight-bearing exercise. Advise patient that raloxifene should be discontinued at least 72 hr before and during prolonged immobilization (recovery from surgery, prolonged bedrest). Instruct patient to avoid prolonged restrictions of movement during travel because of the increased risk of venous thrombosis.
- Advise patient that raloxifene will not reduce hot flashes or flushes associated with estrogen deficiency and may cause hot flashes.
- Instruct patient to notify health care professional immediately if leg pain or a feeling of warmth in the lower leg (calf); swelling of the legs, hands, or feet; sudden chest pain; shortness of breath or coughing up blood; or sudden change in vision, such as loss of vision or blurred vision occur.** Being still for a long time (sitting still during a long car or airplane trip, being in bed after surgery) can increase risk of blood clots.
- Advise patient that raloxifene may have teratogenic effects. Instruct patient to notify health care provider immediately if pregnancy is planned or suspected.

Evaluation/Desired Outcomes

- Prevention of osteoporosis in postmenopausal women.
- Reduced risk of breast cancer in postmenopausal women with osteoporosis and those at high risk for invasive breast cancer.

raltegravir (ral-teg-ra-veer) Isentress

Classification

Therapeutic: antiretrovirals

Pharmacologic: integrase strand transfer inhibitors (INSTIs)

Pregnancy Category C

Indications

HIV-1 infection (with other antiretrovirals) in treatment-experienced or treatment-naïve patients.

Action

Inhibits HIV-1 integrase, which is required for viral replication. **Therapeutic Effects:** Evidence of decreased viral replication and reduced viral load with slowed progression of HIV and its sequelae.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

✶ = Canadian drug name. ⚡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Distribution: Unknown.

Metabolism and Excretion: Mostly metabolized by the uridine diphosphate glucuronosyltransferase (UGT) A1A enzyme system; 23% excreted in urine as parent drug and metabolite.

Half-life: 9 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	3 hr	12 hr

Contraindications/Precautions

Contraindicated in: **Lactation:** Breast feeding not recommended in HIV-infected patients.

Use Cautiously in: Concurrent use of medications associated with rhabdomyolysis/myopathy (may ↑ risk); Phenylketonuria (chewable tablets contain phenylalanine); **Geri:** Choose dose carefully, considering concurrent disease states, drug therapy, and age-related ↓ in hepatic and renal function; **OB:** Use in pregnancy only if maternal benefit outweighs fetal risk; **Pedi:** Children <4 wk (safety and effectiveness not established).

Adverse Reactions/Side Effects

CNS: **SUICIDAL THOUGHTS**, headache, depression, dizziness, fatigue, insomnia, weakness. **CV:** myocardial infarction. **GI:** diarrhea, abdominal pain, gastritis, hepatitis, nausea, vomiting. **GU:** renal failure/impairment. **Hemat:** anemia, neutropenia. **Metab:** lipodystrophy. **Derm:** **STEVENS JOHNSON SYNDROME**, **TOXIC EPIDERMAL NECROLYSIS**, rash. **MS:** **RHABDOMYOLYSIS**, ↑ creatine kinase, myopathy. **Misc:** hypersensitivity reactions, immune reconstitution syndrome, fever.

Interactions

Drug-Drug: Concurrent use with **strong inducers of the UGT A1A enzyme system** including **rifampin** may ↓ blood levels and effectiveness. Concurrent use with **strong inhibitors of the UGT A1A enzyme system** including **atazanavir** may ↑ blood levels. ↑ risk of rhabdomyolysis/myopathy **HMG-CoA reductase inhibitors**. **Proton pump inhibitors** may ↑ levels. **Efavirenz**, **etravirine**, and **tipranavir/ritonavir** may ↓ levels. Administration with **antacids**, containing **magnesium**, **aluminum**, or **calcium** ↓ absorption of tipranavir; separate administration of tipranavir and magnesium- or aluminum-containing antacids by ≥2 hr.

Route/Dosage

PO (Adults): 400 mg twice daily; ↑ dose to 800 mg twice daily when used with rifampin.

PO (Children ≥4 wk and ≥25 kg): *Tablet*—400 mg twice daily; *Chewable tablets (if unable to swallow tablet)*—25–28 kg: 150 mg twice daily; 28–39.9 kg: 200 mg twice daily; ≥40 kg: 300 mg twice daily.

PO (Children ≥4 wk and 20–<25 kg): *Chewable tablets*—150 mg twice daily.

PO (Children ≥4 wk and 14–<20 kg): *Oral suspension*—100 mg twice daily; *Chewable tablets*—100 mg twice daily.

PO (Children ≥4 wk and 11–<14 kg): *Oral suspension*—80 mg twice daily; *Chewable tablets*—75 mg twice daily.

PO (Children ≥4 wk and 8–<11 kg): *Oral suspension*—60 mg twice daily.

PO (Children ≥4 wk and 6–<8 kg): *Oral suspension*—40 mg twice daily.

PO (Children ≥4 wk and 4–<6 kg): *Oral suspension*—30 mg twice daily.

PO (Children ≥4 wk and 3–<4 kg): *Oral suspension*—20 mg twice daily.

Availability

Tablets: 400 mg. **Chewable tablets (orange-banana):** 25 mg, 100 mg. **Packet for oral suspension:** 100 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for change in severity of HIV symptoms and for symptoms of opportunistic infections during therapy.
- **Monitor for anxiety, depression (especially in patients with a history of psychiatric illness), suicidal ideation, and paranoia during therapy.**
- **Assess for rash periodically during therapy.** May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- **Lab Test Considerations:** Monitor viral load and CD4 counts regularly during therapy.
- May cause ↓ ANC, hemoglobin, and platelet counts.
- May cause ↑ serum glucose, AST, ALT, GGT, total bilirubin, alkaline phosphatase, pancreatic amylase, serum lipase, and creatinine kinase concentrations.

Potential Nursing Diagnoses

Risk for infection (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- Tablets are not interchangeable with chewable tablets or packets for oral suspension.
- **PO:** May be administered without regard to meals.
- Swallow tablets whole; do not break, crush, or chew.
- Chewable tablets may be chewed or swallowed.
- Pour packet for oral solution into 5 mL of water and mix. Once mixed, administer with syringe orally within 30 min of mixing. Discard unused solution.

Patient/Family Teaching

- Emphasize the importance of taking **ramelteon** as directed, at evenly spaced times throughout day. Do not take more than prescribed amount and do not stop taking without consulting health care professional. Take missed doses as soon as remembered unless almost time for next dose. Do not double doses. Advise patient to read *Patient Information* sheet before starting therapy and with each prescription renewal in case changes have been made.
- Instruct patient that **ramelteon** should not be shared with others.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Inform patient that **ramelteon** does not cure AIDS or prevent associated or opportunistic infections. **Ramelteon** does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom during sexual contact and to avoid sharing needles or donating blood to prevent spreading the AIDS virus to others. Advise patient that the long-term effects of **ramelteon** are unknown at this time.
- Advise patient to notify health care professional if they develop any unusual symptoms, if any known symptom persists or worsen, or if signs and symptoms of rhabdomyolysis (unexplained muscle pain, tenderness, weakness), rash, or depression or suicidal thoughts occur.
- Immune reconstitution syndrome may trigger opportunistic infections or autoimmune disorders. Notify health care professional if symptoms occur.
- Advise patients to notify health care professional if pregnancy is planned or suspected. Breast feeding should be avoided during therapy.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and improvement in CD4 cell counts.

ramelteon (ra-mel-tee-on)

Rozerem

Classification

Therapeutic: sedative/hypnotics

Pharmacologic: melatonin receptor agonists

Pregnancy Category C

Indications

Treatment of insomnia characterized by difficult sleep onset.

Action

Activates melatonin receptors, which promotes maintenance of circadian rhythm, a part of the sleep-wake cycle. **Therapeutic Effects:** Easier onset of sleep.

Pharmacokinetics

Absorption: Well absorbed (84%), but bioavailability is low (1.8%) due to extensive first pass liver metabolism. Absorption ↑ by a high fat meal.

Distribution: Widely distributed to body tissues.

Metabolism and Excretion: Extensively metabolized by the liver; mainly by CYP1A2 enzyme system. Metabolites are excreted mostly in urine (88%); 4% excreted in feces.

Half-life: 1–2.6 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	30–90 min	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; History of angioedema with previous use; Severe hepatic impairment; Concurrent use of fluvoxamine; **Lactation:** Lactation; **Pedi:** Safety not established.

Use Cautiously in: Depression or history of suicidal ideation; Moderate hepatic impairment; Concurrent use of CYP3A4 inhibitors, such as ketoconazole; Concurrent use of CYP2C9 inhibitors, such as fluconazole; **OB:** Use only if maternal benefit outweighs fetal risk.

Adverse Reactions/Side Effects

CNS: abnormal thinking, behavior changes, dizziness, fatigue, hallucinations, headache, insomnia (worsened), sleep—driving. **GI:** nausea. **Endo:** ↑ prolactin levels, ↓ testosterone levels. **Misc:** **ANGIOEDEMA.**

Interactions

Drug-Drug: Blood levels and effects are ↑ by **fluvoxamine**; concurrent use is contraindicated. Levels and effects may be ↓ by **rifampin**. Concurrent use of CYP3A4 inhibitors, such as **ketoconazole**, may ↑ levels and effects; use cautiously. Concurrent use of CYP2C9 inhibitors, such as **fluconazole**, may ↑ levels and effects; use cautiously. **Donepezil** and **doxepin** may ↑ levels. ↑ risk of excessive CNS depression with other CNS depressants including **alcohol**, **benzodiazepines**, **opioids**, and other **sedative/hypnotics**.

Route/Dosage

PO (Adults): 8 mg within 30 min of going to bed.

✳ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

R

Availability (generic available)

Tablets: 8 mg.

NURSING IMPLICATIONS**Assessment**

- Assess sleep patterns before and periodically throughout therapy.

Potential Nursing Diagnoses

Insomnia (Indications)

Risk for injury (Side Effects)

Implementation

- Do not confuse Rozerem (ramelteon) with Razadyne (galantamine).**
- Do not administer with or immediately after a high-fat meal.
- Before administering, reduce external stimuli and provide comfort measures to increase effectiveness of medication.
- PO:** Administer 30 min prior to going to bed.

Patient/Family Teaching

- Instruct patient to take ramelteon as directed, within 30 min of going to bed and to confine activities to those necessary to prepare for bed. Instruct patient to read the *Medication Guide* before starting and with each Rx refill; changes may occur.
- Causes drowsiness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Caution patient that complex sleep-related behaviors (sleep-driving, making phone calls, preparing and eating food, having sex, sleep walking) may occur while asleep. Inform patient to notify health care professional if sleep-related behaviors (may include sleep-driving—driving while not fully awake after ingestion of a sedative-hypnotic product, with no memory of the event) occur.
- Advise patient to notify health care professional immediately if signs of angioedema (swelling of the tongue or throat, trouble breathing, and nausea and vomiting) or angioedema (severe facial swelling) occur; may occur as early as the first time the product is taken.**
- Caution patient to avoid concurrent use of alcohol or other CNS depressants.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Relief of insomnia.

ramipril, See ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS.

ranitidine, See HISTAMINE H₂ ANTAGONISTS.

ranolazine (ra-nole-a-zeen)

Ranexa

Classification

Therapeutic: antianginals

Pregnancy Category C**Indications**

Chronic angina pectoris.

Action

Does not ↓ BP or heart rate; remainder of mechanism is not known. **Therapeutic Effects:** Decreased frequency of angina.

Pharmacokinetics**Absorption:** Highly variable.**Distribution:** Unknown.

Metabolism and Excretion: Metabolized in the gut (P-glycoprotein) and by the liver (primarily CYP3A and less by CYP2D6); <5% excreted unchanged in urine and feces.

Half-life: 7 hr.**TIME/ACTION PROFILE (blood levels)**

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–5 hr	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of potent inhibitors of CYP3A; Concurrent use of inducers of CYP3A; Hepatic impairment; **Lactation:** Lactation.

Use Cautiously in: Renal impairment; **OB:** Use only when potential benefit outweighs risk to fetus;

Pedi: Safety not established; **Geri:** ↑ risk of adverse reactions in patients >75 yr.

Adverse Reactions/Side Effects

CNS: dizziness, headache. **EENT:** tinnitus. **CV:** **TORSADES DE POINTES**, palpitations, QTc prolongation. **GI:** abdominal pain, constipation, dry mouth, nausea, vomiting.

Interactions

Drug-Drug: **Ketoconazole, itraconazole, clarithromycin, nefazodone, nelfinavir, ritonavir, indinavir, and saquinavir** significantly ↑ levels; concurrent use contraindicated. **Rifampin, rifabutin, rifapentin, phenobarbital, phenytoin, and carbamazepine** significantly ↓ levels; concurrent use contraindicated. **Verapamil, diltiazem, aprepitant, erythromycin, and fluconazole** ↑ levels (do not exceed ranolazine dose of 500 mg twice daily). **Cyclo-**

sporine may ↑ levels. **Paroxetine** may ↑ levels. May ↑ levels of **simvastatin**. May ↓ metabolism and ↑ effects of **metoprolol**, **tricyclic antidepressants**, and **antipsychotics**; dosage adjustments may be necessary. May ↑ **digoxin** levels; dose adjustment may be required.

Drug-Natural Products: **St. John's wort** significantly ↓ levels (contraindicated).

Drug-Food: **Grapefruit juice** ↑ levels (do not exceed ranolazine dose of 500 mg twice daily).

Route/Dosage

PO (Adults): 500 mg twice daily initially, may be ↑ to 1000 mg twice daily.

Availability (generic available)

Extended-release tablet: 500 mg.

NURSING IMPLICATIONS

Assessment

- Assess location, duration, intensity, and precipitating factors of angular pain.
- Monitor ECG at baseline and periodically during therapy to evaluate effects on QT interval.
- **Lab Test Considerations:** Monitor renal function after starting and periodically during therapy in patients with moderate to severe renal impairment (CCr < 60 mL/min) for ↑ serum creatinine accompanied by ↑ BUN. Usually has a rapid onset, but does not progress during therapy and is reversible with discontinuation of ranolazine.
- May cause transient eosinophilia.
- May cause small mean ↓ in hematocrit.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)

Activity intolerance (Indications)

Implementation

- Ranolazine should be used in combination with amlodipine, beta blockers, or nitrates.
- Do not administer with grapefruit juice or grapefruit products.
- **PO:** May be administered without regard to food. Tablets should be swallowed whole; do not break, crush, or chew.

Patient/Family Teaching

- Instruct patient to take ranolazine as directed. If a dose is missed, take the usual dose at the next scheduled time; do not double doses. Explain to patient that ranolazine is used for chronic therapy and will not help an acute angina episode.
- Advise patient to avoid grapefruit juice and grapefruit products when taking ranolazine.
- May cause dizziness and light-headedness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.

ing alertness until response to medication is known.

- Advise patient to notify health care professional if fainting occurs.
- **Inform patient that ranolazine may cause changes in the ECG. Patient should inform health care professional if they have a personal or family history of QTc prolongation, congenital long QT syndrome, or proarrhythmic conditions such as hypokalemia.**
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.

Evaluation/Desired Outcomes

- Decrease in frequency of angina attacks.

rasagiline (ra-za-ji-leen)

Azilect

Classification

Therapeutic: antiparkinson agents

Pharmacologic: monoamine oxidase type B inhibitors

Pregnancy Category C

Indications

Parkinson's disease (monotherapy and adjunctive to levodopa).

Action

Irreversibly inactivates monoamine oxidase (MAO) by binding to it at type B (brain sites); inactivation of MAO leads to increased amounts of dopamine available in the CNS. Differs from selegiline by its nonamphetamine characteristics. **Therapeutic Effects:** Improvement in symptoms of Parkinson's disease, allowing increase in function.

Pharmacokinetics

Absorption: 36% absorbed following oral administration.

Distribution: Readily crosses the blood-brain barrier.

Metabolism and Excretion: Extensively metabolized by the liver (CYP1A2 enzyme) to an inactive metabolite; less than 1% excreted in urine.

Half-life: 1.3 hr; does not correlate with duration of MAO-B inhibition.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1 hr	40 days*

*Recovery of MAO-B function.

🍁 = Canadian drug name. ⚠️ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

R

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent meperidine, tramadol, methadone, sympathomimetic amines, dextromethorphan, mirtazapine, cyclobenzaprine, cocaine, St. John's wort, another MAO inhibitor; Moderate to severe hepatic impairment; Elective surgery requiring general anesthesia; allow 14 days after discontinuation; Pheochromocytoma; Psychotic disorder.

Use Cautiously in: Mild hepatic impairment ($\uparrow$ blood levels); **OB:** Use only if maternal benefit outweighs fetal risk; **Lactation:** May inhibit lactation; **Pedi:** Safety not established.

Adverse Reactions/Side Effects

CNS: depression, dizziness, hallucinations, malaise, vertigo. **EENT:** conjunctivitis, rhinitis. **Resp:** asthma. **CV:** $\uparrow$ BP, chest pain, postural hypotension (may $\uparrow$ levodopa-induced hypotension), syncope. **GI:** anorexia, dizziness, dyspepsia, gastroenteritis, vomiting. **GU:** albuminuria, $\downarrow$ libido. **Derm:** alopecia, ecchymosis, $\uparrow$ melanoma risk, rash. **Endo:** weight loss. **Hemat:** leukopenia. **MS:** arthralgia, arthritis, neck pain. **Neuro:** dyskinesia (may $\uparrow$ levodopa-induced dyskinesia), paresthesia. **Misc:** allergic reactions, flu-like syndrome, $\uparrow$ fall risk, fever.

Interactions

Drug-Drug: Ciprofloxacin and other inhibitors of the CYP1A2 enzyme $\uparrow$ rasagiline levels; dose adjustment is recommended. **Meperidine** has resulted in life-threatening reactions when used with other MAO inhibitors; wait at least 14 days after discontinuation of rasagiline to initiate meperidine. Similar reactions may occur with **tramadol**, **methadone**; concurrent use should be avoided. Concurrent use with **dextromethorphan** may result in psychosis/bizarre behavior and should be avoided. $\uparrow$ risk of adverse reactions with **mirtazapine** and **cyclobenzapine**; concurrent use should be avoided. Hypertensive crisis may occur with **sympathomimetic amines** including **amphetamines**, **cold products**, and some **weight loss products** containing **vasoconstrictors** such as **pseudoephedrine**, **phenylephrine**, or **ephedrine**; avoid concurrent use. $\uparrow$ risk of serotonin syndrome with **tricyclic antidepressants**, **SSRI antidepressants**, **SNRI antidepressants**, and other **MAO inhibitors**; rasagiline should be discontinued ≥ 14 days prior to initiation of antidepressants (**fluoxetine** should be discontinued ≥ 5 wk prior to rasagiline therapy). Hypertensive crisis may also occur when rasagiline is used with **other MAO inhibitors**; allow at least 14 days between usage.

Drug-Natural Products: Risk of toxicity is $\uparrow$ with **St. John's wort**.

Drug-Food: Ingestion of foods containing high amounts of **tyramine** (>150 mg) (e.g., cheese) may result in life-threatening hypertensive crisis.

Route/Dosage

PO (Adults): *Monotherapy*—1 mg daily; *adjunct therapy*—0.5 mg daily, may $\uparrow$ to 1 mg daily; *concurrent ciprofloxacin or other CYP1A2 inhibitors*—0.5 mg daily.

Hepatic Impairment

PO (Adults): *Mild hepatic impairment*—0.5 mg daily.

Availability (generic available)

Tablets: 0.5 mg, 1 mg.

NURSING IMPLICATIONS

Assessment

- Assess signs and symptoms of Parkinson's disease (tremor, muscle weakness and rigidity, ataxic gait) prior to and during therapy.
- Monitor BP periodically during therapy.
- Assess skin for melanomas periodically during therapy.
- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyperreflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).
- **Lab Test Considerations:** May cause albuminuria, leukopenia, and abnormal liver function tests.
- **Toxicity and Overdose:** Concurrent ingestion of tyramine-rich foods and many medications may result in a life-threatening hypertensive crisis. Signs and symptoms of hypertensive crisis include chest pain, tachycardia or bradycardia, severe headache, neck stiffness or soreness, nausea and vomiting, sweating, photosensitivity, and enlarged pupils.

Potential Nursing Diagnoses

Impaired physical mobility (Indications)

Risk for injury (Indications, Side Effects)

Implementation

- Do not confuse Azilect (rasagiline) with Aricept (donepezil).
- If used in combination with levodopa, a reduction in levodopa dose may be considered based on individual results.
- **PO:** Administer once daily.

Patient/Family Teaching

- Instruct patient to take rasagiline as directed. Missed doses should be omitted and next dose taken at usual time the following day. Do not double doses. Do not discontinue abruptly; may cause elevated temperature, muscular rigidity, altered consciousness, and autonomic instability.
- Caution patient to avoid alcohol, CNS depressants, and foods or beverages containing tyramine (see Appendix M) during and for at least 2 wk after therapy.

apy has been discontinued; they may precipitate a hypertensive crisis. Contact health care professional immediately if symptoms of hypertensive crisis or serotonin syndrome develop.

- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications. Caution patient to avoid use of St. John's wort and analgesics meperidine, tramadol, or methadone during therapy.
- Caution patient to avoid elective surgery requiring general anesthesia, cocaine, or local anesthesia containing sympathomimetic vasoconstrictors within 14 days of discontinuing rasagiline. If surgery is necessary sooner, benzodiazepines, rapacuronium, fentanyl, morphine, and codeine may be used cautiously.
- May cause dizziness or drowsiness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Caution patient to change positions slowly to minimize orthostatic hypotension. Geriatric patients are at increased risk for this side effect.
- Advise patient to monitor for melanomas frequently and on a regular basis.
- Caution patient to notify health care professional if new or increased gambling, sexual, or other intense urges occur.
- Advise patient to notify health care professional immediately if severe headache, neck stiffness, heart racing, or palpitations, occur.
- Advise female patients to notify health care professionals if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Improvement in symptoms of Parkinson's disease, allowing increase in function.

 **rasburicase**
(ras-byoor-i-case)
Elitek,  Fasturtec

Classification

Therapeutic: antigout agents, antihyperuricemics

Pharmacologic: enzymes

Pregnancy Category C

Indications

Initial management of increased uric acid levels in patients with leukemia, lymphoma, or other malignancies who are being treated with antineoplastics, which are expected to produce hyperuricemia.

Action

An enzyme that promotes the conversion of uric acid to allantoin, an inactive, water-soluble compound.

Produced by recombinant DNA technology. **Therapeutic Effects:** Decreased sequelae of hyperuricemia (nephropathy, arthropathy).

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: 18 hr.

TIME/ACTION PROFILE (↓ in uric acid)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	unknown	4–24 hr

Contraindications/Precautions

Contraindicated in:  G6PD deficiency (↑ risk of severe hemolysis); Previous allergic reaction, hemolysis, or methemoglobinemia from rasburicase; **Lactation:** Lactation.

Use Cautiously in: **OB:** Pregnancy (use only if clearly needed).

Adverse Reactions/Side Effects

CNS: headache. **Resp:** respiratory distress. **GI:** abdominal pain, constipation, diarrhea, nausea, vomiting, mucositis. **Derm:** rash. **Hemat:** **HEMOLYSIS**, **METHEMOGLOBINEMIA**, neutropenia. **Misc:** hypersensitivity reactions including **ANAPHYLAXIS**, fever, sepsis.

Interactions

Drug-Drug: None known.

Route/Dosage

IV (Adults and Children): 0.2 mg/kg daily as a single dose for 5 days.

Availability

Lyophilized powder for reconstitution: 1.5 mg/vial.

NURSING IMPLICATIONS

Assessment

- **Monitor patients for signs of allergic reactions and anaphylaxis** (chest pain, dyspnea, hypotension, urticaria). If these signs occur, rasburicase should be immediately and permanently discontinued.
- **Lab Test Considerations:** Monitor patients for hemolysis.  Screen patients at high risk for G6PD deficiency (patients of African American or Mediterranean ancestry) prior to therapy. If hemolysis occurs, discontinue and do not restart rasburicase.

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- **Monitor patients for methemoglobinemia.** Discontinue rasburicase and do not restart in patients who develop methemoglobinemia.
- May cause spuriously low uric acid levels in blood samples left at room temperature. Collect blood for uric acid levels in pre-chilled tubes containing heparin and immediately immerse and maintain in an ice water bath. Uric acid must be analyzed in plasma. Plasma samples must be assayed within 4 hr of collection.

Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- Chemotherapy is initiated 4–24 hr after first dose of rasburicase.

IV Administration

- **pH:** No Data.
- **Intermittent Infusion:** Determine number of vials of rasburicase needed based on patient's weight and dose/kg. Reconstitute in diluent provided. Add 1 mL of diluent provided to each vial and mix by swirling very gently. Do not shake or vortex. Solution should be clear and colorless. Do not use solutions that are discolored or contain particulate matter. **Diluent:** Remove dose from reconstituted vials and inject into infusion bag of 0.9% NaCl for a final total volume of 50 mL. Administer within 24 hr of reconstitution. Store reconstituted or diluted solution in refrigerator for up to 24 hr. **Rate:** Administer over 30 min. Do not administer as a bolus.
- **Y-Site Incompatibility:** Infuse through a separate line. Do not use a filter with infusion. If separate line is not possible, flush line with at least 15 mL of 0.9% NaCl prior to rasburicase infusion.

Patient/Family Teaching

- Inform patient and family of purpose of rasburicase infusion.

Evaluation/Desired Outcomes

- Decrease in plasma uric acid levels in pediatric patients receiving antineoplastics expected to result in tumor lysis and subsequent elevation of plasma uric acid levels. More than 1 course of therapy or administration beyond 5 days is not recommended.

regorafenib (re-goe-raf-e-nib)
Stivarga

Classification

Therapeutic: antineoplastics

Pharmacologic: kinase inhibitors

Pregnancy Category D

Indications

Metastatic colorectal cancer (CRC) that has failed previous treatment that included a fluoropyrimidine, oxiplatin, irinotecan, an anti-VEGF therapy, and additional anti-EGFR therapy if tumor is of the KRAS wild type.

Action

Inhibits kinases, which are responsible for many phases of cell function and proliferation. **Therapeutic Effects:** Decreased progression of metastatic CRC with improved survival.

Pharmacokinetics

Absorption: Well absorbed following oral administration (69–83%).

Distribution: Unknown.

Protein Binding: *Regorafenib*—>99.5%, *M-2 metabolite*—99.8%, *M-5 metabolite*—99.95%.

Metabolism and Excretion: Highly metabolized (by CYP3A4 and UGT1A9), 2 metabolites (M-2 and M-5) have antineoplastic activity. Undergoes entero-hepatic circulation.

Half-life: *Regorafenib*—28 hr (range 14–58 hr), *M-2 metabolite*—25 hr (range 14–32 hr), *M-5 metabolite*—51 hr (range 32–70 hr). 47% excreted in feces as parent compound, 24% as metabolites; 19% excreted in urine (mostly as inactive metabolites).

TIME/ACTION PROFILE (improved survival)

ROUTE	ONSET	PEAK	DURATION
PO	3 mo	3 mo	up to 10 mo

Contraindications/Precautions

Contraindicated in: Avoid strong inducers/inhibitors of CYP3A4; **Lactation:** Breast feeding should be avoided; **OB:** May cause fetal harm, pregnancy should be avoided; Severe hepatic impairment (Child-Pugh Class C).

Use Cautiously in: History of hypertension/cardiovascular disease (BP should be controlled prior to treatment); Elective surgical procedures (discontinue 2 wk prior to surgery); Patients with reproductive potential (effective contraception should be practiced during and for 2 mo following treatment); **Pedi:** Safe and effective use in children <18 yr has not been established.

Adverse Reactions/Side Effects

CNS: REVERSIBLE POSTERIOR LEUKOENCEPHALOPATHY, fatigue, headache. **EENT:** dysphonia. **CV:** CARDIAC ISCHEMIA/INFARCTION, HYPERTENSION. **GI:** GASTROINTESTINAL FISTULA/PERFORATION, HEPATOTOXICITY, ↓ appetite, diarrhea, mucositis, altered taste, dry mouth, gastrointestinal reflux, ↑ transaminases. **Derm:** PLAN-TAR ERYTHRODYSSTHESIA, alopecia, impaired wound healing, rash. **Endo:** hypothyroidism. **F and E:** hypocalcemia, hypokalemia, hypophosphatemia, hyponatremia. **GU:** proteinuria. **Hemat:** BLEEDING,

THROMBOCYTOPENIA, anemia, lymphopenia. **Metab:** weight loss, ↑ lipase, ↑ amylase. **MS:** pain, musculoskeletal stiffness. **Neuro:** tremor. **Misc:** **INFECTION**, fever.

Interactions

Drug-Drug: Strong inhibitors of CYP3A4 including clarithromycin, itraconazole, ketoconazole, posaconazole, telithromycin, and voriconazole ↑ blood levels and the risk of toxicity, avoid concurrent use. Strong inducers of CYP3A4 including carbamazepine, phenobarbital, phenytoin, and rifampin ↓ blood levels and effectiveness, avoid concurrent use. May ↑ risk of bleeding with warfarin.

Drug-Natural Products: St. John's wort ↓ blood levels and effectiveness; avoid concurrent use.

Drug-Food: Grapefruit juice ↑ blood levels and the risk of toxicity, avoid concurrent use.

Route/Dosage

PO (Adults): 160 mg daily on days 1–21 of a 28-day cycle (with low-fat meal containing <30% fat). Dose modifications required for hematologic toxicity, dermatologic toxicity, or hypertension. Discontinuation may be necessary for life-threatening toxicities.

Availability

Tablets: 40 mg.

NURSING IMPLICATIONS

Assessment

- Monitor BP prior to and weekly during the first 6 wk, then every cycle of therapy. Do not initiate regorafenib until BP is well controlled.
- Assess for cardiac ischemia or infarction during therapy.
- Assess for bleeding during therapy. Interrupt therapy if severe hemorrhage occurs.
- **Lab Test Considerations:** Obtain liver function test (ALT, AST, bilirubin) before starting, at least every 2 wk during first 2 mo of therapy, and monthly thereafter. Monitor liver function tests weekly in patients with ↑ liver function tests until improvement to <3 × the upper limit of normal or baseline.
- May cause anemia, thrombocytopenia, neutropenia, and lymphopenia.
- May cause hypocalcemia, hypokalemia, hyponatremia, and hypophosphatemia.
- May cause proteinuria, ↑ serum lipase, and ↑ serum amylase.
- May cause ↑ INR. Monitor INR levels more frequently in patients receiving warfarin.

Potential Nursing Diagnoses

Risk for impaired skin integrity

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- **High Alert:** Fatalities have occurred with incorrect administration of chemotherapeutic agents. Before administering, clarify all ambiguous orders; double check single, daily, and course-of-therapy dose limits; have second practitioner independently double check original order and dose calculations. Therapy should be initiated by physician experienced in the treatment of patients with colorectal cancer.
- **PO:** Administer four 40 mg tablets once daily for the first 21 days of the of each 28-day cycle. Swallow tablets whole with a low-fat breakfast that contains <30% fat such as 2 slices of white toast with 1 tbsp of low-fat margarine and 1 tbsp of jelly, and 8 oz of skim milk; or 1 cup of cereal, 8 oz skim milk, 1 slice toast with jam, apple juice, and 1 cup coffee or tea.
- **Dose modifications:** *Interrupt therapy* for Grade 2 hand-foot skin reaction (HFSR) that is recurrent or does not improve in 7 days despite dose reduction; interrupt therapy for a minimum of 7 days for Grade 3 (HFSR), symptomatic Grade 2 hypertension, any Grade 3 or 4 adverse reactions.
- *Reduce dose to 120 mg daily* for first occurrence of Grade 2 HFSR of any duration, after first recovery of any Grade 3 or 4 adverse reaction, for Grade 3 ↑ AST or ALT; only resume if potential benefit outweighs risk of hepatotoxicity.
- *Reduce dose to 80 mg daily* for re-occurrence of Grade 2 HFSR at 120 mg dose, after recovery of any Grade 3 or 4 adverse reaction at 120 mg dose (except hepatotoxicity).
- *Discontinue regorafenib permanently* for failure to tolerate 80 mg dose, any occurrence of ↑ AST or ALT >20 × upper limit of normal, any occurrence of ↑ AST or ALT >3 × upper limit of normal with concurrent bilirubin >2 × upper limit of normal, re-occurrence of ↑ AST or ALT >5 × upper limit of normal despite reduction to 120 mg dose, any Grade 4 adverse reaction; only resume if the potential benefits outweigh the risks.

Patient/Family Teaching

- Instruct patient to take tablets at the same time each day with a low-fat meal. Take missed doses on the same day as soon as remembered; do not take 2 doses on the same day to make up for a missed dose. Store medicine in original container; do not place in daily or weekly pill boxes. Discard remaining tablets 28 days after opening bottle. Tightly

☼ = Canadian drug name. ⚡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

close bottle after each opening and keep desiccant in bottle.

- Advise patient to avoid drinking grapefruit juice or eating grapefruit during regorafenib therapy.
- Advise patient to notify health care professional immediately if signs and symptoms of liver problems (yellowing of skin or white part of eyes, nausea, vomiting, dark tea-colored urine, change in sleep pattern), bleeding, skin changes (redness, pain, blisters, bleeding, swelling), hypertension (severe headache, lightheadedness, neurologic symptoms), myocardial ischemia or infarction (chest pain, shortness of breath, dizziness, fainting), or GI perforation or fistula (severe abdominal pain, persistent swelling of abdomen, high fever, chills, nausea, vomiting, severe diarrhea, dehydration) occur.
- Advise patient to notify health care provider of therapy prior to surgery or if had recent surgery.
- Advise patient to maintain adequate hydration to minimize risk and to notify health care professional promptly if signs and symptoms of reversible posterior leukoencephalopathy syndrome (RPLS) (headache, seizures, weakness, confusion, high BP, blindness or change in vision, problems thinking) occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's Wort.
- Inform female patient that regorafenib can cause fetal harm. Advise women with reproductive potential and men of the need for effective contraception during and for at least 2 mo after completion of therapy. Notify health care provider immediately if pregnancy is planned or suspected or if breast feeding.
- Emphasize importance of monitoring lab values to monitor for adverse reactions.

Evaluation/Desired Outcomes

- Decreased progression of metastatic CRC.

HIGH ALERT

repaglinide (re-pag-gli-nide)

★ Glucanorm, Prandin

Classification

Therapeutic: antidiabetics

Pharmacologic: meglitinides

Pregnancy Category C

Indications

Type 2 diabetes mellitus, with diet and exercise; may be used with metformin, rosiglitazone, or pioglitazone.

Action

Stimulates the release of insulin from pancreatic beta cells by closing potassium channels, which results in the opening of calcium channels in beta cells. This is followed by release of insulin. **Therapeutic Effects:** Lowering of blood glucose levels.

Pharmacokinetics

Absorption: Well absorbed (56%) following oral administration.

Distribution: Unknown.

Protein Binding: >98%.

Metabolism and Excretion: Mostly metabolized by the liver; metabolites are excreted primarily in feces.

Half-life: 1 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	within 30 min	60–90 min	<4 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **Lactation:**

Lactation; Diabetic ketoacidosis; Type 1 diabetes; Concurrent use of gemfibrozil.

Use Cautiously in: Impaired liver function (longer dosing intervals may be necessary); Severe renal impairment (dose ↓ recommended); **Geri:** Consider age-related ↓ in renal/hepatic/cardiovascular function; **OB, Pedi:** Safety not established; insulin recommended to control diabetes during pregnancy.

Adverse Reactions/Side Effects

CV: angina, chest pain. **Endo:** **HYPOGLYCEMIA**, hyperglycemia.

Interactions

Drug-Drug: Ketoconazole, miconazole, gemfibrozil, itraconazole, clarithromycin, and erythromycin may ↓ metabolism and ↑ risk of hypoglycemia; concurrent use with gemfibrozil contraindicated. Levels and effects may also be ↑ by NSAIDs, cyclosporine, hormonal contraceptives, simvastatin, sulfonamides, chloramphenicol, warfarin, probenecid, deferasirox, MAO inhibitors, and beta blockers. Effects may be ↓ by corticosteroids, phenothiazines, thyroid preparations, estrogens, hormonal contraceptives, phenytoin, nicotinic acid, sympathomimetics, isoniazid, and calcium channel blockers.

Drug-Natural Products: Glucosamine may worsen blood glucose control. **Chromium** and **coenzyme Q-10** may produce ↑ hypoglycemic effects.

Route/Dosage

PO (Adults): 0.5–4 mg taken before meals (not to exceed 16 mg/day).

Renal Impairment

PO (Adults): *Severe renal impairment*—start with 0.5 mg/day and titrate carefully.

Availability (generic available)

Tablets: 0.5 mg, 1 mg, 2 mg. **In combination with:** metformin (PrandiMet); see Appendix B.

NURSING IMPLICATIONS

Assessment

- **Observe patient for signs and symptoms of hypoglycemic reactions** (abdominal pain, sweating, hunger, weakness, dizziness, headache, tremor, tachycardia, anxiety). Hypoglycemia may be difficult to recognize in geriatric patients and in patients taking beta blockers. Hypoglycemia is more likely to occur with insufficient caloric intake, following intense prolonged exercise, or when alcohol or more than 1 hypoglycemic agent is used.
- **Lab Test Considerations:** Monitor fasting serum glucose and glycosylated hemoglobin periodically during therapy to evaluate effectiveness.

Potential Nursing Diagnoses

Imbalanced nutrition: more than body requirements (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- **Do not confuse Prandin (repaglinide) with Avandia (rosiglitazone).**
- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin. Withhold repaglinide and reinstitute after resolution of acute episode.
- Repaglinide therapy should be temporarily discontinued for patients requiring surgery involving restricted intake of food and fluids.
- There is no fixed dose of repaglinide. Dose is based on periodic monitoring of blood glucose and long-term response is based on glycosylated hemoglobin levels. If adequate response is not achieved, metformin may be added to regimen. If combination therapy is unsuccessful, oral hypoglycemic therapy may need to be discontinued and replaced with insulin.
- When replacing other oral hypoglycemic agents, repaglinide may be started on the day following discontinuation of the other agent. Monitor blood glucose closely. Discontinuation of long-acting oral hypoglycemics may require monitoring for a week or more.
- Short-term repaglinide therapy may be used for patients well controlled with diet experiencing transient loss of control.

- **PO:** Administer up to 30 min before meals. Patients who skip a meal or add an extra meal should skip or add a dose, respectively, for that meal.

Patient/Family Teaching

- Instruct patient to take repaglinide before each meal, exactly as directed.
- Explain to patient that repaglinide helps control hyperglycemia but does not cure diabetes. Therapy is usually long term.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hyperglycemic or hypoglycemic episodes.
- **Review signs of hypoglycemia and hyperglycemia with patient.** If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water, and notify health care professional.
- Instruct patient in proper testing of blood glucose. These tests should be monitored closely during periods of stress or illness and a health care professional notified if significant changes occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications and alcohol.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Insulin is the recommended method of controlling blood glucose during pregnancy. Counsel female patients to use a form of contraception other than oral contraceptives and to notify health care professional promptly if pregnancy is planned or suspected.
- Advise patient to carry a form of sugar (sugar packets, candy) and identification describing disease process and medication regimen at all times.
- Emphasize the importance of routine follow-up exams and regular testing of blood glucose and glycosylated hemoglobin.

R

Evaluation/Desired Outcomes

- Control of blood glucose levels without the appearance of hypoglycemic or hyperglycemic episodes.

reteplase, See THROMBOLYTIC AGENTS.

✱ = Canadian drug name. ⚠ = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Rh_o(D) IMMUNE GLOBULIN (arr aych oh dee im-yoon glob - yoo-lin)

Rh_o(D) immune globulin standard dose IM

HyperRHO S/D Full Dose, RhoGAM

Rh_o(D) immune globulin micro-dose IM

HyperRHO S/D Mini-Dose, MICRhoGAM, Mini-Gamulin R

Rh_o(D) immune globulin IV

WinRho SDF

Rh_o(D) immune globulin micro-dose IM, IV

Rhophylac

Classification

Therapeutic: vaccines/immunizing agents

Pharmacologic: immune globulins

Pregnancy Category C

Indications

IM, IV: Administered to Rh_o(D)-negative patients who have been exposed to Rh_o(D)-positive blood by: Pregnancy or delivery of a Rh_o(D)-positive infant, Abortion of a Rh_o(D)-positive fetus, Fetal-maternal hemorrhage due to amniocentesis, other obstetrical manipulative procedure, or intra-abdominal trauma while carrying a Rh_o(D)-positive fetus, Transfusion of Rh_o(D)-positive blood or blood products to a Rh_o(D)-negative patient. **IV:** Management of immune thrombocytopenic purpura (ITP).

Action

Prevent production of anti-Rh_o(D) antibodies in Rh_o(D)-negative patients who were exposed to Rh_o(D)-positive blood. Increase platelet counts in patients with ITP. **Therapeutic Effects:** Prevention of antibody response and hemolytic disease of the newborn (erythroblastosis fetalis) in future pregnancies of women who have conceived a Rh_o(D)-positive fetus. Prevention of Rh_o(D) sensitization following transfusion accident. Decreased bleeding in patients with ITP.

Pharmacokinetics

Absorption: Completely absorbed with IV administration. Well absorbed from IM sites.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: approximately 25–30 days.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IM	rapid	5–10 days	unknown
IV†	unknown	2 hr	unknown

†When given for ITP, platelet counts start to rise in 1–2 days, peak after 5–7 days, and last for 30 days

Contraindications/Precautions

Contraindicated in: Prior hypersensitivity reaction to human immune globulin; Rh_o(D)- or Du-positive patients.

Use Cautiously in: ITP patients with pre-existing anemia (decrease dose if Hgb <10 g/dL). May also cause disseminated intravascular coagulation in ITP patients.

Adverse Reactions/Side Effects

CNS: dizziness, headache. **CV:** hypertension, hypotension. **Derm:** rash. **GI:** diarrhea, nausea, vomiting. **GU:** acute renal failure. **Hemat:** ITP—**DISSEMINATED INTRAVASCULAR COAGULATION, INTRAVASCULAR HEMOLYSIS, anemia.** **MS:** arthralgia, myalgia. **Local:** pain at injection site. **Misc:** fever.

Interactions

Drug-Drug: May ↓ antibody response to some live-virus vaccines (measles, mumps, rubella).

Route/Dosage

Rh_o(D) Immune Globulin (for IM use only)

Following Delivery

IM (Adults): *HyperRHO S/D Full Dose, RhoGAM*—1 vial standard dose (300 mcg) within 72 hr of delivery.

Before Delivery

IM (Adults): *HyperRHO S/D Full Dose, RhoGAM*—1 vial standard dose (300 mcg) at 26–28 wk.

Termination of Pregnancy (<13 wk Gestation)

IM (Adults): *HyperRHO S/D Mini-Dose, MICRhoGAM*—1 vial of microdose (50 mcg) within 72 hr.

Termination of Pregnancy (>13 wk Gestation)

IM (Adults): *RhoGAM*—1 vial standard dose (300 mcg) within 72 hr.

Large Fetal-Maternal Hemorrhage (>15 mL)

IM (Adults): *RhoGAM*—20 mcg/mL of Rh_o(D)-positive fetal RBCs.

Transfusion Accident

IM (Adults): *HyperRHO S/D Full Dose, RhoGAM*—(Volume of Rh-positive blood administered × Hct of donor blood)/15 = number of vials of standard dose (300 mcg) preparation (round to next whole number of vials).

Rh₀(D) Immune Globulin IV (for IM or IV Use)**Following Delivery**

IM, IV (Adults): *WinRho SDF*—600 IU (120 mcg) within 72 hr of delivery. *Rhophylac*—1500 IU (300 mcg) within 72 hr of delivery.

Prior to Delivery

IM, IV (Adults): *WinRho SDF, Rhophylac*—1500 IU (300 mcg) at 28 wk; if initiated earlier in pregnancy, repeat q 12 wk.

Following Amniocentesis or Chorionic Villus Sampling

IM, IV (Adults): *WinRho SDF (before 34 wk gestation)*—1500 IU (300 mcg) immediately; repeat q 12 wk during pregnancy. *Rhophylac*—1500 IU (300 mcg) within 72 hr of procedure.

Termination of Pregnancy, Amniocentesis, or Any Other Manipulation

IM, IV (Adults): *WinRho SDF*—600 IU (120 mcg) within 72 hr after event.

Large Fetal-Maternal Hemorrhage/Transfusion Accident

IM (Adults): *WinRho SDF*—6000 IU (1200 mcg) q 12 hr until total dose is given (total dose determined by amount of blood loss/hemorrhage).

IV (Adults): 3000 IU (600 mcg) q 8 hr until total dose is given (total dose determined by amount of blood loss/hemorrhage).

Immune Thrombocytopenic Purpura

IV (Adults and Children): *WinRho SDF, Rhophylac*—50 mcg (250 IU)/kg initially (if Hgb <10 g/dL, ↓ dose to 25–40 mcg [125–200 IU]/kg); further dosing/frequency determined by clinical response (range 25–60 mcg [125–300 IU]/kg). Each dose may be given as a single dose or in 2 divided doses on separate days.

Availability**Rh₀(D) Immune Globulin (for IM Use)**

Injection: 50 mcg/vial (microdose—MICRhOGAM, HyperRHO S/D Mini-Dose), 300 mcg/vial (standard dose—RhOGAM, HyperRHO S/D Full Dose).

Rh₀(D) Immune Globulin Intravenous (for IM or IV Use)

Injection: 600 IU (120 mcg)/vial, 1500 IU (300 mcg)/vial, 2500 IU (500 mcg)/vial, 5000 IU (1000 mcg)/vial, 15,000 IU (3000 mcg)/vial. **Prefilled syringes:** 1500 IU (300 mcg/2 mL).

NURSING IMPLICATIONS**Assessment**

- **IV:** Assess vital signs periodically during therapy in patients receiving IV Rh₀(D) immune globulin.
- **ITP:** Monitor patient for signs and symptoms of intravascular hemolysis (IVH) (back pain, shaking chills, fever, hemoglobinuria), anemia, and renal insufficiency. If transfusions are required, use Rh₀(D)-negative packed red blood cells to prevent exacerbation of IVH.
- **Lab Test Considerations:** *Pregnancy:* Type and crossmatch of mother and newborn's cord blood must be performed to determine need for medication. Mother must be Rh₀(D)-negative and Du-negative. Infant must be Rh₀(D)-positive. If there is doubt regarding infant's blood type or if father is Rh₀(D)-positive, medication should be given.
- An infant born to a woman treated with Rh₀(D) immune globulin antepartum may have a weakly positive direct Coombs' test result on cord or infant blood.
- *ITP:* Monitor platelet counts, RBC counts, hemoglobin, and reticulocyte levels to determine effectiveness of therapy.

Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

R**Implementation**

- Do not give to infant, to Rh₀(D)-positive individual, or to Rh₀(D)-negative individual previously sensitized to the Rh₀(D) antigen. However, there is no more risk than when given to a woman who is not sensitized. When in doubt, administer Rh₀(D) immune globulin.
- Do not confuse IM and IV formulations. Rh immune globulin for IV administration is labelled "Rh Immune Globulin Intravenous." Rh Immune Globulin Intravenous may be given IM; however, Rh Immune Globulin (microdose and standard dose) is for IM use only and cannot be given IV.
- When using prefilled syringes, allow solution to reach room temperature before administration.
- **IM:** Reconstitute Rh₀(D) immune globulin IV for IM use immediately before use with 1.25 mL of 0.9% NaCl. Inject diluent onto inside wall of vial and wet pellet by gently swirling until dissolved. Do not shake.
- Administer into the deltoid muscle. Dose should be given within 3 hr but may be given up to 72 hr after delivery, miscarriage, abortion, or transfusion.

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

IV Administration

- **pH:** 6.5–7.6.
- **Direct IV:** Reconstitute Rh₀(D) immune globulin IV for IV administration immediately before use with 2.5 mL of 0.9% NaCl. Inject diluent onto inside wall of vial and wet pellet by gently swirling until dissolved. Do not shake. **Rate:** Administer over 3–5 min.

Patient/Family Teaching

- **Pregnancy:** Explain to patient that the purpose of this medication is to protect future Rh₀(D)-positive infants.
- **ITP:** Explain purpose of medication to patient.

Evaluation/Desired Outcomes

- Prevention of erythroblastosis fetalis in future Rh₀(D)-positive infants.
- Prevention of Rh₀(D) sensitization following incompatible transfusion.
- Decreased bleeding episodes in patients with ITP.

ribavirin (rye-ba-vye-rin)

Copegus, Rebetol, Virazole

Classification

Therapeutic: antivirals

Pharmacologic: nucleoside analogues

Pregnancy Category X**Indications**

Inhaln: Treatment of severe lower respiratory tract infections caused by the respiratory syncytial virus (RSV) in infants and young children. **PO: Rebetol**—with interferon alfa-2b (*Intron A*) or peginterferon alfa-2b (*PegIntron*) in the treatment of chronic hepatitis C in patients with compensated liver disease. **PO: Copegus**—with peginterferon alfa-2a (Pegasys) in the treatment of chronic hepatitis C in patients with compensated liver disease who have not previously been treated with interferon alfa. **Unlabeled Use:** Early (within 24 hr of symptoms) secondary treatment of influenza A or B in young adults.

Action

Inhibits viral DNA and RNA synthesis and subsequent replication. Must be phosphorylated intracellularly to be active. **Therapeutic Effects:** **Inhaln:** Virustatic action. **PO:** Decreased progression and sequelae of chronic hepatitis C.

Pharmacokinetics

Absorption: Systemic absorption occurs following nasal and oral inhalation. Rapidly and extensively absorbed following oral administration, but undergoes first-pass hepatic metabolism (64% bioavailability).

Distribution: 70% of inhaled drug is deposited in the respiratory tract. Appears to concentrate in the respiratory tract and red blood cells. Enters breast milk.

Metabolism and Excretion: Eliminated from the respiratory tract by distribution across membranes, macrophages, and ciliary motion. Metabolized primarily by the liver; metabolites are renally excreted.

Half-life: *Inhaln*—9.5 hr (40 days in RBCs); *oral*—43.6 hr (single dose); 12 days (multiple dose).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
Inhaln	unknown	end of inhaln	unknown
PO	unknown	1.7–3 hr	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Patients receiving mechanically assisted ventilation; **OB, Lactation:** Pregnancy or lactation; **OB:** Male partners of pregnant patients; CGr <50 mL/min; Significant/unstable cardiovascular disease; Hemoglobinopathies; Autoimmune hepatitis or hepatic decompensation before/during treatment (for combined therapy with interferon alfa-2b or peginterferon alfa-2a); Concurrent use of didanosine, stavudine, or zidovudine.

Use Cautiously in: Sarcoidosis (may exacerbate condition); Anemia (dose reduction/discontinuation may be required); Any pre-existing cardiac disease; **OB:** Patients with childbearing potential.; **Pedi:** May result in ↓ growth.

Adverse Reactions/Side Effects**Inhalation**

CNS: dizziness, faintness. **EENT:** blurred vision, conjunctivitis, erythema of the eyelids, ocular irritation, photosensitivity. **CV:** **CARDIAC ARREST**, hypotension.

Derm: rash. **Hemat:** hemolytic anemia (with interferon alpha 2b), reticulocytosis.

Oral (may reflect combination with interferon)

CNS: emotional lability (↑ in children), fatigue (↓ in children), impaired concentration (↓ in children), insomnia (↓ in children), irritability (↓ in children).

EENT: dry mouth, optic neuritis, papilledema, retinal artery/vein thrombosis, retinal detachment, retinal hemorrhage, retinopathy (with macular edema), visual abnormalities. **Resp:** dyspnea (↓ in children).

GI: anorexia (↑ in children), dyspepsia (↓ in children), vomiting (↑ in children). **Hemat:** hemolytic anemia. **Derm:** **STEVENS-JOHNSON SYNDROME**, pruritus (↓ in children). **MS:** arthralgia (↓ in children).

Misc: fever (↑ in children).

Interactions

Drug-Drug: **Oral:** May ↓ the antiretroviral action of **stavudine** and **zidovudine**. May ↑ hematologic toxicity of **zidovudine**. May ↑ risk of pancytopenia when used with **azathioprine**. May ↑ blood levels and risk of toxicity of **didanosine**. Although used together in

the management of hepatitis, concurrent use with **interferon alpha 2b** ↑ risk of hemolytic anemia.

Route/Dosage

Inhaln (Infants and Young Children): 300 mL of 20 mg/mL solution delivered via mist for 12–18 hr/day.

Rebetol (with peginterferon alfa-2b [Peg-Intron])

If retreatment is necessary, duration of therapy is 48 wk, regardless of viral genotype

PO (Adults >105 kg): 600 mg in the morning, then 800 mg in the evening for 48 wk (viral genotype 1) or 24 wk (viral genotypes 2 and 3).

PO (Adults 81–105 kg): 600 mg in the morning, then 600 mg in the evening for 48 wk (viral genotype 1) or 24 wk (viral genotypes 2 and 3).

PO (Adults 66–80 kg): 400 mg in the morning, then 600 mg in the evening for 48 wk (viral genotype 1) or 24 wk (viral genotypes 2 and 3).

PO (Adults ≤65 kg): 400 mg in the morning, then 400 mg in the evening for 48 wk (viral genotype 1) or 24 wk (viral genotypes 2 and 3).

PO (Children 3–17 yr and >73 kg): 600 mg in the morning and 600 mg in the evening for 48 wk (viral genotype 1) or 24 wk (viral genotypes 2 and 3).

PO (Children 3–17 yr and 60–73 kg): 400 mg in the morning and 600 mg in the evening for 48 wk (viral genotype 1) or 24 wk (viral genotypes 2 and 3).

PO (Children 3–17 yr and 47–59 kg): 400 mg in the morning and 400 mg in the evening for 48 wk (viral genotype 1) or 24 wk (viral genotypes 2 and 3).

PO (Children 3–17 yr and <47 kg): 15 mg/kg/day in 2 divided doses (as oral solution) for 48 wk (viral genotype 1) or 24 wk (viral genotypes 2 and 3).

Rebetol (with interferon alfa-2b [Intron A])

If retreatment is necessary, duration of therapy is 24 wk

PO (Adults >75 kg): 600 mg in the morning, then 600 mg in the evening for 48 wk (viral genotype 1) or 24 wk (viral genotypes 2 and 3).

PO (Adults ≤75 kg): 400 mg in the morning, then 600 mg in the evening for 48 wk (viral genotype 1) or 24 wk (viral genotypes 2 and 3).

PO (Children 3–17 yr and >73 kg): 600 mg in the morning and 600 mg in the evening for 48 wk (viral genotype 1) or 24 wk (viral genotypes 2 and 3).

PO (Children 3–17 yr and 60–73 kg): 400 mg in the morning and 600 mg in the evening for 48 wk (viral genotype 1) or 24 wk (viral genotypes 2 and 3).

PO (Children 3–17 yr and 47–59 kg): 400 mg in the morning and 400 mg in the evening for 48 wk (viral genotype 1) or 24 wk (viral genotypes 2 and 3).

PO (Children 3–17 yr and <47 kg): 15 mg/kg/day in 2 divided doses (as oral solution) for 48 wk (viral genotype 1) or 24 wk (viral genotypes 2 and 3).

Copegus—viral genotype 1 or 4 (with peginterferon alfa-2a)

PO (Adults ≥75 kg): 600 mg twice daily for 48 wk.

PO (Adults <75 kg): 500 mg twice daily for 48 wk.

PO (Children ≥5 yr and ≥75 kg): 600 mg in the morning, then 600 mg in the evening for 48 wk.

PO (Children ≥5 yr and 60–74 kg): 400 mg in the morning, then 600 mg in the evening for 48 wk.

PO (Children ≥5 yr and 47–59 kg): 400 mg in the morning, then 400 mg in the evening for 48 wk.

PO (Children ≥5 yr and 34–46 kg): 200 mg in the morning, then 400 mg in the evening for 48 wk.

PO (Children ≥5 yr and 23–33 kg): 200 mg in the morning, then 200 mg in the evening for 48 wk.

Renal Impairment

PO (Adults): CCr 30–50 mL/min—200 mg/day alternating with 400 mg/day every other day for 48 wk; **CCr <30 mL/min or Hemodialysis—**200 mg once daily for 48 wk.

Copegus—viral genotype 2 or 3 (with peginterferon alfa-2a)

PO (Adults): 400 mg twice daily for 24 wk.

PO (Children ≥5 yr and ≥75 kg): 600 mg in the morning, then 600 mg in the evening for 24 wk.

PO (Children ≥5 yr and 60–74 kg): 400 mg in the morning, then 600 mg in the evening for 24 wk.

PO (Children ≥5 yr and 47–59 kg): 400 mg in the morning, then 400 mg in the evening for 24 wk.

PO (Children ≥5 yr and 34–46 kg): 200 mg in the morning, then 400 mg in the evening for 24 wk.

PO (Children ≥5 yr and 23–33 kg): 200 mg in the morning, then 200 mg in the evening for 24 wk.

Renal Impairment

PO (Adults): CCr 30–50 mL/min—200 mg/day alternating with 400 mg/day every other day for 24 wk; **CCr <30 mL/min or Hemodialysis—**200 mg once daily for 24 wk.

Copegus—with HIV coinfection (regardless of viral genotype) (with peginterferon alfa-2a)

PO (Adults): 800 mg daily for 48 wk.

Availability

Powder for reconstitution for aerosol use (Virazole): 6 g/vial. **Capsules (Rebetol):** 200 mg. **Oral solution (Rebetol):** 40 mg/mL. **Tablets (Cope-**

R

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

gus): 200 mg. **In combination with:** Rebetrob (interferon alfa-2b (Intron A)) as combination therapy for chronic hepatitis C (Rebetron). See Appendix B.

NURSING IMPLICATIONS

Assessment

- **RSV:** Assess patient for infection (vital signs, sputum, WBC) at beginning and during therapy.
- Obtain specimens for culture and sensitivity prior to initiating therapy. First dose may be given before receiving results.
- Assess respiratory (lung sounds, quality and rate of respirations) and fluid status prior to and frequently throughout therapy.
- **Chronic Hepatitis C:** Monitor symptoms of hepatitis during therapy.
- Assess patient for signs of depression during therapy. Monitor closely for neuropsychiatric changes, including suicidal thoughts.
- Obtain ECG prior to therapy in patients with pre-existing cardiac disease. Assess patient for cardiovascular disorders (pulse, BP, chest pain). Reduce dose or discontinue therapy if cardiac disorders occur. May cause myocardial infarction.
- Assess for signs of colitis (abdominal pain, bloody diarrhea, fever) and pancreatitis (nausea, vomiting, abdominal pain) during therapy. Discontinue therapy if these occur; may be fatal.
- Assess pulmonary status (lung sounds, respirations) periodically during therapy. May require discontinuation.
- Monitor for hypersensitivity reactions (urticaria, angioedema, bronchoconstriction, anaphylaxis). Discontinue immediately and institute supportive therapy.
- **Lab Test Considerations: Chronic Hepatitis C:** Monitor CBC with differential and platelet count prior to initiation, at week 2, and week 4, and regularly during therapy. If hemoglobin <10 g/dL in patients with no history of cardiac disease or $\downarrow$ more than 2 g/dL in any 4-wk treatment period in patients with history of stable cardiac disease, $\downarrow$ ribavirin dose to 600 mg (200 mg in AM and 400 mg in PM). If hemoglobin <8.5 g/dL in patients with no history of cardiac disease or <12 g/dL despite dose reduction in patients with history of stable cardiac disease, discontinue combination therapy permanently. If dose withheld in children, may restart with 1/2 original dose.
- Monitor biochemical tests and electrolytes prior to, after 4 wk, and periodically during therapy.
- Monitor liver function tests and thyroid stimulating hormone prior to and periodically during therapy.
- Monitor pregnancy tests prior to, monthly during, and for 6 mo following discontinuation of therapy in women of childbearing age. Ribavirin should be started following a negative pregnancy test.

- May cause $\uparrow$ serum bilirubin and uric acid levels.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)

Impaired gas exchange (Indications)

Implementation

- **Inhaln:** Infants requiring assisted ventilation should be suctioned every 1–2 hr and pulmonary pressures monitored every 2–4 hr.
- Ribavirin treatment should begin within the first 3 days of RSV infection to be effective.
- Ribavirin aerosol should be administered using the Viratek SPAG model SPAG-2 only. Do not administer via other aerosol-generating devices. Usually administered using an infant oxygen hood attached to the SPAG-2 aerosol generator. Administration by face mask may be used if the oxygen hood cannot be used.
- Reconstitute ribavirin 6-g vial with preservative-free sterile water for injection or inhalation. Transfer to clean, sterilized Erlenmeyer flask of the SPAG-2 reservoir and dilute to a final volume of 300 mL. This recommended concentration (20 mg/mL) in the reservoir provides a concentration of aerosol ribavirin of 190 mcg/L of air over a 12-hr period. Solution should be discarded and replaced every 24 hr.
- Aerosol treatments should be administered continuously 12–18 hr/day for 3–7 days.
- **PO:** Administer with food. Capsules should be swallowed whole; do not open, crush, or chew.
- For children, determine if child is able to swallow 200-mg tablet.

Patient/Family Teaching

- **RSV:** Explain the purpose and route of treatment to the patient and parents.
- Inform patient and parents that ribavirin may cause blurred vision and photosensitivity.
- **Chronic Hepatitis C:** Instruct patient to take ribavirin at the same time each day for the full course of therapy. Take missed doses as soon as remembered. If total day dose is missed, notify health care professional; do not double doses. Emphasize the importance of routine lab test to monitor for side effects.
- Advise patient to brush teeth twice daily, have regular dental examinations, and rinse mouth thoroughly after vomiting to prevent dental and periodontal disorders.
- May cause dizziness, confusion, fatigue, and drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Inform patient that ribavirin may not reduce the risk of transmission of HCV to others or prevent cirrhosis, liver failure, or liver cancer.
- Advise patient to consult health care professional before taking any other Rx, OTC, or herbal products.

- Advise patient to stop taking ribavirin and notify health care professional immediately if rash with fever; blisters or sores in mouth, nose, or eyes; or conjunctivitis occurs and to notify health care professional if trouble breathing, hives or swelling, chest pain, severe stomach pain or low back pain, bloody diarrhea or bloody or black stools, bruising or unusual bleeding, change in vision, fever >100.5°F, worsening psoriasis, worsening depression, or suicidal thoughts occur.
- Inform patient about teratogenic effects of ribavirin. Instruct women with childbearing potential, and men, to use 2 forms of effective contraception during and for at least 6 mo following conclusion of therapy. Men must use a condom. Avoid breast feeding during use.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of RSV.
- Decreased progression and sequelae of chronic hepatitis C. Therapy with peginterferon alfa-2a and ribavirin should be discontinued if at least a 2-log 10 reduction from baseline in HCV RNA by 12 wk of therapy, or undetectable HCV RNA levels after 24 wk of therapy.

rifabutin (riff-a-byoo-tin)

Mycobutin

Classification

Therapeutic: agents for atypical mycobacterium

Pregnancy Category B

Indications

Prevention of disseminated *Mycobacterium avium* complex (MAC) disease in patients with advanced HIV infection. **Unlabeled Use:** Treatment of *Helicobacter pylori* ulcer disease that has failed on other regimens (with pantoprazole and amoxicillin).

Action

Appears to inhibit DNA-dependent RNA polymerase in susceptible organisms. **Therapeutic Effects:** Antimycobacterial action against susceptible organisms.

Spectrum: Active against *M. avium* and most strains of *M. tuberculosis*.

Pharmacokinetics

Absorption: Well absorbed following oral administration (50–85%). Absorption is decreased in HIV-positive patients (20%).

Distribution: Widely distributed to body tissues and fluids.

Metabolism and Excretion: Mostly metabolized by the liver; <5% excreted unchanged by the kidneys.

Half-life: 45 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	2–4 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity. Cross-sensitivity with other rifamycins (rifampin) may occur; Active tuberculosis; Concurrent ritonavir or delavirdine.

Use Cautiously in: OB, Lactation, Pedi: Safety not established.

Adverse Reactions/Side Effects

EENT: brown-orange discoloration of tears, ocular disturbances. **Resp:** dyspnea. **CV:** chest pain, chest pressure. **GI:** PSEUDOMEMBRANOUS COLITIS, brown-orange discoloration of saliva, altered taste, drug-induced hepatitis. **GU:** brown-orange discoloration of urine. **Derm:** rash, skin discoloration. **Hemat:** hemolysis, neutropenia, thrombocytopenia. **MS:** arthralgia, myositis. **Misc:** brown-orange discoloration of body fluids, flu-like syndrome.

Interactions

Drug-Drug: Increases metabolism and may decrease the effectiveness of other drugs, including efavirenz, indinavir, nelfinavir, nevirapine, saquinavir (dosage adjustment may be necessary), delavirdine (concurrent use should be avoided), corticosteroids, disopyramide, quinidine, opioid analgesics, oral hypoglycemic agents, warfarin, estrogens, estrogen-containing contraceptives, phenytoin, verapamil, fluconazole, quinidine, theophylline, zidovudine, and chloramphenicol. Ritonavir increases blood levels of rifabutin (concurrent use is contraindicated), similar effects occur with efavirenz and nevirapine.

Route/Dosage

PO (Adults): 300 mg once daily. If GI upset occurs, may give as 150 mg twice daily with food. *H. pylori*—300 mg/day (unlabeled).

Availability

Capsules: 150 mg.

NURSING IMPLICATIONS

Assessment

- Monitor patient for signs of active tuberculosis (purified protein derivative [PPD], chest x-ray, sputum culture, blood culture, urine culture, biopsy of suspicious lymph nodes) prior to and throughout therapy. Rifabutin must not be administered to patients with active tuberculosis.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be re-

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

ported to health care professional promptly as a sign of pseudomembranous colitis. May begin up to several weeks following cessation of therapy.

- **Lab Test Considerations:** Monitor CBC periodically during therapy. May cause neutropenia and thrombocytopenia.

Potential Nursing Diagnoses

Risk for infection (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- **Do not confuse rifabutin with rifampin.**
- **PO:** May be administered without regard to meals. High-fat meals slow rate but not extent of absorption. May be mixed with foods such as applesauce. If GI upset occurs, administer with food.

Patient/Family Teaching

- Advise patient to take medication as directed. Do not skip doses or double up on missed doses. Emphasize the importance of continuing therapy even if asymptomatic.
- Advise patient to notify health care professional promptly if signs and symptoms of neutropenia (sore throat, fever, signs of infection), thrombocytopenia (unusual bleeding or bruising), or hepatitis (yellow eyes and skin, nausea, vomiting, anorexia, unusual tiredness, weakness) occur.
- Caution patient to avoid the use of alcohol during this therapy, because this may increase the risk of hepatotoxicity.
- **Instruct patient to notify health care professional immediately if diarrhea, abdominal cramping, fever, or bloody stools occur** and not to treat with antidiarrheals without consulting health care professionals.
- Instruct patient to report symptoms of myositis (myalgia, arthralgia) or uveitis (intraocular inflammation) to health care professional promptly.
- Inform patient that saliva, sputum, sweat, tears, urine, and feces may become red-orange to red-brown and that soft contact lenses may become permanently discolored.
- Advise patient that this medication has teratogenic properties and may decrease the effectiveness of oral contraceptives. Counsel patient to use a non-hormonal form of contraception throughout therapy.
- Emphasize the importance of regular follow-up exams to monitor progress and to check for side effects.

Evaluation/Desired Outcomes

- Prevention of disseminated MAC in patients with advanced HIV infection.

rifampin (rif-am-pin)

Rifadin,  Rofact

Classification

Therapeutic: antituberculars

Pharmacologic: rifamycins

Pregnancy Category C

Indications

Active tuberculosis (with other agents). Elimination of meningococcal carriers. **Unlabeled Use:** Prevention of disease caused by *Haemophilus influenzae* type B in close contacts. Synergy with other antimicrobial agents for *S. aureus* infections.

Action

Inhibits RNA synthesis by blocking RNA transcription in susceptible organisms. **Therapeutic Effects:** Bactericidal action against susceptible organisms.

Spectrum: Broad spectrum notable for activity against: *Mycobacterium* spp., *Staphylococcus aureus*, *H. influenzae*, *Legionella pneumophila*, *Neisseria meningitidis*.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Widely distributed; enters CSF.

Crosses placenta; enters breast milk.

Protein Binding: 80%.

Metabolism and Excretion: Mostly metabolized by the liver; 60% eliminated in feces via biliary elimination.

Half-life: 3 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	2–4 hr	12–24 hr
IV	rapid	end of infusion	12–24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of atazanavir, darunavir, fosamprenavir, saquinavir, tipranavir, or ritonavir-boosted saquinavir.

Use Cautiously in: History of liver disease; Diabetes; Concurrent use of other hepatotoxic agents; **OB, Lactation:** Pregnancy or lactation.

Adverse Reactions/Side Effects

CNS: ataxia, confusion, drowsiness, fatigue, headache, weakness. **Derm:** rash, pruritus. **EENT:** red discoloration of tears. **GI:** abdominal pain, diarrhea, flatulence, heartburn, nausea, vomiting, ↑ liver enzymes, red discoloration of saliva. **GU:** red discoloration of urine. **Hemat:** hemolytic anemia, thrombocytopenia. **MS:** arthralgia, muscle weakness, myalgia. **Misc:** flu-like syndrome.

Interactions

Drug-Drug: ↑ risk of hepatotoxicity with ritonavir-boosted **saquinavir**; concurrent use contraindicated. Significantly ↓ blood levels of **atazanavir**, **darunavir**, **fosamprenavir**, **saquinavir**, and **tipranavir**; concurrent use contraindicated. ↑ risk of hepatotoxicity with other **hepatotoxic agents**, including **alcohol**, **ketoconazole**, **isoniazid**, **pyrazinamide** (concurrent use with **pyrazinamide** may result in potentially fatal hepatotoxicity and should be avoided). Significantly ↓ blood levels of **delavirdine**, **indinavir**, and **nelfinavir**. Rifampin stimulates liver enzymes, which may ↑ metabolism and ↓ effectiveness of other drugs, including **ritonavir**, **nevirapine**, and **efavirenz** (dose adjustment may be necessary), **ciprofloxacin**, **clarithromycin**, **corticosteroids**, **cyclosporine**, **diazepam**, **diltiazem**, **disopyramide**, **doxycycline**, **levothyroxine**, **methadone**, **nifedipine**, **quinidine**, **opioid analgesics**, **oral hypoglycemic agents**, **warfarin**, **estrogens**, **phenytoin**, **phenobarbital**, **tacrolimus**, **verapamil**, **fluconazole**, **ketoconazole**, **itraconazole**, **quinidine**, **theophylline**, **zidovudine**, **chloramphenicol**, and **hormonal contraceptive agents**.

Route/Dosage

Tuberculosis

PO, IV (Adults): 600 mg/day or 10 mg/kg/day (up to 600 mg/day) single dose; may also be given twice weekly.

PO, IV (Children and Infants): 10–20 mg/kg/day single dose or divided q 12 h (not to exceed 600 mg/day); may also be given twice weekly.

Asymptomatic Carriers of Meningococcus

PO, IV (Adults): 600 mg q 12 hr for 2 days.

PO, IV (Children ≥1 mo): 10 mg/kg q 12 hr for 2 days (max: 600 mg/dose).

PO (Infants <1 mo): 5 mg/kg q 12 hr for 2 days.

H. influenzae Prophylaxis

PO (Adults): 600 mg/day for 4 days.

PO (Children): 20 mg/kg/day for 4 days (max: 600 mg/dose).

PO (Neonates): 10 mg/kg/day for 4 days.

Synergy for S. aureus infections

PO (Adults): 300–600 mg BID.

PO (Children and Neonates): 5–20 mg/kg/day divided q 12 h (max: 600 mg/dose).

Availability (generic available)

Capsules: 150 mg, 300 mg. **Powder for injection:** 600 mg/vial. **In combination with:** isoniazid (IsonaRif, Rifamate); isoniazid and pyrazinamide (Rifater). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Perform mycobacterial studies and susceptibility tests prior to and periodically during therapy to detect possible resistance.
- Assess lung sounds and character and amount of sputum periodically during therapy.
- **Lab Test Considerations:** Evaluate renal function, CBC, and urinalysis periodically and during therapy.
- Monitor hepatic function at least monthly during therapy. May cause ↑ BUN, AST, ALT, and serum alkaline phosphatase, bilirubin, and uric acid concentrations.
- May cause false-positive direct Coombs' test results. May interfere with folic acid and vitamin B assays.
- May interfere with dexamethasone suppression test results; discontinue rifampin 15 days prior to test.
- May interfere with methods for determining serum folate and vitamin B levels and with urine tests based on color reaction.
- May delay hepatic uptake and excretion of sulfobromophthalein (SBP) during SBP uptake and excretion tests; perform test prior to daily dose of rifampin.

Potential Nursing Diagnoses

Risk for infection (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- **Do not confuse rifampin with rifabutin.**
- **PO:** Administer medication on an empty stomach at least 1 hr before or 2 hr after meals with a full glass (240 mL) of water. If GI irritation becomes a problem, may be administered with food. Antacids may also be taken 1 hr prior to administration. Capsules may be opened and contents mixed with applesauce or jelly for patients with difficulty swallowing.
- Pharmacist can compound a syrup for patients unable to swallow solids.

IV Administration

- **pH:** 7.8–8.8.
- **Intermittent Infusion:** Reconstitute each 600-mg vial with 10 mL of sterile water for injection for a concentration of 60 mg/mL. **Diluent:** Dilute further in 100 mL or 500 mL of D5W or 0.9% NaCl. Reconstituted vials are stable for 24 hr at room temperature. Infusion is stable at room temperature for 4 hr (in D5W) or 24 hr (in 0.9% NaCl). **Concentration:** Not to exceed 6 mg/mL. **Rate:** Administer solutions diluted in 100 mL over 30 min and solutions diluted in 500 mL over 3 hr.
- **Y-Site Compatibility:** amiodarone, bumetanide, midazolam, pantoprazole, vancomycin.
- **Y-Site Incompatibility:** diltiazem.

★ = Canadian drug name. ⚡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Patient/Family Teaching

- Advise patient to take medication once daily (unless biweekly regimens are used), as directed, and not to skip doses or double up on missed doses. Emphasize the importance of continuing therapy even after symptoms have subsided. Length of therapy for tuberculosis depends on regimen being used and underlying disease states. Patients on short-term prophylactic therapy should also be advised of the importance of compliance with therapy.
- Advise patient to notify health care professional promptly if signs and symptoms of hepatitis (yellow eyes and skin, nausea, vomiting, anorexia, unusual tiredness, weakness) or of thrombocytopenia (unusual bleeding or bruising) occur.
- Caution patient to avoid the use of alcohol during this therapy, because this may increase the risk of hepatotoxicity.
- Instruct patient to report the occurrence of flu-like symptoms (fever, chills, myalgia, headache) promptly.
- Rifampin may occasionally cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Inform patient that saliva, sputum, sweat, tears, urine, and feces may become red-orange to red-brown and that soft contact lenses may become permanently discolored.
- Advise patient that this medication has teratogenic properties and may decrease the effectiveness of oral contraceptives. Counsel patient to use a non-hormonal form of contraception throughout therapy.
- Emphasize the importance of regular follow-up exams to monitor progress and to check for side effects.

Evaluation/Desired Outcomes

- Decreased fever and night sweats.
- Diminished cough and sputum production.
- Negative sputum cultures.
- Increased appetite.
- Weight gain.
- Reduced fatigue.
- Sense of well-being in patients with tuberculosis.
- Prevention of meningococcal meningitis.
- Prevention of *H. influenzae* type B infection. Prophylactic course is usually short term.

rifaximin (ri-fax-i-min)
Xifaxan

Classification

Therapeutic: anti-infectives
Pharmacologic: rifamycins

Pregnancy Category C

Indications

Travelers' diarrhea due to noninvasive strains of *Escherichia coli*. Reduction in risk of overt hepatic encephalopathy recurrence.

Action

Inhibits bacterial RNA synthesis by binding to bacterial DNA-dependent RNA polymerase.

Therapeutic Effects: Decreased severity of travelers' diarrhea. Decreased episodes of overt hepatic encephalopathy.

Spectrum: *Escherichia coli* (enterotoxigenic and enteroaggregative strains).

Pharmacokinetics

Absorption: Poorly absorbed (<0.4%), action is primarily in GI tract.

Distribution: 80–90% concentrated in gut.

Metabolism and Excretion: Almost exclusively excreted unchanged in feces.

Half-life: 6 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to rifaximin or other rifamycins; Diarrhea with fever or bloody stools; Diarrhea caused by other infectious agents;

Lactation: Potential for adverse effects in the infant. Switch to formula for duration of treatment.

Use Cautiously in: **OB:** Use only if benefit to mother outweighs risk to fetus; **Pedi:** Safety not established in children <18 yr (hepatic encephalopathy) or <12 yr (travelers' diarrhea).

Adverse Reactions/Side Effects

CNS: dizziness. **CV:** peripheral edema. **GI:** PSEUDO-MEMBRANOUS COLITIS.

Interactions

Drug-Drug: Although rifaximin induces the CYP 3A4 enzyme system, since it is not absorbed, drug interactions are unlikely.

Route/Dosage

Travelers' Diarrhea

PO (Adults and Children ≥12 yr): 200 mg 3 times daily for 3 days.

Hepatic Encephalopathy

PO (Adults): 550 mg twice daily.

Availability

Tablets: 200 mg, 550 mg.

NURSING IMPLICATIONS

Assessment

- **Traveler's Diarrhea:** Assess frequency and consistency of stools and bowel sounds prior to and during therapy.
- Assess fluid and electrolyte balance and skin turgor for dehydration.
- **Hepatic Encephalopathy:** Assess mental status periodically during therapy.
- **Monitor bowel function.** Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of pseudomembranous colitis. May begin up to several weeks following cessation of therapy.
- **Lab Test Considerations:** May cause lymphocytosis, monocytosis, and neutropenia.

Potential Nursing Diagnoses

Diarrhea (Indications)

Risk for deficient fluid volume (Indications)

Implementation

- **Do not confuse rifaximin with rifampin.**
- **PO:** Administer with or without food.

Patient/Family Teaching

- Instruct patient to take rifaximin as directed and to complete therapy, even if feeling better. **Caution** patient to stop taking rifaximin if diarrhea symptoms get worse, persist more than 24–48 hr, or are accompanied by fever or blood in the stool. Consult health care professional if these occur. Advise patient not to treat diarrhea without consulting health care professional. May occur up to several weeks after discontinuation of medication.
- May cause dizziness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise female patients to notify health care professional if pregnant or if pregnancy is suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Decreased severity of travelers' diarrhea.
- Reduction in risk of overt hepatic encephalopathy recurrence.

rilpivirine (ril-pi-vir-een) Edurant

Classification

Therapeutic: antiretrovirals

Pharmacologic: non-nucleoside reverse transcriptase inhibitors

Pregnancy Category B

Indications

Treatment-naïve adult patients with HIV infection with HIV-1 RNA $\leq 100,000$ copies/mL at start of therapy.

Action

Inhibits HIV-replication by non-competitively inhibiting HIV reverse transcriptase. **Therapeutic Effects:** Slowed progression of HIV infection and decreased occurrence of sequelae. Increases CD4 cell counts and decreases viral load.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Unknown.

Protein Binding: 99.7%.

Metabolism and Excretion: Mostly metabolized by the liver (CYP3A enzyme system); 25% excreted in feces unchanged, <1% excreted unchanged in urine.

Half-life: 50 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	4–5 hr	24 hr

Contraindications/Precautions

Contraindicated in: Concurrent use of drugs that inhibit the CYP3A enzyme system or $\uparrow$ gastric pH ($\downarrow$ blood levels and effectiveness; $\uparrow$ resistance); **Lactation:** Breast feeding should be avoided due to possible transmission of virus in breast milk.

Use Cautiously in: Concurrent use of drugs that $\uparrow$ risk of torsades de pointes (may $\uparrow$ risk of arrhythmias); History of depression or suicide attempt; Hepatitis B or C; Concurrent use of antacids or H_2 antagonists ($\downarrow$ blood levels and effectiveness); **Ger:** Consider $\downarrow$ hepatic/renal/cardiac function, concurrent diseases, and drug therapy; **OB:** Use only if potential maternal benefit justifies potential risk to fetus; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: depression, dizziness, headache, insomnia.

Derm: rash. **GI:** hepatotoxicity. **Misc:** fat redistribution, immune reconstitution syndrome.

Interactions

Drug-Drug: Drugs that inhibit the CYP3A enzyme system including carbamazepine, dexamethasone (more than a single dose), oxcarbazepine, phenobarbital, phenytoin, rifabutin, rifampin, or, rifapentine $\downarrow$ blood levels and effectiveness and promote of virologic resistance; concurrent use contraindicated. **Proton pump inhibitors** including esomeprazole, lansoprazole, omeprazole, pantoprazole, and rabeprazole $\downarrow$ blood levels and ef-

✶ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

fectiveness and may ↑ resistance; concurrent use contraindicated. Concurrent use with **antacids** may ↓ blood levels and effectiveness; use with caution, administer 2 hr before or 4 hr after. Concurrent use with **H₂ antagonists** may ↓ blood levels and effectiveness; use with caution, administer 12 hr before or 4 hr after. Blood levels may be ↑ by **clarithromycin, erythromycin, or troleandomycin**; consider azithromycin. Concurrent use with **drugs that ↑ risk of torsades de pointes** may ↑ risk of serious arrhythmias. Concurrent use of other **non-nucleoside reverse transcriptase inhibitors** may alter blood levels and should be avoided. May alter blood levels of **methadone**; monitor clinical effects.

Drug-Natural Products: Concurrent use of **St. John's wort** ↓ blood levels and effectiveness, ↑ resistance; concurrent use contraindicated.

Route/Dosage

PO (Adults): 25 mg once daily.

Availability

Tablets: 25 mg. **In combination with:** emtricitabine and tenofovir (Complera). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess for change in severity of HIV symptoms and for symptoms of opportunistic infections during therapy.
- Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.**
- Lab Test Considerations:** Monitor viral load and CD4 cell count regularly during therapy.
- Monitor liver function tests before and periodically during therapy in patients with underlying liver disease, hepatitis B or C, or marked ↑ transaminase. May cause ↑ serum creatinine, AST, ALT, total bilirubin, total cholesterol, LDL, and triglycerides.

Potential Nursing Diagnoses

Risk for infection (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- PO:** Administer once daily with a meal.

Patient/Family Teaching

- Emphasize the importance of taking rilpivirine as directed, at the same time each day. It must always be used in combination with other antiretroviral drugs. Do not take more than prescribed amount and do not stop taking without consulting health care professional. Take missed doses with a meal if remembered <12 hr of the time it is usually taken, then return to regular schedule. If more than 12 hr from time dose is usually taken, omit dose and resume dosing schedule; do not double doses. Advise patient to read *Patient Information* prior to starting therapy and with each Rx refill in case of changes.

- Advise patient to take antacids 2 hr before or 4 hr after and H₂ antagonists 12 hr before or 4 hr after rilpivirine.
- Instruct patient that rilpivirine should not be shared with others.
- Inform patient that rilpivirine does not cure AIDS or prevent associated or opportunistic infections. Rilpivirine does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom and to avoid sharing needles or donating blood to prevent spreading the AIDS virus to others. Advise patient that the long-term effects of rilpivirine are unknown at this time.
- Inform patients and families of risk of suicidal thoughts and behavior and advise that behavioral changes, emergency or worsening signs and symptoms of depression, unusual changes in mood, or emergence of suicidal thoughts, behavior, or thoughts of self-harm should be reported to health care professional immediately.**
- Immune reconstitution syndrome may trigger opportunistic infections or autoimmune disorders. Notify health care professional if symptoms occur.**
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort.
- Inform patient that changes in body fat (increased fat in upper back and neck, breast, and around back, chest, and stomach area; loss of fats from legs, arms, and face) may occur.
- Advise patients to notify health care professional if pregnancy is planned or suspected. Advise patient to avoid breast feeding during rilpivirine therapy.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and increase in CD4 cell counts.

risedronate (riss-ed-roe-nate)
Actonel, Actelvia

Classification

Therapeutic: bone resorption inhibitors
Pharmacologic: biphosphonates

Pregnancy Category C

Indications

Prevention and treatment of postmenopausal and corticosteroid-induced osteoporosis. Treatment of Paget's disease in men and women. Treatment of osteoporosis in men.

Action

Inhibits bone resorption by binding to bone hydroxyapatite, which inhibits osteoclast activity. **Therapeutic Effects:** Reversal of the progression of osteoporosis with decreased fractures and other sequelae. Reduced bone turnover and resorption; normalization of serum alkaline phosphatase with reduced complications of Paget's disease.

Pharmacokinetics

Absorption: Rapidly but poorly absorbed following oral administration (0.63% bioavailability).

Distribution: 60% of absorbed dose distributes to bone.

Metabolism and Excretion: 40% of absorbed dose is excreted unchanged by kidneys; unabsorbed drug is excreted in feces.

Half-life: *Initial*—1.5 hr; *terminal*—220 hr (reflects dissociation from bone).

TIME/ACTION PROFILE (effects on serum alkaline phosphatase)

ROUTE	ONSET	PEAK	DURATION
PO	within days	30 days	up to 16 mo

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypocalcemia; Abnormalities of the esophagus, which delay esophageal emptying (i.e., strictures, achalasia); Inability to stand/sit upright for at least 30 min; **Lactation:** Lactation; Severe renal impairment (GCr <30 mL/min).

Use Cautiously in: History of upper GI disorders; Other disturbances of bone or mineral metabolism (correct abnormalities before initiating therapy); Dietary deficiencies (supplemental vitamin D and calcium may be required); Invasive dental procedures, cancer, receiving chemotherapy or corticosteroids, poor oral hygiene, periodontal disease, dental disease, anemia, coagulopathy, infection, or poorly fitting dentures (may ↑ risk of jaw osteonecrosis); **OB, Pedit:** Safety not established; use in pregnancy only if potential benefit justifies potential risks.

Adverse Reactions/Side Effects

CNS: weakness. **EENT:** amblyopia, conjunctivitis, dry eyes, eye pain/inflammation, tinnitus. **CV:** chest pain, edema. **GI:** abdominal pain, diarrhea, belching, colitis, constipation, dysphagia, esophagitis, esophageal cancer, esophageal ulcer, gastric ulcer, nausea.

Derm: rash. **MS:** arthralgia, musculoskeletal pain, femur fractures, osteonecrosis (primarily of jaw).

Resp: asthma exacerbation. **Misc:** flu-like syndrome.

Interactions

Drug-Drug: Concurrent use with NSAIDs or aspirin ↑ risk of GI irritation. Absorption is ↓ by calcium supplements or antacids. Proton pump inhibitors and H2 antagonists may cause a faster release of drug from the delayed-release product that can ↑ drug levels; concurrent use not recommended.

Drug-Food: Food ↓ absorption (administer at least 30 min before breakfast).

Route/Dosage

PO (Adults): *Postmenopausal Osteoporosis*—5 mg daily; or 35 mg once weekly (immediate- or delayed-release); or 75 mg taken on 2 consecutive days for a total of 2 tablets each month; or 150 mg once monthly. *Osteoporosis in Men*—35 mg once weekly (immediate-release); *Glucocorticoid-induced Osteoporosis*—5 mg daily; *Paget's disease*—30 mg daily for 2 mo; retreatment may be considered after 2 mo off therapy.

Availability

Tablets: 5 mg, 30 mg, 35 mg, 150 mg. **Delayed-release tablets (Atelvia):** 35 mg. **In combination with:** calcium carbonate.

R

NURSING IMPLICATIONS

Assessment

- **Osteoporosis:** Assess patients via bone density study for low bone mass before and periodically during therapy.
- **Paget's disease:** Assess for symptoms of Paget's disease (bone pain, headache, decreased visual and auditory acuity, increased skull size).
- **Lab Test Considerations:** *Osteoporosis:* Assess serum calcium before and periodically during therapy. Hypocalcemia and vitamin D deficiency should be treated before initiating alendronate therapy. May cause mild, transient ↑ of calcium and phosphate.
- *Paget's disease:* Monitor alkaline phosphatase prior to and periodically during therapy to monitor effectiveness of therapy.

Potential Nursing Diagnoses

Risk for injury (Indications)

Implementation

- **PO:** Administer *Actonel* first thing in the morning with 6–8 oz of water, 30 min prior to other medications, beverages, or food. Waiting longer than 30 min will improve absorption. Administer *Atelvia*

✳ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

right after breakfast with 4 ounces of water. Tablet should be swallowed whole; do not crush, break, or chew.

- Calcium-, magnesium-, or aluminum-containing agents may interfere with absorption of risendronate and should be taken at a different time of day with food.
- Avoid administering delayed-release product with proton pump inhibitors or H₂ antagonists; may allow a faster release and increased drug level.

Patient/Family Teaching

- Instruct patient on the importance of taking as directed. Risedronate should be taken with 6–8 oz of water (mineral water, orange juice, coffee, and other beverages decrease absorption). *If a dose of Atonel 35 is missed*, take 1 tablet the morning remembered, then return to the 1 tablet/wk on the originally scheduled day; do not take 2 pills at once. *If 1 or both tablets of Atonel 75 are missed and the next month's scheduled doses are more than 7 days away*: if both Atonel 75 are missed take 1 the morning remembered and 1 the next morning. If only 1 Atonel 75 tablet is missed: take the missed tablet on the morning of the day after you remember, then return to original schedule. Do not take more than two 75 mg tablets within 7 days. *If 1 or both tablets of Atonel 75 are missed and the next month's scheduled doses are within 7 days*, omit and return to schedule next month. *If 1 or both tablets of Atonel 150 are missed and the next month's scheduled doses are more than 7 days away*, take the missed tablet on the morning of the day after you remember, then return to original schedule. Do not take more than two 150-mg tablets within 7 days. *If 1 or both tablets of Atonel 75 are missed and the next month's scheduled doses are within 7 days*, omit and return to schedule next month. Encourage patient to read the *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- Caution patients to remain upright for 30 min following dose to facilitate passage to stomach and minimize risk of esophageal irritation.
- Advise patient to eat a balanced diet and consult health care professional about the need for supplemental calcium and vitamin D (see Appendix M).
- Inform patient that severe musculoskeletal pain may occur within days, months, or years after starting risendronate. Symptoms may resolve completely after discontinuation or slow or incomplete resolution may occur. Notify health care professional if severe pain occurs.
- Encourage patient to participate in regular exercise and to modify behaviors that increase the risk of osteoporosis (stop smoking, reduce alcohol consumption).

- Advise patient to inform health care professional of risedronate therapy prior to dental surgery.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Reversal of the progression of osteoporosis with decreased fractures and other sequelae. For patients at low risk of fracture, discontinue after 3 to 5 yr of use.
- Decrease in serum alkaline phosphatase and the progression of Paget's disease.

 **risperidone** (riss-per-i-done)
Risperdal, Risperdal M-TAB, Risperdal Consta

Classification

Therapeutic: antipsychotics, mood stabilizers

Pharmacologic: benzisoxazoles

Pregnancy Category C

Indications

Schizophrenia in adults and adolescents aged 13–17 yr. Short-term treatment of acute manic or mixed episodes associated with Bipolar I Disorder (oral only) in adults, and children and adolescents aged 10–17 yr, maintenance treatment of Bipolar I Disorder (IM only) in adults only; can be used with lithium or valproate (adults only). Irritability associated with autistic disorder in children.

Action

May act by antagonizing dopamine and serotonin in the CNS. **Therapeutic Effects:** Decreased symptoms of psychoses, bipolar mania, or autism.

Pharmacokinetics

Absorption: 70% after administration of tablets, solution, or orally disintegrating tablets. Following IM administration, small initial release of drug, followed by 3-wk lag; the rest of release starts at 3 wk and lasts 4–6 wk.

Distribution: Unknown.

Metabolism and Excretion: Extensively metabolized by the liver.  Metabolism is genetically determined; extensive metabolizers (most patients) convert risperidone to 9-hydroxyrisperidone rapidly. Poor metabolizers (6–8% of Whites) convert it more slowly. The 9-hydroxyrisperidone is an antipsychotic compound. Risperidone and its active metabolite are renally eliminated.

Half-life: *Extensive metabolizers*—3 hr for risperidone, 21 hr for 9-hydroxyrisperidone. *Poor metabolizers*—20 hr for risperidone and 30 hr for 9-hydroxyrisperidone.

TIME/ACTION PROFILE (clinical effects)

ROUTE	ONSET	PEAK	DURATION
PO	1–2 wk	unknown	up to 6 wk†
IM	3 wk	4–6 wk	up to 6 wk†

†After discontinuation

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **Lactation:** Discontinue drug or bottle feed.

Use Cautiously in: Debilitated patients, patients with renal or hepatic impairment (initial dose reduction recommended); Underlying cardiovascular disease (↑ risk of arrhythmias and hypotension); History of seizures; History of suicide attempt or drug abuse; Diabetes or risk factors for diabetes (may worsen glucose control); Patients at risk for aspiration; **OB, Pedi:** Safety not established; **Geri:** Initial dose ↓ recommended. ↑ risk of mortality in elderly patients treated for dementia-related psychosis.

Adverse Reactions/Side Effects

CNS: **NEUROLEPTIC MALIGNANT SYNDROME, SUICIDAL THOUGHTS**, aggressive behavior, dizziness, extrapyramidal reactions, headache, ↑ dreams, ↑ sleep duration, insomnia, sedation, fatigue, impaired temperature regulation, nervousness, tardive dyskinesia. **EENT:** pharyngitis, rhinitis, visual disturbances. **Resp:** cough, dyspnea. **CV:** arrhythmias, orthostatic hypotension, tachycardia. **GI:** constipation, diarrhea, dry mouth, nausea, weight gain, abdominal pain, anorexia, dyspepsia, polydipsia, ↑ salivation, vomiting, weight loss. **GU:** ↓ libido, dysmenorrhea/menorrhagia, difficulty urinating, polyuria, priapism. **Derm:** itching/skin rash, dry skin, ↑ pigmentation, sweating, photosensitivity, seborrhea. **Endo:** dyslipidemia, galactorrhea, hyperglycemia. **Hemat:** **AGRANULOCYTOSIS**, leukopenia, neutropenia. **MS:** arthralgia, back pain.

Interactions

Drug-Drug: May ↓ the antiparkinsonian effects of levodopa or other dopamine agonists. Carbamazepine, phenytoin, rifampin, phenobarbital, and other enzyme inducers ↑ metabolism and may ↓ effectiveness; dose adjustments may be necessary.

Fluoxetine and **paroxetine** ↑ blood levels and may ↑ effects; dose adjustments may be necessary. **Clozapine** ↓ metabolism and may ↑ effects of risperidone. ↑ CNS depression may occur with other CNS depressants, including alcohol, antihistamines, sedative/hypnotics, or opioid analgesics.

Drug-Natural Products: Kava, valerian, or chamomile can ↑ CNS depression.

Route/Dosage

Schizophrenia

PO (Adults): 1 mg twice daily, ↑ by 1–2 mg/day no more frequently than every 24 hr to 4–8 mg daily.

PO (Children 13–17 yr): 0.5 mg once daily, ↑ by 0.5–1.0 mg no more frequently than every 24 hr to 3 mg daily. May administer half the daily dose twice daily if drowsiness persists.

IM (Adults): 25 mg every 2 wk; some patients may benefit from a higher dose of 37.5 or 50 mg every 2 wk.

Acute Manic or Mixed Episodes Associated with Bipolar I Disorder

PO (Adults): 2–3 mg/day as a single daily dose, dose may be ↑ at 24-hr intervals by 1 mg (range 1–5 mg/day).

PO (Children 13–17 yr): 0.5 mg once daily, ↑ by 0.5–1 mg no more frequently than every 24 hr to 2.5 mg daily. May administer half the daily dose twice daily if drowsiness persists.

PO (Geriatric Patients or Debilitated Patients): Start with 0.5 mg twice daily; ↑ by 0.5 mg twice daily, up to 1.5 mg twice daily; then ↑ at weekly intervals if necessary. May also be given as a single daily dose after initial titration.

Maintenance Treatment of Bipolar I Disorder

IM (Adults): 25 mg every 2 wk; some patients may benefit from a higher dose of 37.5 or 50 mg every 2 wk.

Irritability Associated with Autistic Disorder

PO (Children 5–16 yr weighing <20 kg): 0.25 mg/day initially. After at least 4 days of therapy, may ↑ to 0.5 mg/day. Dose ↑ in increments of 0.25 mg/day may be considered at 2-wk or longer intervals. May be as a single or divided dose.

PO (Children 5–16 yr weighing >20 kg): 0.5 mg/day initially. After at least 4 days of therapy, may ↑ to 1 mg/day. Dose ↑ in increments of 0.5 mg/day may be considered at 2-wk or longer intervals. May be as a single or divided dose.

Renal Impairment

Hepatic Impairment

PO (Adults): Start with 0.5 mg twice daily; ↑ by 0.5 mg twice daily, up to 1.5 mg twice daily; then ↑ at weekly intervals if necessary. May also be given as a single daily dose after initial titration.

Availability (generic available)

Tablets: 0.25 mg, 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg.

Cost: Generic—0.25 mg \$18.40/180, 0.5 mg

★ = Canadian drug name. ‡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

\$22.58/180, 1 mg \$24.13/180, 2 mg \$28.94/180, 3 mg \$34.94/180, 4 mg \$38.30/180. **Orally disintegrating tablets (Risperdal M-Tabs):** 0.25 mg, 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg. **Cost:** *Generic*—0.5 mg \$131.86/28, 1 mg \$154.07/28, 2 mg \$250.49/28, 3 mg \$316.12/28, 4 mg \$424.45/28. **Oral solution:** 1 mg/mL. **Cost:** *Generic*—\$152.56/30 mL. **Extended-release microspheres for injection (Risperdal Consta):** 12.5 mg/vial kit, 25 mg/vial kit, 37.5 mg/vial kit, 50 mg/vial kit.

NURSING IMPLICATIONS

Assessment

- Monitor patient's mental status (orientation, mood, behavior) and mood before and periodically during therapy. **Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression, especially during early therapy.** Restrict amount of drug available to patient.
- Assess weight and BMI initially and throughout therapy. Monitor for symptoms of hyperglycemia polydipsia, polyuria, polyphagia, weakness) periodically during therapy.
- Monitor BP (sitting, standing, lying down) and pulse before and frequently during initial dose titration. May cause prolonged QT interval, tachycardia, and orthostatic hypotension. If hypotension occurs, dose may need to be decreased.
- Observe patient when administering medication to ensure medication is swallowed and not hoarded or cheeked.
- Monitor patient for onset of extrapyramidal side effects (*akathisia*—restlessness; *dystonia*—muscle spasms and twisting motions; or *pseudoparkinsonism*—mask-like face, rigidity, tremors, drooling, shuffling gait, dysphagia). Report these symptoms; reduction of dose or discontinuation may be necessary. Trihexyphenidyl or benztropine may be used to control symptoms.
- Monitor for tardive dyskinesia (involuntary rhythmic movement of mouth, face, and extremities). Report immediately; may be irreversible.
- **Monitor for development of neuroleptic malignant syndrome** (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness). **Notify health care professional immediately if these symptoms occur.**
- **Lab Test Considerations:** May cause ↑ serum prolactin levels.
- May cause ↑ AST and ALT.
- May also cause anemia, thrombocytopenia, leukocytosis, and leukopenia.
- Obtain fasting blood glucose and cholesterol levels initially and periodically during therapy.
- Monitor CBC frequently during initial months of therapy in patients with pre-existing or history of

low WBC. May cause leukopenia, neutropenia, or agranulocytosis. Discontinue therapy if this occurs.

Potential Nursing Diagnoses

Risk for self-directed violence (Indications)

Disturbed thought process (Indications)

Risk for injury (Side Effects)

Implementation

- **Do not confuse risperidone with reserpine.**
- When switching from other antipsychotics, discontinue previous agents when starting risperidone and minimize the period of overlapping antipsychotic agents.
- If therapy is reinstituted after an interval off risperidone, follow initial titration schedule.
- For IM use, establish tolerance with oral dosing before IM use and continue oral dosing for 3 wk following initial IM injection. Do not increase dose more frequently than every 4 wk.
- **PO:** Daily doses can be taken in the morning or evening.
- For orally disintegrating tablets, open blister pack by peeling back foil to expose tablet; do not try to push tablet through foil. Use dry hands to remove tablet from blister and immediately place entire tablet on tongue. Tablets disintegrate in mouth within seconds and can be swallowed with or without liquid. Do not attempt to split or chew tablet. Do not try to store tablets once removed from blister.
- Oral solution can be mixed with water, coffee, orange juice, or low-fat milk; do not mix with cola or tea.
- **IM:** Reconstitute with 2 mL of diluent provided by manufacturer. Administer via deep deltoid (1-inch needle) or gluteal (2-inch needle) injection using enclosed safety needle; alternate arms or buttocks with each injection. Allow solution to warm to room temperature prior to injection. Administer immediately after mixed with diluent; shake well to mix suspension. Must be administered within 6 hr of reconstitution. Store dose pack in refrigerator.
- Do not combine dose strengths in a single injection.

Patient/Family Teaching

- Instruct patient to take medication as directed.
- Inform patient of the possibility of extrapyramidal symptoms. Instruct patient to report these symptoms immediately to health care professional.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- **Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or**

worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking; other unusual changes in behavior or mood occur.

- Advise patient to use sunscreen and protective clothing when exposed to the sun to prevent photosensitivity reactions. Extremes in temperature should also be avoided; this drug impairs body temperature regulation.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications. Caution patient to avoid concurrent use of alcohol and other CNS depressants.
- Advise female patients to notify health care professional if pregnancy is planned or suspected, or if breast feeding or planning to breast feed.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Instruct patient to notify health care professional promptly if sore throat, fever, unusual bleeding or bruising, rash, tremors, or symptoms of hyperglycemia occur.
- Emphasize the importance of routine follow-up exams to monitor side effects and continued participation in psychotherapy to improve coping skills.

Evaluation/Desired Outcomes

- Decrease in excited, manic behavior.
- Decrease in positive symptoms (delusions, hallucinations) of schizophrenia.
- Decreased aggression toward others, deliberate self-injury, temper tantrums, and mood changes in children with autism.
- Decrease in negative symptoms (social withdrawal, flat, blunted affects) of schizophrenia.
- Decrease in autism symptoms.

ritonavir (ri-toe-na-veer)

Norvir

Classification

Therapeutic: antiretrovirals

Pharmacologic: protease inhibitors

Pregnancy Category B

Indications

HIV infection (with other antiretrovirals).

Action

Inhibits the action of HIV protease and prevents the cleavage of viral polyproteins. **Therapeutic Effects:** Increased CD4 cell counts and decreased viral

load with subsequent slowed progression of HIV infection and its sequelae.

Pharmacokinetics

Absorption: Appears to be well absorbed after oral administration.

Distribution: Poor CNS penetration.

Protein Binding: 98–99%.

Metabolism and Excretion: Highly metabolized by the liver (by P450 CYP3A and CYP2D6 enzymes); 1 metabolite has antiretroviral activity; 3.5% excreted unchanged in urine.

Half-life: 3–5 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	4 hr*	12 hr

*Nonfasting

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of alfuzosin, amiodarone, dihydroergotamine, ergotamine, ergonovine, flecainide, fluticasone, lovastatin, meperidine, methylergonovine, midazolam (PO), pimozide, propafenone, quinidine, simvastatin, sildenafil (Revatio), St. John's wort, triazolam, or voriconazole; Hypersensitivity or intolerance to alcohol or castor oil (present in capsules and liquid).

Use Cautiously in: Impaired hepatic function, history of hepatitis; Diabetes mellitus; Hemophilia (↑ risk of bleeding); Structural heart disease, conduction abnormalities, ischemic heart disease, or heart failure (↑ risk of heart block); **OB, PEDI:** Pregnancy or children <12 yr (safety not established); **Lactation:** Breast feeding not recommended in HIV-infected patients.

Adverse Reactions/Side Effects

CNS: **SEIZURES**, abnormal thinking, weakness, dizziness, headache, malaise, somnolence, syncope.

EBENT: pharyngitis, throat irritation. **Resp:** **ANGIOEDEMA**, bronchospasm. **CV:** heart block, orthostatic hypotension, vasodilation. **GI:** abdominal pain, altered taste, anorexia, diarrhea, nausea, vomiting, constipation, dyspepsia, flatulence. **GU:** renal insufficiency. **Derm:** rash, skin eruptions, sweating, urticaria. **Endo:** hyperglycemia. **F and E:** dehydration. **Metab:** hyperlipidemia. **MS:** ↑ creatine phosphokinase, myalgia. **Neuro:** circumoral paresthesia, peripheral paresthesia. **Misc:** hypersensitivity reactions including **STEVENS-JOHNSON SYNDROME**, **TOXIC EPIDERMAL NECROLYSIS**, and **ANAPHYLAXIS**, fat redistribution, fever, immune reconstitution syndrome.

★ = Canadian drug name. ☞ = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Interactions

Drug-Drug: ↑ blood levels and risk of toxicity from some antiarrhythmics (amiodarone, flecainide, pimozone, propafenone, quinidine), ergot derivatives (dihydroergotamine, ergonovine, ergotamine, methylethergonovine), fluticasone (inhalation), meperidine, sildenafil (Revatio), alfuzosin, lovastatin, simvastatin, voriconazole, midazolam (oral), and triazolam; avoid concomitant use. ↑ levels of maraviroc; ↓ maraviroc dose to 150 mg twice daily. ↑ levels of clarithromycin; ↓ clarithromycin dose if CCR <60 mL/min. ↑ levels of rifabutin; ↓ rifabutin dose to 150 mg every other day or 3 times weekly. May also ↑ levels and effects of some opioid analgesics (alfentanil, fentanyl, hydrocodone, oxycodone), tramadol; some NSAIDs (diclofenac, ibuprofen, indomethacin); some antiarrhythmics (disopyramide, lidocaine, mexiletine); many antidepressants (amitriptyline, clomipramine, desipramine, imipramine, nortriptyline, nefazodone, sertraline, trazodone, fluoxetine, paroxetine, venlafaxine); some antiemetics (dronabinol, ondansetron); some beta blockers (metoprolol, pindolol, propranolol, timolol); many calcium channel blockers (amlodipine, diltiazem, felodipine, isradipine, nifedipine, nifedipine, nimodipine, nisoldipine, verapamil); some antineoplastics (etoposides, paclitaxel, tamoxifen, vinblastine, vincristine, dasatinib, nilotinib); some corticosteroids (dexamethasone, prednisone); some immunosuppressants (cyclosporine, tacrolimus); some antipsychotics (chlorpromazine, haloperidol, perphenazine, risperidone, thioridazine); and also quinidine, saquinavir, methamphetamine, and warfarin. Dosage ↓ may be necessary. ↓ levels and effects of hormonal contraceptives, zidovudine, bupropion, and theophylline; dose alteration or alternative therapy may be necessary. Levels may be ↑ by clarithromycin or fluoxetine. ↑ risk of heart block with beta blockers, verapamil, diltiazem, digoxin, or atazanavir. May ↑ concentrations of phosphodiesterase type 5 inhibitors (PDE5) causing hypotension, visual changes, priapism; ↓ starting doses not to exceed 25 mg within 48 hr for sildenafil (Viagra), 2.5 mg q 72 hr for vardenafil and 10 mg q 72 hr for tadalafil. May ↑ risk of adverse effects with salmeterol; concurrent use not recommended. ↑ risk of myopathy with atorvastatin or rosuvastatin; use lowest possible dose of statin. May ↑ bosentan levels; initiate bosentan at 62.5 mg once daily or every other day; if patient already receiving bosentan, discontinue bosentan at least 36 hr before initiation of tipranavir and then restart bosentan at least 10 days later at 62.5 mg once daily or every other day. May ↑ tadalafil (Adcirca) levels; initiate tadalafil (Adcirca) at 20 mg once daily; if patient already receiving tadalafil

(Adcirca), discontinue tadalafil (Adcirca) at least 24 hr before initiation of tipranavir and then restart tadalafil (Adcirca) at least 7 days later at 20 mg once daily. May ↑ colchicine levels; ↓ dose of colchicine; do not administer colchicine if patients have renal or hepatic impairment.

Drug-Natural Products: St. John's wort ↓ levels and may promote resistance; avoid concomitant use.

Drug-Food: Food ↑ absorption.

Route/Dosage

PO (Adults): 300 mg twice daily for 1 day, then 400 mg twice daily for 3 days, then 500 mg twice daily for 1 day, then 600 mg twice daily as maintenance.

PO (Children >1 mo): 250 mg/m² twice daily initially; ↑ by 50 mg/m² twice daily q 2–3 days up to 400 mg/m² twice daily (if unable to get up to 400 mg/m² twice daily, additional antiretroviral therapy is required).

Availability

Capsules: 100 mg. **Tablets:** 100 mg. **Oral solution:** 80 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess patient for change in severity of HIV symptoms and for symptoms of opportunistic infections during therapy.
- Assess patient for rash (mild to moderate rash usually occurs in the 2nd wk of therapy and resolves within 1–2 wk of continued therapy). If rash is severe (extensive erythematous or maculopapular rash with moist desquamation or angioedema) or accompanied by systemic symptoms (serum sickness-like reaction, Stevens-Johnson syndrome, toxic epidermal necrolysis), therapy must be discontinued immediately.
- **Lab Test Considerations:** Monitor viral load and CD4 counts regularly during therapy.
- May cause hyperglycemia.
- Monitor serum triglycerides and total cholesterol prior to and periodically during therapy. May cause ↑ serum AST, ALT, GGT, total bilirubin, CPK, triglycerides, and uric acid concentrations.

Potential Nursing Diagnoses

Risk for infection (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- **Do not confuse ritonavir with Retrovir (zidovudine).**
- **PO:** Administer with a meal or light snack.
- Oral powder may be mixed with chocolate milk, Ensure, or Advera within 1 hr of dosing to improve taste. Use calibrated oral dosing syringe for oral solution. Oral solution does not require refrigeration if used within 30 days and stored below 77°F in the

original container. Keep cap tightly closed. Tablets should be swallowed whole; do not crush, break, or chew. Store tablets at room temperature. Capsules should be stored in the refrigerator and protected from light.

- If nausea occurs on dose of 600 mg twice daily, may titrate by 300 mg twice daily for 1 day, then 400 mg twice daily for 2 days, then 500 mg twice daily for 1 day, then 600 mg twice daily thereafter.
- Patients initiating concurrent therapy with nucleoside analogues may have less GI intolerance by initiating ritonavir for 2 wk and then adding the nucleoside analogue.

Patient/Family Teaching

- Emphasize the importance of taking ritonavir as directed, at evenly spaced times throughout day. Do not take more than prescribed amount and do not stop taking without consulting health care professional. Take missed doses as soon as remembered; do not double doses.
- Instruct patient that ritonavir should not be shared with others.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Inform patient that ritonavir does not cure AIDS or prevent associated or opportunistic infections. Ritonavir does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom during sexual contact and to avoid sharing needles or donating blood to prevent spreading the AIDS virus to others. Advise patient that the long-term effects of ritonavir are unknown at this time.
- Inform patient that ritonavir may cause hyperglycemia. Advise patient to notify health care professional if increased thirst or hunger; unexplained weight loss; increased urination; fatigue; or dry, itchy skin occurs.
- **Instruct patient to notify health care professional immediately if rash occurs.**
- Inform patient that redistribution and accumulation of body fat may occur, causing central obesity, dorsocervical fat enlargement (buffalo hump), peripheral wasting, breast enlargement, and cushingoid appearance. The cause and long-term effects are not known.
- Advise patients taking oral contraceptives to use a nonhormonal method of birth control during ritonavir therapy. Patient should avoid breast feeding.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and improvement in CD4 cell counts.

riTUXimab (ri-tux-i-mab) Rituxan

Classification

Therapeutic: antineoplastics

Pharmacologic: monoclonal antibodies

Pregnancy Category C

Indications

 Relapsed or refractory, low-grade or follicular, CD20-positive, B-cell non-Hodgkin's lymphoma (NHL) as a single agent.  Previously untreated follicular, CD20-positive, B-cell NHL in combination with first-line chemotherapy and, in patients achieving a complete or partial response to rituximab in combination with chemotherapy, as single-agent maintenance therapy.  Non-progressing, low-grade, CD20-positive, B-cell NHL as monotherapy following treatment with cyclophosphamide, vincristine, and prednisolone (CVP).  Previously untreated diffuse large B-cell, CD20-positive, NHL in combination with CHOP or another anthracycline-based chemotherapy regimen.  CD-20 positive chronic lymphocytic leukemia (CLL) in combination with fludarabine and cyclophosphamide (FC). Moderately-to-severely active rheumatoid arthritis with methotrexate in patients who have had an inadequate response to one of more TNF antagonist therapies. Granulomatosis with polyangiitis (GPA) and microscopic polyangiitis (MPA) in combination with glucocorticoids.

Action

Binds to the CD20 antigen on the surface of lymphoma cells, preventing the activation process for cell cycle initiation and differentiation. **Therapeutic Effects:** Death of lymphoma cells. Prolonged progression-free survival in CLL. Reduced signs and symptoms of rheumatoid arthritis. Achievement of complete remission in GPA and MPA.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Binds specifically to CD20 binding sites on lymphoma cells.

Metabolism and Excretion: Unknown.

Half-life: 59.8–174 hr (depending on tumor burden).

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

TIME/ACTION PROFILE (B-cell depletion)

ROUTE	ONSET	PEAK	DURATION
IV	within 14 days	3–4 wk	6–9 mo†

†Duration of depletion after 4 wk of treatment.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to murine (mouse) proteins; **OB:** Can pass placental barrier potentially causing fetal B-cell depletion. Give only if clearly needed; **Lactation:** Potential for immunosuppression in infant. Discontinue nursing.

Use Cautiously in: Pre-existing bone marrow depression; Hepatitis B infection (may reactivate infection during and for several months after treatment); Systemic lupus erythematosus (may cause fatal progressive multifocal leukoencephalopathy); HIV infection (may increase risk of HIV-associated lymphoma);

Pedi: Safety not established.

Adverse Reactions/Side Effects

CNS: **PROGRESSIVE MULTIFOCAL LEUKOENCEPHALOPATHY**, headache. **Resp:** bronchospasm, cough, dyspnea.

CV: **ARRHYTHMIAS**, hypotension, peripheral edema.

GI: abdominal pain, altered taste, dyspepsia. **GU:** renal failure. **Derm:** **MUCOCUTANEOUS SKIN REACTIONS**, flushing, urticaria. **Endo:** hyperglycemia. **F and E:**

hypocalcemia. **Hemat:** **ANEMIA**, **NEUTROPENIA**, **THROMBOCYTOPENIA**. **MS:** arthralgia, back pain. **Misc:** allergic reactions including **ANAPHYLAXIS** and **ANGIOEDEMA**, **HEPATITIS B REACTIVATION**, **INFUSION REACTIONS**, **TUMOR LYSIS SYNDROME**, fever/chills/rigors (infusion related), infections.

Interactions

Drug-Drug: None known.

Route/Dosage**Relapsed or Refractory, Low-Grade or Follicular, CD20-Positive, B-Cell NHL**

IV (Adults): 375 mg/m² once weekly for 4 or 8 doses; may retreat with 375 mg/m² once weekly for 4 doses.

Previously Untreated Follicular, CD20-Positive, B-Cell NHL

IV (Adults): 375 mg/m² given on Day 1 of each cycle of CVP for up to 8 doses; if patients experience complete or partial response, give 375 mg/m² (as monotherapy) every 8 wk for 12 doses (initiate this maintenance therapy 8 wk after completion of rituximab + CVP regimen).

Non-Progressing Low-Grade, CD20-Positive, B-Cell NHL

IV (Adults): For patients who have not progressed following 6–8 cycles of CVP chemotherapy, 375 mg/m² given once weekly for 4 doses given every 6 mo for up to 16 doses.

Diffuse Large B-Cell NHL

IV (Adults): 375 mg/m² given on Day 1 of each cycle of chemotherapy for up to 8 infusions.

CLL

IV (Adults): 375 mg/m² given on the day before initiating FC chemotherapy, then 500 mg/m² on Day 1 of cycles 2–6 (every 28 days).

Rheumatoid Arthritis

IV (Adults): Two 1000 mg infusions separated by 2 wk.

GPA and MPA

IV (Adults): 375 mg/m² once weekly for 4 wk.

Availability

Solution for injection (requires dilution): 10 mg/mL.

NURSING IMPLICATIONS**Assessment**

- Monitor patient for fever, chills/rigors, nausea, urticaria, fatigue, headache, pruritus, bronchospasm, dyspnea, sensation of tongue or throat swelling, rhinitis, vomiting, hypotension, flushing, and pain at disease sites. Infusion-related events occur frequently within 30 min–2 hr of beginning first infusion and may resolve with slowing or discontinuing infusion and treatment with IV saline, diphenhydramine, and acetaminophen. **Patients with increased risk** (females, patients with pulmonary infiltrates, chronic lymphocytic leukemia, or mantle cell leukemia) may have more severe reactions, which may be fatal. Signs of severe reactions include hypotension, angioedema, hypoxia, or bronchospasm and may require interruption of infusion. May result in pulmonary infiltrates, adult respiratory distress syndrome, MI, ventricular fibrillation, and cardiogenic shock. Monitor closely. Incidence decreases with subsequent infusions.
- Monitor patient for tumor lysis syndrome due to rapid reduction in tumor volume (acute renal failure, hyperkalemia, hypocalcemia, hyperuricemia, or hypophosphatemia) usually occurring 12–24 hr after first infusion. Risks are higher in patients with greater tumor burden; may be fatal. Correct electrolyte abnormalities, monitor renal function and fluid balance, and administer supportive care, including dialysis, as indicated.
- Assess patient for hypersensitivity reactions (hypotension, bronchospasm, angioedema) during administration. May respond to decrease in infusion rate. Premedication with diphenhydramine and acetaminophen is recommended. Treatment includes diphenhydramine, acetaminophen, bronchodilators, or IV saline as indicated. Epinephrine, antihistamines, and corticosteroids should be readily

available in the event of a severe reaction. If severe reactions occur, discontinue infusion; may be resumed at 50% of the rate when symptoms have resolved completely.

- Monitor ECG during and immediately after infusion in patients with pre-existing cardiac conditions (arrhythmias, angina) or patients who have developed arrhythmias during previous infusions of rituximab. Life-threatening arrhythmias may occur.
- Assess for signs of progressive multifocal leukoencephalopathy (hemiparesis, apathy, confusion, cognitive deficiencies, and ataxia) periodically during therapy.
- Assess for infection during and for 1 yr after therapy. Bacterial, fungal, and new or reactivated viral infections may occur. Screen patient for hepatitis B infection prior to therapy. Discontinue rituximab and any concomitant chemotherapy in patients who develop viral hepatitis or other serious infections, and institute appropriate treatment.
- Assess for mucocutaneous reactions periodically during therapy. May cause Stevens-Johnson syndrome and toxic epidermal necrolysis. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- **Lab Test Considerations:** Monitor CBC and platelet count regularly during therapy and frequently in patients with blood dyscrasias. May cause anemia, thrombocytopenia, or neutropenia.
- Frequently causes B-cell depletion with an associated ↓ in serum immunoglobulins in a minority of patients; does not appear to cause an increased incidence of infection.
- Obtain HBsAg and anti-HBc to screen patient for HBV infection before initiating therapy. May cause reactivation of hepatitis B up to 24 mo after therapy.

Potential Nursing Diagnoses

Risk for infection (Side Effects)

Implementation

- **Do not confuse rituximab with infliximab.**
- Transient hypotension may occur during infusion; antihypertensive medications may be held for 12 hr before infusion.
- **Rheumatoid Arthritis:** Administer 100 mg methylprednisolone IV or equivalent 30 min prior to each infusion to minimize infusion reactions.
- **GPA and MPA:** Administer methylprednisolone 1000 mg IV per day for 1 to 3 days followed by oral prednisone 1 mg/kg/day (not to exceed 80 mg/day and tapered per clinical need) to treat severe vasculitis symptoms. Begin regimen within 14 days prior

to or with the initiation of rituximab and may continue during and after the 4 wk course of rituximab treatment.

- Prophylaxis against *Pneumocystis jiroveci* pneumonia and herpes virus recommended during treatment and for up to 12 mo following treatment as appropriate for patients with CLL, and during and for at least 6 mo following last rituximab infusion for patients with WG and MPA.

IV Administration

- **Intermittent Infusion:** **Diluent:** Dilute with 0.9% NaCl or D5W. **Concentration:** 1–4 mg/mL. Gently invert bag to mix. Solution is clear and colorless; do not administer solutions that are discolored or contain particulate matter. Discard unused portion remaining in vial. Solution is stable for 12 hr at room temperature and for 24 hr if refrigerated.
Rate: Do not administer as an IV push or bolus.
- **First infusion:** Administer at an initial rate of 50 mg/hr. If hypersensitivity or infusion-related events do not occur, rate may be escalated in 50-mg/hr increments every 30 min to a maximum of 400 mg/hr.
- **Subsequent infusions:** May be administered at an initial rate of 100 mg/hr and increased by 100-mg/hr increments at 30-min intervals to a maximum of 400 mg/hr.
- For previously untreated non-Hodgkins lymphoma and B-cell non-Hodgkin's lymphoma, if no Grade 3 or 4 infusion-related reactions occurred in Cycle 1, may administer via 90-min infusion using glucocorticoids. Begin at rate of 20% of dose over 30 min, with remaining 80% dose over 60 min. If tolerated, then can be used for remainder of therapy.
- **Y-Site Compatibility:** acyclovir, amifostine, amikacin, aminophylline, ampicillin, ampicillin/sulbactam, aztreonam, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium gluconate, carboplatin, carmustine, cefazolin, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chlorproamazine, cisplatin, clindamycin, cyclophosphamide, cytarabine, dactinomycin, daunorubicin hydrochloride, dexamethasone sodium phosphate, dexrazoxane, digoxin, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin liposome, doxycycline, droperidol, enalaprilat, etoposide phosphate, famotidine, fentanyl, filgrastim, flouxiridine, fluconazole, fludarabine, flutauracil, ganciclovir, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, irinotecan, leucovorin, levorphanol, lorazepam, magnesium sulfate, mannitol, meperidine, mesna, methotrexate, methyprednisolone, metoclopramide, metronidazole, mitomycin, mitoxantrone,

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

morphine, nalbuphine, paclitaxel, pentamidine, piperacillin/tazobactam, potassium chloride, prochlorperazine, promethazine, ranitidine, sargramostim, streptozocin, teniposide, theophylline, thiotepa, ticarcillin/clavulanate, tobramycin, trimethoprim/sulfamethoxazole, vinblastine, vincristine, vinorelbine, zidovudine.

- **Y-Site Incompatibility:** aldesleukin, amphotericin B colloidal, ciprofloxacin, cyclosporine, daunorubicin liposome, doxorubicin hydrochloride, furosemide, levofloxacin, minocycline, ondansetron, quinapristin/dalfopristin, sodium bicarbonate, topotecan, vancomycin.
- **Additive Incompatibility:** Do not admix with other medications.

Patient/Family Teaching

- Inform patient of the purpose of the medication. Advise patient to read the *Medication Guide* prior to starting therapy and before each infusion in case of changes.
- Advise patient to report infusion-related events or symptoms of hypersensitivity reactions immediately.
- **Instruct patient to notify health care professional promptly if fever; chills; cough; hoarseness; sore throat; signs of infection; lower back or side pain; painful or difficult urination; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; orthostatic hypotension; or painful ulcers or sores on your skin, lips, or in mouth, blisters, peeling skin, rash, pustule occurs.** Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDs; may precipitate gastric bleeding.
- Advise patient to consult health care professional prior to receiving any vaccinations.
- Instruct patient to use effective contraception during therapy and for 12 mo following therapy, and to avoid breast feeding.

Evaluation/Desired Outcomes

- Decrease in spread of malignancy.
- Reduced signs and symptoms of rheumatoid arthritis.
- Achievement of complete remission in GPA and MPA.

REMS

rivaroxaban (ri-va-rox-a-ban)

Xarelto

Classification

Therapeutic: anticoagulants

Pharmacologic: antithrombotics, factor Xa inhibitors

Pregnancy Category C

Indications

Prevention of deep vein thrombosis that may lead to pulmonary embolism following knee or hip replacement surgery. Reduction in risk of stroke/systemic embolism in patients with nonvalvular atrial fibrillation. Treatment of and reduction in risk of recurrence of deep vein thrombosis or pulmonary embolism.

Action

Acts as selective factor X inhibitor that blocks the active site of factor Xa, inactivating the cascade of coagulation. **Therapeutic Effects:** Prevention of blood clots and subsequent pulmonary emboli following knee/hip replacement surgery.

Pharmacokinetics

Absorption: Well absorbed (80%) following oral administration; absorption occurs in the stomach and decreases as it enters the small intestine.

Distribution: Unknown.

Metabolism and Excretion: 51% metabolized by the liver; 36% excreted unchanged in urine. Metabolites do not have anticoagulant activity.

Half-life: 5–9 hr.

TIME/ACTION PROFILE (anticoagulant effect)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–4 hr†	24 hr

† blood levels

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Active major bleeding; Severe renal impairment [$\text{CCr} < 30 \text{ mL/min}$ (deep vein thrombosis/pulmonary embolism treatment or prevention); $\text{CCr} < 15 \text{ mL/min}$ (atrial fibrillation)]; Prosthetic heart valves; Moderate to severe hepatic impairment (Child-Pugh B or C) or any liver pathology resulting in altered coagulation; **Lactation:** Avoid breast feeding; Concurrent use of drugs that are combined P-gp inducers/CYP3A4 inducers or combined P-gp inhibitors/CYP3A4 inhibitors.

Use Cautiously in: Neuroaxial spinal anesthesia or spinal puncture, especially if concurrent with an indwelling epidural catheter, drugs affecting hemostasis, history of traumatic/repeated spinal puncture or spinal deformity (↑ risk of spinal hematoma); Use of feeding tube (proper placement of tube must be documented to ensure absorption); **OB:** Use only if potential benefit outweighs potential risk.

Adverse Reactions/Side Effects

CNS: syncope. **Derm:** blister, pruritus. **Hemat:**

BLEEDING. **Local:** wound secretion. **MS:** extremity pain, muscle spasm.

Interactions

Drug-Drug: Rivaroxaban acts as a substrate of these subsets of the CYP450 enzyme system: CYP3A4/5, CYP2J2, and ATP-binding cassette G2 (ABCG2). Drugs

that inhibit or induce these systems may alter effectiveness. Concurrent use of drugs that are combined P-gp inhibitors/strong CYP3A4 inhibitors, including **ketoconazole**, **itraconazole**, **lopinavir/ritonavir**, **ritonavir**, **indinavir/ritonavir**, and **conivaptan** may ↑ levels; avoid concomitant use. Concurrent use of drugs that are combined P-gp inducers/strong CYP3A4 inducers, including **carbamazepine**, **phenytoin**, or **rifampin** may ↓ levels; avoid concomitant use. Concurrent use with **aspirin** or **NSAIDs** may ↑ the risk of bleeding. Concurrent use of **clopidogrel** or other **anticoagulants** may ↑ risk of bleeding and should be avoided.

Drug-Natural Products: St. John's wort ↓ levels of rivaroxaban and should be avoided.

Route/Dosage

Prevention of Deep Vein Thrombosis Following Knee or Hip Replacement Surgery

PO (Adults): 10 mg once daily, initiated 6–10 hr post-operatively (when hemostasis is achieved) continued for 35 days after hip replacement or 12 days after knee replacement.

Reduction in Risk of Stroke/Systemic Embolism in Nonvalvular Atrial Fibrillation

PO (Adults): 20 mg once daily with evening meal.

Renal Impairment

PO (Adults): *CCr* 15–50 mL/min—15 mg once daily with evening meal.

Treatment of and Reduction in Risk of Recurrence of Deep Vein Thrombosis or Pulmonary Embolism

PO (Adults): 15 mg twice daily for 21 days, then 20 mg once daily for remainder of treatment period.

Availability

Tablets: 10 mg, 15 mg, 20 mg.

NURSING IMPLICATIONS

Assessment

- **Assess for signs of bleeding and hemorrhage** (bleeding gums; nosebleed; unusual bruising; black, tarry stools; hematuria; fall in hematocrit or BP; guaiac-positive stools); bleeding from surgical site. Notify health care professional if these occur.
- Monitor patients with epidural catheters frequently for signs and symptoms of neurologic impairment. Epidural catheter should not be removed earlier than 18 hr after last administration of rivaroxaban; next dose should be at least 6 hr after catheter removal.
- **Lab Test Considerations:** May cause ↑ serum AST, ALT, total bilirubin, and GGT levels.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)

Risk for injury (Side Effects)

Implementation

- **When switching from warfarin to rivaroxaban**, discontinue warfarin and start rivaroxaban as soon as INR <3.0 to avoid periods of inadequate anticoagulation. **When switching from anticoagulants other than warfarin to rivaroxaban**, start rivaroxaban 0 to 2 hr prior to next scheduled evening dose and omit dose of other anticoagulant. For continuous heparin, discontinue heparin and administer rivaroxaban at same time. **When switching from rivaroxaban to warfarin or other anticoagulants**, no data is available. May discontinue rivaroxaban and begin both parenteral anticoagulant and warfarin at time of next rivaroxaban dose.
- Discontinue at least 24 hr prior to surgery and other interventions. Restart as soon as hemostasis has been reestablished.
- If rivaroxaban must be discontinued for other than bleeding, consider replacing with another anticoagulant; discontinuation increases risk of thrombotic events.
- **PO:** Administer first dose 6–10 hr after surgery, once hemostasis has been established. 10-mg tablet may be administered without regard to food; 15-mg and 20-mg tablet should be taken with food.
- If unable to swallow tablet, 15-mg and 20-mg tablets may be crushed, mixed with applesauce, and administered immediately after mixing. Follow dose immediately with food. Tablets are stable in applesauce for up to 4 hr.
- If administering crushed tablet via GI feeding tube, check placement of tube. Rivaroxaban is absorbed from the GI tract, not the small intestine. Suspend crushed tablet in 50 mL water and administer. Follow administration of 15-mg or 20-mg tablet immediately with food.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as remembered that day. If taking 15 mg twice daily, may take two 15-mg tablets to achieve 30 mg daily dose, then return to regular schedule. If taking 10 mg, 15 mg, or 20 mg once daily, take missed dose immediately. Inform health care professional of missed doses at time of checkup or lab tests. Inform patients that anticoagulant effect may persist for 2–5 days following discontinuation. Advise patient to read *Medication Guide* before starting therapy and with each Rx refill in case of changes. Caution patients not to discontinue medication early without consulting health care professional.

★ = Canadian drug name. ⚠ = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Advise patient to report any symptoms of unusual bleeding or bruising (bleeding gums; nosebleed; black, tarry stools; hematuria; excessive menstrual flow) and symptoms of spinal or epidural hematoma (tingling; numbness, especially in lower extremities; muscular weakness) to health care professional immediately.
- Instruct patient not to drink alcohol or take other Rx, OTC, or herbal products, especially those containing aspirin or NSAIDs, or to start or stop any new medications during rivaroxaban therapy without advice of health care professional.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Prevention of blood clots and subsequent pulmonary emboli following knee/hip replacement surgery. Duration of treatment is 35 days for patients with hip replacement and 12 days for patients with knee replacement surgery.

rivastigmine (rye-va-stig-meen)

Exelon

Classification

Therapeutic: anti-Alzheimer's agents
Pharmacologic: cholinergics (cholinesterase inhibitors)

Pregnancy Category B

Indications

PO: Mild to moderate dementia associated with Alzheimer's disease. **Transdermal:** Treatment of mild, moderate, or severe dementia associated with Alzheimer's disease and mild to moderate dementia associated with Parkinson's disease.

Action

Enhances cholinergic function by reversible inhibition of cholinesterase. Does not cure the disease. **Therapeutic Effects:** Decreased dementia (temporary) associated with Alzheimer's disease and Parkinson's disease. Enhanced cognitive ability.

Pharmacokinetics

Absorption: Well absorbed following oral administration. Transdermal patch is slowly absorbed over 8 hr.

Distribution: Widely distributed.

Metabolism and Excretion: Rapidly and extensively metabolized by the liver; metabolites are excreted by the kidneys.

Half-life: *PO*—1.5 hr; *Transdermal*—24 hr.

TIME/ACTION PROFILE (improvement in dementia)

ROUTE	ONSET	PEAK	DURATION
PO	within 2 wk	up to 12 wk	unknown
Transdermal	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to rivastigmine or other carbamates; History of application site reactions with transdermal product suggestive of allergic contact dermatitis.

Use Cautiously in: History of asthma or obstructive pulmonary disease; History of GI bleeding; Sick sinus syndrome or other supraventricular cardiac conduction abnormalities; Renal or hepatic impairment (dose ↓ may be needed); Patients weighing <50 kg; at risk for ↑ adverse reactions; **OB, Lactation, Pedi:** Safety not established.

Adverse Reactions/Side Effects

CNS: weakness, dizziness, drowsiness, headache, sedation (unusual). **CV:** edema, heart failure, hypotension. **GI:** anorexia, dyspepsia, nausea, vomiting, abdominal pain, diarrhea, flatulence, weight gain (unusual). **Derm:** allergic contact dermatitis.

Neuro: tremor. **Misc:** fever, weight loss, application reactions (for transdermal patch only).

Interactions

Drug-Drug: Nicotine may ↑ metabolism and ↓ levels.

Route/Dosage

PO (Adults): 1.5 mg twice daily initially; after at least 2 wk, dose may be ↑ to 3 mg twice daily. Further increments may be made at 2-wk intervals up to 6 mg twice daily.

Transdermal (Adults): *Initial Dose*—4.6 mg/24-hr transdermal patch initially; ↑ to 9.5 mg/24-hr transdermal patch after at least 4 wk; may ↑ to 13.3 mg/24-hr transdermal patch if needed (is recommended effective dose for patients with severe Alzheimer's disease).

Hepatic Impairment

Transdermal (Adults): *Mild-Moderate Hepatic Impairment*—Do not exceed dose of 4.6 mg/24 hr.

Availability (generic available)

Capsules: 1.5 mg, 3 mg, 4.5 mg, 6 mg. **Oral solution:** 2 mg/mL. **Transdermal patch:** 4.6 mg/24 hr, 9.5 mg/24 hr, 13.3 mg/24 hr.

NURSING IMPLICATIONS

Assessment

- Assess cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) periodically throughout therapy.

- Monitor patient for nausea, vomiting, anorexia, and weight loss. Notify health care professional if these side effects occur.
- Monitor for hypersensitivity skin reactions; may occur after oral or transdermal administration. If allergic contact dermatitis is suspected after transdermal use, may switch to oral rivastigmine after negative allergy testing. If disseminated hypersensitivity reaction of the skin occurs, discontinue therapy.

Potential Nursing Diagnoses

Disturbed thought process (Indications)

Impaired environmental interpretation syndrome (Indications)

Imbalanced nutrition: less than body requirements (Side Effects)

Implementation

- Rivastigmine oral solution and capsules may be interchanged at equal doses.
- Patients switching from oral doses of <6 mg to transdermal doses should use 4.6 mg/24 hr patch. Patients taking oral doses of 6 mg–12 mg may be converted directly to 9.5 mg/24 hr patch. Apply patch on the day following the last oral dose.
- **PO:** Administer in the morning and evening with food.
- Oral solution may be administered directly from syringe provided or mixed with a small glass of water, cold fruit juice, or soda. Mixture should be stirred prior to drinking. Ensure patient drinks entire mixture. Oral solution is stable for 4 hr at room temperature when mixed with cold fruit juice or soda. Do not mix with other solutions.
- **Transdermal:** Apply patch to clean, dry, hairless area that will not be rubbed by tight clothing. Upper or lower back is recommended, may also use upper arm or chest. Do not apply to red, irritated, or cut skin. Rotate sites to prevent irritation, do not use same site within 14 days. Remove adhesive liner and apply by pressing patch firmly until edges stick well. May be worn during bathing and hot weather. Each 24 hr, remove old patch and discard by folding in half and apply new patch to a new area.

Patient/Family Teaching

- **PO:** Emphasize the importance of taking rivastigmine at regular intervals as directed.
- Explain to patient and caregiver how to use oral dosing syringe provided with oral solution. Remove syringe from protective case and push down and twist child-resistant closure to open bottle. Insert syringe into opening in white stopper in bottle. Hold the syringe and pull plunger to the level corresponding to the prescribed dose. Before removing

syringe from bottle, push out larger bubbles (small bubbles will not alter dose) by moving plunger up and down a few times. After large bubbles are gone, move plunger to level of dose. Remove syringe from bottle.

- Caution patient and caregiver that rivastigmine may cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient and caregiver to notify health care professional if nausea, vomiting, anorexia, or weight loss occur. If adverse effects become intolerable during treatment with *transdermal patch*, instruct patient to discontinue patches for several days and then restart at same or next lower dose level. If treatment is interrupted for more than several days, lowest dose level should be used when restarting and titrate according to Route and Dosage section.
- Advise patient and caregiver to notify health care professional of medication regimen prior to treatment or surgery.
- Inform patient and caregiver that improvement in cognitive functioning may take weeks to months and that the degenerative process is not reversed.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- **Transdermal:** Instruct patient and caregiver on the correct application, rotation, and discarding of patch. Patch should be folded in half and discarded out of reach of children and pets; medication remains in discarded patch. Replace missed doses immediately and apply next patch at usual time. Advise patient and caregiver to avoid contact with eyes and to wash hands after applying patch. Avoid exposure to heat sources (excessive sunlight, saunas, heating pads) for long periods.
- Advise patient and caregiver to notify health care professional if skin reactions occur.
- Advise patient referred for MRI test to discuss patch with referring health care professional and MRI facility to determine if removal of patch is necessary prior to test and for directions for replacing patch.

Evaluation/Desired Outcomes

- Temporary improvement in cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) in patients with Alzheimer's disease.
- Improvement in cognitive function and overall functioning in patients with Parkinson's disease.

✳ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

rizatriptan (riz-a-trip-tan)

Maxalt, Maxalt-MLT

Classification

Therapeutic: vascular headache suppressants

Pharmacologic: 5-HT₁ agonists**Pregnancy Category C****Indications**

Acute treatment of migraine with or without aura.

ActionActs as an agonist at specific 5-HT₁ receptor sites in intracranial blood vessels and sensory trigeminal nerves.**Therapeutic Effects:** Cranial vessel vasoconstriction with associated decrease in release of neuropeptides and resultant decrease in migraine headache.**Pharmacokinetics****Absorption:** Completely absorbed after oral administration, but first-pass metabolism results in 45% bioavailability.**Distribution:** Unknown.**Metabolism and Excretion:** Primarily metabolized by monoamine oxidase-A (MAO-A); minor conversion to an active compound; 14% excreted unchanged in urine.**Half-life:** 2–3 hr.**TIME/ACTION PROFILE** (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	30 min	1–1.5 hr	unknown

Contraindications/Precautions**Contraindicated in:** Hypersensitivity; Ischemic or vasospastic cardiovascular, cerebrovascular, or peripheral vascular syndromes; History of significant cardiovascular disease; Uncontrolled hypertension; Should not be used within 24 hr of other 5-HT₁ agonists or ergot-type compounds (dihydroergotamine); Basilar or hemiplegic migraine; Concurrent MAO-A inhibitor therapy or within 2 wk of discontinuing MAO-A inhibitor therapy; Phenylketonuria (orally disintegrating tablet contains aspartame).**Use Cautiously in:** Severe renal impairment, especially in patients on dialysis; Moderate hepatic impairment; **OB, Lactation, Pedi:** Pregnancy, lactation, or children <6 yr (safety not established).**Exercise Extreme Caution in:** Cardiovascular risk factors (hypertension, hypercholesterolemia, cigarette smoking, obesity, diabetes, strong family history, menopausal women or men >40 yr); use only if cardiovascular status has been evaluated and determined to be safe and first dose is administered under supervision.**Adverse Reactions/Side Effects****CNS:** dizziness, drowsiness, weakness. **CV:** CORONARY ARTERY VASOSPASM, MI, VENTRICULAR ARRHYTHMIAS, chest pain, myocardial ischemia. **GI:** dry mouth, nausea. **Misc:** hypersensitivity reactions including ANGIOEDEMA, toxic epidermal necrolysis, pain.**Interactions****Drug-Drug:** Concurrent use with MAO-A inhibitors ↑ levels and adverse reactions (concurrent use or use within 2 wk of MAO inhibitor is contraindicated). Concurrent use with other 5-HT agonists or ergot-type compounds (dihydroergotamine) may result in ↑ vasoactive properties (avoid use within 24 hr of each other). **Propranolol** ↑ levels and risk of adverse reactions (↓ dose of rizatriptan; rizatriptan not recommended in children <40 kg). ↑ risk of serotonin syndrome when used with SSRI or SNRI antidepressants.**Drug-Natural Products:** ↑ risk of serotonergic side effects including serotonin syndrome with **St. John's wort** and **SAME**.**Route/Dosage****PO (Adults):** 5–10 mg (use 5-mg dose in patients receiving propranolol); may be repeated in 2 hr; not to exceed 3 doses/24 hr.**PO (Children 6–17 yr):** ≥40 kg—10 mg single dose (use 5-mg dose in patients receiving propranolol); <40 kg—5 mg single dose (do NOT use in patients receiving propranolol).**Availability (generic available)****Tablets:** 5 mg, 10 mg. **Orally disintegrating tablets (Maxalt-MLT) (peppermint flavor):** 5 mg, 10 mg.**NURSING IMPLICATIONS****Assessment**

- Assess pain location, character, intensity, and duration and associated symptoms (photophobia, phonophobia, nausea, vomiting) during migraine attack.
- **Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyperreflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs).**

Potential Nursing Diagnoses

Acute pain (Indications)

Implementation

- **PO:** Tablets should be swallowed whole with liquid.
- Orally disintegrating tablets should be left in the package until use. Remove from the blister pouch. Do not push tablet through the blister; peel open the blister pack with dry hands and place tablet on

tongue. Tablet will dissolve rapidly and be swallowed with saliva. No liquid is needed to take the orally disintegrating tablet.

Patient/Family Teaching

- Inform patient that rizatriptan should be used only during a migraine attack. It is meant to be used for relief of migraine attacks but not to prevent or reduce the number of attacks.
- Instruct patient to administer rizatriptan as soon as symptoms of a migraine attack appear, but it may be administered at any time during an attack. If migraine symptoms return, a second dose may be used. Allow at least 2 hr between doses, and do not use more than 30 mg in any 24-hr period.
- If first dose does not relieve headache, additional rizatriptan doses are not likely to be effective; notify health care professional.
- Caution patient not to take rizatriptan within 24 hr of other vascular headache suppressants.
- Advise patient that lying down in a darkened room after rizatriptan administration may further help relieve headache.
- Advise patient that overuse (use more than 10 days/mo) may lead to exacerbation of headache (migraine-like daily headaches, or as a marked increase in frequency of migraine attacks). May require gradual withdrawal of rizatriptan and treatment of symptoms (transient worsening of headache).
- Advise patient to notify health care professional before next dose of rizatriptan if pain or tightness in the chest occurs during use. **If pain is severe or does not subside, notify health care professional immediately.** If feelings of tingling, heat, flushing, heaviness, pressure, drowsiness, dizziness, tiredness, or sickness develop, discuss with health care professional at next visit.
- May cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid alcohol, which aggravates headaches, during rizatriptan use.
- **Advise patient to notify health care professional immediately if signs or symptoms of serotonin syndrome occur.**
- Caution female patient to avoid rizatriptan if pregnant or breast feeding, or if pregnancy is suspected or planned. Adequate contraception should be used during therapy.

Evaluation/Desired Outcomes

- Relief of migraine attack.

rOPINiRole (roe-pin-i-role)

Requip, Requip XL

Classification

Therapeutic: antiparkinson agents

Pharmacologic: dopamine agonists

Pregnancy Category C

Indications

Management of signs and symptoms of idiopathic Parkinson's disease. Restless leg syndrome (immediate-release only).

Action

Stimulates dopamine receptors in the brain. **Therapeutic Effects:** Decreased tremor and rigidity in Parkinson's disease. Decreased leg restlessness.

Pharmacokinetics

Absorption: 55% absorbed following oral administration.

Distribution: Widely distributed.

Metabolism and Excretion: Extensively metabolized by the liver (by cytochrome P450 CYP1A2 enzyme system); <10% excreted unchanged in urine.

Half-life: 6 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Hepatic impairment (slower titration may be required); Severe cardiovascular disease; **OB, Lactation, Pedi:** Safety not established; may inhibit lactation; **Geri:** ↑ risk of hallucinations.

Adverse Reactions/Side Effects

CNS: **SLEEP ATTACKS,** dizziness, syncope, confusion, drowsiness, fatigue, hallucinations, headache, dyskinesia, impulse control disorders (gambling, sexual), weakness. **EENT:** abnormal vision. **CV:** orthostatic hypotension, peripheral edema. **GI:** constipation, dry mouth, dyspepsia, nausea, vomiting. **Derm:** sweating, melanoma.

Interactions

Drug-Drug: Drugs that alter the activity of cytochrome P450 CYP1A2 enzyme system may affect the activity of ropinirole. Effects may be ↑ by **estrogens**. Effects may be ↓ by **phenothiazines, butyrophenones, thioxanthenes, or metoclopramide**. May ↑ effects of **levodopa** (may allow dose ↓ of levodopa).

✶ = Canadian drug name. ✶ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Route/Dosage

PO (Adults): *Parkinson's disease*—Immediate-release: 0.25 mg 3 times daily for 1 wk, then 0.5 mg 3 times daily for 1 wk, then 0.75 mg 3 times daily for 1 wk, then 1 mg 3 times daily for 1 wk; then may ↑ by 1.5 mg/day every wk up to 9 mg/day; then may ↑ by up to 3 mg/day every wk up to 24 mg/day; Extended-release: 2 mg once daily for 1–2 wk; may ↑ by 2 mg/day every wk up to 24 mg/day. *Restless leg syndrome*—0.25 mg once daily initially, 1–3 hr before bedtime. After 2 days, ↑ to 0.5 mg once daily and to 1 mg once daily by the end of first week of dosing, then ↑ by 0.5 mg weekly, up to 4 mg/day as needed/tolerated.

Availability (generic available)

Tablets: 0.25 mg, 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg, 5 mg. **Cost:** *Generic*—0.25 mg \$250.21/100, 0.5 mg \$250.21/100, 1 mg \$250.21/100, 2 mg \$250.21/100, 3 mg \$259.54/100, 4 mg \$259.85/100, 5 mg \$259.85/100. **Extended-release tablets:** 2 mg, 4 mg, 6 mg, 8 mg, 12 mg. **Cost:** *Generic*—2 mg \$82.05/30, 4 mg \$164.10/30, 6 mg \$246.16/30, 8 mg \$246.16/30, 12 mg \$410.47/30.

NURSING IMPLICATIONS

Assessment

- Assess BP periodically during therapy.
- Assess patient for drowsiness and sleep attacks.**
Drowsiness is a common side effect of rosinirole, but sleep attacks or episodes of falling asleep during activities that require active participation may occur without warning. Assess patient for concomitant medications that have sedating effects or may increase serum rosinirole levels (see Interactions). May require discontinuation of therapy.
- Parkinson's Disease:** Assess patient for signs and symptoms of Parkinson's disease (tremor, muscle weakness and rigidity, ataxic gait) prior to and during therapy.
- Restless Leg Syndrome:** Assess sleep patterns and frequency of restless leg disturbances.
- Lab Test Considerations:** May cause ↑ BUN.

Potential Nursing Diagnoses

Impaired physical mobility (Indications)
Risk for injury (Indications, Side Effects)

Implementation

- Do not confuse rosinirole with Risperdal (risperidone) or risperidone.**
- PO:** May be administered with or without food. Administration with food may decrease nausea. Extended-release tablets should be swallowed whole; do not break, crush, or chew.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed. Missed doses should be taken as soon as possible, but not if almost time for next dose. Do not double doses.

- Caution patient to change positions slowly to minimize orthostatic hypotension.
- May cause drowsiness and unexpected episodes of falling asleep.** Caution patient to avoid driving or other activities requiring alertness until response to medication is known. Advise patient to notify health care professional if episodes of falling asleep occur.
- Advise patient to avoid alcohol and other CNS depressants concurrently with rosinirole.
- Advise patient that increasing fluids, sugarless gum or candy, ice, or saliva substitutes may help minimize dry mouth. Consult health care professional if dry mouth continues for >2 wk.
- Advise patient to have periodic skin exams to check for lesions that may be melanoma.
- Advise patient to notify health care professional if new or increased gambling, sexual, or other impulse control disorders occur.

Evaluation/Desired Outcomes

- Decreased tremor and rigidity in Parkinson's disease.
- Decrease in restless legs and improved sleep.

ropivacaine, See EPIDURAL LOCAL ANESTHETICS.

REMS

rosiglitazone
(roe-zi-glīt-a-zone)
Avandia

Classification

Therapeutic: antidiabetics
Pharmacologic: thiazolidinediones

Pregnancy Category C

Indications

Type 2 diabetes mellitus (with diet and exercise); may be used with metformin, sulfonylureas, or insulin (patients should only be newly initiated on this drug if they are unable to achieve glucose control with other medications and are unable to take pioglitazone).

Action

Improves sensitivity to insulin by acting as an agonist at receptor sites involved in insulin responsiveness and subsequent glucose production and utilization. Requires insulin for activity. **Therapeutic Effects:** Decreased insulin resistance, resulting in glycemic control without hypoglycemia.

Pharmacokinetics

Absorption: Well absorbed (99%) following oral administration.

Distribution: Unknown.

Protein Binding: 99.8% bound to plasma proteins.

Metabolism and Excretion: Entirely metabolized by the liver.

Half-life: 3.2–3.6 hr (↑ in liver disease).

TIME/ACTION PROFILE (effects on blood glucose)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	12–24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Diabetic ketoacidosis; Clinical evidence of active liver disease or increased ALT (>2.5 times upper limit of normal); Renal dysfunction (creatinine >1.5 mg/dL in males or 1.4 mg/dL in females; **OB, Lactation:** Potential for fetal or infant harm. Insulin monotherapy should be used; **Pedi:** Safety and effectiveness not established.

Use Cautiously in: Edema; HF (avoid use in moderate to severe HF unless benefits outweigh risks); Concurrent use with insulin (may ↑ risk of adverse cardiovascular reactions); Hepatic impairment; **OB:** May restore ovulation and risk of pregnancy in premenopausal women; **Geri:** Dose ↓ and careful titration recommended due to age-related ↓ in renal function. Avoid maximum dose. Should not be given to patients >80 yr.

Adverse Reactions/Side Effects

CNS: **STROKE.** **CV:** **HF, MYOCARDIAL INFARCTION,** edema. **EENT:** new onset and worsening diabetic macular edema. **Derm:** urticaria. **GI:** hepatitis, ↑ liver enzymes. **Hemat:** anemia. **Metab:** ↑ total cholesterol, LDL and HDL, weight gain. **Misc:** **ANGIO-EDEMA,** fractures (arm, hand, foot) in female patients.

Interactions

Drug-Drug: Concurrent use with rifampin ↓ levels and may ↓ effectiveness. Gemfibrozil ↑ levels and may ↑ risk of hypoglycemia (↓ dose of rosiglitazone).

Drug-Natural Products: Glucosamine may worsen blood glucose control. Chromium and coenzyme Q-10 may produce additive hypoglycemic effects.

Route/Dosage

PO (Adults): 4 mg as a single dose once daily or 2 mg twice daily; after 8 wk, may be ↑ if necessary to 8 mg once daily or 4 mg twice daily.

Availability (generic available)

Tablets: 2 mg, 4 mg, 8 mg. **In combination with:** metformin (Avandamet), glimepiride (Avandaryl). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Observe patient taking concurrent insulin for signs and symptoms of hypoglycemia (sweating, hunger, weakness, dizziness, tremor, tachycardia, anxiety).
- Assess patient for edema and signs of HF (dyspnea, rales/crackles, peripheral edema, weight gain, jugular venous distention). May require discontinuation of rosiglitazone.
- **Lab Test Considerations:** Monitor serum glucose and glycosylated hemoglobin periodically during therapy to evaluate effectiveness.
- Monitor CBC with differential periodically during therapy. May cause ↓ in hemoglobin, hematocrit, and WBC, usually during the first 4–8 wk of therapy; then levels stabilize.
- Monitor AST and ALT prior to initiating therapy and periodically thereafter or if jaundice or symptoms of hepatic dysfunction occur. May cause irreversible ↑ in AST and ALT or hepatic failure (rare). If ALT increases to >3 times the upper limit of normal, recheck ALT promptly. Discontinue rosiglitazone if ALT remains >3 times normal.
- May cause ↑ in total cholesterol, LDL, and HDL and ↓ in free fatty acids.
- Monitor renal function tests prior to initiating therapy and periodically thereafter (BUN, creatinine, creatinine clearance), especially in older adults.

Potential Nursing Diagnoses

Imbalanced nutrition: more than body requirements (Indications)

Implementation

- Do not confuse Avandia (rosiglitazone) with Prandin (repaglinide) or Coumadin (warfarin).
- Rosiglitazone is available only through a restricted distribution program called the *Rosiglitazone REMS Program*. Both prescribers and patients need to enroll in the program. To enroll, call 1-800-AVANDIA or visit www.AVANDIA.com.
- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- **PO:** May be administered with or without meals.

Patient/Family Teaching

- Instruct patient to take medication as directed. If dose for 1 day is missed, do not double dose the next day. Explain the *Rosiglitazone REMS Program* to patient.
- Explain to patient that this medication controls hypoglycemia but does not cure diabetes. Therapy is long term.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient

✳ = Canadian drug name. ⚠ = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water and notify health care professional.

- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hypoglycemic or hyperglycemic episodes.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness and health care professional notified if significant changes occur.
- Advise patient to notify health care professional immediately if signs of hepatic dysfunction or **HF** occur.
- Advise patient to inform health care professional of medication regimen prior to treatment, studies using IV contrast, or surgery.
- Advise patient to carry a form of sugar (sugar packets, candy) and identification describing disease process and medication regimen at all times.

- Insulin is the preferred method of controlling blood glucose during pregnancy. Counsel female patients that higher doses of oral contraceptives or a form of contraception other than oral contraceptives may be required and to notify health care professional promptly if pregnancy is planned or suspected.
- Emphasize the importance of routine follow-up exams.

Evaluation/Desired Outcomes

- Control of blood glucose levels.

rosuvastatin, See HMG-CoA REDUCTASE INHIBITORS (statins).

SALICYLATES

aspirin (as-pir-in)

✳️ Arthrinol, ✳️ Arthritis, ✳️ Artria S.R, ASA, ✳️ Asaphen, Ascriptin, Aspercin, Aspergum, Aspartab, ✳️ Astrin, Bayer Aspirin, Bufferin, ✳️ Coryphen, Easprin, Ecotrin, ✳️ Entrophen, Genacote, Halfrin, ✳️ Headache Tablets, Healthprin, ✳️ Novasen, ✳️ Rivasa, St. Joseph Adult Chewable Aspirin, ZORprin

choline and magnesium

salicylates

(koe-leen mag-nee-zhum sal-i-sil-ates)

Trilisate

magnesium salicylate

(mag-nee-zhum sal-i-sil-ate)

✳️ Doan's Backache Pills, Doan's Extra Strength, Keygesic, Momentum

salsalate (sal-sa-late)

Disalcid

Classification

Therapeutic: antipyretics, nonopioid analgesics

Pharmacologic: salicylates

Pregnancy Category D (aspirin—first trimester), **C** (magnesium salicylate, salsalate—first trimester)

Indications

Inflammatory disorders including: Rheumatoid arthritis, Osteoarthritis. Mild to moderate pain. Fever. **Aspirin**: Prophylaxis of transient ischemic attacks and MI.

Action

Produce analgesia and reduce inflammation and fever by inhibiting the production of prostaglandins. **Aspirin Only**: Decreases platelet aggregation. **Therapeutic Effects**: Analgesia. Reduction of inflammation. Reduction of fever. **Aspirin**: Decreased incidence of transient ischemic attacks and MI.

Pharmacokinetics

Absorption: *Aspirin*—Well absorbed from the upper small intestine; absorption from enteric-coated preparations may be unreliable; rectal absorption is slow and variable. *Choline and magnesium salicylates*—Well absorbed after oral administration. *Salsalate*—Splits into 2 molecules of salicylic acid after oral administration; absorbed in the small intestine.

Distribution: All salicylates are rapidly and widely distributed; cross the placenta and enter breast milk.

Metabolism and Excretion: Extensively metabolized by the liver; inactive metabolites excreted by the kidneys. Amount excreted unchanged by the kidneys depends on urine pH; as pH increases, amount excreted unchanged increases from 2–3% up to 80%.

Half-life: 2–3 hr for low doses; up to 15–30 hr with larger doses because of saturation of liver metabolism.

TIME/ACTION PROFILE (analgesia/fever reduction†)

ROUTE	ONSET	PEAK	DURATION
Aspirin—PO	5–30 min	1–3 hr	3–6 hr
Aspirin—PO-ER	5–30 min	2–4 hr	8–12 hr
Aspirin—Rect	1–2 hr	4–5 hr	7 hr
All other salicylates—PO	5–30 min	1–3 hr	3–6 hr

†Antirheumatic effect may take 2–3 wk of chronic dosing

Contraindications/Precautions

Contraindicated in: Hypersensitivity to aspirin, tartrazine (FDC yellow dye #5), or other salicylates; Cross-sensitivity with other NSAIDs may exist (less with non-aspirin salicylates); Bleeding disorders or thrombocytopenia (more important with aspirin); Children or adolescents with viral infections (may increase the risk of Reye's syndrome); Peri-operative pain from coronary artery bypass graft (CABG) surgery.

Use Cautiously in: History of GI bleeding or ulcer disease; Chronic alcohol use/abuse; Severe renal disease (magnesium toxicity may occur with magnesium salicylate); Severe hepatic disease; Cardiovascular disease or risk factors for cardiovascular disease (may ↑ risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke, especially with prolonged use); **OB**: Salicylates may have adverse effects on fetus and mother and, in general, should be avoided during pregnancy, especially during the 3rd trimester; **Lactation**: Safety not established; **Geri**: ↑ risk of adverse reactions especially GI bleeding; more sensitive to toxic levels.

Adverse Reactions/Side Effects

EENT: tinnitus. **GI**: GI BLEEDING, dyspepsia, epigastric distress, nausea, abdominal pain, anorexia, hepatotoxicity, vomiting. **Derm**: *salsalate*—**EXFOLIATIVE DERMATITIS**, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS. **Hemat**: *aspirin*—anemia, hemolysis, increased bleeding time. **Misc**: allergic reactions including **ANAPHYLAXIS** and **LARYNGEAL EDEMA**.

Interactions

Drug-Drug: Aspirin may ↑ the risk of bleeding with **warfarin**, **heparin**, **heparin-like agents**, **thrombolytic agents**, **ticlopidine**, **clopidogrel**, **abcixi-**

✳️ = Canadian drug name. ✳️ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

mab, tirofiban, or eptifibatide, although these agents are frequently used safely in combination and in sequence. Ibuprofen may negate the cardioprotective antiplatelet effects of low-dose aspirin. Aspirin may ↑ risk of bleeding with **cefoperazone, cefotetan, and valproic acid**. May ↑ activity of **penicillins, phenytoin, methotrexate, valproic acid, oral hypoglycemic agents, and sulfonamides**. May ↓ beneficial effects of **probenecid**. **Corticosteroids** may ↓ serum salicylate levels. **Urinary acidification** ↑ reabsorption and may ↑ serum salicylate levels. **Alkalinization of the urine** or the ingestion of large amounts of **antacids** ↓ excretion and ↓ serum salicylate level. May blunt the therapeutic response to **diuretics**, and **anti-hypertensives**. ↑ risk of GI irritation with **NSAIDs**. **Drug-Natural Products:** ↑ anticoagulant effect and bleeding risk when using aspirin with **arnica, chamomile, clove, feverfew, garlic, ginger, ginkgo, Panax ginseng**, and others. **Drug-Food:** Foods capable of acidifying the urine (see Appendix M) may ↑ serum salicylate levels.

Route/Dosage

Aspirin

Pain/Fever

PO, Rect (Adults): 325–1000 mg q 4–6 hr (not to exceed 4 g/day). *Extended-release tablets*—650 mg q 8 hr or 800 mg q 12 hr.

PO, Rect (Children 2–11 yr): 10–15 mg/kg q 4–6 hr (not to exceed 4 g/day).

Inflammation

PO (Adults): 2.4 g/day initially; increased to maintenance dose of 3.6–5.4 g/day in divided doses (up to 7.8 g/day for acute rheumatic fever).

PO (Children): 60–100 mg/kg/day in divided doses (up to 130 mg/kg/day for acute rheumatic fever).

Prevention of Transient Ischemic Attacks

PO (Adults): 50–325 mg once daily.

Prevention of Myocardial Infarction

PO (Adults): 80–325 mg once daily.

PO (Children): 3–10 mg/kg once daily (round dose to a convenient amount).

Kawasaki Disease

PO (Children): 80–100 mg/kg/day in 4 divided doses until fever resolves; may be followed by maintenance dose of 3–5 mg/kg/day as a single dose for up to 8 wk.

Magnesium Salicylate

PO (Adults): 304 mg q 4 hr or 467 mg q 6 hr.

Choline and Magnesium Salicylates

5 mL of liquid equivalent to 500 mg salicylate or 650 mg of aspirin. Tablet strength expressed in mg of salicylate: 500-mg tablet equivalent to 650 mg of aspirin, 750-mg tablet equivalent to 975 mg of aspirin, 1000-mg tablet equivalent to 1.3 g of aspirin.

PO (Adults): *Anti-inflammatory*—3 g/day of salicylate at bedtime or in 2–3 divided doses (not to exceed 4.5 g/day).

PO (Children >37 kg): 2.25 g of salicylate/day in 2 divided doses.

PO (Children <37 kg): 50 mg of salicylate/kg/day in 2 divided doses.

Salsalate

PO (Adults): 1 g 3 times daily initially; further titration may be required.

Availability

Aspirin (generic available)

Tablets: 81 mg^{OTC}, 162.5 mg^{OTC}, 325 mg^{OTC}, 500 mg^{OTC}, 650 mg^{OTC}, 975 mg^{OTC}. **Chewable tablets:** 81 mg^{OTC}, 81 mg^{OTC}. **Chewing gum:** 227 mg^{OTC}. **Dispersible tablets:** 325 mg^{OTC}, 500 mg^{OTC}. **Enteric-coated (delayed-release) tablets:** 80 mg^{OTC}, 165 mg^{OTC}, 300 mg^{OTC}, 325 mg^{OTC}, 500 mg^{OTC}, 600 mg^{OTC}, 650 mg^{OTC}, 975 mg^{OTC}. **Extended-release tablets:** 325 mg^{OTC}, 650 mg^{OTC}, 800 mg. **Delayed-release capsules:** 325 mg^{OTC}, 500 mg^{OTC}. **Suppositories:** 60 mg^{OTC}, 120 mg^{OTC}, 125 mg^{OTC}, 130 mg^{OTC}, 150 mg^{OTC}, 160 mg^{OTC}, 195 mg^{OTC}, 200 mg^{OTC}, 300 mg^{OTC}, 320 mg^{OTC}, 325 mg^{OTC}, 600 mg^{OTC}, 640 mg^{OTC}, 650 mg^{OTC}, 1.2 g^{OTC}. **In combination with:** antihistamines, decongestants, cough suppressants^{OTC}, and opioids. See Appendix B.

Choline and Magnesium Salicylates (listed as salicylate content)

Liquid: 500 mg/5 mL.

Magnesium Salicylate (generic available)

Tablets: 580 mg^{OTC}, 600 mg, 650 mg^{OTC}.

Salsalate (generic available)

Tablets: 500 mg, 750 mg.

NURSING IMPLICATIONS

Assessment

- **Patients who have asthma, allergies, and nasal polyps or who are allergic to tartrazine are at an increased risk for developing hypersensitivity reactions.**
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome or toxic epidermal necrolysis. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- **Pain:** Assess pain and limitation of movement; note type, location, and intensity before and at the peak (see Time/Action Profile) after administration.
- **Fever:** Assess fever and note associated signs (diaphoresis, tachycardia, malaise, chills).
- **Lab Test Considerations:** Monitor hepatic function before antirheumatic therapy and if symptoms of hepatotoxicity occur; more likely in patients, es-

pecially children, with rheumatic fever, systemic lupus erythematosus, juvenile arthritis, or pre-existing hepatic disease. May cause ↑ serum AST, ALT, and alkaline phosphatase, especially when plasma concentrations exceed 25 mg/100 mL. May return to normal despite continued use or dose reduction. If severe abnormalities or active liver disease occurs, discontinue and use with caution in future.

- Monitor serum salicylate levels periodically with prolonged high-dose therapy to determine dose, safety, and efficacy, especially in children with Kawasaki disease.
- **Aspirin:** Prolongs bleeding time for 4–7 days and, in large doses, may cause prolonged prothrombin time. Monitor hematocrit periodically in prolonged high-dose therapy to assess for GI blood loss.
- **Toxicity and Overdose:** Monitor patient for the onset of tinnitus, headache, hyperventilation, agitation, mental confusion, lethargy, diarrhea, and sweating. If these symptoms appear, withhold medication and notify health care professional immediately.

Potential Nursing Diagnoses

Acute pain (Indications)

Impaired physical mobility (Indications)

Implementation

- Use lowest effective dose for shortest period of time.
- **PO:** Administer after meals or with food or an antacid to minimize gastric irritation. Food slows but does not alter the total amount absorbed.
- Do not crush or chew enteric-coated tablets. Do not take antacids within 1–2 hr of enteric-coated tablets. Chewable tablets may be chewed, dissolved in liquid, or swallowed whole. Some extended-release tablets may be broken or crumbled but must not be ground up before swallowing. See manufacturer's prescribing information for individual products.

Patient/Family Teaching

- Instruct patient to take salicylates with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Advise patient to report tinnitus; unusual bleeding of gums; bruising; black, tarry stools; or fever lasting longer than 3 days.
- **Caution patient to avoid concurrent use of alcohol with this medication to minimize possible gastric irritation; 3 or more glasses of alcohol per day may increase the risk of GI bleeding. Caution patient to avoid taking concurrently with acetaminophen or NSAIDs for more than a few days, unless directed by health care professional to prevent analgesic nephropathy.**
- Teach patients on a sodium-restricted diet to avoid effervescent tablets or buffered-aspirin preparations.
- Tablets with an acetic (vinegar-like) odor should be discarded.

- **Instruct patient to notify health care professional if rash or signs and symptoms of hypersensitivity reaction occurs.**
- Advise patients on long-term therapy to inform health care professional of medication regimen before surgery. Aspirin may need to be withheld for 1 wk before surgery.
- **Pedi:** Centers for Disease Control and Prevention warns against giving aspirin to children or adolescents with varicella (chickenpox) or influenza-like or viral illnesses because of a possible association with Reye's syndrome.
- **Transient Ischemic Attacks or MI:** Advise patients receiving aspirin prophylactically to take only prescribed dose. Increasing the dose has not been found to provide additional benefits.

Evaluation/Desired Outcomes

- Relief of mild to moderate discomfort.
- Increased ease of joint movement. May take 2–3 wk for maximum effectiveness.
- Reduction of fever.
- Prevention of transient ischemic attacks.
- Prevention of MI.

salmeterol (sal-me-te-role) Serevent Diskus

Classification

Therapeutic: bronchodilators

Pharmacologic: adrenergics

Pregnancy Category C

S

Indications

As concomitant therapy for the treatment of asthma and the prevention of bronchospasm in patients who are currently taking but are inadequately controlled on a long-term asthma-control medication (e.g., inhaled corticosteroid). Prevention of exercise-induced bronchospasm. Maintenance treatment to prevent bronchospasm in chronic obstructive pulmonary disease (COPD) including chronic bronchitis and emphysema.

Action

Produces accumulation of cyclic adenosine monophosphate (cAMP) at beta₂-adrenergic receptors. Relatively specific for beta (pulmonary) receptors. **Therapeutic Effects:** Bronchodilation.

Pharmacokinetics

Absorption: Minimal systemic absorption follows inhalation.

Distribution: Action is primarily local.

Metabolism and Excretion: Unknown.

Half-life: 3–4 hr.

✳ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

TIME/ACTION PROFILE (bronchodilation)

ROUTE	ONSET	PEAK	DURATION
Inhalation	10–25 min	3–4 hr	12 hr†

†9 hr in adolescents

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Acute attack of asthma (onset of action is delayed); Patients not receiving a long-term asthma-control medication (e.g., inhaled corticosteroid); Patients whose asthma is currently controlled on low- or medium-dose inhaled corticosteroid therapy.

Use Cautiously in: Cardiovascular disease (including angina and hypertension); Seizure disorders; Diabetes; Glaucoma; Hyperthyroidism; Pheochromocytoma; Excessive use (may lead to tolerance and paradoxical bronchospasm); **OB:** Use only if potential benefit justifies potential risk to fetus; may inhibit contractions during labor; **Lactation:** Use only if potential benefit justifies potential risk to infant. Consider discontinuing breast feeding while on salmeterol; **Pedi:** Children <4 yr (safety not established); a fixed-dose combination product containing salmeterol and an inhaled corticosteroid should be strongly considered to ensure adherence.

Adverse Reactions/Side Effects

CNS: headache, nervousness. **CV:** palpitations, tachycardia. **GI:** abdominal pain, diarrhea, nausea. **MS:** muscle cramps/soreness. **Neuro:** trembling. **Resp:** **ASTHMA-RELATED DEATH,** paradoxical bronchospasm, cough.

Interactions

Drug-Drug: Beta blockers may ↓ therapeutic effects. MAO inhibitors and tricyclic antidepressants potentiate cardiovascular effects. ↑ levels and ↑ risk of cardiovascular effects when used with potent CYP3A4 inhibitors (e.g., ketoconazole, itraconazole, ritonavir, atazanavir, clarithromycin, indinavir, nefazodone, nelfinavir, or saquinavir); concurrent use is not recommended.

Drug-Natural Products: Use with caffeine-containing herbs (cola nut, guarana, mate, tea, coffee) ↑ stimulant effect.

Route/Dosage**Asthma**

Inhaln (Adults and Children ≥4 yr): 50 mcg (1 inhalation) twice daily (approximately 12 hr apart).

Prevention of Exercise-Induced Bronchospasm

Inhaln (Adults and Children ≥4 yr): 50 mcg (1 inhalation) at least 30 min before exercise; additional doses should not be used for at least 12 hr.

COPD

Inhaln (Adults): 50 mcg (1 inhalation) twice daily (approximately 12 hr apart).

Availability

Powder for oral inhalation (Serevent Diskus): 50 mcg/blister. **In combination with:** fluticasone (Advair Diskus, Advair HFA, see Appendix B).

NURSING IMPLICATIONS**Assessment**

- Assess lung sounds, pulse, and BP before administration and periodically during therapy.
- Monitor pulmonary function tests before initiating therapy and periodically during therapy.
- Observe for paradoxical bronchospasm (wheezing, dyspnea, tightness in chest) and hypersensitivity reaction (rash; urticaria; swelling of the face, lips, or eyelids). Frequently occurs with first use of new canister or vial. If condition occurs, withhold medication and notify physician or other health care professional immediately.
- Lab Test Considerations:** May cause ↑ serum glucose concentrations; occurs rarely with recommended doses and is more pronounced with frequent use of high doses.
- May cause ↓ serum potassium concentrations, which are usually transient and dose related; rarely occurs at recommended doses and is more pronounced with frequent use of high doses.
- Toxicity and Overdose:** Symptoms of overdose include persistent agitation, chest pain or discomfort, decreased BP, dizziness, hyperglycemia, hypokalemia, seizures, tachyarrhythmias, persistent trembling, and vomiting.
- Treatment includes discontinuing salmeterol and other beta-adrenergic agonists and providing symptomatic, supportive therapy. Cardioselective beta blockers are used cautiously because they may induce bronchospasm.

Potential Nursing Diagnoses

Ineffective airway clearance (Indications)

Implementation

- Salmeterol should be used along with an inhaled corticosteroid, not as monotherapy. Patients taking salmeterol twice daily should not use additional doses for exercise-induced bronchospasm.
- Inhaln:** Once removed from foil overwrap, discard diskus when every blister has been used or 6 wk have passed, whichever comes first.
- Do not use a spacer with powder for inhalation.

Patient/Family Teaching

- Advise patient to take salmeterol as directed. Do not use more than the prescribed dose. If a regularly scheduled dose is missed, use as soon as possible and resume regular schedule. Do not double doses. If symptoms occur before next dose is due, use a rapid-acting inhaled bronchodilator.
- Instruct patient using *powder for inhalation* never to exhale into diskus device and always to hold de-

vice in a level horizontal position. Mouthpiece should be kept dry; never wash.

- **Caution patient not to use salmeterol to treat acute symptoms. A rapid-acting inhaled beta-adrenergic bronchodilator should be used for relief of acute asthma attacks.**
- Advise patients on chronic therapy not to use additional salmeterol to prevent exercise-induced bronchospasm. Patients using salmeterol for prevention of exercise-induced bronchospasm should not use additional doses of salmeterol for 12 hr after prophylactic administration.
- Advise patient to notify health care professional immediately if difficulty in breathing persists after use of salmeterol, if condition worsens, if more inhalations of rapid-acting bronchodilator than usual are needed to relieve an acute attack, or if using 4 or more inhalations of a rapid-acting bronchodilator for 2 or more consecutive days or more than 1 canister in an 8-wk period.
- Salmeterol is often used with inhaled corticosteroids and is not a substitute for corticosteroids or adrenergic bronchodilators. Advise patients using inhalation or systemic corticosteroids to consult health care professional before stopping or reducing therapy.
- Emphasize the importance of regular follow-up exams to determine progress during therapy.

Evaluation/Desired Outcomes

- Prevention of bronchospasm or reduction of frequency of acute asthma attacks in patients with chronic asthma.
- Prevention of exercise-induced asthma.

salsalate, See SALICYLATES.

sargramostim

(sar-gram-oh-stim)

Leukine, rHu GM-CSF (recombinant human granulocyte/macrophage colony-stimulating factor)

Classification

Therapeutic: colony-stimulating factors

Pharmacologic: biologic response modifiers

Pregnancy Category C

Indications

Acceleration of bone marrow recovery after: Autologous bone marrow transplantation in patients with non-Hodgkin's lymphoma, acute lymphoblastic leukemia, or Hodgkin's disease; Allogenic bone marrow transplantation from HLA-matched donors. Management of bone

marrow transplant failure or engraftment delay. After induction chemotherapy for acute myelogenous leukemia (AML) in patients ≥ 55 yr. Mobilization and after transplant of autologous peripheral blood progenitor cells (PBPCs); increases harvest by leukapheresis.

Action

Consists of a glycoprotein produced by recombinant DNA technique that is capable of binding to and stimulating the production, division, differentiation, and activation of granulocytes and macrophages. **Therapeutic Effects:** Accelerated recovery of bone marrow after autologous bone marrow transplantation, resulting in decreased risk of infection and other complications.

Pharmacokinetics

Absorption: After IV administration, absorption is essentially complete. Well absorbed after subcut administration.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: Unknown.

TIME/ACTION PROFILE (noted as effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
Subcut, IV	rapid	unknown	3–7 days

Contraindications/Precautions

Contraindicated in: Presence of $\geq 10\%$ leukemic myeloid blast cells in bone marrow or peripheral blood; Hypersensitivity to granulocyte macrophage colony-stimulating factor (GM-CSF), yeast products, or additives (mannitol, tromethamine, or sucrose); **Pedi:** Products containing benzyl alcohol should not be used in newborns.

Use Cautiously in: Pre-existing fluid retention, HF, or pulmonary infiltrates; Pre-existing cardiac disease; Myeloid malignancies; Previous extensive radiation or chemotherapy (response may be limited); **OB:** Use only if clearly needed; **Lactation, Pedi:** Safety not established.

Adverse Reactions/Side Effects

CNS: headache, malaise, weakness. **Resp:** dyspnea.

CV: pericardial effusion, peripheral edema, transient supraventricular tachycardia. **GI:** diarrhea. **Derm:**

itching, rash. **MS:** arthralgia, bone pain, myalgia.

Misc: chills, fever, first-dose reaction.

Interactions

Drug-Drug: Lithium or corticosteroids may potentiate myeloproliferative effects of sargramostim (concurrent use should be undertaken cautiously).

Route/Dosage

After Bone Marrow Transplantation

IV (Adults): 250 mcg/m²/day for 21 days.

🍁 = Canadian drug name. ⚠️ = Genetic implication. ~~Stricken through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Failure/Delay of Engraftment after Bone Marrow Transplantation

IV (Adults): 250 mcg/m²/day for 14 days; may be repeated after a 7-day rest between courses; if results are inadequate, a 3rd course at 500 mcg/m²/day for 14 days may be given after a 7-day rest.

After Chemotherapy for AML

IV (Adults): 250 mcg/m²/day started around day 11 or 4 days after induction if day 10 bone marrow is hypoplastic with <5% blast cells and continued until absolute neutrophil count (ANC) >1500 cells/mm³ for 3 consecutive days (not to exceed 42 days); if adverse reactions occur, decrease dose by 50% or temporarily discontinue.

Mobilization of PBPCs

IV, Subcut (Adults): 250 mcg/m²/day continued throughout collection of PBPCs.

After PBPC Transplantation

IV, Subcut (Adults): 250 mcg/m²/day continued until ANC >1500 cells/mm³ for 3 consecutive days.

Availability

Powder for injection: 250 mcg/vial. **Solution for injection:** 500 mcg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor heart rate, BP, and respiratory status during and immediately after infusion. If dyspnea develops, slow infusion rate by half. Reassess; medication may need to be discontinued. Assess for peripheral edema daily throughout therapy. Capillary leak syndrome (swelling of feet or lower legs, sudden weight gain, dyspnea) and pleural or pericardial effusion may occur, usually at doses >32 mcg/kg/day.
- Monitor for first-dose reaction (flushing, hypotension, syncope, weakness). Does not recur with first dose of each course but may occur with first dose of more than 1 course.
- Assess for fever daily during therapy. Usually mild and dose-related and resolves with discontinuation or administration of antipyretics.
- Assess for arthralgias and myalgias, usually in lower extremities, which tend to occur when granulocyte counts are returning to normal. May also cause mild to moderate bone pain, possibly from bone marrow expansion. Usually occurs over 1–3 days before myeloid recovery and occurs in the sternum, spine, pelvis, and long bones. Treat with analgesics.
- **Lab Test Considerations:** Obtain a CBC with differential and platelet count before chemotherapy and twice weekly during therapy to avoid leukocytosis. Monitor ANC; may increase rapidly. If ANC >20,000/mm³ or 10,000/mm³ after the nadir has occurred or if platelet count >500,000/mm³, interrupt administration

and reduce dose by half or discontinue. Excessive blood levels usually return to baseline 3–7 days after discontinuation of therapy. If blast cells appear, sargramostim should be discontinued.

- Monitor renal and hepatic function before and bi-weekly throughout therapy in patients with renal or hepatic dysfunction. May cause ↑ BUN, creatinine, and hepatic enzymes.
- May cause ↓ serum albumin concentrations.

Potential Nursing Diagnoses

Risk for infection (Indications)

Implementation

- Administer 2–4 hr after bone marrow transplant and no earlier than 24 hr after cytotoxic chemotherapy or 12 hr after last dose of radiotherapy.
- Refrigerate but do not freeze powder, reconstituted solution, or diluted solution. Reconstitute with 1 mL of sterile water without preservatives injected toward side of vial. Swirl gently to avoid foaming. Do not shake. Solution should be clear and colorless. Discard if left at room temperature for >6 hr. Vial is for 1-time use only.
- **Subcut:** Administer reconstituted solution without further dilution.

IV Administration

- **pH:** 7.1–7.7.
- **Intermittent Infusion:** **Diluent:** Dilute in 0.9% NaCl. **Concentration:** If final concentration is <10 mcg/mL, add 1 mg human albumin per 1 mL of 0.9% NaCl before addition of sargramostim to prevent absorption of the components of the drug delivery system. Do not administer with an in-line filter. **Rate:** Usually infused over 2–4 hr. Has been administered over 30–60 min, over 5–12 hr, and as a continuous infusion over 24 hr.
- **After bone marrow transplantation or failure of engraftment:** Administer over 2 hr.
- **Chemotherapy for AML:** Administer over 4 hr.
- **Mobilization of PBPCs or PBPC transplant:** Administer as a continuous infusion over 24 hr.
- **Y-Site Compatibility:** amikacin, aminocaproic acid, aminophylline, aztreonam, bleomycin, butorphanol, calcium gluconate, carboplatin, carmustine, cefazolin, cefepime, cefotaxime, cefotetan, ceftriaxone, cefuroxime, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, dexamethasone sodium phosphate, diphenhydramine, dopamine, doxorubicin hydrochloride, doxycycline, droperidol, etoposide, famotidine, fentanyl, flouxuridine, fluconazole, fluorouracil, furosemide, gentamicin, granisetron, heparin, idarubicin, ifosfamide, immune globulin, levofloxacin, magnesium sulfate, mannitol, mechlorethamine, meperidine, mesna, methotrexate, metoclopramide, metronidazole, mitoxantrone, pentostatin, piperacillin/tazobactam, potassium chloride, pro-

chlorperazine, promethazine, ranitidine, rituximab, sodium acetate, teniposide, ticarcillin/clavulanate, trastuzumab, trimethoprim/sulfamethoxazole, vinblastine, vincristine, zidovudine.

- **Y-Site Incompatibility:** acyclovir, ampicillin, ampicillin/sulbactam, cefoperazone, chlorpromazine, ganciclovir, haloperidol, hydrocortisone, hydromorphone, hydroxyzine, imipenem/cilastatin, lorazepam, methylprednisolone sodium succinate, mitomycin, morphine, nalbuphine, nesiritide, ondansetron, sodium bicarbonate, tobramycin.
- **Additive Incompatibility:** Do not admix with other medications.

Patient/Family Teaching

- Explain purpose of sargramostim to patient.
- Instruct patient to notify health care professional if dyspnea or palpitations occur.

Evaluation/Desired Outcomes

- Acceleration of bone marrow recovery and decreased incidence of infection in patients after autologous and allogeneic bone marrow transplantation, bone marrow transplant failure or engraftment delay, chemotherapy for AML, and PBPC transplantation.

saxagliptin (sax-a-glip-tin) Onglyza

Classification

Therapeutic: antidiabetics

Pharmacologic: dipeptidyl peptidase-4 (DDP-4) inhibitors

Pregnancy Category B

Indications

Adjunct with diet and exercise to improve glycemic control in adults with type 2 diabetes mellitus.

Action

Acts as a competitive inhibitor of dipeptidyl peptidase-4 (DPP4), which slows inactivation of incretin hormones, thereby increasing their concentrations and reducing fasting and postprandial glucose concentrations. **Therapeutic Effects:** Improved control of blood glucose.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Unknown.

Metabolism and Excretion: Metabolized by the liver via the P450 3A4/5 (CYP3A4/5) enzyme system, with conversion to 5-hydroxysaxagliptin, a pharmacologically active metabolite; 24% of saxagliptin is excreted unchanged in urine, 36% of hydroxysaxagliptin

is excreted unchanged in urine, 22% is eliminated in feces as unabsorbed drug/metabolites excreted in bile.

Half-life: *Saxagliptin*—2.5 hr; 5-hydroxysaxagliptin—3.1 hr.

TIME/ACTION PROFILE (DDP-4 inhibition)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2 hr (4 hr for 5-hydroxysaxagliptin)†	24 hr

† Blood levels

Contraindications/Precautions

Contraindicated in: Type 1 diabetes; Diabetic ketoacidosis; History of hypersensitivity reaction.

Use Cautiously in: **Geri:** May be more sensitive to effects; consider age-related ↓ in renal function; **OB:** Use only if clearly needed; **Lactation:** Use cautiously; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: headache. **CV:** peripheral edema (↑ with thiazolidinediones). **GI:** **PANCREATITIS**, abdominal pain, vomiting. **Hemat:** ↓ lymphocyte count. **Endo:** hypoglycemia (↑ with sulfonylureas). **Misc:** **HYPERSENSITIVITY REACTIONS** (ANAPHYLAXIS, ANGIOEDEMA, EXFOLIATIVE SKIN DISORDERS).

Interactions

Drug-Drug: Strong CYP3A4/5 inhibitors, including ketoconazole, atazanavir, clarithromycin, indinavir, itraconazole, nefazodone, nelfinavir, ritonavir, saquinavir, and telithromycin ↑ blood levels; daily dose should not exceed 2.5 mg. ↑ risk of hypoglycemia with sulfonylureas or insulin; may need to ↓ dose of sulfonylureas or insulin.

Route/Dosage

PO (Adults): 2.5–5 mg once daily; *Strong CYP3A4/5 inhibitors*—2.5 mg once daily.

Renal Impairment

PO (Adults): *CCr* ≤50 mL/min—2.5 mg once daily.

Availability

Tablets: 2.5 mg, 5 mg. **In combination with:** metformin XR (Kombiglyze XR); See Appendix B.

NURSING IMPLICATIONS

Assessment

- Observe patient for signs and symptoms of hypoglycemic reactions (abdominal pain, sweating, hunger, weakness, dizziness, headache, tremor, tachycardia, anxiety).
- **Monitor for signs of pancreatitis** (nausea, vomiting, anorexia, persistent severe abdominal pain, some-

★ = Canadian drug name. † = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

times radiating to the back) during therapy. If pancreatitis occurs, discontinue saxagliptin and monitor serum and urine amylase, amylase/creatinine clearance ratio, electrolytes, serum calcium, glucose, and lipase.

- **Lab Test Considerations:** Monitor hemoglobin A1C prior to and periodically during therapy.
- Monitor renal function prior to and periodically during therapy.
- May cause ↓ absolute lymphocyte count.

Potential Nursing Diagnoses

Imbalanced nutrition: more than body requirements (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- **PO:** May be administered without regard to food. Swallow tablet whole, do not cut or split.

Patient/Family Teaching

- Instruct patient to take saxagliptin as directed. If a dose is missed, take the next dose as prescribed; do not double doses. Advise patient to read the *Patient Package Insert* before starting and with each Rx refill; new information may be available.
- Explain to patient that saxagliptin helps control hyperglycemia but does not cure diabetes. Therapy is usually long term.
- Instruct patient not to share this medication with others, even if they have the same symptoms; it may harm them.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hyperglycemic or hypoglycemic episodes.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water, and notify health care professional.
- Instruct patient in proper testing of blood glucose and urine ketones. These tests should be monitored closely during periods of stress or illness and health care professional notified if significant changes occur.
- **Advise patient to notify health care professional promptly if swelling of hands, feet, or ankles; rash; hives; or swelling of face, lips, or throat occur.**
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Improved hemoglobin A1C, fasting plasma glucose and 2-hr post-prandial glucose levels.

scopolamine (scoe-pol-a-meen)

Scopace, Transderm-Scop,
★ Transderm-V

Classification

Therapeutic: antiemetics

Pharmacologic: anticholinergics

Pregnancy Category C

Indications

Transdermal: Prevention of motion sickness. Management of nausea and vomiting associated with opioid analgesia or general anesthesia/recovery from anesthesia. **IM, IV, Subcut:** Preoperatively to produce amnesia and to decrease salivation and excessive respiratory secretions. **PO:** Symptomatic treatment of postencephalitis parkinsonism and paralysis agitans. Treatment of spasticity. Inhibits excessive motility and hypertonus of GI tract in irritable colon syndrome, mild dysentery, diverticulitis, and pylorospasm. Prevention of motion sickness.

Action

Inhibits the muscarinic activity of acetylcholine. Corrects the imbalance of acetylcholine and norepinephrine in the CNS, which may be responsible for motion sickness. **Therapeutic Effects:** Reduction of nausea and vomiting. Preoperative amnesia and decreased secretions. Reduction of spasms.

Pharmacokinetics

Absorption: Well absorbed following IM, subcut, and transdermal administration.

Distribution: Crosses the placenta and blood-brain barrier.

Metabolism and Excretion: Mostly metabolized by the liver.

Half-life: 8 hr.

TIME/ACTION PROFILE (antiemetic, sedative properties)

ROUTE	ONSET	PEAK	DURATION
PO, IM, subcut	30 min	1 hr	4–6 hr
IV	10 min	1 hr	2–4 hr
Transdermal	4 hr	unknown	72 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity to bromides (injection only); Angle-closure glaucoma; Acute hemorrhage; Prostatic hyperplasia (oral only); Pyloric obstruction (oral only); Tachycardia secondary to cardiac insufficiency or thyrotoxicosis.

Use Cautiously in: Possible intestinal obstruction; Prostatic hyperplasia; Chronic renal, hepatic, pulmonary, or cardiac disease; **OB, Lactation:** Safety not established; to minimize exposure to fetus, apply 1 hr

prior to cesarean section; **Pedi, Geri**: ↑ risk of adverse reactions.

Adverse Reactions/Side Effects

CNS: drowsiness, confusion. **EENT**: blurred vision, mydriasis, photophobia. **CV**: tachycardia, palpitations.

GI: dry mouth, constipation. **GU**: urinary hesitancy, urinary retention. **Derm**: ↓ sweating.

Interactions

Drug-Drug: ↑ anticholinergic effects with **antihistamines**, **antidepressants**, **quinidine**, or **disopyramide**. ↑ CNS depression with **alcohol**, **antidepressants**, **antihistamines**, **opioid analgesics**, or **sedative/hypnotics**. May alter the absorption of other **orally administered drugs** by slowing motility of the GI tract. May ↑ GI mucosal lesions in patients taking oral **wax-matrix potassium chloride preparations**.

Drug-Natural Products: ↑ anticholinergic effects with **jimson weed** and **scopolia**.

Route/Dosage

Transdermal (Adults): *Motion sickness*—Apply 1 patch 4 hr prior to travel and then every 3 days (as needed); *Preoperative*—Apply 1 patch the evening before surgery or 1 hr prior to cesarean section (remove 24 hr after surgery).

PO (Adults): 0.4–0.8 mg; may repeat every 8–12 hr as needed (dose may be ↑ in parkinsonism and spastic states); for motion sickness, give at least 1 hr before exposure to motion.

IM, IV, Subcut (Adults): *Antiemetic/anticholinergic*—0.3–0.6 mg; *antisecretory effect*—0.2–0.6 mg; *amnesic effect*—0.32–0.65 mg; *sedation*—0.6 mg 3–4 times daily.

IM, IV, Subcut (Children): *Antiemetic/anticholinergic*—6 mcg/kg or 0.2 mg/m².

IM (Children 8–12 yr): *Antisecretory*—0.3 mg.

IM (Children 3–8 yr): *Antisecretory*—0.2 mg.

IM (Children 7 mo–3 yr): *Antisecretory*—0.15 mg.

IM (Children 4–7 mo): *Antisecretory*—0.1 mg.

Availability (generic available)

Transdermal therapeutic system: Transderm-Scop—1.5 mg scopolamine/patch releases 0.5 mg scopolamine over 3 days, ★ **Transderm-V**—1.5 mg scopolamine/patch releases 1 mg scopolamine over 3 days.

Tablets: 0.4 mg. **Injection**: 0.3 mg/mL, 0.4 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess patient for signs of urinary retention periodically during therapy.
- Monitor heart rate periodically during parental therapy.

- Assess patient for pain prior to administration. Scopolamine may act as a stimulant in the presence of pain, producing delirium if used without opioid analgesics.

- **Antiemetic**: Assess patient for nausea and vomiting periodically during therapy.

Potential Nursing Diagnoses

Impaired oral mucous membrane (Indications, Side Effects)

Risk for injury (Side Effects)

Implementation

- **PO**: Administer at least 1 hr prior to exposure to travel for motion sickness. Tablets may be crushed or dissolved in water to decrease onset.

IV Administration

- **pH**: 3.5–6.5.
- **Direct IV: Diluent**: Scopolamine should be diluted with sterile water for injection prior to IV administration. **Concentration**: Dilute dose with an equal volume of diluent. **Rate**: Inject slowly over 2–3 min.
- **Syringe Compatibility**: atropine, butorphanol, chlorpromazine, cimetidine, diphenhydramine, droperidol, fentanyl, glycopyrrolate, hydromorphone, meperidine, metoclopramide, midazolam, morphine, nalbuphine, pentazocine, pentobarbital, perphenazine, prochlorperazine, promethazine, ranitidine, sufentanil, thiopental.
- **Y-Site Compatibility**: fentanyl, heparin, hydrocortisone sodium succinate, hydromorphone, methadone, morphine, potassium chloride, propofol, sufentanil, vitamin B complex with C.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as remembered. Do not double doses.
- May cause drowsiness or blurred vision. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Patient should use caution when exercising and in hot weather; overheating may result in heatstroke.
- Advise patient to avoid concurrent use of alcohol and other CNS depressants with this medication.
- Inform patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may minimize dry mouth.
- **Transdermal**: Instruct patient on application of transdermal patches. Apply at least 4 hr (US product) before exposure to travel to prevent motion sickness. Wash hands and dry thoroughly before and after application. Apply to hairless, clean, dry area behind ear; avoid areas with cuts or irritation. Apply pressure over system to ensure contact with

★ = Canadian drug name. ⚡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

skin. System is effective for 3 days. If system becomes dislodged, replace with a new system on another site behind the ear. System is waterproof and not affected by bathing or showering.

- Instruct patient to remove patch and notify health care professional immediately if symptoms of acute angle-closure glaucoma (pain or reddening of the eyes with pupil dilation) occur.
- Caution patients engaging in underwater sports of potentially distorting effects of scopolamine.
- For *perioperative nausea and vomiting*, apply patch the night before surgery, or 1 hr prior to cesarean section to minimize exposure to infant. Keep patch in place for 24 hr, then remove and discard.
- Advise patient referred for MRI test to discuss patch with referring health care professional and MRI facility to determine if removal of patch is necessary prior to test and for directions for replacing patch.

Evaluation/Desired Outcomes

- Decrease in salivation and respiratory secretion preoperatively.
- Postoperative amnesia.
- Prevention of motion sickness.
- Prevention and treatment of opioid- or anesthesia-induced nausea and vomiting.
- Reduction in spasms.
- Reduction in excessive GI motility.

selegiline (se-le-jī-leen)

Eldepryl, Zelapar

Classification

Therapeutic: antiparkinson agents

Pharmacologic: monoamine oxidase type B inhibitors

Pregnancy Category C

Indications

Management of Parkinson's disease (with levodopa or levodopa/carbidopa) in patients who fail to respond to levodopa/carbidopa alone.

Action

Following conversion by MAO to its active form, selegiline inactivates MAO by irreversibly binding to it at type B (brain) sites. Inactivation of MAO leads to increased amounts of dopamine available in the CNS. **Therapeutic Effects:** Increased response to levodopa/dopamine therapy in Parkinson's disease.

Pharmacokinetics

Absorption: Appears to be well absorbed following oral administration.

Distribution: Widely distributed.

Metabolism and Excretion: Metabolism involves some conversion to amphetamine and methamphetamine. 45% excreted in urine as metabolites.

Half-life: Unknown; orally disintegrating tablets 1.3 hr.

TIME/ACTION PROFILE (onset of beneficial effects in Parkinson's disease)

ROUTE	ONSET	PEAK	DURATION
PO	2–3 days	40–90 min	unknown
Orally disintegrating	5 min	10–15 min	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent meperidine or opioid analgesic therapy (possible fatal reactions); **Concurrent use of SSRIs or tricyclic antidepressants.**

Use Cautiously in: Doses >10 mg/day (↑ risk of hypertensive reactions with tyramine-containing foods and some medications); History of peptic ulcer disease.

Adverse Reactions/Side Effects

CNS: confusion, dizziness, fainting, hallucinations, insomnia, urges (gambling, sexual), vivid dreams.

Derm: melanoma. **GI:** nausea, abdominal pain, dry mouth.

Interactions

Drug-Drug: Concurrent use with **meperidine** or other **opioid analgesics** may possibly result in a potentially fatal reaction (excitation, sweating, rigidity, and hypertension; or hypotension and coma). Serotonin syndrome (confusion, agitation, hyperpyrexia, hypertension, seizures) may occur with concurrent use of **nefazodone** or **SSRI antidepressants** (fluoxetine should be discontinued 5 wk prior to selegiline, **venlafaxine** should be discontinued 7 days before selegiline, other agents should be discontinued 2 wk before selegiline). Selegiline should be discontinued 2 wk before **SSRIs** are initiated. Concurrent use with **tricyclic antidepressants** may result in astyole, diaphoresis, hypertension, syncope, behavioral changes, altered consciousness, hyperpyrexia, tremors, muscle rigidity, and seizures (avoid concurrent use; discontinue selegiline 2 wk before initiating tricyclic antidepressant therapy). May initially ↑ risk of side effects of **levodopa/carbidopa** (dose of levodopa/carbidopa may need to be ↓ by 10–30%).

Drug-Food: Doses >10 mg/day may produce hypertensive reactions with **tyramine-containing foods** (see Appendix M).

Route/Dosage

PO (Adults): 5 mg twice daily, with breakfast and lunch (some patients may require further dividing of doses—2.5 mg 4 times daily).

PO (Adults): *Orally disintegrating tablets*—1.25 mg once daily for at least 6 wk. After 6 wk, may increase to 2.5 mg if effect not achieved and patient is tolerating medication.

Availability (generic available)

Capsules: 5 mg. **Tablets:** 5 mg. **Orally disintegrating tablets:** 1.25 mg.

NURSING IMPLICATIONS**Assessment**

- Assess patient for signs and symptoms of Parkinson's disease (tremor, muscle weakness and rigidity, ataxic gait) prior to and during therapy.
- Assess BP periodically during therapy.

Potential Nursing Diagnoses

Impaired physical mobility (Indications)

Risk for injury (Indications, Side Effects)

Implementation

- **Do not confuse selegiline with Salagen (pilocarpine). Do not confuse Zelapar (selegiline) with Zyprexa (olanzapine).**
- An attempt to reduce the dose of levodopa/carbidopa by 10–30% may be made after 2–3 days of selegiline therapy.
- **PO:** Administer 5-mg tablet with breakfast and lunch.
- Administer *orally disintegrating tablets* in the morning, before breakfast and without liquid. Remove tablet gently from blister pack with clean, dry hands immediately before administering. Do not attempt to push tablet through backing. Tablet will disintegrate within seconds when placed on tongue. Avoid food or liquid within 5 min of administering orally disintegrating tablets.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as possible, but not if late afternoon or evening or almost time for next dose. Do not double doses. Caution patient that taking more than the prescribed dose may increase side effects and place patient at risk for hypertensive crisis if foods containing tyramine are consumed (see Appendix M).
- Advise patients taking selegiline ≥ 20 mg/day to avoid large amounts of tyramine-containing foods (see Appendix M), alcoholic beverages, large quantities of caffeine-containing beverages, or OTC or herbal cough or cold medications.
- Inform patient and family of the signs and symptoms of MAO inhibitor–induced hypertensive crisis (severe headache, chest pain, nausea, vomiting, photosensitivity, enlarged pupils). Advise patient to notify health care professional immediately if severe headache or any other unusual symptoms occur.
- Caution patient to change positions slowly to minimize orthostatic hypotension.

- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient to have periodic skin exams to check for lesions that may be melanoma.
- Advise patient to notify health care professional if new or increased gambling, sexual, or other intense urges occur.
- Advise patient that increasing fluids, sugarless gum or candy, ice, or saliva substitutes may help minimize dry mouth. Consult health care professional if dry mouth continues for >2 wk.
- Inform patient that selegiline may cause hallucinations.

Evaluation/Desired Outcomes

- Improved response to levodopa/carbidopa in patients with Parkinson's disease.

selegiline transdermal (se-le-jī-leen) Emsam

Classification

Therapeutic: antidepressants

Pharmacologic: monoamine oxidase type B inhibitors

Pregnancy Category C**Indications**

Major depressive disorder.

Action

Following conversion by MAO to its active form, selegiline inactivates MAO by irreversibly binding to it at type B (brain) sites; this results in higher levels of monoamine neurotransmitters in the brain (dopamine, serotonin, norepinephrine). **Therapeutic Effects:** Decreased symptoms of depression.

Pharmacokinetics

Absorption: 25–30% of patch content is transdermally absorbed, blood levels are higher than those following oral administration because there is less first-pass hepatic metabolism.

Distribution: Rapidly distributes to all body tissues; crosses the blood-brain barrier.

Metabolism and Excretion: Mostly metabolized by the liver, primarily by the CYP2A6, CYP2C9, and CYP3A4/5 enzyme systems. 10% excreted in urine as metabolites, 2% in feces; negligible renal excretion of unchanged drug.

Half-life: 18–25 hr.

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
transdermal	unknown	2 or more wk	2 wk (after discontinuation)

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Pheochromocytoma; Concurrent selective serotonin re-uptake inhibitors (fluoxetine, paroxetine, citalopram, escitalopram, and others), nonselective serotonin re-uptake inhibitors (venlafaxine, duloxetine), tricyclic antidepressants (amitriptyline, imipramine, and others), carbamazepine, oxcarbazepine, amphetamines, vasoconstrictors (ephedrine, pseudoephedrine), bupropion, meperidine, tramadol, methadone, propoxyphene, dextromethorphan, mirtazapine, cyclobenzaprine, other MAO inhibitors (isocarboxazid, phenelzine, tranylcypromine), oral selegiline, sympathomimetic amines, amphetamines, cocaine, or local anesthetics with vasoconstrictors; St. John's wort; Alcohol.

Use Cautiously in: Elective surgery within 10 days; benzodiazepines, rapacuronium, fentanyl, morphine, and codeine may be used cautiously; May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; risk may be greater in children or adolescents (safe use in children <12 yr not established); History of mania; Dosing at 9 mg/24 hr or 12 mg/24 hr requires dietary modification (avoid foods containing large amounts of tyramine); **Geri:** May be more susceptible to orthostatic hypotension; **OB:** Use only if benefit outweighs risk to the fetus; **Lactation:** Safety not established; **Pedi:** Safe use in children and adolescents not established.

Adverse Reactions/Side Effects

CNS: insomnia, abnormal thinking, agitation, amnesia, worsening of mania/hypomania. **EENT:** tinnitus.

Resp: ↑ cough. **CV:** **HYPERTENSIVE CRISIS**, chest pain, orthostatic hypotension, peripheral edema. **GI:** diarrhea, altered taste, anorexia, constipation, flatulence, gastroenteritis, vomiting. **GU:** dysmenorrhea, metrorrhagia, urinary frequency. **Derm:** application site reactions, acne, ecchymoses, pruritus, sweating. **MS:** myalgia, neck pain, pathologic fracture. **Neuro:** paresthesia.

Interactions

Drug-Drug: Concurrent selective serotonin re-uptake inhibitors (fluoxetine, paroxetine, citalopram, escitalopram, and others), nonselective serotonin re-uptake inhibitors (venlafaxine, duloxetine), tricyclic antidepressants (amitriptyline, imipramine, and others), carbamazepine, oxcarbazepine, amphetamines, vasoconstrictors (ephedrine, pseudoephedrine, phenylpropanolamine), bupropion, meperidine, tramadol,

methadone, dextromethorphan, mirtazapine, cyclobenzaprine, other MAO inhibitors (isocarboxazid, phenelzine, tranylcypromine), oral selegiline, sympathomimetic amines, amphetamines, cocaine, or local anesthetics with vasoconstrictors; these may all ↑ risk of hypertensive crisis.

(Fluoxetine should not be used within 2 wk of initiating therapy).

Drug-Natural Products: St. John's wort may ↑ risk of hypertensive crisis.

Route/Dosage

Transdermal (Adults): 6 mg/24 hr, if necessary, may be increased at 2-wk intervals in increments of 3 mg, up to 12 mg/24 hr.

Availability

Transdermal patch : 6 mg/24 hr, 9 mg/24 hr, 12 mg/24 hr.

NURSING IMPLICATIONS**Assessment**

- Assess mental status, mood changes, and anxiety level frequently. Assess for suicidal tendencies, agitation, irritability, and unusual changes in behavior especially during early therapy. Monitor pediatric patients face-to-face weekly during first 4 wk, every other week for 4 wk, at 12 wk, and as clinically indicated during therapy. Restrict amount of drug available to patient.
- **Monitor BP and pulse rate before and frequently during therapy.** Report significant changes promptly.
- **Toxicity and Overdose:** Concurrent ingestion of tyramine-rich foods and many medications may result in a life-threatening hypertensive crisis. Signs and symptoms of hypertensive crisis include chest pain, tachycardia or bradycardia, severe headache, neck stiffness or soreness, nausea and vomiting, sweating, photosensitivity, and enlarged pupils. If hypertensive crisis occurs, discontinue selegiline transdermal and administer phenolamine 5 mg or labetalol 20 mg slowly IV to control hypertension. Manage fever with external cooling. Monitor patient closely until symptoms have stabilized.

Potential Nursing Diagnoses

Ineffective coping (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- **Transdermal:** Apply system to dry, intact skin on the upper torso such as chest, back, upper thigh, or outer surface of the upper arm once every 24 hr at the same time each day. Avoid areas that are hairy, oily, irritated, broken, scarred, or calloused. Wash area gently with soap and warm water, rinse thoroughly. Allow skin to dry completely before application. Apply immediately after removing from pack-

age. Do not alter the system (i.e., cut) in any way before application. Remove liner from adhesive layer and press firmly in place with palm of hand for 30 sec, especially around the edges, to make sure contact is complete. Remove used system and fold so that adhesive edges are together. Only 1 selegiline patch should be worn at a time. Dispose away from children and pets. Apply new system to a different site. Wash hands thoroughly with soap and water to remove any medicine that may have gotten on them.

Patient/Family Teaching

- Instruct patient to apply patch as directed. Advise patients and caregivers to read the *Medication Guide about Using Antidepressants in Children and Teenagers*. Inform patient that improvement may be noticed after 1 to several weeks of therapy. Advise patient not to discontinue therapy without consulting health care professional.
- **Caution patient to avoid alcohol and CNS depressants during and for at least 2 wk after therapy has been discontinued; they may precipitate a hypertensive crisis. Contact health care professional immediately if symptoms of hypertensive crisis develop. Patients taking 9 mg/24 hr or 12 mg/24 hr must avoid foods or beverages containing tyramine (see Appendix M) from the first day of the increased dose through 2 wk after discontinuation of selegiline transdermal therapy.**
- Advise patient to avoid exposing application site to external sources of direct heat such as heating pads, electric blankets, heat lamps, saunas, hot tubs, heated water beds, and prolonged direct sunlight.
- May cause dizziness or drowsiness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Caution patient to change positions slowly to minimize orthostatic hypotension. Geriatric patients are at increased risk for this side effect.
- Advise patient referred for MRI test to discuss patch with referring health care professional and MRI facility to determine if removal of patch is necessary prior to test and for directions for replacing patch.
- Advise patients and caregivers to notify health care professional if severe headache, neck stiffness, heart racing or palpitations, anxiety, agitation, panic attacks, insomnia, irritability, hostility, aggressiveness, impulsivity, akathisia, hypomania, mania, change in behavior, worsening of depression, or suicidal ideation occur, especially during initial therapy or during changes in dose.
- Instruct patient to consult health care professional before taking any Rx, OTC, or herbal products. Caution patient to avoid use of St. John's Wort and the

analgesics meperidine, tramadol, or methadone during therapy.

- Advise patient to notify health care professional of medication regimen before treatment or surgery. If possible, therapy should be discontinued at least 2 wk before surgery.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Improved mood in depressed patients.
- Decreased anxiety.
- Increased appetite.
- Improved energy level.
- Improved sleep. Evaluate effectiveness of therapy periodically.

sennosides (sen-oh-sides)

Black-Draught, Ex-Lax, Ex-Lax Chocolated, Fletchers' Castoria, Maximum Relief Ex-Lax, Sena-Gen, Senexon, Senokot, SenokotXTRA

Classification

Therapeutic: laxatives

Pharmacologic: stimulant laxatives

Pregnancy Category C

S

Indications

Treatment of constipation, particularly when associated with: Slow transit time, Constipating drugs, Irritable or spastic bowel syndrome, Neurologic constipation.

Action

Active components of senna (sennosides) alter water and electrolyte transport in the large intestine, resulting in accumulation of water and increased peristalsis.

Therapeutic Effects: Laxative action.

Pharmacokinetics

Absorption: Minimally absorbed following oral administration.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: Unknown.

TIME/ACTION PROFILE (laxative effect)

ROUTE	ONSET	PEAK	DURATION
PO	6–12 hr†	unknown	3–4 days

†May take as long as 24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Abdominal pain of unknown cause, especially if associated with fe-

✳ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

ver; Rectal fissures; Ulcerated hemorrhoids; Known alcohol intolerance (some liquid products).

Use Cautiously in: Chronic use (may lead to laxative dependence); Possible intestinal obstruction; **OB, Lactation:** Safety not established.

Adverse Reactions/Side Effects

GI: cramping, diarrhea, nausea. **GU:** pink-red or brown-black discoloration of urine. **F and E:** electrolyte abnormalities (chronic use or dependence).

Misc: laxative dependence.

Interactions

Drug-Drug: May ↓ absorption of other orally administered drugs because of ↓ transit time.

Route/Dosage

Larger doses have been used to treat/prevent opioid-induced constipation. Consult labeling of individual OTC products for more specific dosing information.

PO (Adults and Children >12 yr): 12–50 mg 1–2 times daily.

PO (Children 6–12 yr): 6–25 mg 1–2 times daily.

PO (Children 2–6 yr): 3–12.5 mg 1–2 times daily.

Availability (generic available)

Noted as sennoside content

Tablets: 6 mg^{OTC}, 8.6 mg^{OTC}, 15 mg^{OTC}, 17 mg^{OTC}, 25 mg^{OTC}. **Granules:** 15 mg/5 mL^{OTC}, 20 mg/5 mL^{OTC}.

Syrup: 8.8 mg/5 mL^{OTC}. **Liquid:** 25 mg/15 mL^{OTC}, 33.3 mg/mL senna concentrate^{OTC}. **In combination with:** psyllium and docusate^{OTC}. See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess patient for abdominal distention, presence of bowel sounds, and usual pattern of bowel function.
- Assess color, consistency, and amount of stool produced.

Potential Nursing Diagnoses

Constipation (Indications)

Diarrhea (Side Effects)

Implementation

- PO:** Take with a full glass of water. Administer at bedtime for evacuation 6–12 hr later. Administer on an empty stomach for more rapid results.
- Shake oral solution well before administering.
- Granules should be dissolved or mixed in water or other liquid before administration.

Patient/Family Teaching

- Advise patient that laxatives should be used only for short-term therapy. Long-term therapy may cause electrolyte imbalance and dependence.
- Encourage patient to use other forms of bowel regulation, such as increasing bulk in the diet, increasing fluid intake, and increasing mobility. Normal bowel habits are individualized and may vary from 3 times/day to 3 times/wk.

- Inform patient that this medication may cause a change in urine color to pink, red, violet, yellow, or brown.
- Instruct patients with cardiac disease to avoid straining during bowel movements (Valsalva maneuver).
- Advise patient not to use laxatives when abdominal pain, nausea, vomiting, or fever is present.

Evaluation/Desired Outcomes

- A soft, formed bowel movement.

sertraline (ser-tra-leen)

Zoloft

Classification

Therapeutic: antidepressants

Pharmacologic: selective serotonin reuptake inhibitors (SSRIs)

Pregnancy Category C

Indications

Major depressive disorder. Panic disorder. Obsessive-compulsive disorder (OCD). Post-traumatic stress disorder (PTSD). Social anxiety disorder (social phobia). Premenstrual dysphoric disorder (PMDD). **Unlabeled Use:** Generalized anxiety disorder (GAD).

Action

Inhibits neuronal uptake of serotonin in the CNS, thus potentiating the activity of serotonin. Has little effect on norepinephrine or dopamine. **Therapeutic Effects:** Antidepressant action. Decreased incidence of panic attacks. Decreased obsessive and compulsive behavior. Decreased feelings of intense fear, helplessness, or horror. Decreased social anxiety. Decrease in premenstrual dysphoria.

Pharmacokinetics

Absorption: Appears to be well absorbed after oral administration.

Distribution: Extensively distributed throughout body tissues.

Protein Binding: 98%.

Metabolism and Excretion: Extensively metabolized by the liver; 1 metabolite has some antidepressant activity; 14% excreted unchanged in feces.

Half-life: 24 hr.

TIME/ACTION PROFILE (antidepressant effect)

ROUTE	ONSET	PEAK	DURATION
PO	within 2–4 wk	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of MAO inhibitors or MAO-like drugs (linezolid or methylene blue); Concurrent use of pimozide; Oral concentrate contains alcohol; avoid in patients with known intolerance.

Use Cautiously in: Severe hepatic or renal impairment; Patients with a history of mania; History of suicide attempt; **OB:** Use during third trimester may result in neonatal serotonin syndrome requiring prolonged hospitalization, respiratory and nutritional support. Use only if potential benefit justifies potential risk to fetus; **Lactation:** May cause sedation in infant; discontinue drug or bottle-feed; **Pedi:** May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; risk may be greater in children or adolescents.

Adverse Reactions/Side Effects

CNS: **NEUROLEPTIC MALIGNANT SYNDROME, SUICIDAL**

THOUGHTS, dizziness, drowsiness, fatigue, headache, insomnia, agitation, anxiety, confusion, emotional lability, impaired concentration, manic reaction, nervousness, weakness, yawning. **EENT:** pharyngitis, rhinitis, tinnitus, visual abnormalities. **CV:** chest pain, palpitations. **GI:** diarrhea, dry mouth, nausea, abdominal pain, altered taste, anorexia, constipation, dyspepsia, flatulence, ↑ appetite, vomiting. **GU:** sexual dysfunction, menstrual disorders, urinary disorders, urinary frequency. **Derm:** ↑ sweating, hot flashes, rash.

Endo: diabetes. **F and E:** hyponatremia. **MS:** back pain, myalgia. **Neuro:** tremor, hypertonia, hypoesthesia, paresthesia, twitching. **Misc:** **SEROTONIN SYNDROME**, fever, thirst.

Interactions

Drug-Drug: Serious, potentially fatal reactions (hyperthermia, rigidity, myoclonus, autonomic instability, with fluctuating vital signs and extreme agitation, which may proceed to delirium and coma) may occur with concurrent **MAO inhibitors**. MAO inhibitors should be stopped at least 14 days before sertraline therapy. Sertraline should be stopped at least 14 days before MAO inhibitor therapy. Concurrent use with **MAO-inhibitor-like drugs**, such as **linezolid** or **methylene blue** may ↑ risk of serotonin syndrome; concurrent use contraindicated; do not start therapy in patients receiving **linezolid** or **methylene blue**; if **linezolid** or **methylene blue** need to be started in a patient receiving sertraline, immediately discontinue sertraline and monitor for signs/symptoms of serotonin syndrome for 2 wk or until 24 hr after last dose of linezolid or methylene blue, whichever comes first (may resume sertraline therapy 24 hr after last dose of linezolid or methylene blue). May ↑ **pimozide** levels and the risk of potentially life-threatening cardiovascular reactions; concurrent use contraindicated. Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SNRIs**, **fentanyl**, **buspirone**, **tramadol**, and **triptans** ↑ risk of serotonin syndrome. May ↑ sensitivity to **adrenergics** and ↑ the risk of serotonin syndrome. Concurrent use with **alcohol** is

not recommended. May ↑ levels/effects of **warfarin**, **phenytoin**, **tricyclic antidepressants**, some **benzodiazepines** (**alprazolam**), **clozapine**, or **tolbutamide**. ↑ risk of bleeding with **NSAIDs**, **aspirin**, **clopidogrel**, or **warfarin**. **Cimetidine** ↑ blood levels and effects.

Drug-Natural Products: ↑ risk of serotonergic side effects including serotonin syndrome with **St. John's wort** and **SAME**.

Route/Dosage

Depression/ OCD

PO (Adults): 50 mg/day as a single dose in the morning or evening initially; after several weeks may be ↑ at weekly intervals up to 200 mg/day, depending on response.

PO (Children 13–17 yr): *OCD*—50 mg once daily.

PO (Children 6–12 yr): *OCD*—25 mg once daily.

Panic Disorder

PO (Adults): 25 mg/day initially, may ↑ after 1 wk to 50 mg/day.

PTSD

PO (Adults): 25 mg once daily for 7 days, then ↑ to 50 mg once daily; may then be ↑ if needed at intervals of at least 7 days (range 50–200 mg once daily).

Social Anxiety Disorder

PO (Adults): 25 mg once daily initially, then 50 mg once daily; may be ↑ at weekly intervals up to 200 mg/day.

PMDD

PO (Adults): 50 mg/day initially either daily or daily during luteal phase of cycle. Daily dosing may be titrated upward in 50-mg increments at the beginning of a cycle. In luteal phase—only dosing a 50 mg/day titration step for 3 days at the beginning of each luteal phase dosing period should be used (range 50–150 mg/day).

Availability (generic available)

Tablets: 25 mg, 50 mg, 100 mg. **Cost:** *Generic*—25 mg \$17.68/90, 50 mg \$22.22/90, 100 mg \$19.73/90.

Capsules: ★ 50 mg, ★ 100 mg. **Oral concentrate (12% alcohol):** 20 mg/mL. **Cost:** *Generic*—\$64.28/60 mL.

NURSING IMPLICATIONS

Assessment

- Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤24 yr. After starting therapy, children, adolescents, and young adults should be seen

★ = Canadian drug name. † = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

by health care professional at least weekly for 4 wk, every 3 wk for next 4 wk, and on advice of health care professional thereafter.

- Monitor appetite and nutritional intake. Weigh weekly. Notify health care professional of continued weight loss. Adjust diet as tolerated to support nutritional status.
- **Assess for serotonin syndrome** (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyper-reflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).
- **Depression:** Monitor mood changes. Inform health care professional if patient demonstrates significant increase in anxiety, nervousness, or insomnia.
- Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- **OCD:** Assess patient for frequency of obsessive-compulsive behaviors. Note degree to which these thoughts and behaviors interfere with daily functioning.
- **Panic Attacks:** Assess frequency and severity of panic attacks.
- **PTSD:** Assess patient for feelings of fear, helplessness, and horror. Determine effect on social and occupational functioning.
- **Social Anxiety Disorder:** Assess patient for symptoms of social anxiety disorder (blushing, sweating, trembling, tachycardia during interactions with new people, people in authority, or groups) periodically during therapy.
- **Premenstrual Dysphoric Disorder:** Assess patient for symptoms of premenstrual dysphoric disorder (feeling angry, tense, or tired; crying easily, feeling sad or hopeless; arguing with family or friends for no reason; difficulty sleeping or paying attention; feeling out of control or unable to cope; having cramping, bloating, food craving, or breast tenderness) periodically during therapy.
- **Lab Test Considerations:** May cause false-positive urine screening tests for benzodiazepines.
- May cause hyperglycemia and diabetes mellitus; monitor serum glucose if clinical symptoms occur.

Potential Nursing Diagnoses

Ineffective coping (Indications)

Risk for injury (Side Effects)

Sexual dysfunction (Side Effects)

Implementation

- **Do not confuse sertraline with cetrizine or Soriatane (acitretin).**
- Periodically reassess dose and continued need for therapy.

- **PO:** Administer as a single dose in the morning or evening.

Patient/Family Teaching

- Instruct patient to take sertraline as directed. Take missed doses as soon as possible and return to regular dosing schedule. Do not double doses.
- May cause drowsiness or dizziness. Caution patient to avoid driving and other activities requiring alertness until response to the drug is known.
- Advise patient, family, and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide; new or worse depression or anxiety; agitation or restlessness; panic attacks; insomnia; new or worse irritability, aggressiveness, acting on dangerous impulses, mania, or other changes in mood or behavior or if symptoms of serotonin syndrome occur.
- Advise patient to avoid alcohol or other CNS depressant drugs during therapy and to consult with health care professional before taking other medications and to avoid alcohol or other CNS depressant drugs during therapy.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Inform patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may minimize dry mouth. If dry mouth persists for more than 2 wk, consult health care professional regarding use of saliva substitute.
- Advise patient to wear sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to notify health care professional if headache, weakness, nausea, anorexia, anxiety, or insomnia persists.
- Instruct female patient to inform health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the importance of follow-up exams to monitor progress. Encourage patient participation in psychotherapy to improve coping skills.

Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings. May require 1–4 wk of therapy to obtain antidepressant effects.
- Decrease in obsessive-compulsive behaviors.
- Decrease in frequency and severity of panic attacks.
- Decrease in symptoms of PTSD.
- Decrease in social anxiety disorder.
- Decrease in symptoms of premenstrual dysphoric disorder.

sevelamer (se-vel-a-mer)

Renagel, Renvela

Classification

Therapeutic: electrolyte modifiers

Pharmacologic: phosphate binders

Pregnancy Category C**Indications**

Reduction of serum phosphate levels in patients with hyperphosphatemia associated with end-stage renal disease.

Action

A polymer that binds phosphate in the GI tract, preventing its absorption. **Therapeutic Effects:** Decreased serum phosphate levels and reduction in the consequences of hyperphosphatemia (ectopic calcification, secondary hyperparathyroidism with osteitis fibrosa).

Pharmacokinetics

Absorption: Not absorbed; action is local (in GI tract).

Distribution: Unknown.

Metabolism and Excretion: Eliminated in feces.

Half-life: Unknown.

TIME/ACTION PROFILE (↓ in serum phosphate levels)

ROUTE	ONSET	PEAK	DURATION
PO	5 days	2 wk	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypophosphatemia; Bowel obstruction.

Use Cautiously in: Dysphagia, swallowing disorders, severe GI motility disorders, or major GI tract surgery; **OB, Lactation, Pedi:** Safety not established.

Adverse Reactions/Side Effects

GI: **BOWEL OBSTRUCTION/PERFORATION, ESOPHAGEAL OBSTRUCTION** (tablet), **diarrhea, dyspepsia, vomiting, choking** (tablet), constipation, dysphagia (tablet), flatulence, nausea.

Interactions

Drug-Drug: May ↓ absorption of other drugs and ↓ effectiveness, especially **drugs whose efficacy is dependent on tightly controlled blood levels**. ↓ absorption of ciprofloxacin.

Route/Dosage

PO (Adults): 800–1600 mg with each meal; may titrate by 800 mg every 2 wk to achieve target serum phosphorus levels.

Availability

Tablets: 400 mg, 800 mg. **Powder for oral suspension:** 800 mg/packet, 2400 mg/packet.

NURSING IMPLICATIONS**Assessment**

- Assess patient for GI side effects periodically during therapy.
- **Lab Test Considerations:** Monitor serum phosphorus, calcium, bicarbonate, and chloride levels periodically during therapy.

Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- **Do not confuse Renagel with Renvela.**
- Doses of concurrent medications, especially antiarrhythmics, should be spaced at least 1 hr before or 3 hr after sevelamer.
- **PO:** Administer with meals. Do not break, chew, or crush tablets; contents expand in water.
- Place contents of powder packet in a cup and mix thoroughly with at least 1 ounce of water for the 0.8-g dose or 2 ounces of water for the 2.4-g dose packet. Stir mixture vigorously (it does not dissolve) and drink entire preparation within 30 min or resuspend the preparation right before drinking.

Patient/Family Teaching

- Instruct patient to take sevelamer with meals as directed and to adhere to prescribed diet.
- Caution patient to space concurrent medications at least 1 hr before or 3 hr after sevelamer.
- **Advise patient to notify health care professional if GI effects are severe or prolonged.**

Evaluation/Desired Outcomes

- Decrease in serum phosphorous concentration to ≤6 mg/dL. Dose adjustment is based on serum phosphorous concentrations.

sildenafil (sil-den-a-fil)
Revatio, Viagra**Classification**

Therapeutic: erectile dysfunction agents, vasodilators

Pharmacologic: phosphodiesterase type 5 inhibitors

Pregnancy Category B**Indications**

Viagra: Erectile dysfunction. **Revatio:** Pulmonary arterial hypertension (WHO Group I).

★ = Canadian drug name. ⚠ = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Action

Viagra: Enhances effects of nitric oxide released during sexual stimulation. Nitric oxide activates guanylate cyclase, which produces increased levels of cyclic guanosine monophosphate (cGMP). cGMP produces smooth muscle relaxation of the corpus cavernosum, which promotes increased blood flow and subsequent erection. cGMP also leads to vasodilation of the pulmonary vasculature. Sildenafil inhibits the enzyme phosphodiesterase type 5 (PDE5), PDE5 inactivates cGMP.

Revatio: Produces vasodilation of the pulmonary vascular bed. **Therapeutic Effects:** **Viagra:** Enhanced blood flow to the corpus cavernosum and erection sufficient to allow sexual intercourse. Requires sexual stimulation. **Revatio:** Improved exercise tolerance and delay worsening of disease.

Pharmacokinetics

Absorption: Rapidly absorbed (41%) after oral administration; IV administration results in complete bioavailability.

Distribution: Widely distributed to tissues; negligible amount in semen.

Protein Binding: 96%.

Metabolism and Excretion: Mostly metabolized by the liver (by P450 3A4 enzyme system); 1 metabolite is active and accounts for 20% or more of drug effect. Metabolites excreted mostly (80%) in feces; 13% excreted in urine.

Half-life: 4 hr (for sildenafil and active metabolite).

TIME/ACTION PROFILE (vasodilation, ability to produce erection)

ROUTE	ONSET	PEAK	DURATION
PO	within 1 hr	30–120 min	up to 4 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of nitrates; Pulmonary veno-occlusive disease; **OB, Pedi:** Newborns, women, children; **Pedi:** **Revatio:**

Chronic use not recommended for pulmonary hypertension due to lack of efficacy and ↑ risk of death.

Use Cautiously in: Serious underlying cardiovascular disease (including history of MI, stroke, or serious arrhythmia within 6 mo), cardiac failure, or coronary artery disease with unstable angina; History of HF, coronary artery disease, uncontrolled hypertension (BP >170/110 mm Hg) or hypotension (BP <90/50 mm Hg), dehydration, autonomic dysfunction, or severe left ventricular outflow obstruction; Pulmonary hypertension secondary to sickle cell anemia (may ↑ risk of vaso-occlusive crises); Concurrent treatment with antihypertensives or glipizide; Renal impairment (CCr <30 mL/min, hepatic impairment; all result in ↑ blood levels; ↓ dose required with **Viagra**); Anatomic penile deformity (angulation, cavernosal fibrosis, Peyronie disease); Conditions associated with priapism (sickle cell

anemia, multiple myeloma, leukemia); Bleeding disorders or active peptic ulceration; History of sudden severe vision loss or at risk for non-arteritic ischemic optic neuropathy (NAION); may ↑ risk of recurrence; Retinitis pigmentosa; Alpha adrenergic blockers (patients should be on stable dose of alpha blockers before starting sildenafil); **Geri:** ↑ blood levels and may require lower doses; consider age-related decrease in cardiac, hepatic, and renal function as well as concurrent drug therapy and chronic disease states; **Lactation:** Lactation.

Adverse Reactions/Side Effects

CNS: headache, dizziness, insomnia. **EENT:** epistaxis, hearing loss, nasal congestion, vision loss. **CV:** **MYOCARDIAL INFARCTION, SUDDEN DEATH,** hypotension, vaso-occlusive crises. **GI:** dyspepsia, diarrhea. **GU:** priapism, urinary tract infection. **Derm:** flushing, rash. **MS:** myalgia. **Neuro:** paresthesias.

Interactions

Drug-Drug: Concurrent use of **nitrates** may cause serious, life-threatening hypotension and is contraindicated. Blood levels and effects, including the risk of hypotension may be ↑ by **enzyme inhibitors** including cimetidine, erythromycin, tacrolimus, ketoconazole, itraconazole, and protease inhibitor antiretrovirals including nelfinavir, indinavir, ritonavir, and saquinavir (initial dose of sildenafil for erectile dysfunction should be ↓ to 25 mg) (concurrent use of potent CYP3A inhibitors not recommended with oral **Revatio**). ↑ risk of hypotension with **alpha adrenergic blockers** and acute ingestion of alcohol. Rifampin, bosentan, barbiturates, carbamazepine, phenytoin, efavirenz, nevirapine, rifampin, or rifabutin may ↓ blood levels and effects; dose adjustments may be necessary in the treatment of pulmonary arterial hypertension. ↑ levels of bosentan. Use cautiously with glipizide. May ↑ risk of bleeding with warfarin.

Route/Dosage

Viagra (for erectile dysfunction)

PO (Adults): 50 mg taken 1 hr before sexual activity (range 25–100 mg taken 30 min–4 hr before sexual activity); not more than once daily; **Concurrent use with alpha-blocker antihypertensives**—do not use 50–100 mg dose within 4 hr of alpha blocker, 25-mg dose may be taken anytime.

PO (Geriatric Patients ≥65 yr or with concurrent enzyme inhibitors): 25 mg taken 1 hr before sexual activity (range 25–100 mg taken 30 min–4 hr before sexual activity); not more than once daily.

Hepatic/Renal Impairment

PO (Adults): 25 mg taken 1 hr before sexual activity (range 25–100 mg taken 30 min–4 hr before sexual activity); not more than once daily.

Revatio (for pulmonary arterial hypertension)

IV therapy is indicated for patients unable to take PO therapy

PO (Adults): 20 mg 3 times daily; dose adjustments may be necessary for concurrent bosentan, barbiturates, carbamazepine, phenytoin, efavirenz, nevirapine, rifampin, or rifabutin.

IV (Adults): 10 mg 3 times daily.

Availability (generic available)

Tablets (Viagra): 25 mg, 50 mg, 100 mg. **Tablets (Revatio):** 20 mg. **Powder for oral suspension (Revatio):** 10 mg/mL. **Solution for injection (Revatio):** 0.8 mg/mL.

NURSING IMPLICATIONS

Assessment

- **Viagra:** Determine erectile dysfunction before administration. Sildenafil has no effect in the absence of sexual stimulation.
- **Revatio:** Monitor hemodynamic parameters and exercise tolerance prior to and periodically during therapy.

Potential Nursing Diagnoses

Sexual dysfunction (Indications)

Risk for activity intolerance (Indications)

Implementation

- **Do not confuse Viagra (sildenafil) with Allegra (fexofenadine).**
- **PO:** Dose for *erectile dysfunction* is usually administered 1 hr before sexual activity. May be administered 30 min–4 hr before sexual activity.
- Dose for *pulmonary arterial hypertension* is administered 3 times daily without regard to food. Doses should be spaced 4–6 hr apart.
- Use syringe provided for accurate dosing of oral suspension.

IV Administration

- **Direct IV:** Administer undiluted. Solution is clear and colorless; do not administer solutions that are discolored or contain a precipitate. **Rate:** Administer as a bolus three times daily.

Patient/Family Teaching

- Instruct patient to take sildenafil as directed. For *erectile dysfunction*, take approximately 1 hr before sexual activity and not more than once per day. If taking sildenafil for *pulmonary arterial hypertension*, take missed doses as soon as remembered unless almost time for next dose; do not double doses.
- Advise patient that *Viagra* is not indicated for use in women.

- Caution patient not to take sildenafil concurrently with alpha-adrenergic blockers (unless on a stable dose) or nitrates. If chest pain occurs after taking sildenafil, instruct patient to seek immediate medical attention. Advise patient taking sildenafil for *pulmonary arterial hypertension* to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Instruct patient to notify health care professional promptly if erection lasts longer than 4 hr or if experience sudden or decreased vision loss in 1 or both eyes or loss or decrease in hearing, ringing in the ears, or dizziness.
- Inform patient that sildenafil offers no protection against sexually transmitted diseases. Counsel patient that protection against sexually transmitted diseases and HIV infection should be considered.

Evaluation/Desired Outcomes

- Male erection sufficient to allow intercourse.
- Increased exercise tolerance.

sildenafil (si-lo-do-sin)

Rapaflo

Classification

Therapeutic: benign prostatic hyperplasia (BPH) agents

Pharmacologic: alpha-adrenergic blockers

Pregnancy Category B

Indications

Treatment of the signs/symptoms or benign prostatic hyperplasia (BPH).

Action

Blocks post synaptic alpha₁-adrenergic receptors. Decreases contractions in the smooth muscle of the prostatic capsule.

Therapeutic Effects: Decreased signs and symptoms of BPH (urinary urgency, hesitancy, nocturia).

Pharmacokinetics

Absorption: 32% absorbed following oral administration.

Distribution: Unknown.

Protein Binding: 97%.

Metabolism and Excretion: Extensively metabolized (CYP3A4, UGT2B7, and other metabolic pathways involved); 33.5% excreted in urine and 54.9% in feces.

Half-life: 13.3 hr.

☼ = Canadian drug name. ⚡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

TIME/ACTION PROFILE (effect on symptoms of BPH)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	24 hr	24 hr*

*Following discontinuation.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Not indicated for use in women or children; Severe renal impairment (CrCl less than 30 mL/min); Severe hepatic impairment (Child-Pugh score of ≥ 10); Concurrent use of strong CYP3A4 inhibitors or P-gp inhibitors.

Use Cautiously in: Moderate inhibitors of the CYP3A4 enzyme system; Cataract surgery (may cause intraoperative floppy iris syndrome); Moderate renal impairment (lower dose recommended); **Geri:** ↑ risk of orthostatic hypotension; **Pedi:** Safety and effectiveness have not been established.

Adverse Reactions/Side Effects

CNS: dizziness, headache. **CV:** orthostatic hypotension. **GI:** diarrhea. **GU:** retrograde ejaculation.

Derm: pruritis, rash, urticaria. **Misc:** allergic reactions.

Interactions

Drug-Drug: Strong inhibitors of CYP3A4 (including ketoconazole, clarithromycin, itraconazole, and ritonavir) ↓ metabolism, ↑ blood levels and risk of toxicity; concurrent use is contraindicated. Concurrent use with moderate CYP3A4 inhibitors (including diltiazem, erythromycin, and verapamil) may ↑ levels; use cautiously. Concurrent use with antihypertensives (including calcium channel blockers and thiazides), other alpha blockers and phosphodiesterase type 5 inhibitors (including sildenafil, tadalafil, and vardenafil) ↑ the risk of dizziness and orthostatic hypotension. **P-glycoprotein (P-gp) inhibitors** including cyclosporine) may ↑ levels; concurrent use not recommended.

Route/Dosage

PO (Adults): 8 mg once daily.

Renal Impairment

PO (Adults): *CCr 30–50 mL/min*—4 mg once daily.

Availability

Capsules: 4 mg, 8 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for symptoms of benign prostatic hyperplasia (urinary hesitancy, feeling of incomplete bladder emptying, interruption of urinary stream, impairment of size and force of urinary stream, terminal urinary dribbling, straining to start flow, frequency, dysuria, nocturia, urgency) before and periodically during therapy.

- Assess patient for orthostatic reaction and syncope. Monitor BP (lying and standing) and during initial therapy and periodically thereafter.
- Rule out prostatic carcinoma before therapy; symptoms are similar.

Potential Nursing Diagnoses

Risk for injury (Side Effects)

Noncompliance (Patient/Family Teaching)

Implementation

- PO:** Administer with food at the same meal each day.
- If unable to swallow capsule, may open capsule and sprinkle powder inside on a tablespoonful of applesauce. Swallow immediately, within 5 min, without chewing; follow with 8 oz of cool water to ensure complete dose is swallowed. Use cool applesauce, soft enough to be swallowed without chewing. Do not store for future use or subdivide capsule contents.

Patient/Family Teaching

- Instruct patient to take medication with the same meal each day.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Caution patient to avoid sudden changes in position to decrease orthostatic hypotension, especially patients with low BP or concurrently taking antihypertensives.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially cough, cold, or allergy remedies.
- Instruct patient to notify health care professional of medication regimen before any surgery. Patients planning cataract surgery should notify ophthalmologist of silodosin therapy prior to surgery.
- Inform patient that silodosin may cause retrograde ejaculation (orgasm with reduced or no semen). This does not pose a safety concern and is reversible with discontinuation.
- Emphasize the importance of follow-up exams to evaluate effectiveness of medication.
- Geri:** Assess risk for falls; implement fall prevention program and instruct patient and family in preventing falls at home.

Evaluation/Desired Outcomes

- Decreased symptoms of benign prostatic hyperplasia.

simethicone (si-meth-i-kone)

Degas, Extra Strength Gas-X, Flatulex,

★ Gas Relief, Gas-X, Genasyme,

★ Infacol, Maximum Strength Mylanta

Gas, Mylanta Gas, Mylicon, Ovol,
Pediacol, Phazyme

Classification

Therapeutic: antifatulent

Pregnancy Category UK

Indications

Relief of painful symptoms of excess gas in the GI tract that may occur postoperatively or as a consequence of: Air swallowing, Dyspepsia, Peptic ulcer, Diverticulitis.

Action

Causes the coalescence of gas bubbles. Does not prevent the formation of gas. **Therapeutic Effects:** Passage of gas through the GI tract by belching or passing flatus.

Pharmacokinetics

Absorption: No systemic absorption occurs.

Distribution: Not systemically distributed.

Metabolism and Excretion: Excreted unchanged in the feces.

Half-life: Unknown.

TIME/ACTION PROFILE (antiflatulent effect)

ROUTE	ONSET	PEAK	DURATION
PO	immediate	unknown	3 hr

Contraindications/Precautions

Contraindicated in: Not recommended for infant colic.

Use Cautiously in: Abdominal pain of unknown cause, especially when accompanied by fever; **OB: Lactation:** Has been used safely.

Adverse Reactions/Side Effects

None significant.

Interactions

Drug-Drug: None significant.

Route/Dosage

PO (Adults): 40–125 mg qid, after meals and at bedtime (up to 500 mg/day).

PO (Children 2–12 yr): 40 mg 4 times daily.

PO (Children <2 yr): 20 mg 4 times daily (up to 240 mg/day).

Availability (generic available)

Chewable tablets: 40 mg^{OTC}, 80 mg^{OTC}, 125 mg^{OTC}, 150 mg^{OTC}. **Tablets:** 60 mg^{OTC}, 80 mg^{OTC}, 95 mg^{OTC}.

Capsules: 125 mg^{OTC}, 166 mg^{OTC}, 180 mg^{OTC}.

Drops: 40 mg/0.6 mL^{OTC}, 40 mg/mL^{OTC}, 95 mg/1.425 mL^{OTC}. **In combination with:** antacids^{OTC}. See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess patient for abdominal pain, distention, and bowel sounds prior to and periodically throughout course of therapy. Frequency of belching and passage of flatus should also be assessed.

Potential Nursing Diagnoses

Acute pain (Indications)

Implementation

- PO:** Administer after meals and at bedtime for best results. Shake liquid preparations well prior to administration. Chewable tablets should be chewed thoroughly before swallowing for faster and more complete results.
- Drops can be mixed with 30 mL of cool water, infant formula, or other liquid as directed. Shake well before using.

Patient/Family Teaching

- Explain to patient the importance of diet and exercise in the prevention of gas. Also explain that this medication does not prevent the formation of gas.
- Advise patient to notify health care professional if symptoms are persistent.

Evaluation/Desired Outcomes

- Decrease in abdominal distention and discomfort.

simvastatin, See HMG-CoA REDUCTASE INHIBITORS (statins).

sipuleucel (si-pu-loo-sel) Provenge

Classification

Therapeutic: antineoplastics

Pharmacologic: autologous cellular immunotherapies

Indications

Asymptomatic/minimally symptomatic metastatic castrate resistant (hormone refractory) prostate cancer.

Action

Autologous immunotherapy produced by collecting peripheral mononuclear cells during leukapheresis. Cells include antigen presenting cells (APCs), which are activated during a culture period with prostatic acid phosphatase (PAP, an antigen found in prostatic cancer tissue) linked to granulocyte-macrophage colony-stimulating factor (GM-CSF, which activates immune cells). Induces an immune response against prostatic acid phosphatase. **Therapeutic Effects:** ↓ spread of prostate cancer.

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: None noted.

Use Cautiously in: Intended for autologous use only.

Adverse Reactions/Side Effects

CNS: fatigue, headache, dizziness, insomnia. **Resp:** dyspnea. **CV:** hypertension, peripheral edema. **GI:** constipation, diarrhea, nausea, vomiting. **GU:** hematuria. **Derm:** flushing, rash, sweating. **Hemat:** anemia. **MS:** back pain, joint pain, extremity pain, muscle spasms, musculoskeletal pain. **Neuro:** paresthesia, tremor. **Misc:** chills, fever, acute infusion reactions, citrate toxicity.

Interactions

Drug-Drug: Concurrent use of immunosuppressants may alter safety/efficacy.

Route/Dosage

IV (Adults): One dose every 2 wk for a total of 3 doses.

Availability

Suspension for IV infusion: minimum of 50 million autologous CD54⁺ cells activated with PAP-GM-CSF suspended in 250 mL lactated ringer's injection.

NURSING IMPLICATIONS

Assessment

- Monitor for signs of acute infusion reaction (fever, chills, dyspnea, hypoxia, bronchospasm, dizziness, nausea, vomiting, fatigue, headache, muscle aches, hypertension, tachycardia), especially patients with cardiac or pulmonary conditions. If signs occur, infusion may be slowed or interrupted, depending on severity of reaction. If infusion must be interrupted, do not resume if infusion bag will be at room temperature for >3 hr. Monitor patient for at least 30 min following each infusion.

Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

IV Administration

- pH:** No Data.
- Each infusion must be preceded by a leukapheresis procedure approximately 3 days prior. If patient is

unable to receive an infusion, patient will need to undergo an additional leukapheresis procedure.

- Medication is not routinely tested for transmissible infectious diseases. Employ universal precautions in handling leukapheresis material or sipuleucel.
- Premedicate patient with acetaminophen and an antihistamine (diphenhydramine) 30 min prior to administration to minimize acute infusion reactions.
- Upon receipt of sipuleucel from manufacturer, open outer cardboard shipping box to verify product and patient-specific labels. Do not remove insulated container from shipping box or open lid of insulated container until patient is ready for infusion. Do not infuse until confirmation of product release has been received from manufacturer.
- Infusion must begin prior to expiration date and time. Do not infuse expired sipuleucel. Once infusion bag is removed from insulated container, infuse within 3 hr; do not return to shipping container.
- Intermittent Infusion:** Once patient is prepared for infusion and Cell Product Disposition Form has been received, remove infusion bag from insulated container, and inspect bag for leakage. Contents will be slightly cloudy, with cream-to-pink color. Gently mix and re-suspend contents of bag, inspecting for clumps and clots. Small clumps should disperse with gentle manual mixing; do not administer if bag leaks or if clumps remain.
- Sipuleucel is solely for autologous use. Match patient's identity with the patient identifiers on the Cell Product Disposition Form and infusion bag. **Rate:** Infuse the entire volume of the bag over 60 min. Do not use a cell filter.

Patient/Family Teaching

- Explain the purpose of sipuleucel and the importance of maintaining all scheduled appointments, adhering to preparation instructions for leukapheresis procedure to patient.
- Inform patient that a central venous catheter may be required if adequate peripheral venous access is not available.
- Advise patient to notify health care professional if fever over 100°F, swelling or redness around catheter site, pain at infusion or collection sites, symptoms of cardiac arrhythmia (chest pains, racing heart, irregular heartbeats), signs of acute infusion reaction, or persistent side effects occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products, especially immunosuppressive agents, being taken and consult health care professional before taking any new medications.

Evaluation/Desired Outcomes

- ↓ in the spread of prostate cancer.

sirolimus (sir-oh-li-mus)

Rapamune

Classification

Therapeutic: immunosuppressants

Pregnancy Category C**Indications**

Prevention of organ rejection in allogeneic kidney transplantation (with corticosteroids and cyclosporine). Sirolimus is also eluted from the Cypher coronary stent used in angioplasty procedures.

Action

Inhibits T-lymphocyte activation/proliferation, which occurs as a response to antigenic and cytokine stimulation; antibody production is also inhibited. **Therapeutic Effects:** Decreased incidence and severity of organ rejection.

Pharmacokinetics

Absorption: Rapidly absorbed following oral administration (14% bioavailability).

Distribution: Concentrates in erythrocytes; distributes to heart, intestines, kidneys, liver, lungs, muscle, spleen, and testes in high concentrations.

Protein Binding: 92%.

Metabolism and Excretion: Extensively metabolized (some metabolism by P450 3A4 system); 91% excreted in feces.

Half-life: 62 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1–2 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Alcohol intolerance/sensitivity (solution contains ethanol); Concurrent ketoconazole, voriconazole, itraconazole, erythromycin, telithromycin, clarithromycin, rifampin, rifabutin, or grapefruit juice; Severe hepatic impairment; **OB, Lactation:** Pregnancy and lactation.

Use Cautiously in: Mild to moderate hepatic impairment; **OB:** Women with childbearing potential; **Pedi:** Children <13 yr (safety not established).

Adverse Reactions/Side Effects

Reflects combined therapy with corticosteroids and cyclosporine.

CNS: PROGRESSIVE MULTIFOCAL LEUKOENCEPHALOPATHY (PML), insomnia. **Resp:** interstitial lung disease. **CV:** edema, hypotension, pericardial effusion. **GI:** ascites, hepatotoxicity. **GU:** amenorrhea, menorrhagia, ovarian cysts, renal impairment. **Derm:** acne, rash, throm-

bocytopenic purpura. **F and E:** hypokalemia. **He-mat:** leukopenia, thrombocytopenia, anemia. **Metab:** hypercholesterolemia, hypertriglyceridemia. **MS:** arthralgias. **Neuro:** tremor. **Misc:** infection (including activation of latent viral infections such as BK virus-associated nephropathy, pseudomembranous colitis), lymphocele, lymphoma, ↓ wound healing.

Interactions

Drug-Drug: Cyclosporine (modified) greatly ↑ blood levels (administer sirolimus 4 hr after cyclosporine). Drugs that inhibit the CYP3A4 enzyme system may be expected to ↑ blood levels and the risk of adverse reactions. Ketoconazole, voriconazole, itraconazole, clarithromycin, erythromycin, telithromycin significantly ↑ blood levels (concurrent use is contraindicated). Blood levels are also ↑ by diltiazem and verapamil (monitor sirolimus levels and adjust dose as necessary) and may be ↑ by nicardipine, verapamil, clotrimazole, fluconazole, troleandomycin, metoclopramide, cimetidine, danazol, and protease inhibitors. Rifampin and rifabutin ↑ metabolism by stimulating the CYP3A4 enzyme system and significantly ↓ blood levels. Blood levels may also be ↓ by carbamazepine, phenobarbital, phenytoin, and rifapentine. Risk of renal impairment may be ↑ by concurrent use of other nephrotoxic agents. Concurrent use with tacrolimus and corticosteroids in lung transplantation may ↑ risk of anastomotic dehiscence; fatalities have been reported (not approved for this use). Concurrent use with tacrolimus and corticosteroids in liver transplantation may ↑ risk of hepatic artery thrombosis; fatalities have been reported (not approved for this use). May ↓ antibody response to and ↑ risk of adverse reactions to live-virus vaccines (avoid vaccination).

Drug-Natural Products: Concomitant use with echinacea and melatonin may interfere with immunosuppression. **St. John's wort** may ↑ blood levels and the risk of toxicity.

Drug-Food: Grapefruit juice ↓ CYP3A4 metabolism and ↑ levels; do not use as a diluent and avoid concurrent ingestion.

Route/Dosage

PO (Adults and Children ≥13 yr): 6-mg loading dose, followed by 2 mg/day maintenance dose. *Dosing following cyclosporine withdrawal*—Patients at low to moderate risk for rejection after transplantation may be withdrawn from cyclosporine over 4–8 wk beginning 2–4 mo after transplant. Thereafter, sirolimus dose should be titrated upward to maintain a whole blood trough level of 12–14 ng/mL. Clinical assessment should also be used to gauge dose. Dose changes can be made at 7–14 day intervals. The following formula may also be used: sirolimus maintenance dose =

☼ = Canadian drug name. ⚡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

current dose $\times$ (target concentration/current concentration). If a large $\uparrow$ is needed, a loading dose may be given and blood levels reassessed 3–4 days later. Loading dose may be calculated by the following formula: sirolimus loading dose = 3 $\times$ (new maintenance dose-current maintenance dose). Loading doses >40 mg should be spread over 2 days.

PO (Adults and Children ≥ 13 yr and <40 kg): 3 mg/m² loading dose, followed by 1 mg/m²/day maintenance dose. *See adjustments above for doses following cyclosporine withdrawal.*

Hepatic Impairment

PO (Adults and Children ≥ 13 yr and <40 kg): $\downarrow$ maintenance dose by 33%; loading dose is unchanged.

Availability

Tablet: 0.5 mg, 1 mg, 2 mg. **Oral solution:** 1 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor BP closely during therapy. Hypertension is a common complication of sirolimus therapy and should be treated.
- Assess for any new signs or symptoms that may be suggestive of PML, an opportunistic infection of the brain that leads to death or severe disability; withhold dose and notify health care professional promptly. Symptoms of PML may include hemiparesis, apathy, confusion, cognitive deficiencies, and ataxia. Consider decreasing the amount of immunosuppression in these patients.
- **Lab Test Considerations:** Monitor sirolimus blood levels when dose forms are changed and in patients likely to have altered drug metabolism, patients ≥ 13 yr who weigh <40 kg, patients with hepatic impairment, and during concurrent administration of drugs that may interact with sirolimus. Trough concentrations of ≥ 15 ng/mL are associated with an $\uparrow$ in adverse effects.
- Monitor patients for hyperlipidemia. May require additional interventions to treat hyperlipidemia.
- May cause anemia, leukopenia, thrombocytopenia, and hypokalemia.
- May cause $\uparrow$ AST, $\uparrow$ ALT, hypophosphatemia, and hyperglycemia.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)

Implementation

- Therapy with sirolimus should be started as soon as possible post-transplant. Concurrent therapy with cyclosporine and corticosteroids is recommended. Sirolimus should be taken 4 hr after cyclosporine (MODIFIED, Neoral).
- Sirolimus should be ordered only by physicians skilled in immunosuppressive therapy, with the staff and facilities to manage renal transplant patients.

- Antimicrobial prophylaxis for *Pneumocystis jirovecii* pneumonia for 1 yr and for cytomegalovirus protection for 3 mo post-transplant are recommended.
- **PO:** Administer consistently with or without food. Swallow tablet whole; do not crush, break, or chew. Do not administer with or mix with grapefruit juice.
- To dilute from bottle, use amber oral dose syringe to withdraw prescribed amount. Empty sirolimus from syringe into a glass or plastic container holding at least 2 oz (60 mL) of water or orange juice; do not use other liquids. Stir vigorously and drink at once. Refill container with at least 4 oz of additional liquid, stir vigorously, and drink at once.
- If using the pouch, empty entire contents of pouch into at least 2 oz of water or orange juice; do not use other liquids. Stir vigorously and drink at once. Refill container with at least 4 oz of additional liquid, stir vigorously, and drink at once.
- Store bottles and pouches in refrigerator. Protect from light. Solution may develop a slight haze when refrigerated; allow to stand at room temperature and shake gently until haze disappears. Sirolimus may remain in syringe at room temperature or refrigerated for up to 24 hr. Discard syringe after 1 use. Oral solution must be used within 1 mo of opening bottle.

Patient/Family Teaching

- Instruct patient to take sirolimus at the same time each day, as directed. Advise patient to avoid taking with or diluting with grapefruit juice. Do not skip or double up on missed doses. Do not discontinue medication without advice of health care professional.
- Advise patient to avoid grapefruit and grapefruit juice during therapy.
- Reinforce the need for lifelong therapy to prevent transplant rejection. Review symptoms of rejection for transplanted organ and stress need to notify health care professional immediately if they occur.
- Advise patient to notify health care professional if swelling of your face, eyes, or mouth; trouble breathing or wheezing; throat tightness; chest pain or tightness; feeling dizzy or faint; rash or peeling of skin; swelling of hands or feet; or symptoms of PML occur.
- Advise patient to wear sunscreen and protective clothing and limit time in sunlight and UV light due to increased risk of skin cancer.
- Caution patient to notify health care professional if signs of infection occur.
- Advise patient to avoid vaccinations with a live virus during therapy.
- Advise patient of the risk of taking sirolimus during pregnancy. Caution women of childbearing age to use effective contraception prior to, during, and for 12 wk following therapy.

- Emphasize the importance of repeated lab tests during sirolimus therapy.

Evaluation/Desired Outcomes

- Prevention of transplanted kidney rejection.

sitaGLIPTin (sit-a-glip-tin)

Januvia

Classification

Therapeutic: antidiabetics

Pharmacologic: enzyme inhibitors

Pregnancy Category B

Indications

Adjunct to diet and exercise to improve glycemic control in patients with type 2 diabetes mellitus; may be used as monotherapy or combination therapy with metformin, a thiazolidinedione, a sulfonylurea, or insulin.

Action

Inhibits the enzyme dipeptidyl peptidase-4 (DPP-4), which slows the inactivation of incretin hormones, resulting in increased levels of active incretin hormones. These hormones are released by the intestine throughout the day and are involved in regulation of glucose homeostasis. Increased/prolonged incretin levels result in an increase in insulin release and decrease in glucagon levels. **Therapeutic Effects:** Improved control of blood glucose.

Pharmacokinetics

Absorption: 87% absorbed following oral administration.

Distribution: Unknown.

Metabolism and Excretion: 79% excreted unchanged in urine, minor metabolism.

Half-life: 12.4 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1–4 hr	24 hr

Contraindications/Precautions

Contraindicated in: Type 1 diabetes mellitus; Diabetic ketoacidosis; Hypersensitivity.

Use Cautiously in: Renal impairment (dose ↓ required for CCr <50 mL/min); History of pancreatitis; History of angioedema to another DPP-4 inhibitor; **OB:** Use only if clearly needed. **Lactation:** Excretion into breast milk unknown; **Pedi:** Safety not established; **Geri:** Consider age-related ↓ in renal function when determining dose.

Adverse Reactions/Side Effects

CNS: headache. **GI:** PANCREATITIS, nausea, diarrhea.

GU: acute renal failure. **Resp:** upper respiratory tract

infection, nasopharyngitis. **MS:** arthralgia, back pain, myalgia. **Misc:** allergic reactions including ANAPHYLAXIS, ANGIOEDEMA, EXFOLIATIVE SKIN CONDITIONS (STEVENS-JOHNSON SYNDROME), rash, urticaria.

Interactions

Drug-Drug: May slightly ↑ serum digoxin levels; monitoring recommended. ↑ risk of hypoglycemia when used with insulin, glyburide, glipizide, or glimepiride (may need to ↓ dose of insulin or sulfonylurea).

Route/Dosage

PO (Adults): 100 mg once daily.

Renal Impairment

PO (Adults): CCr 30–<50 mL/min—50 mg once daily; CCr <30 mL/min—25 mg once daily.

Availability

Tablets: 25 mg, 50 mg, 100 mg. **Cost:** 25 mg \$801.18/90, 50 mg \$816.93/90, 100 mg \$816.93/90.

In combination with: metformin (Janumet), metformin XR (Janumet XR). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Observe patient for signs and symptoms of hypoglycemic reactions (abdominal pain, sweating, hunger, weakness, dizziness, headache, tremor, tachycardia, anxiety).
- Monitor for signs of pancreatitis (nausea, vomiting, anorexia, persistent severe abdominal pain, sometimes radiating to the back) during therapy. If pancreatitis occurs, discontinue sitagliptin and monitor serum and urine amylase, amylase/creatinine clearance ratio, electrolytes, serum calcium, glucose, and lipase.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- **Lab Test Considerations:** Monitor hemoglobin A1C prior to and periodically during therapy.
- Monitor renal function prior to and periodically during therapy.

Potential Nursing Diagnoses

Imbalanced nutrition: more than body requirements (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- Do not confuse sitagliptin with sumatriptan. Do not confuse Januvia (sitagliptin) with Enjuvia (estrogens, conjugated B), Jantoven (warfarin), or Janumet (sitagliptin/metformin).

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- **PO:** May be administered without regard to food.

Patient/Family Teaching

- Instruct patient to take sitagliptin as directed. Take missed doses as soon as remembered, unless it is almost time for next dose; do not double doses. Advise patient to read *Medication Guide* before starting and with each Rx refill in case of changes.
- Explain to patient that sitagliptin helps control hyperglycemia but does not cure diabetes. Therapy is usually long term.
- Instruct patient not to share this medication with others, even if they have the same symptoms; it may harm them.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hyperglycemic or hypoglycemic episodes.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water, and notify health care professional.
- Instruct patient in proper testing of blood glucose and urine ketones. These tests should be monitored closely during periods of stress or illness and health care professional notified if significant changes occur.
- Advise patient to stop taking sitagliptin and notify health care professional promptly if symptoms of hypersensitivity reactions (rash; hives; swelling of face, lips, tongue, and throat; difficulty in breathing or swallowing) or pancreatitis occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding. Encourage patients who become pregnant while taking sitagliptin to join the pregnancy registry by calling 1-800-986-8999.

Evaluation/Desired Outcomes

- Improved hemoglobin A1C, fasting plasma glucose and 2-hr post-prandial glucose levels.

sodium bicarbonate

(soe-dee-um bye-kar-boe-nate)

Baking Soda, Bell-Ans, Citrocarbonate, Neut, Soda Mint

Classification

Therapeutic: antilucer agents

Pharmacologic: alkalinizing agents

Pregnancy Category C

Indications

PO, IV: Management of metabolic acidosis. **PO, IV:** Used to alkalinize urine and promote excretion of certain drugs in overdose situations (phenobarbital, aspirin). **PO:** Antacid. **Unlabeled Use:** Stabilization of acid-base status in cardiac arrest and treatment of life-threatening hyperkalemia.

Action

Acts as an alkalinizing agent by releasing bicarbonate ions. Following oral administration, releases bicarbonate, which is capable of neutralizing gastric acid.

Therapeutic Effects: Alkalinization. Neutralization of gastric acid.

Pharmacokinetics

Absorption: Following oral administration, excess bicarbonate is absorbed and results in metabolic alkalosis and alkaline urine.

Distribution: Widely distributed into extracellular fluid.

Metabolism and Excretion: Sodium and bicarbonate are excreted by the kidneys.

Half-life: Unknown.

TIME/ACTION PROFILE (PO = antacid effect; IV = alkalinization)

ROUTE	ONSET	PEAK	DURATION
PO	immediate	30 min	1–3 hr
IV	immediate	rapid	unknown

Contraindications/Precautions

Contraindicated in: Metabolic or respiratory alkalosis; Hypocalcemia; Hyponatremia; Excessive chloride loss; As an antidote following ingestion of strong mineral acids; Patients on sodium-restricted diets (oral use as an antacid only); Renal failure (oral use as an antacid only); Severe abdominal pain of unknown cause, especially if associated with fever (oral use as an antacid only).

Use Cautiously in: HF; Renal insufficiency; Concurrent corticosteroid therapy; Chronic use as an antacid (may cause metabolic alkalosis and possible sodium overload); **Pedi:** May ↑ risk of cerebral edema in children with diabetic ketoacidosis.

Adverse Reactions/Side Effects

CV: edema. **GI:** PO—flatulence, gastric distention. **F and E:** metabolic alkalosis, hyponatremia, hypocalcemia, hypokalemia, sodium and water retention. **Local:** irritation at IV site. **Neuro:** tetany, cerebral hemorrhage (with rapid injection in infants).

Interactions

Drug-Drug: Following oral administration, may ↓ absorption of **ketoconazole**. Concurrent use with **calcium-containing antacids** may lead to milk-alkali syndrome. Urinary alkalinization may result in ↓ **sali-cylate** or **barbiturate** blood levels; ↑ blood levels of

quinidine, mexiletine, flecainide, or amphetamines; ↑ risk of crystalluria from **fluoroquinolones**; ↓ effectiveness of **methenamine**. May negate the protective effects of **enteric-coated products** (do not administer within 1–2 hr of each other).

Route/Dosage

Contains 12 mEq of sodium/g.

Alkalinization of Urine

PO (Adults): 48 mEq (4 g) initially. Then 12–24 mEq (1–2 g) q 4 hr (up to 48 mEq q 4 hr) or 1 tsp of powder q 4 hr as needed.

PO (Children): 1–10 mEq/kg (84–840 mg/kg) per day in divided doses.

IV (Adults and Children): 2–5 mEq/kg as a 4–8 hr infusion.

Antacid

PO (Adults): *Tablets/powder*—325 mg–2 g 1–4 times daily or ½ tsp q 2 hr as needed. *Effervescent powder*—3.9–10 g in water after meals; patients >60 yr should receive 1.9–3.9 g after meals.

Systemic Alkalinization/Cardiac Arrest

IV (Adults and Children and Infants): *Cardiac arrest/urgent situations*—1 mEq/kg; may repeat 0.5 mEq/kg q 10 min. *Less urgent situations*—2–5 mEq/kg as a 4–8 hr infusion.

Renal Tubular Acidosis

PO (Adults): 0.5–2 mEq/kg/day in 4–5 divided doses.

PO (Children): 2–3 mEq/kg/day in 3–4 divided doses.

Availability (generic available)

Oral powder: (20.9 mEq Na/½ tsp) in 120-, 240-, 480-, and 2400-g containers^{OTC}. **Tablets:** 325 mg (3.9 mEq Na/tablet)^{OTC},  500 mg (6.0 mEq Na/tablet)^{OTC}, 520 mg (6.2 mEq Na/tablet)^{OTC}, 650 mg (7.7 mEq Na/tablet)^{OTC}. **Solution for injection:** 4.2% (0.5 mEq/mL) in 2.5-, 5-, and 10-mL prefilled syringes, 5% (0.6 mEq/mL) in 500-mL containers, 7.5% (0.9 mEq/mL) in 50-mL vials and prefilled syringes and 200-mL vials, 8.4% (1 mEq/mL) in 10- and 50-mL vials and prefilled syringes. **Neutralizing additive solution for injection:** 4% (0.48 mEq/mL) in 5-mL vials, 4.2% (0.5 mEq/mL) in 6-mL vials.

NURSING IMPLICATIONS

Assessment

- **IV:** Assess fluid balance (intake and output, daily weight, edema, lung sounds) throughout therapy. Report symptoms of fluid overload (hypertension, edema, dyspnea, rales/crackles, frothy sputum) if they occur.

- Assess patient for signs of acidosis (disorientation, headache, weakness, dyspnea, hyperventilation), alkalosis (confusion, irritability, paresthesia, tetany, altered breathing pattern), hyponatremia (edema, weight gain, hypertension, tachycardia, fever, flushed skin, mental irritability), or hypokalemia (weakness, fatigue, U wave on ECG, arrhythmias, polyuria, polydipsia) throughout therapy.
- Observe IV site closely. Avoid extravasation, as tissue irritation or cellulitis may occur. If infiltration occurs, confer with physician or other health care professional regarding warm compresses and infiltration of site with lidocaine or hyaluronidase.
- **Antacid:** Assess patient for epigastric or abdominal pain and frank or occult blood in the stool, emesis, or gastric aspirate.
- **Lab Test Considerations:** Monitor serum sodium, potassium, calcium, bicarbonate concentrations, serum osmolality, acid-base balance, and renal function prior to and periodically throughout therapy.
- Obtain arterial blood gases (ABGs) frequently in emergency situations and during parenteral therapy.
- Monitor urine pH frequently when used for urinary alkalinization.
- Antagonizes effects of pentagastrin and histamine during gastric acid secretion test. Avoid administration during the 24 hr preceding the test.

Potential Nursing Diagnoses

Impaired gas exchange (Indications)

Excess fluid volume (Side Effects)

Implementation

- This medication may cause premature dissolution of enteric-coated tablets in the stomach.
- **PO:** Tablets must be taken with a full glass of water.
- When used in treatment of peptic ulcers, may be administered 1 and 3 hr after meals and at bedtime.

IV Administration

- **pH:** 7.0–8.5.
- **Direct IV:** **Used in cardiac arrest or urgent situations.** **Diluent:** Use premeasured ampules or prefilled syringes to ensure accurate dose. **Rate:** Administer by rapid bolus. Flush IV line before and after administration to prevent incompatible medications used in arrest management from precipitating.
- **Continuous Infusion:** **Diluent:** May be diluted in dextrose, saline, and dextrose/saline combinations. Premixed infusions are already diluted and ready to use. **Rate:** May be administered over 4–8 hr.
- **Y-Site Compatibility:** acyclovir, amifostine, amikacin, aminophylline, asparaginase, atropine, aztreonam, bivalirudin, bumetanide, cefazolin, cefe-

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

pime, cefazidime, ceftriaxone, chloramphenicol, cimetidine, cladribine, clindamycin, cyclophosphamide, cyclosporine, cytarabine, daptomycin, daunorubicin, dexamethasone sodium phosphatedexametomidine, digoxin, docetaxel, doxorubicin, enalaprilat, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fentanyl, filgrastim, fluconazole, fludarabine, furosemide, gemcitabine, gentamicin, granisetron, heparin, hydrocortisone sodium succinate, ifosfamide, indomethacin, insulin, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, melphalan, mesna, meperidine, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, milrinone, morphine, nafcillin, nitroglycerin, nitroprusside, paclitaxel, palonosetron, pantoprazole, pemetrexed, penicillin G potassium, phytylphrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, propranolol, propofol, protamine, ranitidine, remifentanyl, tacrolimus, teniposide, thiotepa, ticarcillin/clavulanate, tirofiban, tobramycin, tolazoline, vasopressin, vitamin B complex with C, voriconazole.

- **Y-Site Incompatibility:** allopurinol, amiodarone, amphotericin B, amphotericin B cholesteryl sulfate complex, ampicillin, anidulafungin, calcium chloride, calcium gluconate, caspofungin, cefotaxime, cefoxitin, cefuroxime, diazepam, diphenhydramine, dobutamine, doxorubicin liposome, doxycycline, epinephrine, fenoldopam, ganciclovir, haloperidol, hydroxyzine, idarubicin, imipenem/cilastatin, isoproterenol, lansoprazole, leucovorin, midazolam, nalbuphine, norepinephrine, ondansetron, phenytoin, prochlorperazine, promethazine, quinuapristin/dalfopristin, sargramostim, trimethoprim/sulfamethoxazole, verapamil, vincristine, vinorelbine.
- **Solution Incompatibility:** Do not add to Ringer's solution, LR, or Ionosol products, as compatibility varies with concentration.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as remembered unless almost time for next dose.
- Review symptoms of electrolyte imbalance with patients on chronic therapy; instruct patient to notify health care professional if these symptoms occur.
- Advise patient not to take milk products concurrently with this medication. Renal calculi or hypercalcemia (milk-alkali syndrome) may result.
- Emphasize the importance of regular follow-up examinations to monitor serum electrolyte levels and acid-base balance and to monitor progress.
- **Antacid:** Advise patient to avoid routine use of sodium bicarbonate for indigestion. Dyspepsia that persists > 2 wk should be evaluated by a health care professional.

- Advise patient on sodium-restricted diet to avoid use of baking soda as a home remedy for indigestion.
- Instruct patient to notify health care professional if indigestion is accompanied by chest pain, difficulty breathing, or diaphoresis or if stools become dark and tarry.

Evaluation/Desired Outcomes

- Increase in urinary pH.
- Clinical improvement of acidosis.
- Enhanced excretion of selected overdoses and poisonings.
- Decreased gastric discomfort.

sodium citrate and citric acid (soe-dee-um sye-trate and sit-rik as-id)

Bicitra, Oracit,  PMS-Dicitrate, Shohl's Solution modified

Classification

Therapeutic: antilithotics, mineral and electrolyte replacements/supplements
Pharmacologic: alkalinizing agents

Pregnancy Category C

Indications

Management of chronic metabolic acidosis associated with chronic renal insufficiency or renal tubular acidosis. Alkalinization of urine. Prevention of cystine and urate urinary calculi. Prevention of aspiration pneumonia during surgical procedures. Used as a neutralizing buffer.

Action

Converted to bicarbonate in the body, resulting in increased blood pH. As bicarbonate is renally excreted, urine is also alkalinized, increasing the solubility of cystine and uric acid. Neutralizes gastric acid. **Therapeutic Effects:** Provision of bicarbonate in metabolic acidosis. Alkalinization of the urine. Prevention of cystine and urate urinary calculi. Prevention of aspiration pneumonia.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Rapidly and widely distributed.

Metabolism and Excretion: Rapidly oxidized to bicarbonate, which is excreted primarily by the kidneys. Small amounts (<5%) excreted unchanged by the lungs.

Half-life: Unknown.

TIME/ACTION PROFILE (effects on serum pH)

ROUTE	ONSET	PEAK	DURATION
PO	rapid (min–hr)	unknown	4–6 hr

Contraindications/Precautions

Contraindicated in: Severe renal insufficiency; Severe sodium restriction; HF, untreated hypertension, edema, or toxemia of pregnancy.

Use Cautiously in: **OB, Lactation:** Safety not established.

Adverse Reactions/Side Effects

GI: diarrhea. **F and E:** fluid overload, hypernatremia (severe renal impairment), hypocalcemia, metabolic alkalosis (large doses only). **MS:** tetany.

Interactions

Drug-Drug: May partially antagonize the effects of antihypertensives. Urinary alkalization may result in ↓ salicylate or barbiturate levels or ↑ levels of quinidine, flecainide, or amphetamines.

Route/Dosage

Adjust dosage according to urine pH. Contains 1 mEq sodium and 1 mEq bicarbonate/mL solution.

Alkalizer

PO (Adults): 10–30 mL solution diluted in water 4 times daily.

PO (Children): 5–15 mL solution diluted in water 4 times daily.

Antiurolithic

PO (Adults): 10–30 mL solution diluted in water 4 times daily.

Neutralizing Buffer

PO (Adults): 15–30 mL solution diluted in 15–30 mL of water.

Availability

Oral solution: 500 mg sodium citrate/334 mg citric acid/5 mL (Bicitra, PMS-Dicitrate), 490 mg sodium citrate/640 mg citric acid/5 mL (Oracit).

NURSING IMPLICATIONS

Assessment

- Assess patient for signs of alkalosis (confusion, irritability, paresthesia, tetany, altered breathing pattern) or hypernatremia (edema, weight gain, hypertension, tachycardia, fever, flushed skin, mental irritability) throughout therapy.
- Monitor patients with renal dysfunction for fluid overload (discrepancy in intake and output, weight gain, edema, rales/crackles, and hypertension).

- Lab Test Considerations:** Prior to and every 4 mo throughout chronic therapy, monitor hematocrit, hemoglobin, electrolytes, pH, creatinine, urinalysis, and 24-hr urine for citrate.

- Monitor urine pH if used to alkalize urine.

Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- PO:** Solution is more palatable if chilled. Administer with 30–90 mL of chilled water. Administer 30 min after meals or as bedtime snack to minimize saline laxative effect.
- When used as preanesthetic, administer 15–30 mL of sodium citrate with 15–30 mL of chilled water.

Patient/Family Teaching

- Instruct patient to take as directed. Missed doses should be taken within 2 hr. Do not double doses.
- Instruct patients receiving chronic sodium citrate on correct method of monitoring urine pH, maintenance of alkaline urine, and the need to increase fluid intake to 3000 mL/day. When treatment is discontinued, pH begins to fall toward pretreatment levels.
- Advise patients receiving long-term therapy on need to avoid salty foods.

Evaluation/Desired Outcomes

- Correction of metabolic acidosis.
- Maintenance of alkaline urine with resulting decreased stone formation.
- Buffering the pH of gastric secretions, thereby preventing aspiration pneumonia associated with intubation and anesthesia.

sodium ferric gluconate complex, See IRON SUPPLEMENTS.

sodium picosulfate/ magnesium oxide/anhydrous citric acid

(soe-dee-um pi-koe-sul-fate/mag-nee-zhum ox-side/an-hye-druss sit-ric as-id)

Prepopik

Classification

Therapeutic: laxatives

Pharmacologic: osmotic laxatives, stimulant laxatives

Pregnancy Category B

☼ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Indications

Cleansing of the colon in preparation for colonoscopy.

Action

Sodium picosulfate—converted by colonic bacteria to BHPM, which directly stimulates colonic peristalsis.

Magnesium oxide and anhydrous citric acid—combine to form magnesium citrate, an osmotic laxative that causes water retention within the GI tract.

Therapeutic Effects: With concurrent fluid ingestion produces watery diarrhea and colonic purging in preparation for colonoscopy.

Pharmacokinetics

Absorption: Minimal systemic absorption.

Distribution: Action is primarily local.

Metabolism and Excretion: Action is primarily local.

Half-life: *Sodium picosulfate*—7.4 hr.

TIME/ACTION PROFILE (onset of watery diarrhea)

ROUTE	ONSET	PEAK	DURATION
PO	within hr	unknown	unknown

Contraindications/Precautions

Contraindicated in: Severely impaired renal function (CCr <30 mL/min); GI obstruction/ileus/bowel perforation/toxic colitis or megacolon/gastric retention.

Use Cautiously in: Renal impairment/concurrent medications affecting renal function (↑ risk of renal impairment); Known risk factors for arrhythmias including prolonged QT interval, recent MI, unstable angina pectoris, CHF, or cardiomyopathy; Known/suspected inflammatory bowel disease (may cause mucosal ulcerations); Electrolyte abnormalities (correct prior to administration); History of seizures or concurrent use of medications that ↓ seizure threshold (may ↑ risk of seizures); Patients at risk for aspiration; **OB:** Use during pregnancy only if clearly needed; **Lactation:** Use caution if breast feeding; **Pedi:** Safe and effective use in children has not been established.

Adverse Reactions/Side Effects

CNS: SEIZURES, headache. **CV:** ARRHYTHMIAS. **GI:** abdominal pain, abdominal distention, abdominal pain, nausea, vomiting. **GU:** RENAL IMPAIRMENT. **F and E:** dehydration, fluid/electrolyte abnormalities.

Interactions

Drug-Drug: Concurrent use of drugs affecting fluid and electrolyte status/renal function including **ACE inhibitors, angiotensin receptor blockers, corticosteroids, NSAIDs, diuretics**, and other **laxatives** may ↑ risk of dehydration, renal impairment, seizures, hypotension, and fluid/electrolyte abnormalities. Concurrent use of medications that ↓ seizure threshold, including **tricyclic antidepressants** or concurrent **al-**

cohol/benzodiazepine withdrawal (may ↑ risk of seizures). Absorption of **oral medications** taken within 1 hr of start may be altered. Prior/concurrent **anti-infectives** may ↓ efficacy. Concurrent use of other **laxatives** (may ↑ risk of mucosal ulcerations). Concurrent use of **digoxin** (electrolyte abnormalities may ↑ risk of toxicity). Concurrent use of drugs that may induce the syndrome if inappropriate secretion of antidiuretic hormone (SIADH) including **antipsychotics, carbamazepine, tricyclic antidepressants**, and **SSRIs** may ↑ risk of water retention and electrolyte abnormalities. Magnesium in preparation chelates and prevents the absorption of **chlorpromazine, digoxin, fluoroquinolones, penicillamine**, and **tetracycline**; these should be given at least 2 hr before or 6 hr after.

Route/Dosage

Each dose should be followed by 3 8-ounce drinks of clear liquid.

PO (Adults): *Split dose method*—One reconstituted packet during evening before colonoscopy, repeated during the morning prior to the colonoscopy; *Day-before method*—One reconstituted packet during afternoon or early evening before colonoscopy, repeated 6 hr later during evening prior to the colonoscopy. Additional clear liquids are required.

Availability

Powder for oral use (requires reconstitution) (orange): 10 mg sodium picosulfate/3.5 g manesium oxide/12 g anhydrous citric acid per packet.

NURSING IMPLICATIONS

Assessment

- Assess patient for abdominal distention, presence of bowel sounds, and usual pattern of bowel function.
- Assess color, consistency, and amount of stool produced. Watery diarrhea to clear liquid should be defecated at the completion.
- Monitor for significant vomiting or signs of dehydration (orthostatic hypotension) following medication. Consider post-colonoscopy lab tests (electrolytes, creatinine, BUN) and treat accordingly. May occur up to 7 days after colonoscopy.
- **Assess for seizures, especially in patients with a seizure disorder or patients taking medications that lower seizure threshold, withdrawing from alcohol or benzodiazepines, or with hyponatremia.**
- Monitor ECG pre-dose and post-colonoscopy in patients with increased risk of arrhythmias (history of prolonged QT interval, uncontrolled arrhythmias, recent MI, unstable angina, HF, cardiomyopathy).
- **Lab Test Considerations:** May cause ↓ serum potassium, sodium, chloride, calcium, eGFR, and ↑ serum magnesium and creatinine.

Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- **Correct fluid and electrolyte abnormalities prior to therapy.**
- Assess for difficulty swallowing or history of regurgitation or aspiration prior to administering.
- **PO:** Reconstitute powder right before use; do not prepare solution in advance. Fill the supplied dosing cup with cold water up to lower (5-oz) line on cup and pour in contents of 1 packet of Prepopik powder. Stir for 2–3 min. Reconstituted solution may become slightly warm as powder dissolves. There are 2 dosing regimens:..
- **Split Dose (Preferred Method):** Take dissolved first packet the night before colonoscopy followed by five 8-oz drinks (upper line of dosing cup) of clear liquid before bed. On day of colonoscopy, take dissolved second packet followed by at least 3 8-oz drinks of clear liquid before colonoscopy. Drinking clear liquids may continue until 2 hr of colonoscopy.
- **Day-Before Dosing:** Take dissolved first packet in afternoon or early evening followed by five 8-oz drinks of clear liquid before next dose. Take dissolved second packet in the late evening followed by 3 8-oz drinks of clear liquid before bed. Drinking clear liquids may continue until 2 hr of colonoscopy.

Patient/Family Teaching

- Instruct patient to consume only clear liquids (no solid food or milk) on the day before colonoscopy and up to 2 hr before time of the colonoscopy. Reconstitute powder as directed and follow dosing regimen.
- Caution patient to hydrate adequately with clear liquids before, during, and after use of Prepopik. Clear liquids include water, clear broth, apple juice, white cranberry juice, white grape juice, gingerale, plain jello (not red or purple), and frozen juice bars (not purple or red). Do not eat solid foods or drink milk during therapy.
- Advise patient to notify health care professional if severe bloating, distention, or abdominal pain occurs following first packet of Prepopik. Delay second packet administration until symptoms resolve.
- Advise patient not to take any other laxatives during therapy.
- Instruct patient to notify health care professional promptly if hives, rash, vomiting that prevents you from keeping down the additional prescribed amounts of clear liquids needed after taking medi-

cation, dizziness, urinating less than normal, or headache occur.

- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Clean colon prior to colonoscopy.

sodium polystyrene sulfonate

(soe-dee-um po-lee-stye-reen sul-fon-ate)

Kalexate, Kayexalate, ❖ K-Exit, Kionex, SPS

Classification

Therapeutic: hypokalemic, electrolyte modifiers

Pharmacologic: cationic exchange resins

Pregnancy Category C

Indications

Mild to moderate hyperkalemia (if severe, more immediate measures such as sodium bicarbonate IV, calcium, or glucose/insulin infusion should be instituted).

Action

Exchanges sodium ions for potassium ions in the intestine (each 1 g is exchanged for 1 mEq potassium).

Therapeutic Effects: Reduction of serum potassium levels.

Pharmacokinetics

Absorption: Distributed throughout the intestine but is nonabsorbable.

Distribution: Not distributed.

Metabolism and Excretion: Eliminated in the feces.

Half-life: Unknown.

TIME/ACTION PROFILE (decrease in serum potassium)

ROUTE	ONSET	PEAK	DURATION
PO	2–12 hr	unknown	6–24 hr
Rectal	2–12 hr	unknown	4–6 hr

Contraindications/Precautions

Contraindicated in: Life-threatening hyperkalemia (other, more immediate measures should be instituted); Hypersensitivity to saccharin or parabens

❖ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

(some products); Ileus; Abnormal bowel function ($\uparrow$ risk for intestinal necrosis); Postoperative patients with no bowel movement ($\uparrow$ risk for intestinal necrosis); History of impaction, chronic constipation, inflammatory bowel disease, ischemic colitis, vascular intestinal atherosclerosis, previous bowel resection, or bowel obstruction ($\uparrow$ risk for intestinal necrosis); Known alcohol intolerance (suspension only).

Use Cautiously in: Geri: Geriatric patients; Heart failure; Hypertension; Edema; Sodium restriction; Constipation.

Adverse Reactions/Side Effects

GI: **INTESTINAL NECROSIS**, constipation, fecal impaction, anorexia, gastric irritation, ischemic colitis, nausea, vomiting. **F and E:** hypocalcemia, hypokalemia, sodium retention, hypomagnesemia.

Interactions

Drug-Drug: Administration with **calcium** or **magnesium-containing antacids** may $\downarrow$ resin-exchanging ability and $\uparrow$ risk of systemic alkalosis. Hypokalemia may enhance **digoxin** toxicity. Use with **sorbitol** may $\uparrow$ risk of colonic necrosis (concomitant use not recommended).

Route/Dosage

4 level tsp = 15 g (4.1 mEq sodium/g).

PO (Adults): 15 g 1–4 times daily in water (up to 40 g 4 times daily).

Rect (Adults): 30–50 g as a retention enema; repeat as needed q 6 hr.

PO, Rect (Children): 1 g/kg/dose q 6 hr.

Availability (generic available)

Suspension: 15 g sodium polystyrene sulfonate with 20 g sorbitol/60 mL, 15 g sodium polystyrene sulfonate with 14.1 g sorbitol/60 mL. **Powder:** 15 g/4 level tsp.

NURSING IMPLICATIONS

Assessment

- Monitor response of symptoms of hyperkalemia (fatigue, muscle weakness, paresthesia, confusion, dyspnea, peaked T waves, depressed ST segments, prolonged QT segments, widened QRS complexes, loss of P waves, and cardiac arrhythmias). Assess for development of hypokalemia (weakness, fatigue, arrhythmias, flat or inverted T waves, prominent U waves).
- Monitor intake and output ratios and daily weight. Assess for symptoms of fluid overload (dyspnea, rales/crackles, jugular venous distention, peripheral edema). Concurrent low-sodium diet may be ordered for patients with HF (see Appendix M).
- In patients receiving concurrent digoxin, assess for symptoms of digoxin toxicity (anorexia, nausea, vomiting, visual disturbances, arrhythmias).
- Assess abdomen and note character and frequency of stools. Discontinue sodium polystyrene sulfonate

if patient becomes constipated. Concurrent sorbitol or laxatives may be ordered to prevent constipation or impaction. Some products contain sorbitol to prevent constipation. Patient should ideally have 1–2 watery stools each day during therapy. **Monitor for intestinal necrosis if sorbitol is added.**

- **Lab Test Considerations:** Monitor serum potassium daily during therapy. Notify health care professional when potassium $\downarrow$ to 4–5 mEq/L.
- Monitor renal function and electrolytes (especially sodium, calcium, bicarbonate, and magnesium) prior to and periodically throughout therapy.

Potential Nursing Diagnoses

Constipation (Side Effects)

Implementation

- Solution is stable for 24 hr when refrigerated.
- Consult health care professional regarding discontinuation of medications that may increase serum potassium (angiotensin-converting enzyme inhibitors, potassium-sparing diuretics, potassium supplements, salt substitutes).
- An osmotic laxative (sorbitol) is usually administered concurrently to prevent constipation.
- **PO:** For oral administration, shake commercially available suspension well before use. When using powder, add prescribed amount to 3–4 mL water/g of powder. Shake well. Syrup may be ordered to improve palatability. Resin cookie or candy recipes are available; discuss with pharmacist or dietician.
- **Retention Enema:** Precede retention enema with cleansing enema. Administer solution via rectal tube or 28-French Foley catheter with 30-mL balloon. Insert tube at least 20 cm and tape in place.
- For retention enema, add powder to 100 mL of prescribed solution (usually sorbitol or 20% dextrose in water). Shake well to dissolve powder thoroughly; should be of liquid consistency. Position patient on left side and elevate hips on pillow if solution begins to leak. Follow administration of medication with additional 50–100 mL of diluent to ensure administration of complete dose. Encourage patient to retain enema as long as possible, at least 30–60 min.
- After retention period, irrigate colon with 1–2 L of non-sodium-containing solution. Y-connector with tubing may be attached to Foley or rectal tube; cleansing solution is administered through 1 port of the Y and allowed to drain by gravity through the other port.

Patient/Family Teaching

- Explain purpose and method of administration of medication to patient.
- Advise patient to avoid taking antacids or laxatives during therapy, unless approved by health care professional; may cause systemic alkalosis.
- Advise female patient to notify health care professional if pregnant or breast feeding.

- Inform patient of need for frequent lab tests to monitor effectiveness.

Evaluation/Desired Outcomes

- Normalization of serum potassium levels.

solifenacin (so-li-fen-a-sin)
VESicare

Classification

Therapeutic: urinary tract antispasmodics
Pharmacologic: anticholinergics

Pregnancy Category C

Indications

Overactive bladder with symptoms (urge incontinence, urgency, frequency).

Action

Acts as a muscarinic (cholinergic) receptor antagonist; antagonizes bladder smooth muscle contraction.

Therapeutic Effects: Decreased symptoms of overactive bladder.

Pharmacokinetics

Absorption: Well absorbed (90%).

Distribution: Unknown.

Protein Binding: 98%.

Metabolism and Excretion: Extensively metabolized by the CYP3A4 enzyme system. 69% excreted in urine as metabolites, 22% in feces.

Half-life: 45–68 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
Oral	unknown	3–8 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Urinary retention; Gastric retention; Uncontrolled angle-closure glaucoma; Severe hepatic impairment; **Lactation:** Lactation.

Use Cautiously in: Concurrent use of CYP3A4 inhibitors (use lower dose/clinical monitoring may be necessary); Moderate hepatic impairment (lower dose recommended); Renal impairment (dose should not exceed 5 mg/day if CCr <30 mL/min); Bladder outflow obstruction; GI obstructive disorders, severe constipation, or ulcerative colitis; Myasthenia gravis; Angle-closure glaucoma; **OB:** Use only if maternal benefit outweighs fetal risk; **Pedi:** Safety not established.

Adverse Reactions/Side Effects

CNS: confusion, drowsiness, hallucinations, headache.

CV: palpitations, tachycardia. **EENT:** blurred vision.

GI: constipation, dry mouth, dyspepsia, nausea. **MS:** muscle weakness. **Misc:** ANGIOEDEMA.

Interactions

Drug-Drug: Drugs that induce or inhibit the CYP3A4 enzyme system may significantly alter levels; ketoconazole ↑ levels and risk of toxicity (do not exceed 5 mg/day).

Route/Dosage

PO (Adults): 5 mg once daily, may be ↑ to 10 mg once daily; *Concurrent use of ketoconazole or other potent CYP3A4 inhibitors*—Dose should not exceed 5 mg/day.

Renal Impairment

(Adults): CCr <30 mL/min—Dose should not exceed 5 mg/day.

Hepatic Impairment

(Adults): *Moderate hepatic impairment*—Dose should not exceed 5 mg/day.

Availability

Tablets: 5 mg, 10 mg. **Cost:** All strengths \$703.66/90.

NURSING IMPLICATIONS

Assessment

- Monitor voiding pattern and assess symptoms of overactive bladder (urinary urgency, urinary incontinence, urinary frequency) to and periodically during therapy.

Potential Nursing Diagnoses

Impaired urinary elimination (Indications)

Implementation

- Do not confuse Vesicare (solifenacin) with Vesanoïd (oral tretinoin).
- **PO:** Administer once daily without regard to food. Tablets must be swallowed whole; do not break, crush, or chew.

Patient/Family Teaching

- Instruct patient to take solifenacin as directed. Advise patient to read the *Patient Information* before starting therapy and with each prescription refill. If a dose is missed, skip dose and take next day; do not take 2 doses in same day.
- Do not share solifenacin with others; may be dangerous.
- May cause dizziness and blurred vision. Caution patient to avoid driving and other activities that require alertness until response to medication is known.
- Advise patient to notify health care professional immediately if hives; rash; swelling of lips, face, tongue, or throat; trouble breathing occurs.

✶ = Canadian drug name. ✶ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Inform patient of potential anticholinergic side effects (constipation, urinary retention, blurred vision, heat prostration in a hot environment).
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.

Evaluation/Desired Outcomes

- Decrease in symptoms of overactive bladder (urge urinary incontinence, urgency, frequency).

somatropin (recombinant), See GROWTH HORMONES.

sotalol (soe-ta-lole)

Betapace, Betapace AF,  Rylosol, Sordine

Classification

Therapeutic: antiarrhythmics (class III)

Pregnancy Category B

Indications

Management of life-threatening ventricular arrhythmias. **Betapace AF:** Maintenance of normal sinus rhythm in patients with highly symptomatic atrial fibrillation/atrial flutter (AF/AFL) who are currently in sinus rhythm.

Action

Blocks stimulation of beta₁ (myocardial) and beta₂ (pulmonary, vascular, and uterine) -adrenergic receptor sites. **Therapeutic Effects:** Suppression of arrhythmias.

Pharmacokinetics

Absorption: Well absorbed following oral administration (bioavailability 90–100%).

Distribution: Crosses the placenta; enters breast milk.

Metabolism and Excretion: Elimination is mostly renal.

Half-life: 12 hr (↑ in renal impairment).

TIME/ACTION PROFILE (antiarrhythmic effects)

ROUTE	ONSET	PEAK	DURATION
PO	hr	2–3 days	8–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Uncompensated HF; Pulmonary edema; Asthma; Cardiogenic shock; Congenital or acquired long QT syndromes; Sinus bradycardia, 2nd- and 3rd-degree AV block (unless a functioning pacemaker is present); CCr <40 mL/min in patients who are being treated with Betapace AF.

Use Cautiously in: Renal impairment (↑ dosing interval recommended if CCr ≤60 mL/min for patients with ventricular arrhythmias); Hepatic impairment; Hypokalemia (↑ risk of arrhythmias); **Geri:** ↑ sensitivity to beta blockers; Diabetes mellitus (may mask signs of hypoglycemia); Thyrotoxicosis (may mask symptoms); Patients with a history of severe allergic reactions (intensity of reactions may be increased); **OB, Lactation, PEDI:** Safety not established; may cause fetal/neonatal bradycardia, hypotension, hypoglycemia, or respiratory depression.

Adverse Reactions/Side Effects

CNS: fatigue, weakness, anxiety, dizziness, drowsiness, insomnia, memory loss, mental depression, mental status changes, nervousness, nightmares. **EENT:** blurred vision, dry eyes, nasal stuffiness. **Resp:** bronchospasm, wheezing. **CV:** **ARRHYTHMIAS, BRADYCARDIA, HF, PULMONARY EDEMA**, orthostatic hypotension, peripheral vasoconstriction. **GI:** constipation, diarrhea, nausea. **GU:** erectile dysfunction, ↓ libido. **Derm:** itching, rash. **Endo:** hyperglycemia, hypoglycemia. **MS:** arthralgia, back pain, muscle cramps. **Neuro:** paresthesia. **Misc:** drug-induced lupus syndrome.

Interactions

Drug-Drug: Concurrent use with other **class 1A antiarrhythmics** is not recommended due to ↑ risk of arrhythmias. **General anesthesia, IV phenytoin, and verapamil** may cause additive myocardial depression. Additive bradycardia may occur with **digoxin, beta-blockers, verapamil, and diltiazem**. Additive hypotension may occur with other **antihypertensives**, acute ingestion of **alcohol**, or **nitrates**. Concurrent use with **amphetamines, cocaine, ephedrine, epinephrine, norepinephrine, phenylephrine, or pseudoephedrine** may result in unopposed alpha-adrenergic stimulation (excessive hypertension, bradycardia). Concurrent **thyroid hormone** administration may ↓ effectiveness. May alter the effectiveness of **insulin** or **oral hypoglycemic agents** (dose adjustments may be necessary). May ↓ the effectiveness of **beta-adrenergic bronchodilators** and **theophylline**. May ↓ the beneficial beta₁ cardiovascular effects of **dopamine** or **dobutamine**. Discontinuation of **clonidine** in patients receiving sotalol may result in excessive rebound hypertension. Use cautiously within 14 days of **MAO inhibitors** (may result in hypertension).

Route/Dosage

Ventricular Arrhythmias

PO (Adults): 80 mg twice daily; may be gradually ↑ (usual maintenance dose is 160–320 mg/day in 2–3 divided doses; some patients may require up to 480–640 mg/day).

Renal Impairment

PO (Adults): CCr 30–59 mL/min—initial dose of 80 mg, with subsequent doses given q 24 hr; CCr 10–

29 mL/min—initial dose of 80 mg, with subsequent doses given q 36–48 hr.

Atrial Fibrillation/Atrial Flutter

PO (Adults): 80 mg twice daily, may be ↑ during careful monitoring to 120 mg twice daily if necessary.

Renal Impairment

PO (Adults): CCr 40–60 mL/min—Administer q 24 hr.

Availability (generic available)

Tablets: 80 mg, 120 mg, 160 mg, 240 mg. **Tablets (Betapace AF):** 80 mg, 120 mg, 160 mg.

NURSING IMPLICATIONS

Assessment

- Monitor ECG prior to and periodically during therapy. May cause life-threatening ventricular tachycardia associated with QT interval prolongation. Do not initiate sotalol therapy if baseline QTc is longer than 450 ms. If QT interval becomes ≥500 ms, reduce dose, prolong duration of infusion, or discontinue therapy.
- Monitor BP and pulse frequently during dose adjustment period and periodically during therapy. Assess for orthostatic hypotension when assisting patient up from supine position.
- Monitor intake and output ratios and daily weight. Assess patient routinely for evidence of fluid overload (peripheral edema, dyspnea, rales/crackles, fatigue, weight gain, jugular venous distention).
- **Lab Test Considerations:** Calculate creatinine clearance prior to dosing.
- May cause ↑ BUN, serum lipoprotein, potassium, triglyceride, and uric acid levels.
- May cause increased ANA titers.
- May cause increase in blood glucose levels.
- **Toxicity and Overdose:** Monitor patients receiving beta blockers for signs of overdose (bradycardia, severe dizziness or fainting, severe drowsiness, dyspnea, bluish fingernails or palms, seizures). Notify health care professional immediately if these signs occur.
- Glucagon has been used to treat bradycardia and hypotension.

Potential Nursing Diagnoses

Decreased cardiac output (Side Effects)

Noncompliance (Patient/Family Teaching)

Implementation

- Do not confuse sotalol with Sudafed (pseudoephedrine).
- Patients should be hospitalized and monitored for arrhythmias for at least 3 days during initiation of therapy and dose increases.

- Do not substitute Betapace for Betapace AF. Make sure patients transferred from Betapace to Betapace AF have enough Betapace AF upon leaving the hospital to allow for uninterrupted therapy until Betapace AF prescription can be filled.
- **PO: Take apical pulse prior to administering.** If <50 bpm or if arrhythmia occurs, withhold medication and notify health care professional.
- Administer on an empty stomach, 1 hr before or 2 hr after meals. Administration with food, especially milk or milk products, reduces absorption by approximately 20%.
- Avoid administering antacids containing aluminum or magnesium within 2 hr before administration of sotalol.
- For patients unable to swallow pills, pharmacist can convert tablets to a solution.

Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day, even if feeling well; do not skip or double up on missed doses. Take missed doses as soon as possible up to 8 hr before next dose. **Abrupt withdrawal may precipitate life-threatening arrhythmias, hypertension, or myocardial ischemia.** Advise patients taking *Betapace AF* to read *Medication Guide* before starting and with each Rx refill in case of changes.
- Advise patient to make sure enough medication is available for weekends, holidays, and vacations. A written prescription may be kept in wallet in case of emergency.
- Teach patient and family how to check pulse and BP. Instruct them to check pulse daily and BP bi-weekly. Advise patient to hold dose and contact physician or other health care professional if pulse is <50 bpm or if BP changes significantly.
- May cause drowsiness or dizziness. Caution patients to avoid driving or other activities that require alertness until response to the drug is known.
- Advise patients to change positions slowly to minimize orthostatic hypotension, especially during initiation of therapy or when dose is increased.
- Caution patient that this medication may increase sensitivity to cold.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially cold preparations.
- Diabetic patients should closely monitor blood glucose, especially if weakness, malaise, irritability, or fatigue occurs. Medication may mask tachycardia and increased BP as signs of hypoglycemia, but dizziness and sweating may still occur.

S

☼ = Canadian drug name. ☼ = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Advise patient to notify health care professional immediately if new fast heartbeats with lightheadedness and fainting occurs, or if slow pulse, difficulty breathing, wheezing, cold hands and feet, dizziness, confusion, depression, rash, fever, sore throat, unusual bleeding, bruising, or if pain or swelling at the infusion site occurs.
- Instruct patient to inform health care professional of medication regimen prior to treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.

Evaluation/Desired Outcomes

- Control of arrhythmias without appearance of detrimental side effects.

spironolactone, See DIURETICS (POTASSIUM-SPARING).

streptokinase, See THROMBOLYTIC AGENTS.

streptomycin, See AMINOGLYCOSIDES.

strong iodine solution, See IODINE, IODIDE.

sucralfate (soo-kral-fate)

Carafate, ★ Sulcrate

Classification

Therapeutic: antiulcer agents
Pharmacologic: GI protectants

Pregnancy Category B

Indications

Short-term management of duodenal ulcers. Maintenance (preventive) therapy of duodenal ulcers. **Unlabeled Use:** Management of gastric ulcer or gastroesophageal reflux. Prevention of gastric mucosal injury caused by high-dose aspirin or other NSAIDs in patients with rheumatoid arthritis or in high-stress situations (e.g., intensive care unit). **Suspension:** Mucositis/stomatitis/rectal or oral ulcerations from various etiologies.

Action

Aluminum salt of sulfated sucrose reacts with gastric acid to form a thick paste, which selectively adheres to the ulcer surface. **Therapeutic Effects:** Protection of ulcers, with subsequent healing.

Pharmacokinetics

Absorption: Systemic absorption is minimal (<5%).

Distribution: Unknown.

Metabolism and Excretion: >90% is eliminated in the feces.

Half-life: 6–20 hr.

TIME/ACTION PROFILE (mucosal protectant effect)

ROUTE	ONSET	PEAK	DURATION
PO	1–2 hr	unknown	6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Renal failure (accumulation of aluminum can occur); Diabetes (↑ risk of hyperglycemia with suspension); Impaired swallowing (↑ risk of tablet aspiration).

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness. **GI:** constipation, diarrhea, dry mouth, gastric discomfort, indigestion, nausea. **Derm:** pruritus, rashes. **Endo:** hyperglycemia (with suspension). **Misc:** **ANAPHYLAXIS.**

Interactions

Drug-Drug: May ↓ absorption of phenytoin, fat-soluble vitamins, or tetracycline. ↓ effectiveness when used with antacids, cimetidine, or ranitidine. ↓ absorption of fluoroquinolones (separate administration by 2 hr).

Route/Dosage

Treatment of Ulcers

PO (Adults): 1 g 4 times daily, given 1 hr before meals and at bedtime; or 2 g twice daily, on waking and at bedtime.

Prevention of Ulcers

PO (Adults): 1 g twice daily, given 1 hr before a meal.

Gastroesophageal Reflux

PO (Adults): 1 g 4 times daily, given 1 hr before meals and at bedtime (unlabeled).

PO (Children): 40–80 mg/kg/day divided q 6 hr, given 1 hr before meals and at bedtime (unlabeled).

Stomatitis

PO (Adults and Children): 5–10 mL of suspension swish and spit or swish and swallow 4 times daily.

Proctitis

Rect (Adults): 2 g of suspension given as an enema once or twice daily.

Availability (generic available)

Tablets: 1 g. **Cost:** *Generic*—\$23.86/100. **Oral suspension:** 1 g/10 mL. **Cost:** \$122.42/420 mL.

NURSING IMPLICATIONS

Assessment

- Assess patient routinely for abdominal pain and frank or occult blood in the stool.

Potential Nursing Diagnoses

Acute pain (Indications)

Constipation (Side Effects)

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- **PO:** Administer on an empty stomach, 1 hr before meals and at bedtime. Tablet may be broken or dissolved in water before ingestion. Shake suspension well before administration.
- If nasogastric or feeding tube administration is required, consult pharmacist; protein-binding properties of sucralfate have resulted in formation of a bezoar when administered with enteral feedings and other medications.
- If antacids are also required for pain, administer 30 min before or after sucralfate dosage.

Patient/Family Teaching

- Advise patient to continue with course of therapy for 4–8 wk, even if feeling better, to ensure ulcer healing. If a dose is missed, take as soon as remembered unless almost time for next dose; do not double doses.
- Advise patient that increase in fluid intake, dietary bulk, and exercise may prevent drug-induced constipation.
- Emphasize the importance of routine examinations to monitor progress.

Evaluation/Desired Outcomes

- Decrease in abdominal pain.
- Prevention and healing of duodenal ulcers, seen by x-ray examination and endoscopy.

sulconazole, See ANTIFUNGALS (TOPICAL).

sulfaSALazine

(sul-fa-sal-a-zeen)

Azulfidine, Azulfidine EN-tabs,

✳ Salazopyrin

Classification

Therapeutic: antirheumatics (DMARD), gastrointestinal anti-inflammatories

Pregnancy Category B

Indications

Mild-to-moderate ulcerative colitis or as adjunctive therapy in severe ulcerative colitis. Rheumatoid arthritis unresponsive or intolerant to salicylates and/or NSAIDs.

Action

Locally acting anti-inflammatory action in the colon, where activity is probably a result of inhibition of prostaglandin synthesis. **Therapeutic Effects:** Reduction in the symptoms of ulcerative colitis or rheumatoid arthritis.

Pharmacokinetics

Absorption: 10–15% absorbed after oral administration.

Distribution: Widely distributed; crosses the placenta and enters breast milk.

Protein Binding: 99%.

Metabolism and Excretion: Split by intestinal bacteria into sulfapyridine and 5-aminosalicylic acid. Some absorbed sulfasalazine is excreted by bile back into intestines; 15% excreted unchanged by the kidneys. Sulfapyridine also excreted mostly by the kidneys.

Half-life: 6 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	1 hr	1.5–6 hr	6–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity reactions to sulfonamides, salicylates, or sulfasalazine; Cross-sensitivity with furosemide, sulfonyleurea hypoglycemic agents, or carbonic anhydrase inhibitors may exist; Glucose-6-phosphate dehydrogenase (G6PD) deficiency; Hypersensitivity to bisulfites (mesalamine enema only); Urinary tract or intestinal obstruction; Porphyria; **Pedi:** Children <2 yr (safety not established).

Use Cautiously in: Severe hepatic or renal impairment; History of porphyria; Blood dyscrasias; **OB:** Neural tube defects have been reported; **Lactation:** Safety not established; may compete with bilirubin for binding sites on plasma proteins in the newborn and cause kernicterus; bloody stools or diarrhea reported in breast-fed infants.

Adverse Reactions/Side Effects

CNS: headache. **Resp:** pneumonitis. **GI:** anorexia, diarrhea, nausea, vomiting, drug-induced hepatitis.

GU: crystalluria, infertility, oligospermia, orange-yellow discoloration of urine. **Derm:** **EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, rash,** photosensitivity, yellow discoloration.

Hemat: **AGRANULOCYTOSIS, APLASTIC ANEMIA,** blood dyscrasias, eosinophilia, hemolytic anemia, megalob-

✳ = Canadian drug name. ⚡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

blastic anemia, thrombocytopenia. **Neuro:** peripheral neuropathy. **Misc:** **ANGIOEDEMA**; *hypersensitivity reactions including*, **ANAPHYLAXIS**, fever.

Interactions

Drug-Drug: May ↑ action/risk of toxicity from **oral hypoglycemic agents**, **phenytoin**, **methotrexate**, **zidovudine**, or **warfarin**. ↑ risk of drug-induced hepatitis with other **hepatotoxic agents**. ↑ risk of crystalluria with **methenamine**. May ↓ metabolism and increase effects/toxicity of **mercaptopurine** or **thioguanine**.

Drug-Food: May ↓ **iron** and **folic acid** absorption.

Route/Dosage

Ulcerative Colitis

PO (Adults): 1 g q 6–8 hr (may start with 500 mg q 6–12 hr), followed by maintenance dose of 500 mg q 6 hr.

PO (Children >2 yr): *Initial*—6.7–10 mg/kg q 4 hr or 10–15 mg/kg q 6 hr or 13.3–20 mg/kg q 8 hr. *Maintenance*—7.5 mg/kg q 6 hr (not to exceed 2 g/day).

Rheumatoid arthritis

PO (Adults): 500 mg–1 g/day (as delayed-release tablets) for 1 wk, then ↑ by 500 mg/day q wk up to 2 g/day in 2 divided doses; if no benefit seen after 12 wk, ↑ to 3 g/day in 2 divided doses.

PO (Children ≥6 yr): 30–50 mg/kg/day in 2 divided doses (as delayed-release tablets); initiate therapy at ¼–½ of planned maintenance dose and ↑ q 7 days until maintenance dose is reached (not to exceed 2 g/day).

Availability (generic available)

Tablets: 500 mg. **Delayed-release (enteric-coated) tablets (Azulfidine EN-tabs):** 500 mg.

NURSING IMPLICATIONS

Assessment

- **Assess patient for allergy to sulfonamides and salicylates.** Therapy should be discontinued if rash, difficulty breathing, swelling of face or lips, or fever occur.
- **Monitor intake and output ratios.** Fluid intake should be sufficient to maintain a urine output of at least 1200–1500 mL daily to prevent crystalluria and stone formation.
- **Assess for rash periodically during therapy.** May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- **Ulcerative Colitis:** Assess abdominal pain and frequency, quantity, and consistency of stools at the beginning of and during therapy.

- **Rheumatoid Arthritis:** Assess range of motion and degree of swelling and pain in affected joints before and periodically during therapy.
- **Lab Test Considerations:** Monitor urinalysis, BUN, and serum creatinine before and periodically during therapy. May cause crystalluria and urinary cell calculi formation.
- **Lab Test Considerations:** Monitor CBC with differential and liver function tests before and every second wk during first 3 mo of therapy, monthly during the second 3 mo, and every 3 mo thereafter of as clinically indicated. Discontinue sulfasalazine if blood dyscrasias occur.
- **Lab Test Considerations:** Serum sulfapyridine levels may be monitored; concentrations >50 µg/mL may be associated with increased incidence of adverse reactions.

Potential Nursing Diagnoses

Acute pain (Indications)

Diarrhea (Indications)

Implementation

- **Do not confuse sulfasalazine with sulfadiazine.**
- Varying dosing regimens of sulfasalazine may be used to minimize GI side effects.
- **PO:** Administer after meals or with food to minimize GI irritation, with a full glass of water. Do not crush or chew enteric-coated tablets.

Patient/Family Teaching

- Instruct patient on the correct method of administration. Advise patient to take medication as directed, even if feeling better. Take missed doses as soon as remembered unless almost time for next dose.
- May cause dizziness. Caution patient to avoid driving or other activities that require alertness until response to medication is known.
- Advise patient to notify health care professional if skin rash, sore throat, fever, mouth sores, unusual bleeding or bruising, wheezing, fever, or hives occur.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Inform patient that this medication may cause orange-yellow discoloration of urine and skin, which is not significant. May permanently stain contact lenses yellow.
- Instruct patient to notify health care professional if symptoms worsen or do not improve. If symptoms of acute intolerance (cramping, acute abdominal pain, bloody diarrhea, fever, headache, rash) occur, discontinue therapy and notify health care professional immediately.
- Inform male patient that sulfasalazine may cause infertility.
- Instruct patient to notify health care professional if symptoms do not improve after 1–2 mo of therapy.

Evaluation/Desired Outcomes

- Decrease in diarrhea and abdominal pain.
- Return to normal bowel pattern in patients with ulcerative colitis. Effects may be seen within 3–21 days. The usual course of therapy is 3–6 wk.
- Maintenance of remission in patients with ulcerative colitis.
- Decrease in pain and inflammation and increase in mobility in patients with rheumatoid arthritis.

HIGH ALERT

SULFONYLUREAS

glimepiride (glye-me-pye-ride)
Amaryl

glipizide (glip-i-zide)
Glucotrol, Glucotrol XL

glyburide (glye-byoo-ride)
DiaBeta, ★ Euglucon, Glynase PresTab

Classification

Therapeutic: antidiabetics

Pharmacologic: sulfonylureas

Pregnancy Category B (glyburide [Glynase PresTab]), **C** (glimepiride, glipizide, and glyburide [DiaBeta])

Indications

Control of blood glucose in type 2 diabetes mellitus when diet therapy fails. Require some pancreatic function.

Action

Lower blood glucose by stimulating the release of insulin from the pancreas and increasing the sensitivity to insulin at receptor sites. May also decrease hepatic glucose production. **Therapeutic Effects:** Lowering of blood glucose in diabetic patients.

Pharmacokinetics

Absorption: All agents are well absorbed after oral administration.

Distribution: *Glyburide*—reaches high concentrations in bile and crosses the placenta.

Protein Binding: *Glimepiride*—99.5%, *glipizide*—99%, *glyburide*—99%.

Metabolism and Excretion: All agents are mostly metabolized by the liver. *Glimepiride*—converted to a metabolite with some hypoglycemic activity; *Glyburide*—Primarily metabolized by CYP2C9.

Half-life: *Glimepiride*—5–9.2; *glipizide*—2.1–2.6 hr; *glyburide*—10 hr.

TIME/ACTION PROFILE (hypoglycemic activity)

ROUTE	ONSET	PEAK	DURATION
Glimepiride	unknown	2–3 hr	24 hr
Glipizide	15–30 min	1–2 hr	up to 24 hr
Glyburide	45–60 min	1.5–3 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity with sulfonamides (cross-sensitivity may occur); Type 1 diabetes; Diabetic coma or ketoacidosis; Concurrent use of bosentan (glyburide only).

Use Cautiously in: **Geri:** ↑ sensitivity; dose reduction may be required; Glucose 6-phosphate dehydrogenase deficiency (↑ risk of hemolytic anemia); Renal or hepatic dysfunction (↑ risk of hypoglycemia); Infection, trauma, or surgery (may alter requirements for control of blood glucose); Impaired pituitary or adrenal function; Prolonged nausea or vomiting; Debilitated or malnourished patients (↑ risk of hypoglycemia); **OB, Lactation:** Safety not established; insulin recommended during pregnancy; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, headache, weakness. **GI:** constipation, cramps, diarrhea, drug-induced hepatitis, heartburn, ↑ appetite, nausea, vomiting. **Derm:** photosensitivity, rashes. **Endo:** hypoglycemia. **F and E:** hyponatremia. **Hemat:** **APLASTIC ANEMIA**, agranulocytosis, hemolytic anemia, leukopenia, pancytopenia, thrombocytopenia.

Interactions

Drug-Drug: ↑ risk of elevated liver enzymes when **bosentan** used with glyburide (avoid concurrent use). Effectiveness may be ↓ by concurrent use of **diuretics**, **corticosteroids**, **phenothiazines**, **oral contraceptives**, **estrogens**, **thyroid preparations**, **phenytoin**, **niacin**, **sympathomimetics**, and **isoniazid**. **Alcohol**, **androgens** (testosterone), **chloramphenicol**, **clarithromycin**, **fluoroquinolones**, **MAO inhibitors**, **NSAIDs**, **salicylates**, **sulfonamides**, and **warfarin** may ↑ risk of hypoglycemia. Concurrent use with **warfarin** may alter the response to both agents (↑ effects of both initially, then ↓ activity); close monitoring recommended during any changes in dose. **Beta blockers** may mask the signs and symptoms of hypoglycemia. May ↑ **cyclosporine** levels. **Colesevelam** may ↓ effects of glyburide and glipizide; administer glyburide and glipizide ≥4 hr before colesevelam.

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Route/Dosage

Glimepiride

PO (Adults): 1–2 mg once daily initially; may ↑ q 1–2 wk up to 8 mg/day (usual range 1–4 mg/day).

PO (Geriatric Patients): 1 mg/day initially.

Glipizide

PO (Adults): 5 mg/day initially, may be ↑ by 2.5–5 mg/day at weekly intervals as needed (maximum dose = 40 mg/day immediate-release), 20 mg/day (XL); XL dose form is given once daily. Doses >15 mg/day should be given as 2 divided doses of immediate-release tablets (not XL).

PO (Geriatric Patients): 2.5 mg/day initially.

Glyburide

The nonmicronized formulation (Diabeta) cannot be used interchangeably with the micronized formulation (Glynase PresTab)

PO (Adults): *Diabeta* (nonmicronized)—2.5–5 mg once daily initially; may be ↑ by 2.5–5 mg/day at weekly intervals (range 1.25–20 mg/day). *Glynase PresTab* (micronized)—1.5–3 mg/day initially; may be ↑ by 1.5 mg/day at weekly intervals (range 0.75–12 mg/day; doses >6 mg/day should be given as divided doses).

PO (Geriatric Patients): *Diabeta* (nonmicronized)—1.25 mg/day initially; may be ↑ by 2.5 mg/day at weekly intervals. *Glynase PresTab* (micronized)—0.75 mg/day; may be ↑ by 1.5 mg/day at weekly intervals.

Availability

Glimepiride (generic available)

Tablets: 1 mg, 2 mg, 4 mg. **Cost:** *Generic*—1 mg \$9.83/100, 2 mg \$10.83/100, 4 mg \$10.83/100. **In combination with:** pioglitazone (Duetact); rosiglitazone (Avandaryl); see Appendix B.

Glipizide (generic available)

Tablets: 5 mg, 10 mg. **Cost:** *Generic*—5 mg \$10.83/100, 10 mg \$7.18/100. **Extended-release tablets:** 2.5 mg, 5 mg, 10 mg. **Cost:** *Generic*—2.5 mg \$23.76/90, 5 mg \$22.86/90. **In combination with:** Metformin (Metaglip); see Appendix B.

Glyburide (generic available)

Tablets: 1.25 mg, 2.5 mg, 5 mg. **Cost:** *Generic*—All strengths \$10.83/100. **Micronized tablets:** 1.5 mg, 3 mg, 6 mg. **Cost:** *Generic*—1.5 mg \$37.50/100, 3 mg \$60.50/100, 6 mg \$107.32/100. **In combination with:** metformin (Glucovance); see Appendix B.

NURSING IMPLICATIONS

Assessment

- Observe for signs and symptoms of hypoglycemic reactions (sweating, hunger, weakness, dizziness, tremor, tachycardia, anxiety).
- Assess patient for allergy to sulfonamides.
- Patients on concurrent beta-blocker therapy may have very subtle signs of hypoglycemia.
- **Lab Test Considerations:** Monitor serum glucose and glycosylated hemoglobin periodically during therapy to evaluate effectiveness of treatment.
- **Monitor CBC periodically during therapy. Report ↓ in blood counts promptly.**
- May cause an ↑ in AST, LDH, BUN, and serum creatinine.
- **Toxicity and Overdose:** Overdose is manifested by symptoms of hypoglycemia. Mild hypoglycemia may be treated with administration of oral glucose. Severe hypoglycemia should be treated with IV D50W followed by continuous IV infusion of more dilute dextrose solution at a rate sufficient to keep serum glucose at approximately 100 mg/dL.

Potential Nursing Diagnoses

Imbalanced nutrition: more than body requirements (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- **High Alert:** Accidental administration of oral hypoglycemic agents to non-diabetic adults and children has resulted in serious harm or death. Before administering, confirm that patient has type 2 diabetes.
- **High Alert:** Several oral hypoglycemic agents are subject to sound-alike or look-alike confusion: Do not confuse Diabeta (glyburide) with Zebeta (bisoprolol).
- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- To convert from other oral hypoglycemic agents, gradual conversion is not required. For insulin dosage of less than 20 units/day, change to oral hypoglycemic agents can be made without gradual dose adjustment. Patients taking 20 or more units/day should convert gradually by receiving oral agent and a 25–30% reduction in insulin dose every day or every 2nd day with gradual insulin dose reduction as tolerated. Monitor serum or urine glucose and ketones at least 3 times/day during conversion.
- **PO:** May be administered once in the morning with breakfast or divided into 2 doses.
- Administer *glipizide* 30 min before a meal.
- Do not administer *nonmicronized glyburide* with a meal high in fat. *Micronized glyburide* cannot be substituted for *nonmicronized glyburide*. These preparations are not equivalent.

Patient/Family Teaching

- Instruct patient to take medication at same time each day. Take missed doses as soon as remembered unless almost time for next dose. Do not take if unable to eat.
- Explain to patient that this medication controls hyperglycemia but does not cure diabetes. Therapy is long term.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water or an appropriate number of glucose tablets and notify health care professional.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hypoglycemic or hyperglycemic episodes.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness and health care professional notified if significant changes occur.
- Concurrent use of alcohol may cause a disulfiram-like reaction (abdominal cramps, nausea, flushing, headaches, and hypoglycemia).
- May occasionally cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid other medications, especially alcohol, while on this therapy without consulting health care professional.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to carry a form of sugar (sugar packets, candy) and identification describing disease process and medication regimen at all times.
- Advise patient to notify health care professional promptly if unusual weight gain, swelling of ankles, drowsiness, shortness of breath, muscle cramps, weakness, sore throat, rash, or unusual bleeding or bruising occurs.
- Insulin is the recommended method of controlling blood glucose during pregnancy. Counsel female patients to use a form of contraception other than oral contraceptives and to notify health care professional promptly if pregnancy is planned or suspected.
- Emphasize the importance of routine follow-up exams.

Evaluation/Desired Outcomes

- Control of blood glucose levels without the appearance of hypoglycemic or hyperglycemic episodes.

sulindac (soo-lin-dak)

Clinoril

Classification

Therapeutic: antirheumatics, nonsteroidal anti-inflammatory agents

Pregnancy Category C

Indications

Management of inflammatory disorders, including: Rheumatoid arthritis, Osteoarthritis, Acute gouty arthritis, Bursitis.

Action

Inhibits prostaglandin synthesis. **Therapeutic Effects:** Suppression of pain and inflammation.

Pharmacokinetics

Absorption: Well absorbed from the GI tract after oral administration.

Distribution: Unknown. Enters breast milk in small amounts.

Metabolism and Excretion: Converted by the liver to active drug. Minimal amounts excreted unchanged by the kidneys.

Half-life: 7.8 hr (16.4 hr for active metabolite).

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO (analgesic)	1–2 days	unknown	12 hr
PO (anti-inflammatory)	few days–1 wk	2 wk or more	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity may occur with other NSAIDs, including aspirin; Active GI bleeding or ulcer disease; Peri-operative pain from coronary artery bypass graft (CABG) surgery; **OB:** May cause premature closure of ductus arteriosus in third trimester.

Use Cautiously in: Cardiovascular disease or risk factors for cardiovascular disease (may ↑ risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke, especially with prolonged use); Severe renal or hepatic disease (dosage modification recommended); History of ulcer disease; **OB:** Use in first and second trimester only if maternal benefit exceeds potential risks to fetus; **Lactation, Pedi:** Safety not established; **Geri:** May ↑ risk of GI bleeding.

Adverse Reactions/Side Effects

CNS: dizziness, headache, drowsiness. **EENT:** blurred vision, tinnitus. **CV:** edema. **GI:** GI BLEEDING,

☼ = Canadian drug name. ⚠ = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

DRUG-INDUCED HEPATITIS, constipation, diarrhea, discomfort, dyspepsia, nausea, vomiting, anorexia, flatulence, pancreatitis. **GU**: renal failure. **Derm**: **EXFOLIATIVE DERMATITIS**, **STEVENS-JOHNSON SYNDROME**, **TOXIC EPIDERMAL NECROLYSIS**, rashes, photosensitivity. **Hemat**: blood dyscrasias, prolonged bleeding time. **Misc**: allergic reactions including **ANAPHYLAXIS** and **HYPERSENSITIVITY SYNDROME**.

Interactions

Drug-Drug: Concurrent use of **aspirin** may ↓ effectiveness. ↑ risk of bleeding with **anticoagulants**, **thrombolytic agents**, **tirofiban**, **eptifibatide**, **clopidogrel**, **ticlopidine**, **cefoperazone**, **cefotetan**, or **valproic acid**. ↑ adverse GI side effects with **aspirin**, **corticosteroids**, and other **NSAIDs**. May ↓ response to **antihypertensives** or **diuretics**. May ↑ levels and risk of toxicity from **lithium**. May ↑ risk of hematologic toxicity from **antineoplastics** or **radiation therapy**. May ↑ risk of adverse renal effects with **cyclosporine** or chronic use of **acetaminophen**. May blunt the antihypertensive effect of and ↑ the risk of renal dysfunction associated with **ACE inhibitors** or **angiotensin II antagonists**. **Antacids** ↓ levels and decrease effectiveness of sulindac. ↑ risk of photosensitivity reactions with other **photosensitizing medications**. ↑ risk of hypoglycemia with **insulins** or **oral hypoglycemic agents**. Should not be used concurrently with **dimethyl sulfoxide** because of ↑ risk of peripheral neuropathy and ↓ levels of sulindac and its metabolite.

Route/Dosage

PO (Adults): 150–200 mg twice daily (not to exceed 400 mg/day).

Availability (generic available)

Tablets: 150 mg, 200 mg.

NURSING IMPLICATIONS

Assessment

- Patients who have asthma, aspirin-induced allergy, and nasal polyps are at increased risk for developing hypersensitivity reactions. Monitor for rhinitis, asthma, and urticaria.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- Assess pain and range of movement before and after 1–2 wk of therapy.
- **Lab Test Considerations**: Evaluate BUN, serum creatinine, CBC, and liver function periodically in patients receiving prolonged therapy.
- Serum potassium, glucose, alkaline phosphatase, AST, and ALT may show ↑ levels.
- Bleeding time may be prolonged for 1 day after discontinuation of therapy.

Potential Nursing Diagnoses

Acute pain (Indications)

Impaired physical mobility (Indications)

Implementation

- Administration in higher than recommended doses does not provide increased effectiveness but may cause increased side effects. Use lowest effective dose for shortest period of time.
- **PO**: May be administered with food, milk, or antacids to decrease GI irritation. Food slows but does not reduce the extent of absorption. Tablets may be crushed and mixed with fluids or food.

Patient/Family Teaching

- Advise patient to take this medication with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Instruct patient to take medication as directed. Take missed doses as soon as remembered but not if almost time for the next dose. Do not double doses.
- May cause dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications. Caution patient to avoid the concurrent use of alcohol, aspirin, NSAIDs, or acetaminophen.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to consult health care professional if itching, visual disturbances, tinnitus, weight gain, edema, black stools, persistent headache, or influenza-like syndrome (chills, fever, muscle aches, pain) occurs.
- Instruct patient to notify health care professional immediately if rash, shortness of breath, trouble breathing, slurred speech, chest pain, swelling of face or throat, or weakness in 1 part or side of your body occur.
- Advise patient to inform health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Decreased pain and improved joint mobility. Partial arthritic relief may be seen within 7 days, but maximum effectiveness may require 2–3 wk of continuous therapy. Patients who do not respond to 1 NSAID may respond to another.

SUMatriptan (soo-ma-trip-tan)

Alsuma, Imitrex, Imitrex STATdose, Sumavel DosePro, Zecuity

Classification

Therapeutic: vascular headache suppressants

Pharmacologic: 5-HT₁ agonists**Pregnancy Category C****Indications**

Subcut, PO, Intranasal, Transdermal: Acute treatment of migraine attacks. **Subcut:** Acute treatment of cluster headache episodes.

Action

Acts as a selective agonist of 5-HT₁ at specific vascular serotonin receptor sites, causing vasoconstriction in large intracranial arteries. **Therapeutic Effects:** Relief of acute attacks of migraine.

Pharmacokinetics

Absorption: Well absorbed (97%) after subcut administration. Absorption after oral administration is incomplete and significant amounts undergo substantial hepatic metabolism, resulting in poor bioavailability (14%). Well absorbed after intranasal and transdermal administration.

Distribution: Does not cross the blood-brain barrier. Remainder of distribution not known.

Metabolism and Excretion: Mostly metabolized (80%) by the liver.

Half-life: 2 hr.

TIME/ACTION PROFILE (relief of migraine)

ROUTE	ONSET	PEAK	DURATION
PO	within 30 min	2–4 hr	up to 24 hr
Subcut	30 min	up to 2 hr	up to 24 hr
Nasal	within 60 min	2 hr	unknown
TD	unknown	2 hr	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Ischemic heart disease or signs and symptoms of ischemic heart disease, Prinzmetal's angina, or uncontrolled hypertension; Stroke or transient ischemic attack; Peripheral vascular disease (including, but not limited to, ischemic bowel disease); Concurrent MAO inhibitor therapy; Hemiplegic or basilar migraine; Concurrent use of (within 24 hr) ergotamine-containing or ergot-type drugs or other 5HT₁ agonists; Severe hepatic impairment; **Geri:** Excessive risk of cardiovascular complications.

Use Cautiously in: Patients with childbearing potential; **OB, Lactation, Pedi:** Safety not established; excreted in breast milk (avoid breast feeding for ≥12 hr after treatment).

Exercise Extreme Caution in: Cardiovascular risk factors (hypertension, hypercholesterolemia,

smoking, obesity, diabetes, family history, menopausal women or men >40 yr); use only if cardiovascular status has been evaluated and determined to be safe and 1st dose is administered under supervision.

Adverse Reactions/Side Effects

All adverse reactions are less common after oral administration.

CNS: dizziness, vertigo, anxiety, drowsiness, fatigue, feeling of heaviness, feeling of tightness, headache, malaise, strange feeling, tight feeling in head, weakness. **EENT:** alterations in vision, nasal sinus discomfort, throat discomfort. **CV:** **MI**, angina, chest pressure, chest tightness, coronary vasospasm, ECG changes, transient hypertension. **GI:** abdominal discomfort, dysphagia. **Derm:** tingling, warm sensation, burning sensation, contact dermatitis (patch only), cool sensation, flushing. **Local:** injection site reaction. **MS:** jaw discomfort, muscle cramps, myalgia, neck pain, neck stiffness. **Neuro:** numbness.

Interactions

Drug-Drug: The risk of vasospastic reactions may be ↑ by concurrent use of **ergotamine** or **dihydroergotamine** (avoid within 24 hr of each other). Avoid concurrent use with other **5HT₁ agonists**. **MAO inhibitors** may ↑ levels (do not use within 2 wk of discontinuing MAO inhibitor). ↑ risk of serotonin syndrome when used with **SSRI** or **SNRI antidepressants**.

Drug-Natural Products: ↑ risk of serotonergic side effects including serotonin syndrome with **St. John's wort** and **SAME**.

Route/Dosage

PO (Adults): 25 mg initially; if response is inadequate at 2 hr, up to 100 mg may be given (initial doses of 25–50 mg may be more effective than 25 mg). If headache recurs, doses may be repeated q 2 hr (not to exceed 300 mg/day). If PO therapy is to follow subcut injection, additional PO sumatriptan may be taken q 2 hr (not to exceed 200 mg/day).

Subcut (Adults): 6 mg; may repeat after 1 hr (not to exceed 12 mg in 24 hr).

Intranasal (Adults): Single dose of 5, 10, or 20 mg in 1 nostril; may be repeated in 2 hr, not to exceed 40 mg/24 hr or treatment of >5 episodes/mo.

Transdermal (Adults): Apply 1 patch; may be repeated in 2 hr, not to exceed 2 patches/24 hr.

Hepatic Impairment

PO (Adults): 25 mg initially; if response is inadequate at 2 hr, up to 50 mg may be given (initial doses of 25–50 mg may be more effective than 25 mg). If headache recurs, doses may be repeated q 2 hr (not to exceed 300 mg/day). If PO therapy is to follow subcut injection, additional PO sumatriptan may be taken q 2 hr

☼ = Canadian drug name. ⚠ = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

(not to exceed 200 mg/day); no single oral dose should exceed 50 mg.

Availability (generic available)

Tablets: 25 mg, 50 mg, 100 mg. **Cost:** *Generic*—25 mg \$243.47/9, 50 mg \$226.26/9, 100 mg \$226.26/9.

Injection: 4 mg/0.5-mL prefilled syringes, 6 mg/0.5-mL prefilled syringes, vials, or needle-free delivery system. **Cost:** *Generic*—4 mg/0.5 mL \$60.56/0.5 mL, 6 mg/0.5 mL \$31.20/0.5 mL. **Nasal spray:** 5 mg/nasal spray device (delivers 5 mg/spray), 20 mg/nasal spray device (delivers 20 mg/spray). **Cost:** *Generic*—All strengths \$49.26/device. **Transdermal patch:** delivers 6.5 mg/4 hr. **In combination with:** naproxen (Treximet); see Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess pain location, intensity, duration, and associated symptoms (photophobia, phonophobia, nausea, vomiting) during migraine attack.
- Give initial subcut dose under observation to patients with potential for coronary artery disease including postmenopausal women, men >40 yr, patients with risk factors for coronary artery disease such as hypertension, hypercholesterolemia, obesity, diabetes, smoking, or family history. Monitor BP before and for 1 hr after initial injection. If angina occurs, monitor ECG for ischemic changes.
- Monitor for serotonin syndrome in patients taking SSRIs or SNRIs concurrently with sumatriptan.

Potential Nursing Diagnoses

Acute pain (Indications)

Implementation

- Do not confuse sumatriptan with sitagliptin or zolmitriptan.
- PO:** Tablets should be swallowed whole; do not crush, break, or chew. Tablets are film-coated to prevent contact with tablet contents, which have an unpleasant taste and may cause nausea and vomiting.
- Subcut:** Administer as a single injection just below the skin. Solution is clear and colorless or pale yellow; do not use if dark-colored or cloudy or if beyond expiration date.
- Sumavel DosePro:** The snap-off tip should sit firmly on the end of the clear medication chamber; do not use if tip tilted or broken off upon removal from packaging. Administer only in abdomen or thigh.
- Intranasal:** 10-mg dose may be administered as 2 sprays of 5 mg in 1 nostril or 1 spray in each nostril.
- Transdermal:** Apply to dry, non-irritated, intact skin of upper arm or thigh. Site must be relatively free of hair and without scars, tattoos, abrasions, eczema, psoriasis, melanoma, or contact dermatitis. After application, push activation button within 15

min and red light emitting diode (LED) will turn on. Secure patch with medical tape if needed. System stops operating when dosing complete; activation light turns off signaling system can be removed. System cannot be reactivated when completed. If light turns off before 4 hr, dosing has stopped and patch can be removed. Fold patch so adhesive sides stick together and discard away from children and pets; contains lithium-manganese dioxide batteries; dispose in accordance with state and local regulations.

- If headache is not completely relieved, may retreat no sooner than 2 hr in a different site; use no more than 2 patches in 24 hr. Rotate sites; do not apply to a previous site until site is free from erythema for at least 3 days.

Patient/Family Teaching

- Inform patient that sumatriptan should be used only during a migraine attack. It is meant to be used for relief of migraine attacks but not to prevent or reduce the number of attacks.
- Instruct patient to administer sumatriptan as soon as symptoms of a migraine attack appear, but it may be administered at any time during an attack. If migraine symptoms return, a second injection may be used. Allow at least 1 hr between doses, and do not use more than 2 injections in any 24-hr period. Additional sumatriptan doses are not likely to be effective, and alternative medications may be used. If no relief from 1st dose, unlikely 2nd dose will provide relief. Advise patient to read *Patient Information* prior to using and with each Rx refill; new information may be available.
- Advise patient that lying down in a darkened room after sumatriptan administration may further help relieve headache.
- Advise patient that overuse (use more than 10 days/mo) may lead to exacerbation of headache (migraine-like daily headaches, or as a marked increase in frequency of migraine attacks). May require gradual withdrawal of sumatriptan and treatment of symptoms (transient worsening of headache).
- Advise patient to notify health care professional before next dose of sumatriptan if pain or tightness in chest occurs during use. If pain is severe or does not subside, notify health care professional immediately. If wheezing; heart throbbing; swelling of eyelids, face, or lips; skin rash; skin lumps; or hives occur, notify health care professional immediately, and do not take more sumatriptan without approval of health care professional. If usual dose fails to relieve 3 consecutive headaches, or if frequency and/or severity increases, notify health care professional. If feelings of tingling, heat, flushing, heaviness, pressure, drowsiness, dizziness, tiredness, or sickness

develop, discuss with health care professional at next visit.

- Sumatriptan may cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid alcohol, which aggravates headaches, during sumatriptan use.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications **Patients concurrently taking SSRI or SNRI antidepressants should notify health care professional promptly if signs of serotonin syndrome (mental status changes: agitation, hallucinations, coma; autonomic instability: tachycardia, labile BP, hyperthermia; neuromuscular aberrations: hyper-reflexia, incoordination; and/or gastrointestinal symptoms: nausea, vomiting, diarrhea) occur.**
- Caution patient not to use sumatriptan if pregnant, suspects pregnancy, or plans to become pregnant. Adequate contraception should be used during therapy.
- **Subcut:** Instruct patient on the proper technique for loading, administering, and discarding the autoinjector or for using *Sumavel DosePro*. Patient information pamphlet is provided. Instructional video is available from the manufacturer.
- Inform patient that pain or redness at the injection site usually lasts less than 1 hr.
- **Intranasal:** Instruct patient in proper technique for intranasal administration. Usual dose is a single spray in 1 nostril. If headache returns, a 2nd dose may be administered in ≥ 2 hr. Do not administer 2nd dose if no relief was provided by 1st dose without consulting health care professional.
- **Transdermal:** Instruct patient to read *Patient Information and Instructions for Use* before starting and with each Rx refill, in case of changes.
- Advise patient not to bathe, shower, or swim while wearing patch.
- Inform patient that skin redness under patch site that disappears within 24 hr is common. If signs and symptoms of allergic contact dermatitis (itching, redness, irritation, blistering or peeling, warmth or tenderness of skin, blisters that ooze, drain, or crust over) occur, stop using sumatriptan transdermal and notify health care professional.
- Advise patient referred for MRI test to discuss patch with referring health care professional and MRI facility to determine if removal of patch is necessary prior to test and for directions for replacing patch.
- Advise patient not to use more than 4 times/mo without consulting health care professional.

Evaluation/Desired Outcomes

- Relief of migraine attack.

SUNitinib (su-ni-ti-nib) Sutent

Classification

Therapeutic: antineoplastics

Pharmacologic: kinase inhibitors

Pregnancy Category D

Indications

Gastrointestinal stromal tumor (GIST) that has progressed or intolerance to imatinib. Advanced renal cell carcinoma (RCC). Advanced pancreatic neuroendocrine tumors (pNET).

Action

Inhibits multiple receptor tyrosine kinases, which are enzymes implicated in tumor growth, abnormal vascular growth, and tumor metastases. **Therapeutic Effects:** Decreased tumor spread.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Unknown.

Protein Binding: *Sunitinib*—95%; *primary active metabolite*—90%.

Metabolism and Excretion: Metabolized by the CYP3A4 enzyme system to its primary active metabolite. This metabolite is further metabolized by CYP3A4. Excretion is primarily fecal.

Half-life: *Sunitinib*—40–60 hr; *primary active metabolite*—80–110 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	6–12 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **OB, Lactation:** Pregnancy, lactation; Concurrent use of ketoconazole or St. John's wort.

Use Cautiously in: Hepatic/renal impairment; Concurrent use of bisphosphonates or a history of dental disease (may ↑ risk of jaw osteonecrosis); **OB:** Child-bearing potential; **Pedi:** Safety not established.

Adverse Reactions/Side Effects

CNS: **REVERSIBLE POSTERIOR LEUKOENCEPHALOPATHY SYNDROME**, fatigue, dizziness, headache. **CV:** CHF, hypertension, peripheral edema, QT interval prolongation, thromboembolic events. **EENT:** epistaxis. **GI:** **HEPATOTOXICITY**, diarrhea, dyspepsia, nausea, stomati-

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

tis, vomiting, altered taste, anorexia, cholecystitis, constipation, esophagitis, ↑ lipase/amylase, ↑ liver enzymes, oral pain. **Derm:** ERYTHEMA MULTIFORME, alopecia, hand-foot syndrome, hair color change, impaired wound healing, rash, skin discoloration. **Endo:** hypothyroidism, adrenal insufficiency, hyperthyroidism. **F and E:** dehydration, hypophosphatemia. **Hemat:** HEMORRHAGE, anemia, lymphopenia, neutropenia, thrombocytopenia. **Metab:** hyperuricemia. **MS:** arthralgia, back pain, limb pain, myalgia, osteonecrosis (primarily of jaw). **Misc:** TUMOR LYSIS SYNDROME, fever.

Interactions

Drug-Drug: Ketoconazole and other **inhibitors of the CYP3A4 enzyme system** may ↑ levels and the risk of toxicity; ↓ dose to 37.5 mg daily (for GIST and RCC) or 25 mg daily (for pNET); avoid these strong inhibitors, if possible. **Rifampin** and other **inducers of the CYP3A4 enzyme system** may ↓ levels and effectiveness; ↑ dose to 87.5 mg daily (for GIST and RCC) or 62.5 mg daily (for pNET); avoid these strong inducers, if possible. Concurrent use with **alendronate**, **etidronate**, **ibandronate**, **pamidronate**, **risedronate**, **tiludronate**, or **zoledronic acid** may ↑ risk of jaw osteonecrosis. ↑ risk of microangiopathic hemolytic anemia when used with **bevacizumab** (concurrent use not recommended).

Drug-Natural Products: St. John's wort may ↓ levels and effectiveness; avoid concurrent use.

Drug-Food: Blood levels and effects are ↑ by **grapefruit juice**; concurrent use should be avoided.

Route/Dosage

GIST and RCC

PO (Adults): 50 mg once daily for 4 wk, followed by 2-wk rest; alteration of dose is based on safety/tolerability and is made in 12.5-mg increments/decrements.

pNET

PO (Adults): 37.5 mg once daily.

Availability

Capsules: 12.5 mg, 25 mg, 37.5 mg, 50 mg.

NURSING IMPLICATIONS

Assessment

- Monitor for signs of HF (dyspnea, edema, jugular venous distention) during therapy. Assess left ventricular ejection fraction (LVEF) at baseline and periodically during therapy in patients with cardiac events in the previous 12 mo and a baseline ejection fraction in patients without cardiovascular risk factors. Discontinue sunitinib if signs of HF occur.
- Monitor for hypertension and treat with standard antihypertensive therapy. If severe hypertension occurs, may discontinue sunitinib until controlled.

- Monitor ECG and electrolytes periodically during therapy; may cause QT prolongation and torsades de pointes.
- **Lab Test Considerations:** Monitor CBC with platelet count and serum chemistries including phosphate at the beginning of each treatment cycle. May cause neutropenia, lymphopenia, anemia, and thrombocytopenia. May cause ↑ creatinine, hypokalemia, hyperuricemia, and ↑ uric acid.
- Monitor ALT, AST, and bilirubin before starting therapy, during each cycle of treatment, and as clinically indicated. Stop therapy if Grade 3 or 4 drug-related hepatic adverse events occur and discontinue if there is no resolution. Do not restart sunitinib if patients subsequently experience severe changes in liver function tests or have other signs and symptoms of liver failure. May cause ↑ AST, ALT, alkaline phosphatase, total and indirect bilirubin, amylase, and lipase.
- Monitor thyroid function at baseline and in patients with symptoms of hypothyroidism or hyperthyroidism. May be treated with standard medical practice.

Potential Nursing Diagnoses

Diarrhea (Adverse Reactions)

Nausea (Adverse Reactions)

Implementation

- Do not confuse sunitinib with sorafenib.
- PO: Administer once daily with or without food.

Patient/Family Teaching

- Instruct patient to take sunitinib as directed. Take missed doses as soon as remembered, but not just before next dose. Take next dose at regular time. Do not take more than 1 dose at a time. Tell your health care professional about the missed dose.
- Advise patient to avoid grapefruit juice and grapefruit products during therapy.
- Instruct patient to notify health care professional promptly if signs of liver failure (itching, yellow eyes or skin, dark urine, pain or discomfort in the right upper stomach area) or tumor lysis syndrome (nausea, shortness of breath, irregular heartbeat, clouding of urine, tiredness) occur.
- Advise patient that GI disorders (diarrhea, nausea, stomatitis, dyspepsia, vomiting) are common and may require antiemetic and antidiarrheal medications.
- Inform patient that sunitinib may cause discoloration (yellow) of skin and depigmentation of hair or skin.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise patient to notify health care professional if bleeding or swelling occur.
- Advise women of childbearing potential to avoid becoming pregnant while receiving sunitinib.

Evaluation/Desired Outcomes

- Decrease in tumor spread.

TACROLIMUS

tacrolimus (oral, IV)

(ta-kro-e-li-mus)

Astagraf XL, Prograf

tacrolimus (topical)

Protopic

Classification

Therapeutic: immunosuppressants

Pregnancy Category C

Indications

PO, IV: Prevention of organ rejection in patients who have undergone allogenic liver, kidney, or heart transplantation (used concurrently with corticosteroids) (used concurrently with azathioprine or mycophenolate mofetil in kidney or heart transplants) (extended-release only indicated for kidney transplant). **Topical:** Moderate to severe atopic dermatitis in patients who do not respond to or cannot tolerate alternative, conventional therapies.

Action

Inhibit T-lymphocyte activation. **Therapeutic Effects:** Prevention of transplanted organ rejection. Improvement in signs/symptoms of atopic dermatitis.

Pharmacokinetics

Absorption: Absorption following oral administration is erratic and incomplete (bioavailability ranges 5–67%); minimal amounts absorbed following topical use.

Distribution: Crosses the placenta and enters breast milk.

Protein Binding: 99%.

Metabolism and Excretion: 99% metabolized by the liver; <1% excreted unchanged in the urine.

Half-life: *Liver transplant patients*—11.7 hr; *healthy volunteers*—21.2 hr.

TIME/ACTION PROFILE (immunosuppression)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1.3–3.2 hr*	12 hr
PO-ER	unknown	unknown	24 hr
IV	rapid	unknown	8–12 hr
Topical†	unknown	1–2 wk	unknown

*Blood level

†Improvement in atopic dermatitis

Contraindications/Precautions

Contraindicated in: Hypersensitivity to tacrolimus or to castor oil (a component in the injection); Concurrent use with cyclosporine or sirolimus should be

avoided; Congenital long QT syndrome; **Lactation:**

Breast feeding should be avoided; Weakened/compromised immune system; Malignant or premalignant skin condition; **Pedi:** Children <2 yr (safety not established).

Use Cautiously in: Heart failure, bradycardia, or electrolyte disorders (hypokalemia, hypomagnesemia, hypocalcemia); Concurrent use of other drugs known to prolong the QT interval; Renal or hepatic impairment (dose ↓ may be required; if oliguria occurs, wait 48 hr before initiating tacrolimus); Exposure to sunlight/UV light (may ↑ risk of malignant skin changes); **OB:** Hyperkalemia and renal impairment may occur in the newborn; use only if benefit to mother justifies risk to the fetus; **Pedi:** Higher end of dosing range required to maintain adequate blood levels; Superficial skin infections.

Adverse Reactions/Side Effects

Noted primarily for PO and IV use.

CNS: SEIZURES, dizziness, headache, insomnia, tremor, abnormal dreams, agitation, anxiety, confusion, depression, emotional lability, hallucinations, posterior reversible encephalopathy syndrome, psychoses, somnolence. **EENT:** abnormal vision, amblyopia, sinusitis, tinnitus. **Resp:** cough, pleural effusion, asthma, bronchitis, pharyngitis, pneumonia, pulmonary edema. **CV:** hypertension, peripheral edema, QTc interval prolongation. **GI:** GI BLEEDING, GI PERFORATION, abdominal pain, anorexia, ascites, constipation, diarrhea, dyspepsia, ↑ liver enzymes, nausea, vomiting, cholangitis, cholestatic jaundice, dysphagia, flatulence, ↑ appetite, oral thrush, peritonitis. **GU:** nephrotoxicity, urinary tract infection. **Derm:** pruritus, rash, alopecia, herpes simplex, hirsutism, photosensitivity, sweating. **Endo:** hyperglycemia, hyperlipidemia. **F and E:** hyperkalemia, hypomagnesemia, hyperphosphatemia, hypocalcemia, hyponatremia, hypophosphatemia, metabolic acidosis, metabolic alkalosis. **Hemat:** anemia, leukocytosis, leukopenia, thrombocytopenia, coagulation defects, pure red cell aplasia. **Local:** topical—burning, stinging. **MS:** arthralgia, hypertonia, leg cramps, muscle spasm, myalgia, myasthenia, osteoporosis. **Neuro:** paresthesia, neuropathy. **Misc:** allergic reactions including ANAPHYLAXIS, generalized pain, abnormal healing, chills, fever, infection (including activation of latent viral infections such as BK virus-associated nephropathy), ↑ risk of lymphoma/skin cancer.

Interactions

Noted primarily for PO and IV use, but should be considered for topical use.

★ = Canadian drug name. ‡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Drug-Drug: Risk of nephrotoxicity is ↑ by concurrent use of **aminoglycosides**, **amphotericin B**, **cisplatin**, or **cyclosporine** (allow 24 hr to pass after stopping cyclosporine before starting tacrolimus).

Concurrent use of **potassium-sparing diuretics**, **ACE inhibitors**, or **angiotensin II receptor blockers** ↑ risk of hyperkalemia. **Strong CYP3A4 inhibitors**, including **ketoconazole**, **itraconazole**, **voriconazole**, **ritonavir**, **clarithromycin**, **boceprevir**, and **telaprevir** may significantly ↑ levels; closely monitor tacrolimus whole blood trough concentrations.

Bromocriptine, **calcium channel blockers**, **chloramphenicol**, **cimetidine**, **lansoprazole**, **cyclosporine**, **amiodarone**, **danazol**, **ethinyl estradiol**, **erythromycin**, **magnesium/aluminum hydroxide** **methylprednisolone**, **omeprazole**, **nefazodone**, and **metoclopramide**, and **protease inhibitors** may ↑ levels; avoid concurrent use with **nefinavir**. Concurrent use with **CYP3A4 substrates** or **CYP3A4 inhibitors** that also prolong the QT interval may ↑ the risk of QT interval prolongation. **Strong CYP3A4 inducers**, including **rifampin** and **rifabutin** may significantly ↓ levels; closely monitor tacrolimus whole blood trough concentrations. **Phenobarbital**, **phenytoin**, **caspofungin**, **sirolimus** and **carbamazepine** may ↓ levels; closely monitor tacrolimus whole blood trough concentrations. **Vaccinations** may be less effective if given concurrently with tacrolimus (avoid use of live-virus vaccines). May ↑ levels of **mycophenolate mofetil** or **mycophenolic acid**.

Drug-Natural Products: Concomitant use with **astragalus**, **echinacea**, and **melatonin** may interfere with immunosuppression. **St. John's wort** may ↓ tacrolimus blood levels.

Drug-Food: Food ↓ the rate and extent of GI absorption. **Grapefruit juice** ↑ absorption.

Route/Dosage

Because of the potential risk for anaphylaxis, the IV route of administration should be reserved for those patients unable to take the drug orally. Extended-release capsules are not interchangeable with immediate-release capsules.

Kidney Transplantation

PO (Adults): *Initial dose of immediate-release capsules (with azathioprine)*—0.2 mg/kg/day in 2 divided doses; titrate to achieve recommended whole blood trough concentration; *Initial dose of immediate-release capsules (with mycophenolate mofetil and IL-2 antagonist)*—0.1 mg/kg/day in 2 divided doses; titrate to achieve recommended whole blood trough concentration; *Extended-release capsules (with basiliximab induction)*—0.15 mg/kg once daily (to be started either before or within 48 hr of completion of transplant); *Extended-release capsules (without basiliximab induction)*—0.1 mg/kg given

as single dose preoperatively within 12 hr prior to reperfusion, followed by 0.2 mg/kg once daily started postoperatively at least 4 hr after preoperative dose and within 12 hr after reperfusion.

PO (Children): 0.15–0.4 mg/kg/day in 2 divided doses; titrate to achieve recommended whole blood trough concentration.

IV (Adults): *Initial dose*—0.03–0.1 mg/kg/day as a continuous infusion; titrate to achieve recommended whole blood trough concentration.

IV (Children): 0.03–0.15 mg/kg/day.

Liver Transplantation

PO (Adults): *Initial dose*—0.1–0.15 mg/kg/day in two divided doses; titrate to achieve recommended whole blood trough concentration.

PO (Children): *Initial dose*—0.15–0.2 mg/kg/day in 2 divided doses; titrate to achieve recommended whole blood trough concentration.

IV (Adults and Children): Same as for kidney transplant.

Heart Transplantation

PO (Adults): *Initial dose*—0.075 mg/kg/day in two divided doses; titrate to achieve recommended whole blood trough concentration.

IV (Adults): *Initial dose*—0.01 mg/kg/day as a continuous infusion; titrate to achieve recommended whole blood trough concentration.

Atopic Dermatitis

Topical (Adults): Apply 0.03% or 0.1% ointment twice daily. Discontinue when signs/symptoms of atopic dermatitis resolve.

Topical (Children ≥2–15 yr): Apply 0.03% ointment twice daily. Discontinue when signs/symptoms of atopic dermatitis resolve.

Availability (generic available)

Capsules: 0.5 mg, 1 mg, 5 mg. **Extended-release capsules (Astragraf XL):** 0.5 mg, 1 mg, 5 mg. **Injection:** 5 mg/mL. **Ointment:** 0.03%, 0.1%.

NURSING IMPLICATIONS

Assessment

- Assess for symptoms of posterior reversible encephalopathy syndrome [PRES] (headache, altered mental status, seizures, visual disturbances, hypertension) periodically during therapy. Confirm diagnosis by radiologic procedure. If PRES is suspected or diagnosed, maintain BP control and immediately reduce immunosuppression. Symptoms are usually reversed on reduction or discontinuation of immunosuppression.
- Prevention of Organ Rejection:** Monitor BP closely during therapy. Hypertension is a common complication of tacrolimus therapy and should be treated.

- **Observe patients receiving IV tacrolimus for the development of anaphylaxis (rash, pruritus, laryngeal edema, wheezing) for at least 30 min and frequently thereafter. If signs develop, stop infusion and initiate treatment.**
- **Atopic Dermatitis:** Assess skin lesions prior to and periodically during therapy.
- Use only for short time, not continuously, and in the minimum dose possible to decrease risk of developing skin cancer.
- **Lab Test Considerations:** Tacrolimus blood level monitoring may be helpful in the evaluation of rejection and toxicity, dose adjustments, and assessment of compliance. For liver transplantation, most patients are stable when tacrolimus trough whole blood concentrations are maintained between 5–20 ng/mL. For kidney transplantation, during the first 3 mo, most patients maintained tacrolimus whole blood concentrations between 7–20 ng/mL and then between 5–15 ng/mL through 1 yr. For heart transplantation, from wk 1 to 3 mo, most patients maintained tacrolimus trough whole blood concentrations between 8–20 ng/mL and then between 6–18 ng/mL from 3–18 mo post-transplant.
- Monitor serum creatinine, potassium, and glucose closely. ↑ serum creatinine and ↓ urine output may indicate nephrotoxicity. May also cause insulin-dependent post-transplant diabetes mellitus (⚠ incidence is higher in African American and Hispanic patients).
- May also cause hyperuricemia, hypokalemia, hyperkalemia, hypomagnesemia, metabolic acidosis, metabolic alkalosis, hyperlipidemia, hyperphosphatemia, hypophosphatemia, hypocalcemia, and hyponatremia.
- Monitor CBC. May cause anemia, leukocytosis, and thrombocytopenia.
- Oral therapy is preferred because of the risk of anaphylactic reactions with IV tacrolimus. IV therapy should be replaced with oral therapy as soon as possible.
- Adults should be started at the lower end of the dose range; children require a higher doses to maintain blood trough concentrations similar to adults.
- Immediate and extended-release capsules are not interchangeable.
- **PO:** Oral doses can be initiated 8–12 hr after discontinuation of IV doses. May be taken without regard to food, but should be consistent, with or without food and at same time each day.
- Take extended-release capsules at the same time each day at least 1 hr before or 2 hrs after breakfast. Swallow capsules whole; do not chew, divide, or crush.
- **Topical:** Do not use continuously for a long time.

IV Administration

- **Continuous Infusion:** **Diluent:** Dilute in 0.9% NaCl or D5W. **Concentration:** 0.004–0.02 mg/mL. May be stored in polyethylene or glass containers for 24 hr following dilution. Do not store in PVC containers. **Rate:** Administer daily dose as a continuous infusion over 24 hr.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, agtatroban, atracurium, azithromycin, aztreonam, benztrapine, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium acetate, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dextrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doripenem, doxacurium, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, foscarnet, fosphenytoin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, lev-

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)

Implementation

- **Do not confuse Prograf (tacrolimus) with Prozac (fluoxetine).**
- Should only be prescribed by health care professionals experienced with immunosuppressive therapy and organ transplant patients.
- Therapy with tacrolimus should be started no sooner than 6 hr post-transplantation. Concurrent therapy with corticosteroids is recommended in the early postoperative period.
- Tacrolimus should not be used concomitantly with cyclosporine. Tacrolimus or cyclosporine should be discontinued at least 24 hr before starting the other.

🍁 = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

ofloxacin, levorphanol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meclizine, meperidine, meropenem, mesna, metaraminol, methotrexate, methylglutamate, methylprednisolone, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, penicillin G potassium, pentamidine, pentazocine, perphenazine, phenolamine, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, ranitidine, remifentanyl, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tioposide, theophylline, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** acyclovir, allopurinol, azathioprine, cefepime, dantrolene, diazepam, diazoxide, esomeprazole, folic acid, ganciclovir, iron sucrose, levothyroxine, omeprazole, phenytoin, thiopental.

Patient/Family Teaching

- Instruct patient to take tadalafil at the same time each day, with or without food, as directed. Do not skip or double up on missed doses. Do not discontinue medication without advice of health care professional. Take missed doses of extended-release capsule as soon as remembered unless more than 14 hrs after scheduled dose; do not double doses. Advise patient to read the *Patient Information* before starting tadalafil and with each refill in case of changes. Instruct patient to inspect capsules with each new Rx, before taking. Contact health care professional if appearance of capsules or dose has changed.
- Advise patient to avoid grapefruit and grapefruit juice and alcohol during therapy.
- Reinforce the need for lifelong therapy to prevent transplant rejection. Review symptoms of rejection for transplanted organ and stress need to notify health care professional immediately if they occur.
- Advise patient to avoid eating raw oysters or other shellfish; make sure they are fully cooked before eating.
- Instruct patient to notify health care professional if signs of diabetes mellitus (frequent urination, increased thirst or hunger), infection (fever, sweats,

chills, cough or flu-like symptoms, muscle aches, warm, red, painful areas on skin) or PRES occur.

- Advise patient to wear protective clothing and sunscreen to avoid photosensitivity reactions.
- Instruct patient to avoid exposure to chicken pox, measles, mumps, and rubella. If exposed, see health care professional for prophylactic therapy.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Inform patient of the risk of lymphoma or skin cancer with tacrolimus therapy.
- Advise patient of the risk of taking tacrolimus during pregnancy or breast feeding.
- Emphasize the importance of repeated lab tests during tacrolimus therapy.
- **Topical:** Advise patients to contact health care professional if their symptoms do not improve after 6 wk of therapy, if their symptoms worsen, or they develop a skin infection.
- Instruct patient to use ointment only on areas of skin with atopic dermatitis.
- Advise patient to stop using the ointment when the signs/symptoms of atopic dermatitis go away.
- Advise patient to limit sun exposure during treatment.

Evaluation/Desired Outcomes

- Prevention of transplanted organ rejection.
- Management of atopic dermatitis.

tadalafil (ta-da-la-fil)

Adcirca, Cialis

Classification

Therapeutic: erectile dysfunction agents, vasodilators

Pharmacologic: phosphodiesterase type 5 inhibitors

Pregnancy Category B

Indications

Cialis: Treatment of: Erectile dysfunction (ED), Benign prostatic hyperplasia (BPH), ED and BPH. *Adcirca:* Pulmonary arterial hypertension.

Action

Increases cyclic guanosine monophosphate (cGMP) levels by inhibiting phosphodiesterase type 5 (PDE5) an enzyme responsible for the breakdown of cGMP. cGMP produces smooth muscle relaxation of the corpus cavernosum, which in turn promotes increased blood flow and subsequent erection. cGMP also leads to vasodilation of the pulmonary vasculature. **Therapeutic Effects:** *Cialis:* Enhanced blood flow to the corpus cavernosum and erection sufficient to allow

sexual intercourse. Improved signs and symptoms of BPH. *Adcirca*: Improved exercise tolerance.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Extensive tissue distribution; penetrates semen.

Protein Binding: 94%.

Metabolism and Excretion: Mostly metabolized by the liver (mainly CYP3A4 enzyme system); metabolites are excreted in feces (61%) and urine (36%).

Half-life: 17.5 hr.

TIME/ACTION PROFILE (vasodilation, improved erectile function)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	0.5–6 hr	36

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of nitrates; Unstable angina, recent history of stroke, life-threatening heart failure within 6 mo, uncontrolled hypertension, arrhythmias, stroke within 6 mo or MI within 90 days; Any other cardiovascular pathology precluding sexual activity; Known hereditary degenerative retinal disorders; Severe hepatic impairment; Severe renal impairment (*Adcirca* only); Severe renal impairment (CCr <30 mL/min) (*Cialis* once daily dosing); Congenital or acquired QT interval prolongation or concurrent use of Class IA or III antiarrhythmics; Concurrent use of ketoconazole, itraconazole, or rifampin (*Adcirca* only); Alpha adrenergic blockers (when tadalafil used for BPH); **Pedi:** Women, children or newborns.

Use Cautiously in: Left ventricular outflow obstruction; Penile deformity; Renal impairment; Underlying conditions predisposing to priapism including sickle cell anemia, multiple myeloma, or leukemia; Bleeding disorders or active peptic ulcer disease; Strong inhibitors of the CYP3A4 enzyme system; Alpha adrenergic blockers (patients should be on stable dose of alpha blockers before starting tadalafil for ED); History of sudden severe vision loss or non arteritic ischemic optic neuropathy (NAION); may ↑ risk of recurrence; **Geri:** May experience more side effects.

Adverse Reactions/Side Effects

CNS: headache. **EENT:** hearing loss, nasal congestion, vision loss. **CV:** hypotension. **GI:** dyspepsia. **GU:** priapism. **Derm:** flushing. **MS:** back pain, limb pain, myalgia.

Interactions

Drug-Drug: Concurrent use of **nitrates** may cause serious, life threatening hypotension and is contraindi-

cated. ↑ risk of hypotension with **alpha adrenergic blockers** and acute ingestion of **alcohol**; discontinue alpha-adrenergic blocker therapy ≥1 day before starting *Cialis* for BPH. Strong inhibitors of CYP3A4 including **ritonavir**, **ketoconazole**, **itraconazole** ↑ effects and the risk of adverse reactions (dose adjustments recommended; ketoconazole and itraconazole contraindicated with *Adcirca*). Similar effects may be expected of other **inhibitors of CYP3A4**. **CYP3A4 inducers** may ↓ effects (**rifampin** contraindicated with *Adcirca*).

Route/Dosage

Cialis (for ED)

PO (Adults): 10 mg prior to sexual activity (range 5–20 mg; not to exceed one dose/24 hr) or 2.5 mg once daily (max: 5 mg/day); *Concurrent use of CYP3A4 inhibitors including itraconazole, ketoconazole and ritonavir*—single dose should not exceed 10 mg in any 72 hour period; for once daily dose regimen, should not exceed 2.5 mg/day.

Renal Impairment

PO (Adults): *CCr 30–50 mL/min (as needed dosing)*—Initial dose should not exceed 5 mg/day; maximum dose should not exceed 10 mg in 48 hr; *CCr <30 mL/min (as needed dosing)*—Maximum dose should not exceed 5 mg in 72 hr; *CCr <30 mL/min (once daily dosing)*—Not recommended for use.

Hepatic Impairment

PO (Adults): *Mild or moderate hepatic impairment (Child–Pugh class A or B)*—Daily dose should not exceed 10 mg (once daily dose regimen not recommended) *Severe hepatic impairment (Child–Pugh class C)*—Not recommended for use.

Cialis (for BPH or ED/BPH)

PO (Adults): 5 mg once daily; *Concurrent use of CYP3A4 inhibitors including itraconazole, ketoconazole and ritonavir*—Should not exceed 2.5 mg/day.

Renal Impairment

PO (Adults): *CCr 30–50 mL/min*—Initial dose should not exceed 2.5 mg/day; maximum dose should not exceed 5 mg/day; *CCr <30 mL/min*—Not recommended for use.

Hepatic Impairment

PO (Adults): Not recommended for use.

Adcirca (for pulmonary arterial hypertension)

PO (Adults): 40 mg once daily; *If receiving ritonavir for ≥1 wk*—start 20 mg once daily; may then ↑ to 40 mg once daily based on tolerability; *If initiating ritonavir while on Adcirca*—stop *Adcirca* ≥24 hr

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

before starting ritonavir; may reinstitute Adcirca at 20 mg once daily after ≥ 1 wk of therapy with ritonavir; may then $\uparrow$ to 40 mg once daily based on tolerability.

Renal Impairment

(Adults): *CCr 31–80 mL/min*—Start 20 mg once daily; may then $\uparrow$ to 40 mg once daily based on tolerability.

Hepatic Impairment

PO (Adults): *Mild or moderate hepatic impairment (Child–Pugh class A or B)*—Start with 20 mg once daily.

Availability

Tablets (Cialis): 2.5 mg, 5 mg, 10 mg, 20 mg. **Tablets (Adcirca):** 20 mg.

NURSING IMPLICATIONS

Assessment

- **Cialis: for ED** : Determine ED before administration. Tadalafil has no effect in the absence of sexual stimulation.
- **Cialis for BPH:** Assess for symptoms of prostatic hyperplasia (urinary hesitancy, feeling of incomplete bladder emptying, interruption of urinary stream, impairment of size and force of urinary stream, terminal urinary dribbling, straining to start flow, dysuria, urgency) before and periodically during therapy.
- Digital rectal examinations should be performed before and periodically during therapy for BPH.
- **Adcirca:** Monitor hemodynamic parameters and exercise tolerance prior to and periodically during therapy.

Potential Nursing Diagnoses

Sexual dysfunction (Indications)

Impaired urinary elimination (Indications)

Risk for activity intolerance (Indications)

Implementation

- **PO:** Administer dose *as needed for ED* at least 30 min prior to sexual activity; effectiveness may continue for 36 hr.
- Administer dose for *pulmonary hypertension, BPH, ED/BPH, or daily for ED* once daily at the same time each day.
- May be administered without regard to food. Swallow tablets whole; do not crush, break, or chew.

Patient/Family Teaching

- Instruct patient to take tadalafil as needed for ED at least 30 min before sexual activity and not more than once per day. Inform patient that sexual stimulation is required for an erection to occur after taking tadalafil.
- Advise patient that tadalafil is not indicated for use in women.
- Caution patient not to take tadalafil concurrently with alpha adrenergic blockers (unless on a stable

dose) or nitrates. If chest pain occurs after taking tadalafil, instruct patient to seek immediate medical attention.

- Advise patient to avoid excess alcohol intake (≥ 5 units) in combination with tadalafil; may increase risk of orthostatic hypotension, increased heart rate, decreased standing BP, dizziness, headache.
- Instruct patient to notify health care professional promptly if erection lasts longer than 4 hr, if they are not satisfied with their sexual performance or develop unwanted side effects or if they experience sudden or decreased vision loss in one or both eyes or loss or decrease in hearing, ringing in the ears, or dizziness.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications that may interact with tadalafil.
- Inform patient that tadalafil offers no protection against sexually transmitted diseases. Counsel patient that protection against sexually transmitted diseases and HIV infection should be considered.

Evaluation/Desired Outcomes

- Male erection sufficient to allow intercourse.
- Decrease in urinary symptoms of benign prostatic hyperplasia.
- Increased exercise tolerance.

tamoxifen (ta-mox-i-fen)

Nolvadex, $\star$ Nolvadex-D, $\star$ Tamofen, $\star$ Tamone, $\star$ Tamoplex

Classification

Therapeutic: antineoplastics

Pharmacologic: antiestrogens

Pregnancy Category D

Indications

Adjuvant therapy of breast cancer after surgery and radiation (delays recurrence). Palliative or adjunctive treatment of advanced breast cancer. Prevention of breast cancer in high-risk patients. Treatment of ductal carcinoma *in situ* following breast surgery and radiation.

Action

Competes with estrogen for binding sites in breast and other tissues. Reduces DNA synthesis and estrogen response. **Therapeutic Effects:** Suppression of tumor growth. Reduced incidence of breast cancer in high-risk patients.

Pharmacokinetics

Absorption: Absorbed after oral administration.

Distribution: Widely distributed.

Metabolism and Excretion: Mostly metabolized by the liver. Slowly eliminated in the feces. Minimal amounts excreted in the urine.

Half-life: 7 days.

TIME/ACTION PROFILE (tumor response)

ROUTE	ONSET	PEAK	DURATION
PO	4–10 wk	several mo	several wk

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent warfarin therapy with history of deep vein thrombosis (patients at high risk for breast cancer only); **OB, Lactation:** Pregnancy or lactation.

Use Cautiously in: ↓ bone marrow reserve; Women with childbearing potential.

Adverse Reactions/Side Effects

CNS: **STROKE**, confusion, depression, headache, weakness. **EENT:** blurred vision. **CV:** **THROMBOEMBOLISM**, edema. **GI:** nausea, vomiting. **GU:** **UTERINE MALIGNANCIES**, vaginal bleeding. **F and E:** hypercalcemia. **Hemat:** leukopenia, thrombocytopenia. **Me-tab:** hot flashes. **MS:** bone pain. **Misc:** tumor flare.

Interactions

Drug-Drug: **Estrogens** may ↓ effectiveness of concurrently administered tamoxifen. Blood levels are ↑ by **bromocriptine**. May ↑ the anticoagulant effect of **warfarin**. Risk of thromboembolic events is ↑ by concurrent use of other **antineoplastics**.

Route/Dosage

Treatment of Breast Cancer

PO (Adults): 10–20 mg twice daily; doses of 20 mg/day may be taken as a single dose.

Prevention of Breast Cancer/Ductal Carcinoma *in situ*

PO (Adults): 20 mg once daily for 5 yr.

Availability (generic available)

Tablets: 10 mg, 20 mg. **Enteric-coated tablets:** * 20 mg.

NURSING IMPLICATIONS

Assessment

- Assess for an increase in bone or tumor pain. Confer with health care professional regarding analgesics. This transient pain usually resolves despite continued therapy.
- Lab Test Considerations:** Monitor CBC, platelets, and calcium levels before and during therapy. May cause transient hypercalcemia in patients with metastases to the bone. An estrogen receptor assay should be assessed before initiation of therapy.

- Monitor serum cholesterol and triglyceride concentrations in patients with pre-existing hyperlipidemia. May cause ↑ concentrations.
- Monitor hepatic function tests and thyroxine (T_4) periodically during therapy. May cause ↑ serum hepatic enzyme and thyroxine concentrations.
- Gynecologic examinations should be performed regularly; may cause variations in Papanicolaou and vaginal smears.

Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- PO:** Administer with food or fluids if GI irritation becomes a problem. Consult health care professional if patient vomits shortly after administration of medication to determine need for repeat dose.
- Do not crush, break, chew, or administer an antacid within 1–2 hr of enteric-coated tablet.

Patient/Family Teaching

- Instruct patient to take medication as directed. If a dose is missed, it should be omitted.
- If skin lesions are present, inform patient that lesions may temporarily increase in size and number and may have increased erythema.
- Advise patient to report bone pain to health care professional promptly. This pain may be severe. Analgesics should be ordered to control pain. Inform patient that this may be an indication of the drug's effectiveness and will resolve over time.
- Instruct patient to monitor weight weekly. Weight gain or peripheral edema should be reported to health care professional.
- Advise patient that medication may cause hot flashes. Notify health care professional if these become bothersome.
- Instruct patient to notify health care professional promptly if pain or swelling of legs, shortness of breath, weakness, sleepiness, confusion, nausea, vomiting, weight gain, dizziness, headache, loss of appetite, or blurred vision occurs.** Patient should also report menstrual irregularities, vaginal bleeding, pelvic pain or pressure.
- This medication may induce ovulation and may have teratogenic properties. Advise patient to use a nonhormonal method of contraception during and for 1 mo after the therapy.

Evaluation/Desired Outcomes

- Decrease in the size or spread of breast cancer. Observable effects of therapy may not be seen for 4–10 wk after initiation.

* = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

tamsulosin (tam-soo-loe-sin)

Flomax

Classification

Therapeutic: none assigned

Pharmacologic: peripherally acting antiadrenergics

Pregnancy Category B**Indications**

Management of outflow obstruction in male patients with prostatic hyperplasia.

Action

Decreases contractions in smooth muscle of the prostatic capsule by preferentially binding to α_1 -adrenergic receptors. **Therapeutic Effects:** Decreased symptoms of prostatic hyperplasia (urinary urgency, hesitancy, nocturia).

Pharmacokinetics

Absorption: Slowly absorbed after oral administration.

Distribution: Widely distributed.

Protein Binding: 94–99%.

Metabolism and Excretion: Extensively metabolized by the liver; <10% excreted unchanged in urine.

Half-life: 14 hr.

TIME/ACTION PROFILE (↑ in urine flow)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2 wk	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Patients at risk for prostate carcinoma (symptoms may be similar); Patients undergoing cataract surgery (↑ risk of intraoperative floppy iris syndrome); Sulf allergy.

Adverse Reactions/Side Effects

CNS: dizziness, headache. **EENT:** rhinitis. **CV:** orthostatic hypotension. **GU:** priapism, retrograde/diminished ejaculation.

Interactions

Drug-Drug: Cimetidine may ↑ blood levels and the risk of toxicity. ↑ risk of hypotension with other peripherally acting anti-adrenergics (**doxazosin, prazosin, terazosin**); concurrent use should be avoided. ↑ risk of hypotension with **sildenafil, tadalafil, and vardenafil**. Strong **CYP3A4 inhibitors** and **CYP2D6 inhibitors** may ↑ blood levels (concurrent use should be avoided).

Route/Dosage

PO (Adults): 0.4 mg once daily after a meal; may be ↑ after 2–4 wk to 0.8 mg/day.

Availability (generic available)

Capsules: 0.4 mg. **Cost:** Generic—\$26.89/100. **In**

combination with: dutasteride (Jalyn); see Appendix B.

NURSING IMPLICATIONS**Assessment**

- Assess patient for symptoms of prostatic hyperplasia (urinary hesitancy, feeling of incomplete bladder emptying, interruption of urinary stream, impairment of size and force of urinary stream, terminal urinary dribbling, straining to start flow, dysuria, urgency) before and periodically during therapy.
- Assess patient for first-dose orthostatic hypotension and syncope. Incidence may be dose related. Observe patient closely during this period and take precautions to prevent injury.
- Monitor intake and output ratios and daily weight, and assess for edema daily, especially at beginning of therapy. Report weight gain or edema.
- Rectal exams prior to and periodically throughout therapy to assess prostate size are recommended.

Potential Nursing Diagnoses

Risk for injury (Side Effects)

Impaired urinary elimination (Indications)

Implementation

- **PO:** Administer daily dose 30 min after the same meal each day. Swallow capsules whole; do not open, crush, or chew.
- If dose is interrupted for several days at either the 0.4-mg or 0.8-mg dose, restart therapy with the 0.4-mg/day dose.

Patient/Family Teaching

- Emphasize the importance of continuing to take this medication, even if feeling well. Instruct patient to take medication at the same time each day. If a dose is missed, take as soon as remembered unless almost time for next dose. Do not double doses.
- May cause dizziness. Advise patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially cough, cold, or allergy remedies.
- Emphasize the importance of follow-up visits to determine effectiveness of therapy.

Evaluation/Desired Outcomes

- Decrease in urinary symptoms of benign prostatic hyperplasia.

REMS

tapentadol (ta-pen-ta-dol)

Nucynta, Nucynta ER

Classification

Therapeutic: analgesics (centrally acting), opioid analgesics

Pharmacologic: opioid agonists

Schedule II**Pregnancy Category C****Indications**

Management of moderate to severe pain; extended release product should be used for patients requiring around-the-clock management of chronic pain. Diabetic pain associated with diabetic peripheral neuropathy in patients requiring around-the-clock opioid analgesia for an extended time.

Action

Acts as μ -opioid receptor agonist. Also inhibits the reuptake of norepinephrine. **Therapeutic Effects:** Decrease in pain severity.

Pharmacokinetics

Absorption: 32% absorbed following oral administration.

Distribution: Widely distributed.

Metabolism and Excretion: Undergoes extensive first-pass hepatic metabolism (97%); metabolites have no analgesic activity; metabolized drug is 99% renally excreted.

Half-life: 4 hr.

TIME/ACTION PROFILE (analgesic effect)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1 hr	4–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Significant respiratory depression in unmonitored settings or where resuscitative equipment is not readily available; Paralytic ileus; Severe hepatic or renal impairment; Concurrent MAO inhibitors or use of MAO inhibitors in the preceding 2 wk; Acute or severe bronchial asthma; Acute, mild, intermittent, or postoperative pain (extended-release only); **Lactation:** Lactation; **Pedi:** Safety not established.

Use Cautiously in: Conditions associated with hypoxia, hypercapnea, or $\downarrow$ respiratory reserve including asthma, chronic obstructive pulmonary disease, cor pulmonale, extreme obesity, sleep apnea syndrome, myxedema, kyphoscoliosis, CNS depression, use of other CNS depressants or coma ($\uparrow$ risk of further res-

piratory depression); use smallest effective dose; History of substance abuse or addiction disorder; Seizure disorders; Moderate hepatic impairment; **Ger:** Elderly or debilitated patients ($\uparrow$ risk of respiratory depression); consider age-related $\downarrow$ in hepatic, renal, and cardiovascular function, concurrent disease states and drug therapy (initial dose should be $\downarrow$); **OB:** Use only if potential benefit justifies potential risk to the fetus.

Adverse Reactions/Side Effects

CNS: SEIZURES, dizziness, headache, somnolence.

Resp: RESPIRATORY DEPRESSION. **CV:** hypotension.

GI: diarrhea, nausea, vomiting. **Misc:** ANGIOEDEMA.

Interactions

Drug-Drug: Concurrent MAO inhibitors or use of MAO inhibitors in the preceding 2 wk can result in potentially life-threatening adverse cardiovascular reactions due to additive effects on norepinephrine levels. Concurrent use of other CNS depressants including sedative/hypnotics, alcohol, antihistamines, antidepressants, phenothiazines, and other opioids $\uparrow$ risk of further CNS depression; consider dose $\downarrow$ of one or both agents. $\uparrow$ risk of serotonin syndrome with SNRIs, SSRIs, triptans, tricyclic antidepressants, and MAO inhibitors.

Route/Dosage

When switching from immediate-release to extended-release product, the same total daily dose can be used.

PO (Adults): Immediate-release or oral solution—50 mg, 75 mg, or 100 mg initially, then every 4–6 hr as needed and tolerated. If pain control is not achieved within first hour of first dose, additional dose may be given. Doses should not exceed 700 mg on the first day or 600 mg/day thereafter; Extended-release—50 twice daily; titrate dose up to 100–250 mg twice daily (not to exceed dose of 500 mg/day).

Hepatic Impairment

PO (Adults): Moderate hepatic impairment—Immediate release or oral solution: 50 mg every 8 hr initially, then titrate to maintain analgesia without intolerable side effects; Extended-release: 50 mg once daily; may titrate up to maximum dose of 100 mg once daily, if needed.

Availability

Immediate-release tablets: 50 mg, 75 mg, 100 mg. **Extended-release tablets:** 50 mg, 100 mg, 150 mg, 200 mg, 250 mg. **Oral solution:** 20 mg/mL.

NURSING IMPLICATIONS**Assessment**

- Assess type, location, and intensity of pain before and 1 hr (peak) after administration.

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Assess BP and respiratory rate before and periodically during administration. Monitor for respiratory depression especially during initial dosing and with patients at increased risk.
- Assess bowel function routinely. Prevention of constipation should be instituted with increased intake of fluids and bulk and with laxatives to minimize constipating effects. Administer stimulant laxatives routinely if opioid use exceeds 2–3 days, unless contraindicated.
- Prolonged use may lead to physical and psychological dependence and tolerance, although these may be milder than with opioids. This should not prevent patient from receiving adequate analgesia. Most patients who receive tapentadol for pain do not develop psychological dependence.
- Monitor patient for seizures. May occur within recommended dose range. Risk is increased in patients with a history of seizures and in patients taking antidepressants (SSRIs, SNRIs, tricyclics) or other drugs that decrease the seizure threshold.
- Monitor for serotonin syndrome (mental-status changes [agitation, hallucinations, coma]), autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyperreflexia, incoordination] and/or gastrointestinal symptoms [nausea, vomiting, diarrhea] in patients taking SSRIs, SNRIs, triptans, tricyclic antidepressants, or MAO inhibitors concurrently with tapentadol.
- **Toxicity and Overdose:** Overdose may cause respiratory depression. Naloxone (Narcan) may reverse some, but not all, of the symptoms of overdose. Treatment should be symptomatic and supportive. Maintain adequate respiratory exchange.

Potential Nursing Diagnoses

Acute pain (Indications)

Implementation

- Initial dose of 50 mg, 75 mg, or 100 mg is individualized based on pain severity, previous experience with similar drugs, and ability to monitor patient. Second dose may be administered as soon as 1 hr after first dose if adequate pain relief is not obtained with first dose.
- **PO:** Tapentadol may be administered without regard to meals.
- Swallow extended-release tablets whole; do not crush, break or chew.
- Use calibrated syringe to administer correct dose of oral solution.

Patient/Family Teaching

- Instruct patient on how and when to ask for and take pain medication and to take tapentadol as directed; do not adjust dose without consulting health care professional. Report breakthrough pain and adverse reactions to health care professional. Do not take tapentadol if pain is mild or can be con-

trolled with other pain medications such as NSAIDs or acetaminophen. Do not stop abruptly; may cause withdrawal symptoms (anxiety, sweating, insomnia, rigors, pain, nausea, tremors, diarrhea, upper respiratory symptoms, hallucinations). Decrease dose gradually. Advise patient to read the *Medication Guide* prior to taking tapentadol and with each Rx refill, in case of new information.

- Advise patient that tapentadol is a drug with known abuse potential. Protect it from theft, and never give to anyone other than the individual for whom it was prescribed; may be dangerous.
- May cause dizziness and drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Inform patient that tapentadol may cause seizures. Stop taking tapentadol and notify health care professional immediately if seizures occur.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise patient to notify health care professional if signs of serotonin syndrome occur.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.
- Advise female patients to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.

telaprevir (tel-a-pre-vir)

Incivek

Classification

Therapeutic: antivirals

Pharmacologic: protease inhibitors

Pregnancy Category B (telaprevir), X (with peginterferon and ribavirin)

Indications

⚠ Treatment of chronic hepatitis C (genotype 1) infection in combination with peginterferon alfa and ribavirin in adult patients with compensated liver disease who are previously untreated or who have failed previous treatment with interferon and ribavirin.

Action

Acts as an inhibitor of viral protease resulting in direct antiviral effect; effect is additive with other antivirals.

Therapeutic Effects: Decreased progression of hepatic damage and improved virologic response.

Pharmacokinetics

Absorption: Well absorbed following oral administration; food, especially fat enhances absorption.

Distribution: Unknown.

Metabolism and Excretion: Extensively metabolized by the liver, primarily by the CYP3A4 enzyme system; metabolites mostly eliminated in feces, 1% excreted in urine.

Half-life: 9–11 hr (steady state).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	4–5 hr	8–12 hr

Contraindications/Precautions

Contraindicated in: Concurrent use of alfuzosin, rifampin, ergot derivatives, St. John's wort, lovastatin, simvastatin, pimozide, sildenafil (Revatio), tadalafil (Adcirca), midazolam (PO), triazolam, carbamazepine, phenobarbital, or phenytoin; **OB:** Avoid using in pregnant patients and in male patients whose partners are pregnant (due to concurrent use with ribavirin); **Lactation:** Avoid breast feeding.

Use Cautiously in: Concurrent infection with HIV or Hepatitis B (safety and efficacy not established); Decompensated cirrhosis (safety and effectiveness not established for Child-Pugh score ≥ 7 [Class B and C]); Solid organ transplantation (safety and effectiveness not established); **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: fatigue. **GI:** diarrhea, nausea, anorectal discomfort/pruritus, dysgeusia, hemorrhoids. **Derm:** **DRUG**

RASH WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, rash, pruritus. GU: acute renal failure. **Hemat:** anemia.

Interactions

Drug-Drug: ↑ blood levels and risk of toxicity from **ergot derivatives (dihydroergotamine, ergotamine, methylergonovine, ergonovine)**, **lovastatin, midazolam (PO), pimozide, sildenafil (Revatio), tadalafil (Adcirca) simvastatin, alfuzosin, or triazolam;** concurrent use is contraindicated. **Rifampin, carbamazepine, phenobarbital, and phenytoin** may ↓ blood levels; **concurrent use contraindicated.** ↑ blood levels and risk of toxicity with **amiodarone, flecainide, lidocaine (systemic), propafenone, and quinidine;** concurrent use should be undertaken with caution and clinical monitoring. ↑ **digoxin** levels; use lowest dose, monitor lev-

els, titrate to desired effect. Concurrent use with **clarithromycin, erythromycin, or telithromycin** may ↑ levels of anti-infectives and telaprevir; may also ↑ risk of torsade de pointes. May ↑ or ↓ effects of **warfarin;** monitor INR. May ↓ levels and effectiveness of **escitalopram.** May ↑ levels and risk of toxicity with **trazodone;** dose ↓ may be warranted. Levels are ↑ by **ketoconazole** and may be ↑ by **posaconazole or itraconazole.** ↑ levels of **ketoconazole, posaconazole, and itraconazole;** daily dose of ketoconazole or itraconazole should not exceed 200 mg. ↑ risk of QTc prolongation and arrhythmias with **ketoconazole, posaconazole, and voriconazole;** because of variable effects on **voriconazole** concurrent use should be avoided unless benefits outweigh risks of combined therapy. ↑ levels and risk of toxicity with **colchicine;** avoid concurrent use in patients with hepatic or renal impairment. If used for gout flares initial dose is 0.6 mg followed by 0.3 mg one hour later, not to be repeated in less than three days. For prophylaxis of gout flares if initial regimen was 0.6 mg twice daily, ↓ to 0.3 mg once daily; if initial regimen was 0.6 mg once daily, ↓ dose to 0.3 mg once every other day. For Familial Mediterranean Fever maximum dose should not exceed 0.6 mg/day (or 0.3 mg twice daily). **Rifabutin** may ↓ telaprevir levels while telaprevir may ↑ **rifabutin** levels; concurrent use is not recommended. ↑ levels and risk of excess sedation with **alprazolam.** ↓ levels and effect of **zolpidem;** dosage adjustments may be necessary. ↑ levels and effects of calcium channel blockers including **amlodipine, diltiazem, felodipine, nicardipine, nifedipine, nisoldipine, and verapamil;** clinical monitoring is recommended. ↑ levels of systemic **corticosteroids** including **prednisone** and **methylprednisolone** and the inhaled **corticosteroids fluticasone** and **budesonide;** concurrent use is not recommended. Systemic **dexamethasone** ↓ levels and effectiveness; use cautiously/consider alternatives. ↑ levels of **bosentan** use cautiously and monitor clinically. Levels are ↓ by concurrent **atazanavir/ritonavir,** ↑ **atazanavir** levels. ↓ levels of telaprevir and **darunavir** when used concurrently with **darunavir/ritonavir;** avoid if possible. Concurrent use with **fosamprenavir/ritonavir** ↓ levels of **fosamprenavir** and telaprevir and should be avoided. Concurrent use with **lopinavir/ritonavir** ↓ levels and should be avoided. Concurrent use with **efavirenz** ↓ levels of efavirenz and telaprevir. ↑ levels of **tenofovir;** dosage ↓ may be necessary. ↓ levels of **ethinyl estradiol** may ↓ contraceptive effectiveness, additional contraception recommended; when used for estrogen replacement, monitor for deficiency. ↑ levels of **cyclosporine, sirolimus, and tacrolimus** and risk of associated toxicities; dose reduction/increased interval are required. ↓ levels of methadone;

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

dosage adjustments may be needed during maintenance treatment. ↑ levels of **sildenafil**, **tadalafil**, and **vardeafil**; for erectile dysfunction sildenafil dose should not exceed a single 25 mg dose in 48 hr, tadalafil should not exceed 10 mg in 72 hour and vardenafil should not exceed 2.5 mg in 72 hr. Concurrent use with **vardeafil** may ↑ risk of adverse cardiovascular effects. ↑ risk of myopathy with **atorvastatin**; avoid concurrent use. May ↑ levels of **fluvastatin**, **pitavastatin**, **pravastatin**, and **rosuvastatin**. May ↑ **repaglinide** levels. May ↑ **alfentanil** and **fentanyl** levels; monitor for respiratory depression.

Drug-Natural Products: **St. John's wort** may ↓ levels and efficacy; concurrent use is contraindicated.

Route/Dosage

PO (Adults): 1125 mg twice daily, duration of treatment depends on virologic response.

Availability

Tablets: 375 mg.

NURSING IMPLICATIONS

Assessment

- Monitor symptoms of hepatitis during therapy.
- **Assess for skin reactions** (rash, fever, edema, mucosal erosions or ulcerations, red or inflamed eyes). Monitor patient with mild to moderate rash for progression. If rash becomes severe or systemic symptoms occur, discontinue telaprevir. If no improvement after 7 days, discontinue sequentially or simultaneously peginterferon alfa and ribavirin. Do not restart telaprevir if discontinued due to rash.
- **Lab Test Considerations:** Monitor HCV-RNA levels at Treatment Weeks 4 and 12 to determine effectiveness of therapy.
- Monitor hemoglobin prior to and at least at weeks 2, 4, 8, and 12 during telaprevir combination therapy. Ribavirin dose should be reduced according to guidelines to manage anemia. If ribavirin dose reductions are inadequate, consider discontinuing telaprevir. If ribavirin is permanently discontinued for anemia, telaprevir must be discontinued. Ribavirin may be restarted according to guidelines. Telaprevir dose must not be reduced and must not be restarted if discontinued.
- Monitor CBC with differential, electrolytes, serum creatinine, uric acid, hepatic enzymes, bilirubin, and TSH prior to and at Treatment Weeks 2, 4, 8, and 12, and as clinically appropriate. May cause ↓ lymphocyte counts, ↓ platelet counts, ↑ serum bilirubin and ↑ uric acid levels.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)

Implementation

- **PO:** Administer 2 times daily, 10–14 hrs apart, with food (not low fat). Swallow tablets whole; do not break, crush, dissolve, or chew.

Patient/Family Teaching

- Instruct patient to take telaprevir as directed, with peginterferon alfa and ribavirin. If peginterferon alfa and ribavirin are discontinued for any reason, telaprevir must be discontinued. Do not discontinue without discussing with health care professional. If a dose is missed and it is within 6 hrs of when it is usually taken, take as soon as possible; if more than 6 hrs from the time usually taken, skip dose and resume normal dosing schedule. Advise patient to read the *Medication Guide* prior to starting therapy and with each Rx refill in case of changes.
- Advise patient that fat content of the meal or snack is essential for absorption of telaprevir. Food should be eaten within 30 min prior to each dose. Examples of food include a bagel with cream cheese, 1/2 cup nuts, 3 tbsp peanut butter, 1 cup ice cream, 2 ounces American or cheddar cheese, 2 ounces of potato chips, or 1/2 cup trail mix.
- Inform patient of importance of keeping hydrated by drinking fluids. Signs and symptoms of dehydration include increased thirst, dry mouth, decreased urine frequency or volume, and dark colored urine. Notify health care professional if these symptoms occur or if severe vomiting or diarrhea occur.
- Advise patient to notify health care professional promptly of any skin changes or itching or signs and symptoms of anemia (tiredness, weakness, shortness of breath, dizziness). Do not stop telaprevir due to rash unless instructed by health care professional.
- Inform patient that telaprevir may not reduce the risk of transmission of HCV to others; precautions should be taken.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort.
- Inform female patients of the importance of simultaneously using two reliable non-hormonal forms of contraception, unless abstinence is the chosen method, during therapy and for 6 mo post-therapy. Hormonal contraceptives may not be reliable during and for up to 2 wks following discontinuation of telaprevir therapy. Advise pregnant women and men whose female partners are pregnant to avoid this therapy due to birth defects and fetal death with ribavirin. Encourage pregnant patients or partners to register with Ribavirin Pregnancy Registry by calling 1-800-593-2214.

Evaluation/Desired Outcomes

- Decreased progression of hepatic damage and improved virologic response.
- Therapy is discontinued if HCV-RNA levels are ≥1000 IU/mL at Treatment Week 4 or 12 or confirmed detectable HCV-RNA levels at Treatment Week 24.

REMS

telavancin (tel-a-van-sin)

Vibativ

Classification

Therapeutic: anti-infectives

Pharmacologic: lipoglycopeptides

Pregnancy Category C**Indications**

Treatment of complicated skin/skin structure infections caused by susceptible bacteria. Hospital-acquired and ventilator-associated bacterial pneumonia caused by *Staphylococcus aureus*.

Action

Inhibits bacterial cell wall synthesis by interfering with the polymerization and cross-linking of peptidoglycan.

Therapeutic Effects: Bactericidal action against susceptible organisms. **Spectrum:** Active against *Staphylococcus aureus* (including methicillin-susceptible and -resistant strains), *Streptococcus pyogenes*, *Streptococcus agalactiae*, *Streptococcus anginosus* (including *S. anginosus*, *S. intermedius*, and *S. constellatus*), and *Enterococcus faecalis* (vancomycin-susceptible strains only).

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Penetrates blister fluid.

Metabolism and Excretion: Metabolism is not known; 76% excreted unchanged in urine <1% in feces.

Half-life: 8 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	unknown	end of infusion	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Congenital long QT syndrome, known prolongation of the QT interval, uncompensated HF, or severe left ventricular hypertrophy (risk of fatal arrhythmias); **OB:** Do not use unless potential maternal benefit outweighs potential risk to fetus.

Use Cautiously in: Renal impairment (efficacy may be ↓; dose ↓ recommended for CCr ≤50 mL/min) (↑ risk of mortality in patients with CCr ≤50 mL/min; use only if benefit outweighs risk) (↑ risk of renal impairment); Diabetes, HF, hypertension (↑ risk of renal impairment); **Geri:** Consider age-related ↓ in renal function, adjust dose according (↑ risk of adverse renal

reactions); **Lactation:** Use cautiously; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: dizziness. **CV:** QT interval prolongation. **GI:** PSEUDOMEMBRANOUS COLITIS, taste disturbance, nausea, vomiting, abdominal pain. **GU:** foamy urine, nephrotoxicity. **Misc:** ANAPHYLAXIS, infusion reactions.

Interactions

Drug-Drug: Concurrent use of other medications known to prolong QT interval may ↑ risk of arrhythmias. Concurrent use of **NSAIDs**, **ACE inhibitors**, and **loop diuretics** may ↑ risk of adverse renal effects.

Route/Dosage**Complicated Skin/Skin Structure Infections**

IV (Adults): 10 mg/kg ever 24 hr for 7–14 days.

Hospital-Acquired/Ventilator-Associated Bacterial Pneumonia

IV (Adults): 10 mg/kg ever 24 hr for 7–21 days.

Renal Impairment

IV (Adults): CCr 30–50 mL/min—7.5 mg/kg every 24 hr; CCr 10–≤30 mL/min—10 mg/kg every 48 hr.

Availability

Sterile lyophilized powder for IV use (requires reconstitution): 250 mg/vial, 750 mg/vial.

NURSING IMPLICATIONS**Assessment**

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain specimens for culture and sensitivity prior to therapy. First dose may be given before receiving results.
- Assess women of child bearing age for pregnancy. Women should have a negative serum pregnancy test before starting telavancin.
- Monitor bowel function.** Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of pseudomembranous colitis. May begin up to several weeks following cessation of therapy.
- Monitor for infusion reactions (Red-man syndrome—flushing of upper body, urticaria, pruritus, rash). May resolve with stopping or slowing infusion.
- Observe patient for signs and symptoms of anaphylaxis** (rash, pruritus, laryngeal edema, wheezing).

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Discontinue drug and notify health care professional immediately if symptoms occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in case of anaphylactic reaction.

- **Lab Test Considerations:** Monitor renal function (serum creatinine, creatinine clearance) prior to, every 48–72 hrs during, and at the end of therapy. May cause nephrotoxicity. If renal function decreases, reassess need for telavancin.
- May interfere with prothrombin time, INR, aPTT, activated clotting time, and coagulation based factor Xa tests. Collect blood samples for these tests as close to next dose of telavancin as possible.
- Interferes with urine qualitative dipstick protein assays and quantitative dye methods; may use microalbumin assays.

Potential Nursing Diagnoses

Risk for infection (Indications)

Diarrhea (Adverse Reactions)

Implementation

IV Administration

- **Intermittent Infusion:** Reconstitute the 250 mg vial with 15 mL and the 750 mg vial with 45 mL of D5W, sterile water for injection, or 0.9% NaCl for concentrations of 15 mg/mL. Reconstitution time is usually under 2 min but may require up to 20 min. Mix thoroughly with contents dissolved completely. Do not administer solution that is discolored or contains particulate matter. Discard vial if vacuum did not pull diluent into vial. Time in vial plus time in bag should not exceed 4 hr at room temperature or 72 hr if refrigerated. **Diluent:** For doses of 150–800 mg dilute further with 100–250 mL of D5W, 0.9% NaCl, or LR. **Concentration:** For doses <150 mg or >800 mg dilute for a final concentration of 0.6–8 mg/mL. **Rate:** Administer over at least 60 min to minimize infusion reactions.
- **Y-Site Incompatibility:** Do not mix or administer with other medications. Flush line with D5W, 0.9% NaCl, or LR before and after administration.
- **Y-Site Compatibility:** amphotericin B lipid complex, ampicillin/sulbactam, azithromycin, calcium gluconate, caspofungin, cefepime, ceftazidime, ceftriaxone, ciprofloxacin, dexamethasone, diltiazem, dobutamine, dopamine, doripenem, doxycycline, ertapenem, famotidine, fluconazole, gentamicin, hydrocortisone, labetalol, magnesium sulfate, mannitol, meropenem, metoclopramide, milrinone, norepinephrine, ondansetron, pantoprazole, phenylephrine, piperacillin/tazobactam, potassium chloride, potassium phosphates, ranitidine, sodium bicarbonate, sodium phosphates, tigecycline, tobramycin, vasopressin.

- **Y-Site Incompatibility:** amphotericin B colloidal, amphotericin B liposome, digoxin, esomeprazole, furosemide, levofloxacin, micafungin.

Patient/Family Teaching

- **Instruct patient to notify health care professional immediately if diarrhea, abdominal cramping, fever, or bloody stools occur and not to treat with antidiarrheals without consulting health care professionals.**
- Inform patient that common side effects include taste disturbance, nausea, vomiting, headache and foamy urine. Notify health care professional if signs of infusion reaction occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise female patients to use effective contraception during therapy and to notify health care professional if pregnancy is suspected. Encourage pregnant patients to enroll in the VIBATIV pregnancy registry by calling 1-888-658-4228.
- Instruct the patient to notify health care professional if symptoms do not improve.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

telmisartan, See ANGIOTENSIN II RECEPTOR ANTAGONISTS.

temazepam (tem-az-a-pam) Restoril

Classification

Therapeutic: sedative/hypnotics

Pharmacologic: benzodiazepines

Schedule IV

Pregnancy Category X

Indications

Short-term management of insomnia (<4 weeks).

Action

Acts at many levels in the CNS, producing generalized depression. Effects may be mediated by GABA, an inhibitory neurotransmitter. **Therapeutic Effects:** Relief of insomnia.

Pharmacokinetics

Absorption: Well absorbed after oral administration.

Distribution: Widely distributed; crosses blood-brain barrier. Probably crosses the placenta and en-

ters breast milk. Accumulation of drug occurs with chronic dosing.

Protein Binding: 96%.

Metabolism and Excretion: Metabolized by the liver.

Half-life: 10–20 hr.

TIME/ACTION PROFILE (sedation)

ROUTE	ONSET	PEAK	DURATION
PO	30 min	2–3 hr	6–8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with other benzodiazepines may exist; Pre-existing CNS depression; Severe uncontrolled pain; Angle-closure glaucoma; Impaired respiratory function; Sleep apnea; **OB:** Neonates born to mothers taking temazepam may experience withdrawal effects; **Lactation:** Infants may become sedated. Discontinue drug or bottle feed.

Use Cautiously in: Pre-existing hepatic dysfunction; History of suicide attempt or drug addiction; **Geri:** Elderly patients have increased sensitivity to benzodiazepines. Appears on Beers list and is associated with increased risk of falls (↓ dose required).

Adverse Reactions/Side Effects

CNS: abnormal thinking, behavior changes, hangover, dizziness, drowsiness, hallucinations, lethargy, paradoxical excitation, sleep—driving. **EENT:** blurred vision. **GI:** constipation, diarrhea, nausea, vomiting.

Derm: rash. **Misc:** physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: ↑ CNS depression with alcohol, antidepressants, antihistamines, opioid analgesics, and other sedative/hypnotics. May ↓ efficacy of **levodopa**. **Rifampin** or **smoking** ↑ metabolism and may ↓ effectiveness of temazepam. **Probenecid** may prolong effects of temazepam. Sedative effects may be ↓ by **theophylline**.

Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, **skullcap**, **chamomile**, or **hops** can ↑ CNS depression.

Route/Dosage

PO (Adults): 15–30 mg at bedtime initially if needed; some patients may require only 7.5 mg.

PO (Geriatric Patients or Debilitated Patients): 7.5 mg at bedtime.

Availability (generic available)

Capsules: 7.5 mg, 15 mg, 22.5 mg, 30 mg. **Cost:** *Generic*—7.5 mg \$995.03/100, 15 mg \$73.45/100, 22.5 mg \$298.21/30, 30 mg \$88.45/100.

NURSING IMPLICATIONS

Assessment

- Assess mental status (orientation, mood, behavior) and potential for abuse prior to administering medication.
- Assess sleep patterns before and periodically throughout therapy.
- Prolonged high-dose therapy may lead to psychological or physical dependence. Restrict amount of drug available to patient, especially if patient is depressed or suicidal or has a history of addiction.
- **Geri:** Assess CNS effects and risk of falls. Institute falls prevention strategies.

Potential Nursing Diagnoses

Insomnia (Indications)

Risk for falls (Side Effects)

Implementation

- **Do not confuse Restoril (temazepam) with Risperdal (risperidone).**
- Supervise ambulation and transfer of patients after administration. Remove cigarettes. Side rails should be raised and call bell within reach at all times.
- **PO:** Administer with food if GI irritation becomes a problem.

Patient/Family Teaching

- Instruct patient to take temazepam as directed. Teach sleep hygiene techniques (dark room, quiet, bedtime ritual, limit daytime napping, avoidance of nicotine and caffeine). If less effective after a few weeks, consult health care professional; do not increase dose.
- May cause daytime drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known. **Geri:** Instruct patient and family how to reduce falls risk at home.
- Advise patient to avoid the use of alcohol and other CNS depressants and to consult health care professional before using OTC preparations that contain antihistamines or alcohol.
- Caution patient that complex sleep-related behaviors (sleep-driving, making phone calls, preparing and eating food, having sex, sleep walking) may occur while asleep. Inform patient to notify health care professional if sleep-related behaviors, (may include sleep-driving—driving while not fully awake after ingestion of a sedative-hypnotic product, with no memory of the event) occur.
- Emphasize the importance of follow-up appointments to monitor progress.
- Refer for psychotherapy if ineffective coping is basis for sleep pattern disturbance.

★ = Canadian drug name. ⚠ = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Advise patient to take temazepam only if able to devote 8 hr to sleep.
- Advise patient to inform health care professional if pregnancy is planned or suspected and to avoid breast feeding while taking temazepam.

Evaluation/Desired Outcomes

- Improvement in sleep pattern with decreased number of nighttime awakenings, improved sleep onset, and increased total sleep time, which may not be noticeable until the 3rd day of therapy.

tenecteplase, See THROMBOLYTIC AGENTS.

tenofovir (te-noe-fo-veer)

Virad

Classification

Therapeutic: antiretrovirals

Pharmacologic: nucleoside reverse transcriptase inhibitors

Pregnancy Category B

Indications

HIV infection (with other antiretrovirals). Chronic hepatitis B.

Action

Active drug (tenofovir) is phosphorylated intracellularly; tenofovir diphosphate inhibits HIV reverse transcriptase resulting in disruption of DNA synthesis.

Therapeutic Effects: Slowed progression of HIV infection and decreased occurrence of sequelae. Increased CD4 cell count and decreased viral load. Decreased progression/sequelae of chronic hepatitis B infection.

Pharmacokinetics

Absorption: Tenofovir disoproxil fumarate is a prodrug, which is split into tenofovir, the active component.

Distribution: Absorption is enhanced by food.

Metabolism and Excretion: 70–80% excreted unchanged in urine by glomerular filtration and active tubular secretion.

Half-life: Unknown.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2 hr*	24 hr

*When taken with food

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of antiretroviral combination products containing

tenofovir; Concurrent or recent use of NSAIDs (↑ risk of acute renal failure); **Lactation:** HIV-infected women should not breast feed.

Use Cautiously in: Co-infection with HIV and chronic hepatitis B; Obesity, women, prolonged nucleoside exposure (may be risk factors for lactic acidosis/hepatomegaly); Renal impairment (↑ dosing interval if CCr <50 mL/min); History of pathologic bone fractures or at risk for osteopenia; **OB:** Has been used safely; **Pedi:** Children <2 yr (safety not established).

Adverse Reactions/Side Effects

CNS: depression, headache, weakness. **GI:** **HEPATOMEGALY**, (with steatosis), diarrhea, nausea, abdominal pain, anorexia, vomiting, flatulence. **GU:** proximal renal tubulopathy, renal impairment. **F and E:** **LACTIC ACIDOSIS**, hypophosphatemia. **Derm:** rash. **MS:** ↓ bone mineral density, osteomalacia. **Misc:** immune reconstitution syndrome.

Interactions

Drug-Drug: May ↑ didanosine levels; ↓ didanosine dose. Blood levels may be ↑ by **cidofovir**, **acyclovir**, **ganciclovir**, or **valganciclovir**. Risk of renal toxicity ↑ by other **nephrotoxic agents**. Combination therapy with **atazanavir** may lead to ↓ virologic response and possible resistance to atazanavir (small amounts of **ritonavir** may be added to boost blood levels); may also ↑ tenofovir levels. **Lopinavir/ritonavir** may ↑ levels. Concurrent use with **adefovir** for chronic hepatitis B infection should be avoided. Concurrent use with **NSAIDs** may ↑ risk of acute renal failure.

Route/Dosage

HIV

PO (Adults and Children ≥12 yr and ≥35 kg): 300 mg once daily.

Renal Impairment

PO (Adults): CCr 30–49 mL/min— 300 mg every 48 hr; **CCr 10–29 mL/min—** 300 mg every 72–96 hr; **Hemodialysis patients—** 300 mg every 7 days following dialysis.

PO (Children 2–11 yr and ≥17 kg): Tablets: ≥35 kg—300 mg once daily; 28–34.9 kg—250 mg once daily; 22–27.9 kg—200 mg once daily; 17–21.9 kg—150 mg once daily.

PO (Children 2–11 yr): Oral Powder: ≥35 kg—7.5 scoops (300 mg) once daily; 34–34.9 kg—7 scoops (280 mg) once daily; 32–33.9 kg—6.5 scoops (260 mg) once daily; 29–31.9 kg—6 scoops (240 mg) once daily; 27–28.9 kg—5.5 scoops (220 mg) once daily; 24–26.9 kg—5 scoops (200 mg) once daily; 22–23.9 kg—4.5 scoops (180 mg) once daily; 19–21.9 kg—4 scoops (160 mg) once daily; 17–18.9 kg—3.5 scoops (140 mg) once daily; 14–16.9 kg—3 scoops (120 mg) once daily; 12–13.9

kg—2.5 scoops (100 mg) once daily; 10–11.9 kg—2 scoops (80 mg) once daily;.

Chronic Hepatitis B

PO (Adults and Children ≥12 yr and ≥35 kg): 300 mg once daily.

Renal Impairment

PO (Adults): *CCr* 30–49 mL/min—300 mg every 48 hr; *CCr* 10–29 mL/min—300 mg every 72–96 hr; *Hemodialysis patients*—300 mg every 7 days following dialysis.

Availability

Tablets: 150 mg, 200 mg, 250 mg, 300 mg. **Oral powder:** 40 mg/scoop. **In combination with:** emtricitabine (Truvada); emtricitabine and rilpivirine (Complera); efavirenz and emtricitabine (Atripla); elvitegravir, cobicistat, and emtricitabine (Stribild). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Monitor for change in severity of HIV symptoms and for symptoms of opportunistic infection before and during therapy.
- Monitor bone mineral density in patients who have a history of pathologic bone fracture or are at risk for osteoporosis or bone loss.
- **Lab Test Considerations:** Monitor viral load and CD4 count before and routinely during therapy to determine response.
- Monitor liver function tests and hepatitis B virus levels throughout and following therapy. If therapy is discontinued, may cause severe exacerbation of hepatitis B. May cause ↑ AST, ALT, alkaline phosphatase, creatine kinase, amylase, and triglyceride concentrations. **Lactic acidosis may occur with hepatic toxicity causing hepatic steatosis; may be fatal, especially in women.**
- Calculate creatinine clearance prior to and periodically during therapy and when clinically indicated.
- Monitor serum phosphate periodically during therapy in patients at risk for renal impairment. May cause hypophosphatemia in patients with renal impairment.
- May cause hyperglycemia and glucosuria.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)

Risk for injury (Side Effects)

Implementation

- When tenofovir is administered concomitantly with didanosine, administer tenofovir 2 hr before or 1 hr after didanosine.
- **PO:** Administer once daily with or without food.

- Patients unable to swallow tablets can use oral powder. Using only dosing scoop, mix in soft food (applesauce, baby food, yogurt). Do not mix in liquid; powder floats to top even after stirring. Ingest entire mixture immediately to avoid bitter taste.

Patient/Family Teaching

- Instruct patient on the importance of taking tenofovir as directed, even if feeling better. Do not take more than prescribed amount and do not stop taking without consulting health care professional. Discontinuing therapy may lead to severe exacerbations. Take missed doses as soon as remembered unless almost time for next dose; do not double doses. Caution patient not to share or trade this medication with others.
- Inform patient that tenofovir may cause hyperglycemia. Advise patient to notify health care professional if increased thirst or hunger; unexplained weight loss; increased urination; fatigue; or dry, itchy skin occurs.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Caution patient to avoid crowds and persons with known infections.
- Inform patient that tenofovir does not cure AIDS and does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom and avoid sharing needles or donating blood to prevent spreading HIV to others.
- **Advise patient to notify health care professional immediately if symptoms of lactic acidosis (nausea, vomiting, unusual or unexpected stomach discomfort, and weakness) or signs of Immune Reconstitution Syndrome (signs and symptoms of an infection) occur.**
- Inform patient that changes in body fat distribution (increased fat in upper back and neck, breast, and trunk, and loss of fat from legs, arms, and face) may occur, but may not be related to drug therapy.
- Advise female patients to notify health care professional if pregnancy is planned or suspected. Breast feeding should be avoided. Pregnancy registry is available for patient taking antiretroviral medications.
- Emphasize the importance of regular exams to monitor for side effects.

Evaluation/Desired Outcomes

- Decreased incidence of opportunistic infection and slowed progression of HIV infection.
- Slowed progression of chronic hepatitis B infection.

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

terazosin (ter-ay-zoe-sin)

Hytrin

Classification

Therapeutic: antihypertensives

Pharmacologic: peripherally acting antiadrenergics

Pregnancy Category C**Indications**

Mild to moderate hypertension (alone or with other agents). Urinary outflow obstruction in patients with prostatic hyperplasia.

Action

Dilates both arteries and veins by blocking postsynaptic alpha₁-adrenergic receptors. Decreases contractions in smooth muscle of the prostatic capsule.

Therapeutic Effects: Lowering of BP. Decreased symptoms of prostatic hyperplasia (urinary urgency, hesitancy, nocturia).

Pharmacokinetics

Absorption: Well absorbed after oral administration.

Distribution: Unknown.

Metabolism and Excretion: 50% metabolized by the liver. 10% excreted unchanged by the kidneys. 20% excreted unchanged in feces. 40% eliminated in bile.

Half-life: 12 hr.

TIME/ACTION PROFILE

ROUTE	ONSET†	PEAK‡	DURATION†
PO-hypertension	15 min	6–8 wk	24 hr
PO-prostatic hyperplasia	2–6 wk	unknown	unknown

†After single dose

‡After multiple oral dosing

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Dehydration, volume or sodium depletion (↑ risk of hypotension); **OB, Lactation, Pedi:** Safety not established; Patients undergoing cataract surgery (↑ risk of intraoperative floppy iris syndrome).

Adverse Reactions/Side Effects

CNS: dizziness, headache, weakness, drowsiness, nervousness. **EENT:** nasal congestion, blurred vision, conjunctivitis, intraoperative floppy iris syndrome, sinusitis. **Resp:** dyspnea. **CV:** first-dose orthostatic hypotension, arrhythmias, chest pain, palpitations, peripheral edema, tachycardia. **GI:** nausea, abdominal pain, diarrhea, dry mouth, vomiting. **GU:** erectile dys-

function, urinary frequency. **Derm:** pruritus. **Metab:** weight gain. **MS:** arthralgia, back pain, extremity pain. **Neuro:** paresthesia. **Misc:** fever.

Interactions

Drug-Drug: ↑ risk of hypotension with **sildenafil, tadalafil, vardenafil**, other **antihypertensives, nitrates**, or acute ingestion of **alcohol**. **NSAIDs, sympathomimetics, or estrogens** may ↓ effects of antihypertensive therapy.

Route/Dosage

The first dose should be taken at bedtime.

Hypertension

PO (Adults): 1 mg initially, then slowly ↑ up to 5 mg/day (usual range 1–5 mg/day); may be given as single dose or in 2 divided doses (not to exceed 20 mg/day).

Benign Prostatic Hyperplasia

PO (Adults): 1 mg at bedtime; gradually may be ↑ up to 5–10 mg/day.

Availability (generic available)

Tablets: 1 mg, 2 mg, 5 mg, 10 mg. **Cost:** Generic—All strengths \$160.38/100.

NURSING IMPLICATIONS**Assessment**

- Assess for first-dose orthostatic reaction (dizziness, weakness) and syncope. May occur 30 min–2 hr after initial dose and occasionally thereafter. Incidence may be dose related. Volume-depleted or sodium-restricted patients may be more sensitive. Observe patient closely during this period; take precautions to prevent injury. First dose may be given at bedtime to minimize this reaction.
- Monitor intake and output ratios and daily weight; assess for edema daily, especially at beginning of therapy.
- **Hypertension:** Monitor BP and pulse frequently during initial dosage adjustment and periodically throughout therapy. Report significant changes.
- Monitor frequency of prescription refills to determine adherence.
- **Benign Prostatic Hyperplasia:** Assess patient for symptoms of prostatic hyperplasia (urinary hesitancy, feeling of incomplete bladder emptying, interruption of urinary stream, impairment of size and force of urinary stream, terminal urinary dribbling, straining to start flow, dysuria, urgency) before and periodically during therapy.
- Rule out prostatic carcinoma before therapy; symptoms are similar.

Potential Nursing Diagnoses

Risk for injury (Side Effects)

Noncompliance (Patient/Family Teaching)

Implementation

- May be used in combination with diuretics or beta blockers to minimize sodium and water retention. If these are added to terazosin therapy, reduce dose of terazosin initially and titrate to effect.
- **PO:** Administer daily dose at bedtime. If necessary, dose may be increased to twice daily.

Patient/Family Teaching

- Instruct patient to take medication at the same time each day. Take missed doses as soon as remembered. If not remembered until next day, omit; do not double doses.
- Advise patient to weigh self twice weekly and assess feet and ankles for fluid retention.
- May cause dizziness or drowsiness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Caution patient to avoid sudden changes in position to decrease orthostatic hypotension. Alcohol, CNS depressants, standing for long periods, hot showers, and exercising in hot weather should be avoided because of enhanced orthostatic effects.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially cough, cold, or allergy remedies.
- Instruct patient to notify health care professional of medication regimen before any surgery.
- Advise patient to notify health care professional if frequent dizziness, fainting, or swelling of feet or lower legs occurs.
- Emphasize the importance of follow-up exams to evaluate effectiveness of medication.
- **Hypertension:** Emphasize the importance of continuing to take this medication as directed, even if feeling well. Medication controls but does not cure hypertension.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol consumption, regular exercise, and stress management).
- Instruct patient and family on proper technique for BP monitoring. Advise them to check BP at least weekly and to report significant changes.

Evaluation/Desired Outcomes

- Decrease in BP without appearance of side effects.
- Decreased symptoms of prostatic hyperplasia. May require 2–6 wk of therapy before effects are noticeable.

terbinafine (ter-bi-na-feen)

Lamisil

Classification

Therapeutic: antifungals (systemic)

Pregnancy Category B

For topical use, refer to Antifungals, Topical monograph

Indications

Onychomycosis (fungal nail infection). Tinea capitis.

Action

Interferes with fungal cell wall synthesis (ergosterol biosynthesis) by inhibiting the enzyme squalene epoxidase. **Therapeutic Effects:** Fungal cell death.

Spectrum: Active against dermatophytes and other fungi.

Pharmacokinetics

Absorption: 70–80% absorbed after oral administration.

Distribution: Extensively distributed; penetrates dermis and epidermis; concentrates in stratum corneum, hair, scalp, and nails. Enters breast milk.

Protein Binding: 99%.

Metabolism and Excretion: Extensively metabolized by the liver by CYP isoenzymes 1A2, 2C9, 2C19, and 3A4.

Half-life: Plasma—22 days; longer from skin and nails.

TIME/ACTION PROFILE (antifungal tissue levels)

ROUTE	ONSET	PEAK	DURATION
PO	several days	days–wk	several wk

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Chronic or active liver disease; Heart failure or left ventricular dysfunction.

Use Cautiously in: History of alcoholism; Renal impairment (dose ↓ recommended for CrCl <50 mL/min); **OB, Lactation:** Safety not established.

Adverse Reactions/Side Effects

CNS: depression, headache. **Resp:** cough, nasopharyngitis. **CV:** heart failure. **GI:** HEPATOTOXICITY, anorexia, diarrhea, nausea, stomach pain, vomiting, drug-induced hepatitis, smell disturbance, taste disturbance. **Derm:** **DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS SYNDROME**, **STEVENS-JOHNSON SYNDROME**, **TOXIC EPIDERMAL NECROLYSIS**, itching, rash. **Hemat:** neutropenia, pancytopenia. **Misc:** pyrexia.

✳ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Interactions

Drug-Drug: Alcohol or other hepatotoxic agents may ↑ risk of hepatotoxicity. Rifampin may ↓ effectiveness. Fluconazole and cimetidine may ↑ levels. May ↑ effects of CYP2D6 substrates including tricyclic antidepressants, selective serotonin reuptake inhibitors, beta-blockers, flecainide, and propafenone.

Drug-Natural Products: ↑ caffeine levels and side effects with caffeine-containing herbs (cola nut, guarana, mate, tea, coffee).

Route/Dosage

PO (Adults): 250 mg once daily for 6 wk for finger-nail infection or 12 wk for toenail infection.

PO (Children ≥4 yr—≥35 kg): 250 mg/day for 6 wk.

PO (Children ≥4 yr—25–35 kg): 187.5 mg/day for 6 wk.

PO (Children ≥4 yr—<25 kg): 125 mg/day for 6 wk.

Availability (generic available)

Tablets: 250 mg. **Oral granules:** 125 mg/packet, 187.5 mg/packet.

NURSING IMPLICATIONS

Assessment

- Assess for signs and symptoms of infection (nail beds, scalp) before and periodically throughout therapy.
- Specimens for culture should be taken before instituting therapy. Therapy may be started before results are obtained.
- Monitor for depression periodically during therapy.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.
- Lab Test Considerations:** CBC should be monitored in patients receiving therapy for >6 wk. Discontinue if abnormal values occur.
- Monitor AST and ALT prior to, and periodically throughout, therapy. Terbutaline should be discontinued if symptomatic elevations occur.
- If signs of secondary infection occur, monitor neutrophil count. If <1000/mm³, discontinue treatment.
- May cause ↓ absolute lymphocyte count.
- Monitor serum potassium. May cause hypokalemia.

Potential Nursing Diagnoses

Risk for infection (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- Do not confuse Lamisil (terbinafine) with Lamictal (lamotrigine).

- PO:** May be administered without regard to food.
- Oral granules** should be taken with food and may be sprinkled on a spoonful of pudding or other soft, nonacidic food, such as mashed potatoes and swallowed in entirety. Applesauce or fruit-based foods should not be used.

Patient/Family Teaching

- Instruct patient to take medication as directed, for the full course of therapy, even if feeling better. Doses should be taken at the same time each day.
- Instruct patient to notify health care professional immediately if signs and symptoms of liver dysfunction (unusual fatigue, anorexia, nausea, vomiting, upper right abdominal pain, jaundice, dark urine, or pale stools) depression, or rash occur. Terbinafine should be discontinued.
- May cause disturbance in smell. Advise patient to notify health care professional if this occurs.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.

Evaluation/Desired Outcomes

- Resolution of clinical and laboratory indications of fungal nail infections. Inadequate period of treatment may lead to recurrence of active infection.
- Resolution of tinea capitis infection.

terbinafine, See ANTIFUNGALS (TOPICAL).

terbutaline (ter-byoo-ta-leen)

Bricanyl

Classification

Therapeutic: bronchodilators

Pharmacologic: adrenergics

Pregnancy Category B

Indications

Management of reversible airway disease due to asthma or COPD; inhalation and subcut used for short-term control and oral agent as long-term control. **Unlabeled Use:** Management of preterm labor (tocolytic) (the FDA has recommended that injectable terbutaline should not be used in pregnancy for the prevention or prolonged treatment [≥48–72 hr] of preterm labor in either the inpatient or outpatient settings because of the potential for serious maternal heart problems and death; oral terbutaline should not be used for the prevention or any treatment of preterm labor because of a lack of efficacy and the potential for serious maternal heart problems and death).

Action

Results in the accumulation of cyclic adenosine monophosphate (cAMP) at beta-adrenergic receptors. Produces bronchodilation. Inhibits the release of mediators of immediate hypersensitivity reactions from mast cells. Relatively selective for beta₂ (pulmonary)-adrenergic receptor sites, with less effect on beta₁ (cardiac)-adrenergic receptors. **Therapeutic Effects:** Bronchodilation.

Pharmacokinetics

Absorption: 35–50% absorbed following oral administration but rapidly undergoes first-pass metabolism. Well absorbed following subcut administration.

Distribution: Enters breast milk.

Metabolism and Excretion: Partially metabolized by the liver; 60% excreted unchanged by the kidneys following subcut administration.

Half-life: Unknown.

TIME/ACTION PROFILE (bronchodilation)

ROUTE	ONSET	PEAK	DURATION
PO	within 60–120 min	within 2–3 hr	4–8 hr
Subcut	within 15 min	within 0.5–1 hr	1.5–4 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to adrenergic amines.

Use Cautiously in: Cardiac disease; Hypertension; Hyperthyroidism; Diabetes; Glaucoma; **Geri:** More susceptible to adverse reactions; may require dose ↓; Excessive use may lead to tolerance and paradoxical bronchospasm (inhaler); **OB, Lactation:** Pregnancy (near term) and lactation.

Adverse Reactions/Side Effects

CNS: nervousness, restlessness, tremor, headache, insomnia. **Resp:** pulmonary edema. **CV:** angina, arrhythmias, hypertension, myocardial ischemia, tachycardia. **GI:** nausea, vomiting. **Endo:** hyperglycemia. **F and E:** hypokalemia.

Interactions

Drug-Drug: Concurrent use with other **adrenergics** (sympathomimetic) will have additive adrenergic side effects. Use with **MAO inhibitors** may lead to hypertensive crisis. **Beta blockers** may negate therapeutic effect.

Drug-Natural Products: Use with caffeine-containing herbs (**cola nut, guarana, mate, tea, coffee**) ↑ stimulant effect.

Route/Dosage

PO (Adults and Children >15 yr): *Bronchodilation*—2.5–5 mg 3 times daily, given q 6 hr (not to exceed 15 mg/24 hr).

PO (Children 12–15 yr): *Bronchodilation*—2.5 mg 3 times daily (given q 6 hr) (not to exceed 7.5 mg/24 hr).

PO (Children <12 yr): *Bronchodilation*—0.05 mg/kg 3 times daily; may ↑ gradually (not to exceed 0.15 mg/kg 3–4 times daily or 5 mg/24 hr).

Subcut (Adults and Children ≥12 yr): *Bronchodilation*—250 mcg; may repeat in 15–30 min (not to exceed 500 mcg/4 hr).

Subcut (Children <12 yr): *Bronchodilation*—0.005–0.01 mg/kg; may repeat in 15–20 min.

IV (Adults): *Tocolysis*—2.5–10 mcg/min infusion; ↑ by 5 mcg/min q 10 min until contractions stop (not to exceed 30 mcg/min). After contractions have stopped for 30 min, ↓ infusion rate to lowest effective amount and maintain for 4–8 hr (unlabeled).

Availability (generic available)

Tablets: 2.5 mg, 5 mg. **Injection:** 1 mg/mL.

NURSING IMPLICATIONS

Assessment

- **Bronchodilator:** Assess lung sounds, respiratory pattern, pulse, and BP before administration and during peak of medication. Note amount, color, and character of sputum produced, and notify health care professional of abnormal findings.
- Monitor pulmonary function tests before initiating therapy and periodically throughout therapy to determine effectiveness of medication.
- **Preterm Labor:** Monitor maternal pulse and BP, frequency and duration of contractions, and fetal heart rate. Notify health care professional if contractions persist or increase in frequency or duration or if symptoms of maternal or fetal distress occur. Maternal side effects include tachycardia, palpitations, tremor, anxiety, and headache.
- Assess maternal respiratory status for symptoms of pulmonary edema (increased rate, dyspnea, rales/crackles, frothy sputum).
- Monitor mother and neonate for symptoms of hypoglycemia (anxiety; chills; cold sweats; confusion; cool, pale skin; difficulty in concentration; drowsiness; excessive hunger; headache; irritability; nausea; nervousness; rapid pulse; shakiness; unusual tiredness; or weakness) and mother for hypokalemia (weakness, fatigue, U wave on ECG, arrhythmias).
- **Lab Test Considerations:** May cause transient ↓ in serum potassium concentrations with higher than recommended doses.

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Monitor maternal serum glucose and electrolytes. May cause hypokalemia and hypoglycemia. Monitor neonate's serum glucose, because hypoglycemia may also occur in neonates.
- **Toxicity and Overdose:** Symptoms of overdose include persistent agitation, chest pain or discomfort, decreased BP, dizziness, hyperglycemia, hypokalemia, seizures, tachyarrhythmias, persistent trembling, and vomiting.
- Treatment includes discontinuing beta-adrenergic agonists and symptomatic, supportive therapy. Cardioselective beta blockers are used cautiously, because they may induce bronchospasm.

Potential Nursing Diagnoses

Ineffective airway clearance (Indications)

Implementation

- Do not confuse Brethine (terbutaline) with Methergine (methylethergonovine).
- **PO:** Administer with meals to minimize gastric irritation.
- Tablet may be crushed and mixed with food or fluids for patients with difficulty swallowing.
- **Subcut:** Administer subcut injections in lateral deltoid area. Do not use solution if discolored.

IV Administration

- **pH:** 3.0–5.0.
- **Continuous Infusion:** **Diluent:** May be diluted in D5W, 0.9% NaCl, or 0.45% NaCl. **Concentration:** 1 mg/mL (undiluted). **Rate:** Use infusion pump to ensure accurate dose. Begin infusion at 10 mcg/min. Increase dosage by 5 mcg every 10 min until contractions cease. Maximum dose is 80 mcg/min. Begin to taper dose in 5-mcg decrements after a 30–60 min contraction-free period is attained. Switch to oral dose form after patient is contraction-free 4–8 hr on the lowest effective dose.
- **Y-Site Compatibility:** insulin.

Patient/Family Teaching

- Instruct patient to take medication as directed. If on a scheduled dosing regimen, take a missed dose as soon as possible; space remaining doses at regular intervals. Do not double doses. Caution patient not to exceed recommended dose; may cause adverse effects, paradoxical bronchospasm, or loss of effectiveness of medication.
- Instruct patient to contact health care professional immediately if shortness of breath is not relieved by medication or is accompanied by diaphoresis, dizziness, palpitations, or chest pain.
- Advise patient to consult health care professional before taking any OTC medications or alcoholic beverages concurrently with this therapy. Caution patient also to avoid smoking and other respiratory irritants.

- **Preterm Labor:** Notify health care professional immediately if labor resumes or if significant side effects occur.

Evaluation/Desired Outcomes

- Prevention or relief of bronchospasm.
- Increase in ease of breathing.
- Control of preterm labor in a fetus of 20–36 wk gestational age.

terconazole, See ANTIFUNGALS (VAGINAL).

teriflunomide

(ter-i-floo-noe-mide)

Aubagio

Classification

Therapeutic: anti-multiple sclerosis agents
Pharmacologic: immune response modifiers, pyrimidine synthesis inhibitors

Pregnancy Category X

Indications

Management of relapsing forms of multiple sclerosis (MS).

Action

Inhibits an enzyme required for pyrimidine synthesis; has antiproliferative and anti-inflammatory effects.

Therapeutic Effects: ↓ incidence and severity of relapses in MS, with a decrease in disability progression.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Unknown.

Protein Binding: >99%.

Metabolism and Excretion: Eliminated via biliary excretion of unchanged drug with renal excretion of metabolites (37.5 in feces and 22.6% in urine), some metabolism occurs.

Half-life: 18–19 days.

TIME/ACTION PROFILE (decrease in disability progression)

ROUTE	ONSET	PEAK	DURATION
PO	3–6 mo	unknown	unknown

Contraindications/Precautions

Contraindicated in: Severe hepatic impairment; Concurrent leflunomide treatment; Live virus vaccinations; Active acute or chronic infection; Severe immunodeficiency, bone marrow disease or severe uncontrolled infection; **Lactation:** Discontinue teriflunomide

or discontinue breast feeding; **OB:** Pregnancy or woman with childbearing potential using unreliable contraception (may cause fetal harm).

Use Cautiously in: Pre-existing liver disease; Severe immunodeficiency, bone marrow disease or severe uncontrolled infection; Hypertension (treat appropriately prior); **Ger:** Age >60 yr, concurrent neurotoxic medications or diabetes mellitus (↑ risk of peripheral neuropathy); **OB:** Women with child-bearing potential; **Pedi:** Safe and effective use in children has not been established.

Adverse Reactions/Side Effects

CV: hypertension. **Resp:** **INTERSTITIAL LUNG DISEASE** (rare). **GI:** **HEPATOTOXICITY**, diarrhea, ↑ transaminases, nausea. **GU:** acute renal failure (urate nephropathy). **Derm:** severe skin reactions including **STEVENS-JOHNSON SYNDROME** and **TOXIC EPIDERMAL NECROLYSIS**, alopecia. **F and E:** hyperkalemia, hypophosphatemia. **Hemat:** leukopenia, neutropenia, thrombocytopenia. **Neuro:** paresthesia, peripheral neuropathy. **Misc:** **ATYPICAL INFECTIONS, INCLUDING LATENT TUBERCULOSIS**, influenza.

Interactions

Drug-Drug: May ↑ levels and effects of **drugs metabolized by the CYP2C8 enzyme system** including paclitaxel, pioglitazone, repaglinide, and rosiglitazone. May ↓ levels and effectiveness of **drugs metabolized by the CYP1A2 enzyme system** including alosetron, duloxetine, theophylline, and tizanidine. May ↓ response to and ↑ risk of adverse reactions from **live vaccines** (avoid live vaccinations and consider long half-life of teriflunomide before administering). May ↑ levels and effects of **ethinylestradiol** and **levonorgestrel**. May ↑ risk of bleeding with **warfarin**. ↑ risk of additive immunosuppression with other **immunosuppressants** or **antineoplastics** (consider long half-life of teriflunomide). Levels and effects may be ↑ by breast cancer resistant protein (BCRP) inhibitors including **cytosporine**, **eltrombopag**, and **gefitinib**. May alter response to **warfarin**. May ↑ risk of adverse reactions and ↓ antibody response to **live virus vaccines**.

Route/Dosage

PO (Adults): 7 or 14 mg once daily.

Availability

Film-coated tablets: 7 mg, 14 mg.

NURSING IMPLICATIONS

Assessment

- Assess BP before starting and periodically during therapy. Treat hypertension as needed.
- Lab Test Considerations:** Monitor liver function tests (transaminases, bilirubin) within 6 months of

starting therapy and monthly after teriflunomide therapy begins. Do not administer if ALT >2 × upper limit of normal. Consider discontinuing therapy if serum transaminase ↑ >3 × upper limit of normal is confirmed. Monitor serum transaminase and bilirubin in patients with symptoms of liver dysfunction. If liver injury is suspected, discontinue teriflunomide, begin accelerated elimination procedure, and monitor liver function tests weekly until normal.

- Obtain a pregnancy test from female patients prior to beginning therapy.
- Monitor CBC with platelet count within 6 months prior to starting and periodically during therapy based on signs and symptoms of infection. Mean decrease in WBC occurs during first 6 wks and remains low during therapy.
- Monitor INR closely in patients taking warfarin, a decrease in warfarin peak may occur.

Potential Nursing Diagnoses

Impaired physical mobility (Indications)

Implementation

- Administer a tuberculin skin test prior to administration of teriflunomide. Patients with active latent TB should be treated for TB prior to therapy.
- PO:** Administer once daily without regard to food.
- Drug Elimination Procedure:** Either of the following procedures is recommended to achieve nondetectable plasma levels <0.02 mg/L after stopping treatment with teriflunomide. 1) Administer cholestyramine 8 g 3 times daily (every 8 hrs) for 11 days. If cholestyramine 8 g is not well tolerated, cholestyramine 4 g 3 times/day can be used. or 2) Administration of 50 g oral activated charcoal powder every 12 hr for 11 days. (Days do not need to be consecutive unless rapid lowering of levels is desired.) Verify plasma levels <0.02 mg/L by 2 separate tests at least 14 days apart. Plasma levels may take up to 2 yr to reach nondetectable levels without drug elimination procedure.

Patient/Family Teaching

- Instruct patient to take teriflunomide as directed. Advise patient to read *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- Advise patient to notify health care professional promptly if symptoms of liver problems (nausea, vomiting, stomach pain, loss of appetite, tiredness, skin or whites of eyes yellowing, dark urine), serious skin problems (redness or peeling), infection (fever, tiredness, body aches, chills, nausea, vomiting), or interstitial lung disease (cough, dyspnea, with or without fever) occur.

☼ = Canadian drug name. ☼ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Instruct patient to notify health care professional if symptoms of peripheral neuropathy (numbness and tingling in hands and feet different from symptoms of MS), kidney problems (flank pain), high potassium level (nausea or racing heartbeat), or high BP occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Instruct patient to avoid vaccinations with live vaccines during and following therapy without consulting health care professional.
- Discuss the possibility of hair loss with patient. Explore methods of coping.
- Advise patient that teriflunomide is teratogenic. Effective birth control should be used during therapy and until blood levels of teriflunomide are low enough. If pregnancy is planned or suspected, or if breast feeding notify health care professional immediately, accelerated elimination procedure may be used to decrease blood levels more rapidly. Male patients with female partner who plans to become pregnant may also use this method. If female partner does not plan to become pregnant, use effective birth control until blood levels are low enough; may require 2 years. Females of childbearing potential are recommended to undergo accelerated elimination procedure upon discontinuation of teriflunomide. Patients who become pregnant should be encouraged to enroll in the Aubagio Pregnancy Registry at 1-800-745-4447 to collect information about mother and baby's health.

Evaluation/Desired Outcomes

- Decrease in the number of MS flares (relapses) and slowing of physical problems caused by MS.

tesamorelin (tess-a-moe-rel-in) Egrifta

Classification

Therapeutic: none assigned
Pharmacologic: growth hormone-releasing factor analogues

Pregnancy Category X

Indications

Reduction of excess abdominal fat (lipodystrophy) seen in HIV-infected patients.

Action

Acts as an analog of human growth hormone-releasing factor (GRF, GHRH), resulting in endogenous production of growth hormone (GH), which has anabolic and lipolytic properties. **Therapeutic Effects:** Reduction of abdominal adipose tissue in HIV-infected patients.

Pharmacokinetics

Absorption: <4% absorbed following subcutaneous administration.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: 26–38 min.

TIME/ACTION PROFILE (effect on visceral adipose tissue)

ROUTE	ONSET	PEAK	DURATION
Subcut	within 3 mos	10–12 mos	3 mos†

†Following discontinuation.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to tesamorelin or mannitol; Any pathology that alters the hypothalamic-pituitary axis, including hypophysectomy, hypopituitarism, pituitary surgery/tumor, cranial irradiation/trauma; **OB:** may cause fetal harm; **Lactation:** Breast feeding should be avoided by HIV-infected patients.

Use Cautiously in: Acute critical illness (may ↑ risk of serious complications; consider discontinuation); Pre-existing malignancy (disease should be inactive or treatment completed); Non-malignant neoplasms (carefully consider benefit); Persistently elevated Insulin-like Growth Factor (IGF-1; may require discontinuation); Diabetes mellitus (may cause glucose intolerance); **Pedi:** Safe and effective use in children not established.

Adverse Reactions/Side Effects

CV: peripheral edema. **Endo:** glucose intolerance.

Local: erythema, hemorrhage, irritation, pain, pruritus. **MS:** arthralgia, carpal tunnel syndrome, extremity pain, myalgia. **Misc:** hypersensitivity reactions.

Interactions

Drug-Drug: May alter the clearance and actions of drugs known to be metabolized by the CYP450 enzyme system including **corticosteroids**, **androgens**, **estrogens** and **progestins** (including **hormonal contraceptives**), **anticonvulsants**, and **cyclosporine**, careful monitoring for efficacy and/or toxicity recommended. Inhibits the conversion of **cortisone acetate** and **prednisone** to active forms; patients on replacement therapy may need ↑ maintenance/stress doses.

Route/Dosage

Subcut (Adults): 2 mg once daily.

Availability

Lyophilized powder for subcutaneous administration (requires reconstitution): 1 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess for fluid retention which manifests as ↑ tissue turgor and musculoskeletal discomfort (edema, arthralgia, extremity pain, carpal tunnel syndrome). May be transient or resolve with discontinuation of treatment.
- **Lab Test Considerations:** Monitor serum IGF-I closely during therapy; tesamorelin stimulates growth hormone production and the effect on progression of malignancies is unknown. Consider discontinuing tesamorelin in patients with persistent elevations of IGF-I levels, especially if efficacy response is not strong.
- May cause glucose intolerance and ↑ risk of developing diabetes. Monitor serum glucose prior to starting and periodically during therapy. Monitor diabetic patients closely for worsening of retinopathy.

Potential Nursing Diagnoses

Disturbed body image (Indications)

Implementation

- **Subcut:** Sterile Water for Injection 10 mL diluent is provided. Inject 2.2 mL of Sterile Water into tesamorelin, angled so that water goes down inside wall to prevent foaming. Roll vial gently between hands for 30 seconds to mix; do not shake. Change needle. Withdraw solution and inject into 2nd tesamorelin vial with solution against wall of vial. Mix between hands for 30 seconds. Withdraw all solution (2 mg/2.2 mL). Solution is clear and colorless; do not administer solution that is discolored or contains particulate matter. Use solution immediately upon reconstitution or discard; do not refrigerate or freeze. Change needle to 1/2 inch 27 gauge needle. Pinch skin and inject at right angle into abdomen below navel; rotate sites. Remove hand from pinched area and inject slowly. Do not inject into scar, bruises, or the navel. Prior to reconstitution, vials must be refrigerated and protected from light.

Patient/Family Teaching

- Instruct patient on correct technique for administration of tesamorelin. Caution patient never to share needles with others.
- Inform patient that tesamorelin may cause symptoms of fluid retention (edema, arthralgia, carpal tunnel syndrome); usually transient or resolve with discontinuation of therapy.
- Advise patient to discontinue tesamorelin and notify health care professional promptly if signs and symptoms of hypersensitivity (rash, urticaria, hives, swelling of face or throat, shortness of breath, fast heartbeat, fainting) occur.

- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Reduction of excess abdominal fat in HIV-infected patients with lipodystrophy.

REMS

TESTOSTERONE

(tess-toss-te-rone)

testosterone buccal system, mucoadhesive

Striant

testosterone cypionate

Depo-Testosterone

testosterone enanthate

Delatestryl

testosterone gel

AndroGel, Fortesta, Testim

testosterone pellets

Testopel

testosterone topical solution

Axiron

testosterone transdermal

Androderm

Classification

Therapeutic: hormones

Pharmacologic: androgens

Schedule III

Pregnancy Category X

Indications

Hypogonadism in androgen-deficient men. Delayed puberty in men (enanthate and pellets). Androgen-responsive breast cancer in post-menopausal women (palliative) (enanthate).

Action

Responsible for the normal growth and development of male sex organs. Maintenance of male secondary sex characteristics: Growth and maturation of the prostate, seminal vesicles, penis, scrotum, Development of male hair distribution, Vocal cord thickening, Alterations in body musculature and fat distribution.

Therapeutic Effects: Correction of hormone deficiency in male hypogonadism: Initiation of male puberty. Suppression of tumor growth in some forms of breast cancer.

✳ = Canadian drug name. ⚠ = Genetic implication. ~~Striant~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Pharmacokinetics

Absorption: Well absorbed from IM sites, through buccal mucosa, or through skin. Cypionate and enanthate salts are absorbed slowly. Skin serves as reservoir for sustained release of testosterone into systemic circulation; 10% absorbed into systemic circulation during 24-hr period.

Distribution: Crosses the placenta.

Protein Binding: 98%.

Metabolism and Excretion: Metabolized by the liver. Absorption from buccal mucosa bypasses initial liver metabolism. 90% eliminated in urine as metabolites.

Half-life: *Buccal, enanthate, pellets, gel, topical solution*—10–100 min; *transdermal*—70 min; *cypionate*—8 days.

TIME/ACTION PROFILE (androgenic effects†)

ROUTE	ONSET	PEAK	DURATION
IM—cypionate, enanthate	unknown	unknown	2–4 wk
IM—propionate	unknown	unknown	1–3 days
Buccal	unknown	10–12 hr	12 hr
Pellets	unknown	unknown	3–6 mo
Topical solution	unknown	14 days	7–10 days
Transdermal (gel)	30 min	unknown	24 hr
Transdermal (patch)	unknown	6–8 hr‡	24 hr§

†Response is highly variable among individuals; may take months

‡Plasma testosterone levels following applications of patch

§Following patch removal

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Male patients with breast or prostate cancer; Severe liver, renal, or cardiac disease (propionate); Some products contain benzyl alcohol and should be avoided in patients with known hypersensitivity; Women (buccal, pellets, gel, patch, topical solution); **OB, Lactation:** Pregnancy or lactation.

Use Cautiously in: Diabetes mellitus; Coronary artery disease (enanthate); Pre-existing cardiac, renal, or liver disease; Benign prostatic hyperplasia; Hypercalcemia (cypionate, enanthate, pellets); Sleep apnea (buccal); Obesity (buccal); Chronic lung disease (buccal); **Pedi:** Prepubertal males exposed to testosterone may experience premature development of secondary sexual characteristics, aggression, and other side effects; **Geri:** ↑ risk of prostatic hyperplasia/carcinoma.

Adverse Reactions/Side Effects

CNS: anxiety, confusion, depression, fatigue, headache, vertigo. **EENT:** deepening of voice. **CV:** edema.

GI: abdominal cramps, changes in appetite, ↑ liver enzymes, nausea, vomiting; *buccal*—bitter taste, gingivitis, gum edema, gum tenderness. **GU:** menstrual irregularities, nocturia, priapism, prostatic enlargement, urinary hesitancy, urinary incontinence. **Endo:** *women*—change in libido, clitoral enlargement, ↓ breast size; *men*—acne, facial hair, gynecomastia, erectile dysfunction, oligospermia, priapism. **F and E:** hypercalcemia, hyperkalemia, hyperphosphatemia. **Derm:** male pattern baldness. **Local:** chronic skin irritation (transdermal), pain at injection/implantation site.

Interactions

Drug-Drug: May ↑ action of **warfarin**, **oral hypoglycemic agents**, and **insulin**. Concurrent use with **corticosteroids** may ↑ risk of edema formation.

Route/Dosage

Replacement Therapy

IM (Adults): 50–400 mg q 2–4 wk (enanthate or cypionate).

Transdermal (patch) (Adults): One 4-mg/day system applied q 24 hr in the evening; adjust dose based on serum testosterone concentrations (dosing range = 2–6 mg/day).

Transdermal (Adults): *AndroGel 1% or Testim*—5 g (contains 50 mg of testosterone; 5 mg systemically absorbed) applied once daily (morning preferable), if needed may be ↑ to maximum of 10 g (contains 100 mg of testosterone; 10 mg systemically absorbed); *AndroGel 1.62%*—40.5 mg of testosterone (2 pump actuations) applied once daily (morning preferable); dose may be adjusted down to a minimum of 20.25 mg or up to a maximum of 81 mg of testosterone, if needed (dose based on serum testosterone levels) *Fortesta*—40 mg of testosterone (4 pump actuations) applied once daily (morning preferable); dose may be adjusted down to a minimum of 10 mg or up to a maximum of 70 mg of testosterone, if needed (dose based on serum testosterone levels).

Buccal (Adults): 30 mg (one system) applied to gum region twice daily (in the morning and evening, spaced 12 hr apart).

Subcut (for subcutaneous implantation) (pellets) (Adults): 150–450 mg q 3–6 mo.

Topical (Adults): 60 mg (2 pump actuations) applied once daily; may be ↑ up to 120 mg (4 pump actuations) based on serum testosterone concentrations.

Delayed Male Puberty

IM (Children): 50–200 mg q 2–4 wk for up to 6 mo (enanthate).

Subcut (for subcutaneous implantation) (pellets) (Children): 150–450 mg q 3–6 mo.

Palliative Management of Breast Cancer

IM (Adults): 200–400 mg q 2–4 wk (enanthate).

Availability (generic available)

Testosterone cypionate injection (in oil): 100 mg/mL, 200 mg/mL. **Testosterone enanthate injection (in oil):** 200 mg/mL. **Testosterone transdermal patches:** 2 mg/day in packages of 60, 4 mg/day in packages of 30. **1% gel (AndroGel):** 2.5-g unit-dose packets in boxes of 30, 5-g unit-dose packets in boxes of 30, 7.5-g metered dose pump (each pump dispenses 60 metered 1.25-g doses). **1% gel (Testim):** 5-g unit-dose tubes in boxes of 30. **1.62% gel (AndroGel):** Metered dose pump (each pump dispenses 120 metered 10-mg doses). **Gel (Fortesta):** 60-g metered dose pump (each pump dispenses 60 metered 20.25-mg doses). **Testosterone buccal, mucoadhesive:** 30 mg/system in blister packs of 10 systems/pack. **Testosterone pellets:** 75 mg. **Testosterone topical solution:** 30 mg/pump actuation.

NURSING IMPLICATIONS**Assessment**

- Monitor intake and output ratios, weigh patient twice weekly, and assess patient for edema. Report significant changes indicative of fluid retention.
- **Men:** Monitor for precocious puberty in boys (acne, darkening of skin, development of male secondary sex characteristics—increased penis size, frequent erections, growth of body hair). Bone age determinations should be measured every 6 mo to determine rate of bone maturation and effects on epiphyseal closure.
- Monitor for breast enlargement, persistent erections, and increased urge to urinate in men. Monitor for difficulty urinating in elderly men, because prostate enlargement may occur.
- **Women:** Assess for virilism (deepening of voice, unusual hair growth or loss, clitoral enlargement, acne, menstrual irregularity).
- In women with metastatic breast cancer, monitor for symptoms of hypercalcemia (nausea, vomiting, constipation, lethargy, loss of muscle tone, thirst, polyuria).
- **Lab Test Considerations:** Monitor hemoglobin and hematocrit periodically during therapy; may cause polycythemia.
- Monitor hepatic function tests, prostate specific antigen and serum cholesterol levels periodically during therapy. May cause $\uparrow$ serum AST, ALT, and bilirubin, $\uparrow$ cholesterol levels, and suppress clotting factors II, V, VII, and X.
- Monitor serum and urine calcium levels and serum alkaline phosphatase concentrations in women with metastatic breast cancer.
- Monitor serum sodium, chloride, potassium, and phosphate concentrations (may be $\uparrow$).

- Monitor blood glucose closely in patients with diabetes who are receiving oral hypoglycemic agents or insulin.
- **Transdermal:** Monitor serum testosterone concentrations 3–4 wk after starting therapy; these concentrations should be obtained in the morning (following application of patch during previous evening).
- **Buccal:** Monitor serum testosterone concentrations 4–12 wk after starting therapy.
- **Topical Solution:** Measure serum testosterone concentrations after initiation of therapy to ensure desired concentrations (300 ng/dL–1050 ng/dL) are achieved. Adjust dose based on serum testosterone concentration from a single blood draw 2–8 hours after applying and at least 14 days after starting treatment or following dose adjustment. If concentration is below 300 ng/dL, daily dose may be increased from 60 mg (2 pump actuations) to 90 mg (3 pump actuations) or from 90 mg to 120 mg (4 pump actuations). If concentration exceeds 1050 ng/dL, the daily testosterone dose should be decreased from 60 mg (2 pump actuations) to 30 mg (1 pump actuation) as instructed by health care professional. If concentration consistently exceeds 1050 ng/dL at lowest daily dose of 30 mg (1 pump actuation), discontinue therapy.

Potential Nursing Diagnoses

Sexual dysfunction (Indications, Side Effects)

Implementation

- Range-of-motion exercises should be done with all bedridden patients to prevent mobilization of calcium from the bone.
- **IM:** Administer IM deep into gluteal muscle. Crystals may form when vials are stored at low temperatures; warming and shaking vial will redissolve crystals. Use of a wet syringe or needle may cause solution to become cloudy but will not affect its potency.
- **Subcut:** Pellets are to be implanted subcutaneously by a health care professional.
- **Transdermal:** Apply patch to clean, dry, hairless skin on the back, abdomen, upper arms, or thighs. Do not apply to the scrotum. Also avoid application over bony prominences or a part of the body that may be subject to prolonged pressure during sleep or sitting. The patch does not need to be removed while swimming or taking a shower or bath.
- The sites of application should be rotated; once a patch is removed, the same site should not be used again for at least 1 wk.
- If skin irritation occurs, apply a small amount of OTC topical hydrocortisone cream after system removal or a small amount of 0.1% triamcinolone

☼ = Canadian drug name. ⚡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

cream may be applied to the skin under the central drug reservoir of the Androderm system without affecting the absorption of testosterone. Ointment formulations should not be used for pretreatment because they may significantly reduce testosterone absorption.

- Patch should be removed if undergoing a magnetic resonance imaging (MRI) scan. The system contains aluminum and may predispose the patient to skin burns during the test.
- **Buccal:** Apply to gum region twice daily (about 12 hr apart), rotating sides with each dose.
- **Topical: Solution:** Apply *Axiron*™ to axilla using applicator at the same time each morning, to clean, dry, intact skin. Do not apply to other parts of the body including to the scrotum, penis, abdomen, shoulders or upper arms. Prime pump when using for first time by depressing pump 3 times, discard any product dispensed directly into a basin, sink, or toilet and then wash liquid away thoroughly. Prime only prior to first use of each pump. After priming, completely depress pump once with nozzle over applicator cup to dispense 30 mg of testosterone. Apply in 30 mg (1 pump actuation) increments. Place actuator into the axilla and wipe steadily down and up into the axilla. If solution drips or runs, wipe back up with applicator cup. Do not rub into skin with fingers or hand. Repeat process for each 30 mg dose needed. When repeat application to same axilla, allow axilla to dry completely before more is applied. Rinse applicator under room temperature, running water and pat dry with a tissue. Allow axilla to dry completely prior to dressing. Solution has an alcohol based and is flammable until dry. Apply deodorant prior to application of testosterone solution. Avoid swimming or washing for 2 hrs after application. Wash hands immediately with soap and water after application.
- **Topical: Gel:** Apply gel once daily, preferably in the morning, to clean dry intact skin of shoulders and upper arms (*AndroGel*™ and *Testim*™) or abdomen (*AndroGel*™ only) or front or inner thighs (*Fortesta*™). Gel should not be applied to scrotum (5–30x more permeable than other sites). Refer to the chart on the pump label to determine how many full pump depressions are required for the daily prescribed dose.
- The dose of *Fortesta*™ should be titrated based on the serum testosterone concentration from a single blood draw 2 hours after applying *Fortesta*™ and at approximately 14 days and 35 days after starting treatment or following dose adjustment.

Patient/Family Teaching

- Advise patient to report the following signs and symptoms promptly: in male patients, priapism (sustained and often painful erections) difficulty urinating, or gynecomastia; in female patients, viril-

ism (which may be reversible if medication is stopped as soon as changes are noticed), or hypercalcemia (nausea, vomiting, constipation, and weakness); in male or female patients, edema (unexpected weight gain, swelling of feet), hepatitis (yellowing of skin or eyes and abdominal pain), or unusual bleeding or bruising.

- Explain rationale for prohibiting use of testosterone for increasing athletic performance. Testosterone is neither safe nor effective for this use and has a potential risk of serious side effects.
- Advise diabetic patients to monitor blood closely for alterations in blood glucose concentrations.
- Emphasize the importance of regular follow-up physical exams, lab tests, and x-ray exams to monitor progress.
- Radiologic bone age determinations should be evaluated every 6 mo in prepubertal children to determine rate of bone maturation and effects on epiphyseal centers.
- Instruct females to notify health care professional immediately if pregnancy is planned or suspected.
- **Transdermal:** Advise patient to notify health care professional if their female sexual partner develops signs/symptoms of virilization (e.g. change in body hair distribution, significant increase in acne, deepening of voice, menstrual irregularities).
- Instruct patient that the protective plastic liner must be removed before applying the patch.
- Instruct patient to apply patch to a clean, dry area of skin on back, abdomen, upper arms, or thighs. The patch should not be applied to their genitals or over bony areas (e.g., upper shoulders or upper hip).
- Instruct patient to rotate the sites of application. Once a patch is removed, the site should not be used again for at least 1 week.
- Advise patient that the patch does not need to be removed while showering, bathing, or swimming.
- Avoid contact of patch with women and children.
- Advise patient that the patch should be removed prior to undergoing an MRI scan.
- If a patch falls off before noon, advise patient to replace it with a fresh patch which should be worn until a new patch is applied in the evening. If a patch falls off after noon, advise patient that it does not need to be replaced until a fresh patch is applied in the evening.
- **Buccal:** Instruct patient to place the rounded side surface of the buccal system in a comfortable position against the gum just above incisor tooth. Hold the system firmly in place with a finger over the lip and against the product for 30 seconds to ensure adhesion. Buccal system is designed to stay in position until removed; if it fails to adhere to the gum or falls off within the first 8 hr after application, remove original system and apply a new one (this counts as replacing the first dose; apply the next

system ~12 hr after the original system was applied). If the buccal system falls off after 8 hr but before 12 hr, replace the original system (this replacement can serve as the second dose for that day).

- Advise patient to avoid dislodging buccal system and to check on placement after toothbrushing, use of mouthwash, eating or drinking. Do not chew or swallow buccal system. To remove, slide system downwards from gum toward tooth to avoid scratching the gum.
- **Topical:** Explain application to patient.
- Advise patient that women and children should avoid contact with unclothes or unwashed application site. Patients should cover the application site(s) with clothing (T-shirt) after solution has dried. For direct skin-to-skin contact, patient should wash application site thoroughly with soap and water to remove any testosterone residue. If unwashed or unclothed skin with testosterone solution comes in direct contact with skin of another person, wash area of contact with soap and water as soon as possible.

Evaluation/Desired Outcomes

- Resolution of the signs of androgen deficiency without side effects. Therapy is usually limited to 3–6 mo followed by bone growth or maturation determinations.
- Decrease in the size and spread of breast malignancy in postmenopausal women. In antineoplastic therapy, response may require 3 mo of therapy; if signs of disease progression appear, therapy should be discontinued.

tetrabenazine (te-tra-ben-a-zeen) Xenazine

Classification

Therapeutic: antichoreas

Pharmacologic: reversible monoamine depleters

Pregnancy Category C

Indications

Treatment of chorea due to Huntington's Disease.

Action

Acts as a reversible inhibitor of the vesicle monoamine transporter type 2 (VMAT-2); which inhibits the reuptake of serotonin, norepinephrine and dopamine into vesicles in presynaptic neurons. **Therapeutic Effects:** Decreased chorea due to Huntington's Disease.

Pharmacokinetics

Absorption: At least 75% absorbed following oral administration.

Distribution: Crosses the blood-brain barrier.

Metabolism and Excretion:  Rapidly and extensively metabolized by the liver; CYP2D6 plays a large role in the metabolic process (the CYP2D6 enzyme system exhibits genetic polymorphism; 7% of population may be poor metabolizers and may have significantly ↑ concentrations and an ↑ risk of adverse effects). Metabolites are renally excreted. Two metabolites α-dihydrotetrabenazine (α-HTBZ) and β-HTBZ bind to VMAT-2 and are pharmacologically active.

Half-life: α-HTBZ—4–8 hrs; β-HTBZ—2–4 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1.0–1.5 hr	12–18 hr*

*Return of symptoms following discontinuation.

Contraindications/Precautions

Contraindicated in: Hepatic impairment; Concurrent use of reserpine or MAO inhibitors; Patients who are actively suicidal or have untreated depression; **Lactation:** Lactation.

Use Cautiously in: History of/proensity for depression or history of psychiatric illness; history of suicidality;  Poor CYP2D6 metabolizers; initial dose reduction required; Concurrent use of CYP2D6 inhibitors; dose modification required; Recent history of myocardial infarction or unstable heart disease; **OB:** Use only when potential benefit justifies potential risk to the fetus; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: anxiety, fatigue, insomnia, depression, sedation/somnolence, cognitive defects, dizziness, headache.

Resp: shortness of breath. **CV:** hypotension, QTc interval prolongation. **GI:** nausea, dysphagia. **Neuro:** akathisia, balance difficulty, dysarthria, parkinsonism, unsteady gait. **Misc:** **NEUROLEPTIC MALIGNANT SYNDROME.**

Interactions

Drug-Drug: Blood levels are ↑ by drugs that inhibit the CYP2D6 enzyme system including **fluoxetine**, **paroxetine**, and **quinidine**; initial dose ↓ of tetrabenazine recommended. **Reserpine** binds to VMAT-2 and depletes monoamines in the CNS; avoid concurrent use; wait 3 wk after discontinuing to initiate tetrabenazine. Concurrent use of **MAO inhibitors** ↑ risk of serious adverse reactions and is contraindicated. Concurrent use with **neuroleptic drugs** or **dopamine antagonists** including **haloperidol**, **chlorpromazine**.

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

zine, risperidone, and olanzapine may ↑ risk of QTc interval prolongation, neuroleptic malignant syndrome and extrapyramidal disorders. Concurrent use of **alcohol** or other **CNS depressants** may ↑ risk of CNS depression.

Route/Dosage

☞ **PO (Adults):** 12.5 mg/day for one wk initially, ↑ by 12.5 weekly up to 37.5–50 mg/day in 3 divided doses; *Concurrent use of strong inhibitors of CYP2D6 or poor CYP2D6 metabolizers*—start with initial dose of 6.25 mg, titrate carefully.

Availability

Tablets: 12.5 mg, 25 mg.

NURSING IMPLICATIONS

Assessment

- Assess signs of Huntington's disease (changes in mood, cognition, chorea, rigidity, and functional capacity) periodically during therapy. Re-evaluate need for tetrabenazine periodically by assessing beneficial effect and side effects; determination may require dose reduction or discontinuation. Underlying chorea may improve over time, decreasing need for tetrabenazine.
- Monitor closely for new or worsening depression or suicidality. If depression or suicidality occurs ↓ dose and may initiate or ↑ dose of antidepressants.
- Monitor for signs of neuroleptic malignant syndrome (hyperpyrexia, muscle rigidity, altered mental status, irregular pulse or BP, tachycardia, diaphoresis, cardiac dysrhythmia) periodically during therapy. If symptoms occur discontinue tetrabenazine and manage symptomatically. If re-introduction of tetrabenazine is considered monitor carefully; recurrences of neuroleptic malignant syndrome have occurred.**
- Monitor patient for onset of akathisia (restlessness or desire to keep moving) and parkinsonian (difficulty speaking or swallowing, loss of balance control, pill rolling of hands, mask-like face, shuffling gait, rigidity, tremors). Notify health care professional if these symptoms occur; reduction in dose or discontinuation may be necessary.
- Assess BP sitting and standing. May cause orthostatic hypotension.
- Lab Test Considerations:** ☞ Test for the CYP2D6 gene in patients requiring doses of >50 mg/day to determine if they are poor, intermediate, or extensive metabolizers. Limit dose to 50 mg in patients who are poor metabolizers.

Potential Nursing Diagnoses

Risk for suicide (Adverse Reactions)

Implementation

- Dose should be titrated slowly and individualized.
- PO:** May be administered without regard to food.

Patient/Family Teaching

- Instruct patient to take tetrabenazine as directed. Do not take more or stop taking tetrabenazine without consulting health care professional. Dose adjustment may take several wk. Discuss procedure for missed doses with health care professional before beginning therapy; do not double doses. If a dose is missed or medication discontinued, involuntary movements will return or worsen in 12–18 hrs. If tetrabenazine is stopped for more than 5 days, consult health care professional before taking another dose; lower dose may be required.
- Advise patient and family to monitor for changes, especially sudden changes, in mood, behaviors, thoughts or feelings. If new or worse feelings of sadness or crying spells, lack of interest in friends or activities, sleeping a lot more or less, feelings of unimportance, guilt, hopelessness or helplessness, irritability or aggression, more or less hungry, difficulty paying attention, or thoughts of hurting self or ending life occur, notify health care professional promptly.
- Causes sedation. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to avoid alcohol and other CNS depressants during therapy; ↑ sedation.
- Inform patient of potential side effects and instruct to notify health care professional if side effects occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- ↓ in chorea due to Huntington's disease.

TETRACYCLINES

doxycycline (dox-i-sye-kleen)

★ Apprilon, ★ Atridox, Doryx, Doxy, ★ Doxycin, ★ Doxytab, ★ Doxytab, Monodox, Oracea, Periostat, Vibramycin, ★ Vibra-Tabs

minocycline (min-oh-sye-kleen)

Dynacin, Minocin, Solodyn

tetracycline (te-tra-sye-kleen)

Sumycin

Classification

Therapeutic: anti-infectives

Pharmacologic: tetracyclines

Pregnancy Category D

Indications

Treatment of various infections caused by unusual organisms, including: *Mycoplasma*, *Chlamydia*, *Rickettsia*, *Borellia burgdorferi*. Treatment of gonorrhea and syphilis in penicillin-allergic patients. Prevention of exacerbations of chronic bronchitis. Treatment of inhalational anthrax (postexposure) and cutaneous anthrax (doxycycline only). Treatment of acne. Malaria prophylaxis (doxycycline only). Inflammatory lesions of non-nodular acne vulgaris (Solodyn).

Action

Inhibits bacterial protein synthesis at the level of the 30S bacterial ribosome. **Therapeutic Effects:** Bacteriostatic action against susceptible bacteria. **Spectrum:** Includes activity against some gram-positive pathogens: *Bacillus anthracis*, *Clostridium perfringens*, *Clostridium tetani*, *Listeria monocytogenes*, *Nocardia*, *Propionibacterium acnes*, *Actinomyces israelii*. Active against some gram-negative pathogens: *Haemophilus influenzae*, *Legionella pneumophila*, *Yersinia enterocolitica*, *Yersinia pestis*, *Neisseria gonorrhoeae*, *Neisseria meningitidis*. Also active against several other pathogens, including: *Mycoplasma*, *Treponema pallidum*, *Chlamydia*, *Rickettsia*, *B. burgdorferi*.

Pharmacokinetics

Absorption: *Tetracycline*—60–80% absorbed following oral administration. *Doxycycline*, *minocycline*—well absorbed from the GI tract.

Distribution: Widely distributed, some penetration into CSF; crosses the placenta and enters breast milk.

Metabolism and Excretion: *Doxycycline*—20–40% excreted unchanged by the urine; some inactivation in the intestine and some enterohepatic circulation with excretion in bile and feces. *Minocycline*—5–20% excreted unchanged by the urine; some metabolism by the liver with enterohepatic circulation and excretion in bile and feces. *Tetracycline*—Excreted mostly unchanged by the kidneys.

Half-life: *Doxycycline*—14–17 hr (↑ in severe renal impairment). *Minocycline*—11–26 hr. *Tetracycline*—6–12 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
Doxycycline-PO	1–2 hr	1.5–4 hr	12 hr
Doxycycline-IV	rapid	end of infusion	12 hr
Minocycline-PO	rapid	2–3 hr	6–12 hr
Minocycline-PO—ER	unknown	3.5–4 hr	24 hr
Tetracycline-PO	1–2 hr	2–4 hr	6–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Some products contain alcohol or bisulfites; avoid in patients with known hypersensitivity or intolerance; **OB:** Risk of permanent staining of teeth in infant if used during last half of pregnancy; **Lactation:** Lactation; **Pedi:** Children <8 yr (permanent staining of teeth); **OB, Lactation, Pedi:** Can be used in children and pregnant and lactating women for the treatment of anthrax (doxycycline only); Some products contain alcohol or bisulfites; avoid in patients with known hypersensitivity or intolerance; **OB:** Risk of permanent staining of teeth in infant if used during last half of pregnancy; **Lactation:** Lactation; **Pedi:** Children <8 yr (permanent staining of teeth); **OB, Lactation, Pedi:** Can be used in children and pregnant and lactating women for the treatment of anthrax (doxycycline only).

Use Cautiously in: Cachectic or debilitated patients; Renal impairment; Hepatic impairment (doxycycline, minocycline); Nephrogenic diabetes insipidus.

Adverse Reactions/Side Effects

CNS: benign intracranial hypertension (higher in children); *minocycline*, dizziness. **EENT:** *minocycline*, vestibular reactions. **GI:** HEPATOTOXICITY, PSEUDO-MEMBRANOUS COLITIS, diarrhea, nausea, vomiting, esophagitis, pancreatitis. **Derm:** DRUG RASH WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS, ERYTHEMA MULTIFORME, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, photosensitivity, rashes; *minocycline*, pigmentation of skin and mucous membranes. **Hemat:** blood dyscrasias. **Endo:** *minocycline*—thyroid disorders. **MS:** *minocycline*—lupus-like syndrome. **Local:** *doxycycline*, *minocycline*—phlebitis at IV site. **Misc:** hypersensitivity reactions, superinfection.

Interactions

Drug-Drug: May ↑ effect of warfarin. May ↓ effectiveness of estrogen-containing hormonal contraceptives. Antacids, calcium, iron, zinc, aluminum, and magnesium form insoluble compounds (chelates) and ↓ absorption of tetracyclines. Sucralfate may bind to tetracycline and ↓ its absorption from the GI tract. Cholestyramine or colestipol ↓ oral absorption of tetracyclines. Adsorbent anti-diarrheals may ↓ absorption of tetracyclines. Barbiturates, carbamazepine, or phenytoin may ↓ activity of doxycycline.

Drug-Food: Calcium in foods or dairy products ↓ absorption by forming insoluble compounds (chelates).

☼ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Route/Dosage

Doxycycline

PO (Adults and Children >8 yr and >45 kg):

Most infections—100 mg q 12 hr on the 1st day, then 100–200 mg once daily or 50–100 mg q 12 hr.

Gonorrhea—100 mg q 12 hr for 7 days or 200 mg once daily for 7 days (delayed–release tablets) or 300 mg followed 1 hr later by another 300-mg dose. *Malaria prophylaxis*—100 mg once daily. *Lyme disease*—100 mg twice daily. *Periodontitis*—20 mg twice daily. *Anthrax*—100 mg twice daily for 60 days.

PO (Children >8 yr and ≤45 kg): *Most infections*—2–5 mg/kg/day in 1–2 divided doses (not to exceed 200 mg/day).

IV (Adults and Children >8 yr and >45 kg): 200 mg once daily or 100 mg q 12 hr on the 1st day, then 100–200 mg once daily or 50–100 mg q 12 hr. *Anthrax*—100 mg q 12 hr change to oral when appropriate, for 60 days.

IV (Children >8 yr and ≤45 kg or ≤8 yr): 4.4 mg/kg once daily or 2.2 mg/kg q 12 hr on the 1st day, then 2.2–4.4 mg/kg/day given once daily or 1.1–2.2 mg/kg q 12 hr. *Anthrax*—2.2 mg/kg q 12 hr, change to oral when appropriate, for 60 days.

Minocycline

Immediate-Release

PO (Adults): 100–200 mg initially, then 100 mg q 12 hr or 50 mg q 6 hr.

PO (Children ≥8 yr): 4 mg/kg initially, then 2 mg/kg q 12 hr.

Extended-Release

PO (Adults and Children ≥12 yrs [Solodyn]):

126–136 kg 135 mg once daily for 12 wks; *111–125 kg*—115 mg once daily for 12 wks; *97–110 kg*—105 mg once daily for 12 wks; *85–96 kg*—90 mg once daily for 12 wks; *72–84 kg*—80 mg once daily for 12 wks; *60–71 kg*—65 mg once daily for 12 wks; *50–59 kg*—55 mg once daily for 12 wks; *45–49 kg*—45 mg once daily for 12 wks.

Tetracycline

PO (Adults): 250–500 mg q 6 hr or 500 mg–1 g q 12 hr. *Chronic treatment of acne*—500 mg–2 g/day for 3 wks, then ↓ to 125 mg–1 g/day.

PO (Children ≥8 yr): 6.25–12.5 mg/kg q 6 hr or 12.5–25 mg/kg q 12 hr.

Availability

Doxycycline (generic available)

Tablets: 20 mg, 50 mg, 75 mg, 100 mg, 150 mg.

Cost: Generic—20 mg \$118.90/100, 50 mg \$335.71/100, 75 mg \$498.35/100, 100 mg \$246.02/50, 150 mg \$274.17/30. **Delayed-release tablets:** 75 mg, 100 mg, 150 mg, 200 mg. **Cost: Generic**—75 mg \$613.45/60, 100 mg \$1,314.83/100, 150 mg

\$1,759.94/100. **Capsules:** 50 mg, 75 mg, 100 mg, 150 mg. **Cost: Generic**—50 mg \$118.74/100, 75 mg \$1,639.77/100, 100 mg \$96.92/50, 150 mg \$1,479.01/60. **Delayed-release capsules:** 40 mg. **Cost:** \$501.12/30. **Oral suspension (raspberry flavor):** 25 mg/5 mL. **Cost: Generic**—\$22.77/60 mL. **Syrup (apple-raspberry flavor):** 50 mg/5 mL. **Cost:** \$339.47/473 mL. **Powder for injection:** 100 mg/vial, 200 mg/vial.

Minocycline (generic available)

Capsules: 50 mg, 75 mg, 100 mg. **Cost: Generic**—50 mg \$169.87/100, 75 mg \$197.96/100, 100 mg \$169.87/50. **Tablets:** 50 mg, 75 mg, 100 mg. **Cost: Generic**—50 mg \$343.47/100, 75 mg \$504.25/100, 100 mg \$300.98/50. **Extended-release tablets:** 45 mg, 55 mg, 65 mg, 80 mg, 90 mg, 105 mg, 115 mg, 135 mg. **Cost: Generic**—45 mg \$605.01/30, 90 mg \$605.01/30, 135 mg \$605.01/30; *Solodyn*—55 mg \$1,044.22/30, 65 mg \$1,044.22/30, 80 mg \$1,044.22/30, 105 mg \$1,044.22/30, 115 mg \$1,044.22/30.

Tetracycline (generic available)

Capsules: 250 mg, 500 mg. **Cost: Generic**—250 mg \$6.88/100, 500 mg \$11.80/100.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- **Monitor bowel function.** Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of pseudomembranous colitis. May begin up to several weeks following cessation of therapy.
- **Assess for rash periodically during therapy.** May cause Stevens-Johnson syndrome or toxic epidermal necrolysis. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.
- **IV:** Assess IV site frequently; may cause thrombophlebitis.
- **Lab Test Considerations:** Monitor renal and hepatic function and CBC periodically during long-term therapy.
- May cause ↑ AST, ALT, serum alkaline phosphatase, bilirubin, and amylase concentrations. Tetracyclines, except doxycycline, may cause ↑ serum BUN.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Noncompliance (Patient/Family Teaching)

Implementation

- **Do not confuse Oracea with Orenzia. Do not confuse Dynacin with Dynacirc.**
- May cause yellow-brown discoloration and softening of teeth and bones if administered prenatally or during early childhood. Not recommended for children under 8 yr of age or during pregnancy or lactation unless used for the treatment of anthrax.
- **PO:** Administer around the clock. Administer at least 1 hr before or 2 hr after meals. *Doxycycline* and *minocycline* may be taken with food or milk if GI irritation occurs. Administer with a full glass of liquid and at least 1 hr before going to bed to avoid esophageal ulceration. Use calibrated measuring device for liquid preparations. Shake liquid preparations well. Do not administer within 1–3 hr of other medications.
- Do not open, break, crush or chew extended-release capsules and tablets.
- Avoid administration of calcium, zinc, antacids, magnesium- or aluminum-containing medications, sodium bicarbonate, or iron supplements within 1–3 hr of oral tetracyclines.

Doxycycline

- The *Oracea* product is only indicated for rosacea, not for infections.
- **PO: Public Health Emergency —Exposure to Anthrax:** To prepare doses for infants and children exposed to anthrax, place one 100 mg tablet in a small bowl and crush to a fine powder with a metal spoon, leaving no large pieces. Add 4 level teaspoons of lowfat milk, lowfat chocolate milk, regular chocolate milk, chocolate pudding, or apple juice. Mix food or drink and doxycycline powder until powder dissolves. Mixture is stable in a covered container for 24 hr if refrigerated (if made with milk or pudding) or at room temperature (if made with juice). Number of teaspoons to administer/dose is based on child's weight (0–12.5 lb—1/2 tsp; 12.5–25 lb—1 tsp; 25–37.5 lb—1 1/2 tsp; 37.5–50 lb—2 tsp; 50–62.5 lb—2 1/2 tsp; 62.5–75 lb—3 tsp; 75–87.5 lb—3 1/2 tsp; 87.5–100 lb—4 tsp).
- Capsules may also be administered by carefully opening and sprinkling capsule contents on a spoonful of applesauce. The applesauce should be swallowed immediately without chewing and followed with a cool 8-ounce glass of water to ensure complete swallowing of the capsule contents. The applesauce should not be hot, and it should be soft enough to be swallowed without chewing. If mixture cannot be taken immediately, discard; do not store for later use.

IV Administration

- **Intermittent Infusion:** Reconstitute each 100 mg with 10 mL of sterile water or 0.9% NaCl for injection. **Diluent:** Dilute further in 100–1000 mL of 0.9% NaCl, D5W, D5/LR, Ringer's, or lactated Ringer's solution. Solution is stable for 12 hr at room temperature and 72 hr if refrigerated. If diluted with D5/LR or lactated Ringer's solution, administer within 6 hr. Protect solution from direct sunlight. **Concentration:** Concentrations of less than 1 mcg/mL or greater than 1 mg/mL are not recommended. **Rate:** Administer over a minimum of 1–4 hr. Avoid rapid administration. Avoid extravasation.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, amifostine, amikacin, aminophylline, amiodarone, anidulafungin, argatroban, ascorbic acid, atropine, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gulconate, carboplatin, carmustine, caspofungin, cefotaxime, ceftriaxone, chlorpromazine, cisatracurium, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexmedetomidine, dextrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxorubicin, enalapril, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, gemcitabine, gentamicin, glycopyrrolate, granisetron, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlor-ethamine, melfalan, meperidine, methyldopa, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, multivitamins, mycophenolate, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, pamidronate, pancuronium, pantoprazole, papaverine, pentamidine, pentazocine, perphenazine, phenolamine, phenylephrine, phytonadione, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxime, quinupristin/dalfopristin, ranitidine, remifentanyl, rituximab, rocuronium, sargramostim, sodium acetate, streptokinase, succinylcholine, sufentanil, tacrolimus, telavancin, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tirofiban, tobramycin, tolazoline, trastuzumab, vancomycin,

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zoledronic acid.

- **Y-Site Incompatibility:** allopurinol, aminocaproic acid, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, azathioprine, cefazolin, cefoperazone, cefotetan, cefoxitin, ceftazidime, cefuroxime, chloramphenicol, dantrolene, dexamethasone, diazepam, diazoxide, erythromycin, fluorouracil, folic acid, furosemide, ganciclovir, heparin, hydrocortisone, indomethacin, ketorolac, methotrexate, methylprednisolone, nafcillin, oxacillin, palonosetron, pemetrexed, penicillin G, pentobarbital, phenobarbital, phenytoin, piperacillin/tazobactam, potassium acetate, sodium bicarbonate, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Instruct patient to take medication around the clock and to finish the drug completely as directed, even if feeling better. Take missed doses as soon as possible unless it is almost time for next dose; do not double doses. Advise patient that sharing of this medication may be dangerous.
- Advise patient to avoid taking milk or other dairy products concurrently with oral tetracyclines. Also avoid taking antacids, zinc, calcium, magnesium- or aluminum-containing medications, sodium bicarbonate, and iron supplements within 1–3 hr of oral tetracyclines.
- **Instruct patient to notify health care professional immediately if rash, diarrhea, abdominal cramping, fever, or bloody stools occur and not to treat with antidiarrheals without consulting health care professionals.**
- Advise female patient to use a nonhormonal method of contraception while taking tetracyclines and until next menstrual period.
- **Minocycline** commonly causes dizziness or unsteadiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known. Notify health care professional if these symptoms occur.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to report the signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools). Skin rash, pruritus, and urticaria should also be reported.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.

- Instruct patient to notify health care professional if symptoms do not improve within a few days for systemic preparations.
- Caution patient to discard outdated or decomposed tetracyclines; they may be toxic.
- **Malaria Prophylaxis:** Advise patient to avoid being bitten by mosquitoes by using protective measures, especially from dusk to dawn (e.g., staying in well-screened areas, using mosquito nets, covering the body with clothing, and using an effective insect repellent). Doxycycline prophylaxis should begin 1–2 days before travel to the malarious area, continued daily while in the malarious area and after leaving the malarious area, should be continued for 4 more weeks to avoid development of malaria. Do not exceed 4 mo.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.
- Decrease in acne lesions.
- Treatment of inhalation anthrax (post exposure) or treatment of cutaneous anthrax (doxycycline).
- Prevention of malaria.
- Reduction in inflammatory lesions associated with rosacea.

REMS

thalidomide (tha-lid-oh-mide)

Thalomid

Classification

Therapeutic: immunosuppressants

Pregnancy Category X

Indications

Cutaneous manifestations of moderate to severe erythema nodosum leprosum (ENL). Prevention (maintenance) and suppression of recurrent ENL. Newly diagnosed multiple myeloma (with dexamethasone).

Unlabeled Use: Bechet's syndrome. HIV-associated wasting syndrome. Aphthous stomatitis (including HIV associated). Crohn's disease.

Action

May suppress excess levels of tumor necrosis factor-alpha (TNF-alpha) in patients with ENL and alter leukocyte migration by altering characteristics of cell surfaces. **Therapeutic Effects:** Decreased skin lesions in ENL and prevention of recurrence.

Pharmacokinetics

Absorption: 67–93% absorbed following oral administration.

Distribution: Crosses the placenta; highly protein bound.

Protein Binding: Highly bound.

Metabolism and Excretion: Hydrolyzed in plasma to multiple metabolites.

Half-life: 5–7 hr.

TIME/ACTION PROFILE (dermatologic effects)

ROUTE	ONSET	PEAK	DURATION
PO	48 hr	1–2 mo	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **OB:** Women with childbearing potential (unless specific conditions are met); **OB:** Pregnancy (can cause fetal harm); Seizure disorders; Sexually mature men (unless specific conditions are met); **Lactation:** Potential for serious adverse reactions in the infant.

Use Cautiously in: **Pedi:** Children <12 yr (safety not established).

Adverse Reactions/Side Effects

CNS: **SEIZURES**, dizziness, drowsiness. **CV:** bradycardia, edema, orthostatic hypotension, thromboembolic events (↑ risk with dexamethasone in multiple myeloma). **GI:** constipation. **Derm:** **STEVENS-JOHNSON SYNDROME**, **TOXIC EPIDERMAL NECROLYSIS**, rash, photosensitivity.

Hemat: neutropenia. **Neuro:** peripheral neuropathy. **Misc:** **SEVERE BIRTH DEFECTS**, hypersensitivity reactions, ↑ HIV viral load, tumor lysis syndrome.

Interactions

Drug-Drug: ↑ CNS depression with concurrent use of **barbiturates**, **sedative/hypnotics**, **alcohol**, **chlorpromazine**, **reserpine**, or other **CNS depressants**. Concurrent use of **agents that may cause peripheral neuropathy** ↑ risk of peripheral neuropathy.

Drug-Natural Products: Concomitant use with **echinacea**, and **melatonin** may interfere with immunosuppression.

Route/Dosage

ENL

PO (Adults ≥50 kg): 100–300 mg/day initially; up to 400 mg/day has been used, depending on previous response. Every 3–6 mo, attempts should be made to taper and discontinue in decrements of 50 mg q 2–4 wk.

PO (Adults <50 kg): 100 mg/day initially; up to 400 mg/day has been used, depending on previous response. Every 3–6 mo, attempts should be made to taper and discontinue in decrements of 50 mg q 2–4 wk.

Multiple Myeloma

PO (Adults): 200 mg daily in 28-day treatment cycles. Dexamethasone 40 mg is administered on Days 1–4, 9–12, 17–20.

Availability

Capsules: 50 mg, 100 mg, 150 mg, 200 mg.

NURSING IMPLICATIONS

Assessment

- Assess monthly for initial 3 mo and periodically during therapy to detect early signs of peripheral neuropathy (numbness, tingling, or pain in hands and feet). Commonly occurs with prolonged therapy, but has occurred following short-term use or following completion of therapy. May be severe and irreversible. Electrophysiologic testing may be done at baseline and every 6 mo to detect asymptomatic peripheral neuropathy. If symptoms occur, discontinue thalidomide immediately to limit further damage. Reinstate therapy only if neuropathy returns to baseline.
- Monitor for signs of hypersensitivity reaction (erythematous macular rash, fever, tachycardia, hypotension). May require discontinuation of therapy if severe. If reaction recurs when dosing is resumed, discontinue thalidomide.
- Monitor for side effects (constipation, oversedation, peripheral neuropathy); may require discontinuation or dose reduction until side effects resolve.
- Multiple Myeloma:** Assess for venous thromboembolism (dyspnea, chest pain, arm or leg swelling) periodically during therapy, especially in patients concurrently taking dexamethasone. Consider prophylaxis depending on patient risk factors.
- Lab Test Considerations:** Monitor WBC with differential during therapy. May cause ↓ WBC. Do not initiate therapy with an ANC ≤750/mm³. If ANC ↓ to ≤750/mm³ during therapy, re-evaluate medication regimen; if neutropenia persists, consider discontinuing therapy.
- May cause ↑ viral load levels in patients with HIV.

Potential Nursing Diagnoses

Impaired skin integrity (Indications)

Risk for injury (Adverse Reactions)

Implementation

- Do not confuse Thalomid (thalidomide) with thiamine.**
- Due to teratogenic effects, thalidomide may be prescribed only by prescribers registered in the System for Thalidomide Education and Prescribing Safety (STEPS) program.** Thalidomide is started within 24 hr of a negative pregnancy test with a sensitivity of at least 50 mIU/mL. Pregnancy testing must occur weekly during first month of therapy, then monthly thereafter in women with a regular menstrual cycle. For women with irregular menses,

✳ = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

pregnancy testing should occur every 2 wk. If pregnancy occurs, thalidomide should be discontinued immediately. Any suspected fetal exposure must be reported to the FDA and the manufacturer, and patient should be referred to an obstetrician/gynecologist experienced in reproductive toxicity.

- If health care professionals or other caregivers are exposed to body fluids from patients receiving thalidomide, use appropriate precautions, such as wearing gloves to prevent the potential cutaneous exposure to thalidomide or washing the exposed area with soap and water.
- Corticosteroids may be used concurrently with thalidomide for patients with moderate to severe neuritis associated with a severe ENL reaction. Use of corticosteroids can be tapered and discontinued when neuritis resolves.
- **PO:** Administer once daily with water, preferably at bedtime and at least 1 hr after the evening meal. If divided doses are used, administer at least 1 hr after meals.

Patient/Family Teaching

- Instruct patient to take thalidomide as directed. Do not discontinue without notifying health care professional; dose should be tapered gradually. Explain *STEPS* program to patient.
- Advise patient that thalidomide should not be shared with others.
- Frequently causes drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Instruct patient not to donate blood and male patients not to donate sperm while taking thalidomide and for 1 month following discontinuation.
- Advise patient to notify health care professional immediately if pain, numbness, tingling, or burning in hands or feet or shortness of breath, chest pain, swelling of arms or legs occur.
- **Caution patient on the extreme importance of maintaining contraception for 1 mo prior to, during, and for 1 mo following discontinuation of therapy.** *For women of childbearing age*, two methods of reliable contraception must be used unless complete abstinence is used. *For men*, a latex condom must be used, even if a successful vasectomy has been performed. Patients must meet *ALL* of the *STEPS* conditions: Understands and can follow instructions and is capable of complying with contraceptive measures, pregnancy testing, patient registration, and patient survey. Patients must receive verbal and written warnings of the potential teratogenicity of thalidomide and must acknowledge in writing their understanding and acceptance of these conditions.

- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications. Concomitant use of HIV-protease inhibitors, modafinil, penicillins, rifampin, rifabutin, phenytoin, carbamazepine, or certain herbal supplements such as St. John's wort with hormonal contraceptive agents may reduce the effectiveness of contraception during and for up to one month after discontinuation of these concomitant therapies. Therefore, women requiring treatment with one or more of these drugs must use two other effective or highly effective methods of contraception or abstain from heterosexual sexual contact while taking thalidomide.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of active ENL reaction. Usually requires at least 2 wk of therapy; then taper medication in 50 mg decrements every 2–4 wk.
- Prevention of recurrent ENL. Tapering off medication should be attempted every 3–6 mo in decrements of 50 mg every 2–4 wk.
- Decrease in serum and urine paraprotein measurements in patients with multiple myeloma.

thiamine (thye-a-min)

✶ Betaxin, vitamin B1

Classification

Therapeutic: vitamins

Pharmacologic: water soluble vitamins

Pregnancy Category A

Indications

Treatment of thiamine deficiencies (beriberi). Prevention of Wernicke's encephalopathy. Dietary supplement in patients with GI disease, alcoholism, or cirrhosis.

Action

Required for carbohydrate metabolism. **Therapeutic Effects:** Replacement in deficiency states.

Pharmacokinetics

Absorption: Well absorbed from the GI tract by an active process. Excessive amounts are not absorbed completely. Also well absorbed from IM sites.

Distribution: Widely distributed. Enters breast milk.

Metabolism and Excretion: Metabolized by the liver. Excess amounts are excreted unchanged by the kidneys.

Half-life: Unknown.

TIME/ACTION PROFILE (time for symptoms of deficiency—edema and heart failure—to resolve†)

ROUTE	ONSET	PEAK	DURATION
PO, IM, IV	hr	days	days–wk

†Confusion and psychosis take longer to respond

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Known alcohol intolerance or bisulfite hypersensitivity (elixir only).

Use Cautiously in: Wernicke's encephalopathy (condition may be worsened unless thiamine is administered before glucose).

Adverse Reactions/Side Effects

Adverse reactions and side effects are extremely rare and are usually associated with IV administration or extremely large doses.

CNS: restlessness, weakness. **EENT:** tightness of the throat. **Resp:** pulmonary edema, respiratory distress.

CV: **VASCULAR COLLAPSE**, hypotension, vasodilation.

GI: GI bleeding, nausea. **Derm:** cyanosis, pruritus, sweating, tingling, urticaria, warmth. **Misc:** **ANGIO-EDEMA**.

Interactions

Drug-Drug: None significant.

Route/Dosage

Thiamine Deficiency (Beriberi)

PO (Adults): 5–10 mg 3 times daily.

PO (Children): 10–50 mg/day in divided doses.

IM, IV (Adults): 5–100 mg 3 times daily.

IM, IV (Children): 10–25 mg/day.

Dietary Supplement

PO (Adults): 1–1.6 mg/day.

PO (Children 4–10 yr): 0.9–1 mg/day.

PO (Children birth–3 yr): 0.3–0.7 mg/day.

Availability (generic available)

Tablets: 5 mg^{OTC}, 10 mg^{OTC}, 25 mg^{OTC}, 50 mg^{OTC}, 100 mg^{OTC}, 250 mg^{OTC}, 500 mg^{OTC}. **Injection:** 100 mg/mL.

In combination with: other vitamins, minerals, and trace elements in multi-vitamin preparations^{OTC}.

NURSING IMPLICATIONS

Assessment

- Assess for signs and symptoms of thiamine deficiency (anorexia, GI distress, irritability, palpitations, tachycardia, edema, paresthesia, muscle weakness and pain, depression, memory loss, confusion, psychosis, visual disturbances, elevated serum pyruvic acid levels).

- Assess patient's nutritional status (diet, weight) prior to and throughout therapy.
- Monitor patients receiving IV thiamine for anaphylaxis (wheezing, urticaria, edema).**
- Lab Test Considerations:** May interfere with certain methods of testing serum theophylline, uric acid, and urobilinogen concentrations.

Potential Nursing Diagnoses

Imbalanced nutrition: less than body requirements (Indications)

Implementation

- Do not confuse thiamine with Thalomid (thalidomide).**
- Because of infrequency of single B-vitamin deficiencies, combinations are commonly administered.
- IM, IV:** Parenteral administration is reserved for patients in whom oral administration is not feasible.
- IM:** Administration may cause tenderness and induration at injection site. Cool compresses may decrease discomfort.

IV Administration

- pH:** 2.5–4.0.
- IV:** Sensitivity reactions and death have occurred from IV administration. An intradermal test dose is recommended in patients with suspected sensitivity. Monitor site for erythema and induration.
- Direct IV: Concentration:** Administer undiluted at 100 mg/mL. **Rate:** Administer at a rate of 100 mg over 5 min.
- Continuous Infusion: Diluent:** May be diluted in dextrose/Ringer's or LR combinations, dextrose/saline combinations, D5W, D10W, Ringer's and LR injection, 0.9% NaCl, or 0.45% NaCl. Usually administered with other vitamins.
- Y-Site Compatibility:** alfentanil, amikacin, ascorbic acid, atracurium, atropine, aztreonam, benzotropine, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cefazolin, cefonocid, cefotaxime, cefotetan, cefoxitin, ceftriaxone, cefuroxime, chlorpromazine, clindamycin, cyanocobalamin, cyclosporine, dexamethasone, digoxin, diphenhydramine, dobutamine, dopamine, doxycycline, enalaprilat, ephedrine, epinephrine, erythromycin, esmolol, famotidine, fentanyl, gentamicin, glycopyrrolate, heparin, insulin, isoproterenol, labetalol, lidocaine, magnesium sulfate, mannitol, meperidine, metaraminol, methoxamine, methyl dopate, metoclopramide, metoprolol, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, oxacillin, oxytocin, papaverine, penicillin G, pentamidine, pentazocine, phentolamine, phenylephrine, phytonadione, potassium chloride, procain-

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

amide, prochlorperazine, promethazine, propranolol, protamine, pyridoxime, ranitidine, streptokinase, succinylcholine, sufentanil, theophylline, ticarcillin/clavulanate, tobramycin, tolazoline, trimetaphan, vancomycin, vasopressin, verapamil.

- **Y-Site Incompatibility:** aminophylline, amphotericin B colloidal, azathioprine, cefoperazone, cefazidime, chloramphenicol, dantrolene, diazepam, diazoxide, folic acid, furosemide, ganciclovir, hydrocortisone, imipenem/cilastatin, indomethacin, methylprednisolone, pentobarbital, phenobarbital, phenytoin, sodium bicarbonate, trimethoprim/sulfamethoxazole.
- **Additive Incompatibility:** Solutions with neutral or alkaline pH, such as carbonates, bicarbonates, citrates, and acetates.

Patient/Family Teaching

- Encourage patient to comply with dietary recommendations of health care professional. Explain that the best source of vitamins is a well-balanced diet with foods from the four basic food groups.
- Teach patient that foods high in thiamine include cereals (whole grain and enriched), meats (especially pork), and fresh vegetables; loss is variable during cooking.
- Caution patients self-medicating with vitamin supplements not to exceed RDA. The effectiveness of megadoses of vitamins for treatment of various medical conditions is unproved and may cause side effects.

Evaluation/Desired Outcomes

- Prevention of or decrease in the signs and symptoms of vitamin B deficiency.
- Decrease in the symptoms of neuritis, ocular signs, ataxia, edema, and heart failure may be seen within hours of administration and may disappear within a few days.
- Confusion and psychosis may take longer to respond and may persist if nerve damage has occurred.

HIGH ALERT

THROMBOLYTIC AGENTS

alteplase (al-te-plase)

Activase,  Activase rt-PA, Cathflo
Activase, tissue plasminogen activator,
t-PA

reteplase (re-te-plase)

Retavase

streptokinase

(strep-toe-kye-nase)
Streptase

tecteplase (te-nek-te-plase) TNKase

Classification

Therapeutic: thrombolytics

Pharmacologic: plasminogen activators

Pregnancy Category C

Indications

Alteplase, reteplase, streptokinase, tecteplase: Acute myocardial infarction (MI). **Alteplase, streptokinase:** Acute massive pulmonary emboli. **Alteplase:** Acute ischemic stroke. **Streptokinase:** Acute deep vein thrombosis. **Streptokinase:** Acute arterial thrombi. **Streptokinase:** Occluded arteriovenous cannulae. **Alteplase:** Occluded central venous access devices.

Action

Convert plasminogen to plasmin, which is then able to degrade fibrin present in clots. Alteplase, reteplase, and tecteplase directly activate plasminogen. Streptokinase combines with plasminogen to form activator complexes, which then converts plasminogen to plasmin. **Therapeutic Effects:** Lysis of thrombi in coronary arteries, with preservation of ventricular function or improvement of ventricular function (and ↓ risk of HF or death). Lysis of pulmonary emboli or deep vein thrombosis. Lysis of thrombi causing ischemic stroke, reducing risk of neurologic sequelae. Restoration of cannula or catheter patency and function.

Pharmacokinetics

Absorption: Complete after IV administration. Intracoronary administration or administration into occluded catheters or cannulae has a more localized effect.

Distribution: Streptokinase appears to cross the placenta minimally, if at all. Remainder of distribution for streptokinase or other agents is not known.

Metabolism and Excretion: *Alteplase, tecteplase*—Rapidly metabolized by the liver. *Reteplase*—Cleared primarily by the liver and kidneys. *Streptokinase*—Rapidly cleared from circulation by antibodies and other unknown mechanism.

Half-life: *Alteplase*—35 min; *reteplase*—13–16 min; *streptokinase*—initially 18 min (due to clearance by antibodies), then 83 min; *Tecteplase*—20–24 min (initial phase), 90–130 min (terminal phase).

TIME/ACTION PROFILE (fibrinolysis)

ROUTE	ONSET	PEAK	DURATION
Alteplase IV	30 min	60 min	unknown
Reteplase IV	30 min	30–90 min	48 hr
Streptokinase IV	immediate	rapid	4 hr (up to 12 hr)
Tecteplase IV	rapid	unknown	unknown

Contraindications/Precautions

Contraindicated in: Active internal bleeding; History of cerebrovascular accident; Recent (within 2 mo) intracranial or intraspinal injury or trauma; Intracranial neoplasm, AV malformation, or aneurysm; Severe uncontrolled hypertension; Known bleeding tendencies; Hypersensitivity; cross-sensitivity with other thrombolytics may occur.

Use Cautiously in: Recent (within 10 days) major surgery, trauma, GI, or GU bleeding; Left heart thrombus; Severe hepatic or renal disease; Hemorrhagic ophthalmic conditions; Septic phlebitis; Previous puncture of a noncompressible vessel; Subacute bacterial endocarditis or acute pericarditis; Recent streptococcal infection or previous therapy with streptokinase (from 5 days–6 mo); may produce resistance because of antibody formation; ↑ dosage requirements may be encountered (streptokinase only); **Geri:** >75 yr; ↑ risk of intracranial bleeding; **OB, Lactation, Pedi:** Safety not established.

Exercise Extreme Caution in: Patients receiving concurrent anticoagulant therapy (↑ risk of intracranial bleeding).

Adverse Reactions/Side Effects

CNS: INTRACRANIAL HEMORRHAGE. **EENT:** epistaxis, gingival bleeding. **Resp:** bronchospasm, hemoptysis.

CV: hypotension, reperfusion arrhythmias. **GI:** GI BLEEDING, RETROPERITONEAL BLEEDING, nausea, vomiting. **GU:** GU TRACT BLEEDING. **Derm:** ecchymoses, flushing, urticaria. **Hemat:** BLEEDING. **Local:** hemorrhage at injection sites, phlebitis at IV site. **MS:** musculoskeletal pain. **Misc:** allergic reactions including ANAPHYLAXIS, fever.

Interactions

Drug-Drug: Concurrent use of aspirin, other NSAIDs, warfarin, heparin, low-molecular-weight heparins, direct thrombin inhibitors, abcximab, eptifibatide, tirofiban, clopidogrel, ticlopidine, or dipyridamole may ↑ risk of bleeding, although these agents are frequently used together or in sequence. Effects may be ↓ by antifibrinolytic agents, including aminocaproic acid or tranexamic acid.

Drug-Natural Products: ↑ anticoagulant effect and bleeding risk with anise, arnica, chamomile, clove, dong quai, fenugreek, feverfew, garlic, ginger, ginkgo, Panax ginseng, licorice, and others.

Route/Dosage

Alteplase

Myocardial Infarction (Accelerated or Front-Loading Infusion)

IV (Adults): 15 mg bolus, then 0.75 mg/kg (up to 50 mg) over 30 min, then 0.5 mg/kg (up to 35 mg) over next 60 min; usually accompanied by heparin therapy.

Myocardial Infarction (3-Hour Infusion)

IV (Adults >65 kg): 60 mg over 1st hr (6–10 mg given as a bolus over first 1–2 min), 20 mg over the 2nd hr, and 20 mg over the 3rd hr for a total dose of 100 mg.

IV (Adults <65 kg): 0.75 mg/kg over 1st hr (0.075–0.125 mg/kg given as a bolus over first 1–2 min), 0.25 mg/kg over the 2nd hr, and 0.25 mg/kg over the 3rd hr for a total dose of 1.25 mg/kg (not to exceed 100 mg total).

Pulmonary Embolism

IV (Adults): 100 mg over 2 hr; follow with heparin.

Acute Ischemic Stroke

IV (Adults): 0.9 mg/kg (not to exceed 90 mg), given as an infusion over 1 hr, with 10% of the dose given as a bolus over the 1st min.

Occluded Venous Access Devices

IV (Adults and Children >30 kg): 2 mg/2 mL instilled into occluded catheter; if unsuccessful, may repeat once after 2 hr.

IV (Adults and Children <30 kg): 110% of the lumen volume (not to exceed 2 mg in 2 mL) instilled into occluded catheter; if unsuccessful, may repeat once after 2 hr.

Reteplase

IV (Adults): 10 units, followed 30 min later by an additional 10 units.

Streptokinase

Myocardial Infarction

IV (Adults): 1.5 million units given as a continuous infusion over up to 60 min.

Intracoronary (Adults): 20,000 unit bolus followed by 2000–4000 units/min infusion for 30–90 min.

Deep Vein Thrombosis, Pulmonary Emboli, or Arterial Thromboses

IV (Adults): 250,000 unit loading dose over 30 min, followed by 100,000 unit/hr for 24 hr for pulmonary emboli or arterial thrombosis/embolism, 72 hr for deep vein thrombosis.

✳ = Canadian drug name. ⚠ = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Tenecteplase

IV (Adults <60 kg): 30 mg.

IV (Adults ≥60 kg and <70 kg): 35 mg.

IV (Adults ≥70 kg and <80 kg): 40 mg.

IV (Adults ≥80 kg and <90 kg): 45 mg.

IV (Adults ≥90 kg): 50 mg.

Availability

Alteplase

Powder for injection: 2 mg/vial, 50 mg/vial, 100 mg/vial.

Retepase

Powder for injection: 10.8 units/vial.

Streptokinase

Powder for injection: 250,000 units/vial, 750,000 units/vial, 1,500,000 units/vial.

Tenecteplase

Powder for injection: 50 mg/vial.

NURSING IMPLICATIONS

Assessment

- Begin therapy as soon as possible after the onset of symptoms.
- Monitor vital signs, including temperature, continuously for coronary thrombosis and at least every 4 hr during therapy for other indications. Do not use lower extremities to monitor BP. Notify health care professional if systolic BP >180 mm Hg or diastolic BP >110 mm Hg. Should not be given if hypertension is uncontrolled. Inform health care professional if hypotension occurs. Hypotension may result from the drug, hemorrhage, or cardiogenic shock.
- **Assess patient carefully for bleeding every 15 min during the 1st hr of therapy, every 15–30 min during the next 8 hr, and at least every 4 hr for the duration of therapy.** Frank bleeding may occur from sites of invasive procedures or from body orifices. Internal bleeding may also occur (decreased neurologic status; abdominal pain with coffee-ground emesis or black, tarry stools; hematuria; joint pain). If uncontrolled bleeding occurs, stop medication and notify health care professional immediately.
- Inquire about previous reaction to streptokinase therapy. Assess patient for hypersensitivity reaction (rash, dyspnea, fever, changes in facial color, swelling around the eyes, wheezing). If these occur, inform health care professional promptly. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- Inquire about recent streptococcal infection. *Streptokinase* may be less effective if administered between 5 days and 6 mo of a streptococcal infection.

- **Assess neurologic status throughout therapy.** Altered sensorium or neurologic changes may be indicative of intracranial bleeding.
- **Myocardial Infarction:** Monitor ECG continuously. Notify health care professional if significant arrhythmias occur. Monitor cardiac enzymes. Radionuclide myocardial scanning and/or coronary angiography may be ordered 7–10 days after therapy to monitor effectiveness of therapy.
- Assess intensity, character, location, and radiation of chest pain. Note presence of associated symptoms (nausea, vomiting, diaphoresis). Notify health care professional if chest pain is unrelieved or recurs.
- Monitor heart sounds and breath sounds frequently. Inform health care professional if signs of HF occur (rales/crackles, dyspnea, S₃ heart sound, jugular venous distention).
- **Acute Ischemic Stroke:** Assess neurologic status. Determine time of onset of stroke symptoms. Alteplase must be administered within 3–4.5 hr of onset (within 3 hr in patients older than 80 yr, those taking oral anticoagulants, those with a baseline National Institutes of Health Stroke Scale score 25, or those with both a history of stroke and diabetes).
- **Pulmonary Embolism:** Monitor pulse, BP, hemodynamics, and respiratory status (rate, degree of dyspnea, ABGs).
- **Deep Vein Thrombosis/Acute Arterial Thrombosis:** Observe extremities and palpate pulses of affected extremities every hour. Notify health care professional immediately if circulatory impairment occurs. Computerized tomography, impedance plethysmography, quantitative Doppler effect determination, and/or angiography or venography may be used to determine restoration of blood flow and duration of therapy; however, repeated venograms are not recommended.
- **Cannula/Catheter Occlusion:** Monitor ability to aspirate blood as indicator of patency. Ensure that patient exhales and holds breath when connecting and disconnecting IV syringe to prevent air embolism.
- **Lab Test Considerations:** Hematocrit, hemoglobin, platelet count, fibrin/fibrin degradation product (FDP) titer, fibrinogen concentration, prothrombin time, thrombin time, and activated partial thromboplastin time (aPTT) may be evaluated before and frequently during therapy. Bleeding time may be assessed before therapy if patient has received platelet inhibitors.
- Obtain type and crossmatch and have blood available at all times in case of hemorrhage.
- Stools should be tested for occult blood loss and urine for hematuria periodically during therapy.
- **Toxicity and Overdose: High Alert:** If local bleeding occurs, apply pressure to site. If severe or

internal bleeding occurs, discontinue infusion. Clotting factors and/or blood volume may be restored through infusions of whole blood, packed RBCs, fresh frozen plasma, or cryoprecipitate. Do not administer dextran; it has antiplatelet activity. Aminocaproic acid (Amicar) may be used as an antidote.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)

Risk for injury (Side Effects)

Implementation

- **High Alert:** Overdose and underdose of thrombolytic medications have resulted in patient harm or death. Have second practitioner independently check original order, dosage calculations, and infusion pump settings. Do not confuse the abbreviation *t-PA* for alteplase (Activase) with the abbreviation *TNK t-PA* for tenecteplase (TNKase) and *r-PA* for reteplase (Retavase). Clarify orders that contain either of these abbreviations.
- Thrombolytic agents should be used only in settings in which hematologic function and clinical response can be adequately monitored.
- Starting two IV lines before therapy is recommended: one for the thrombolytic agent, the other for any additional infusions.
- Avoid invasive procedures, such as IM injections or arterial punctures, with this therapy. If such procedures must be performed, apply pressure to all arterial and venous puncture sites for at least 30 min. Avoid venipunctures at noncompressible sites (jugular vein, subclavian site).
- Acetaminophen may be ordered to control fever.

Alteplase

- **pH:** 7.3.

IV Administration

- **Intermittent Infusion:** Vials are packaged with sterile water for injection (without preservatives) to be used as diluent. Do not use bacteriostatic water for injection. Reconstitute 20-mg vials with 20-mL and 50-mg vials with 50 mL using an 18-gauge needle. Avoid excess agitation during dilution; swirl or invert gently to mix. Solution may foam upon reconstitution. Bubbles will resolve upon standing a few min. Solution will be clear to pale yellow. Stable for 8 hr at room temperature. **Concentration:** May be administered as reconstituted (1 mg/mL). **Diluent:** May be further diluted immediately before use in an equal amount of 0.9% NaCl or D5W. **Rate:** Flush line with 20–30 mL of saline at completion of infusion to ensure entire dose is received. See Route and Dosage section for specific rates.

- **Y-Site Compatibility:** eptifibatide, lidocaine, metoprolol, propranolol.
- **Y-Site Incompatibility:** bivalirudin, dobutamine, dopamine, heparin, nitroglycerin.
- **Cathflo Activase:** Reconstitute by withdrawing 2.2 mL of sterile water (provided) and injecting into Cathflo Activase vial, directing diluent into powder for a concentration of 1 mg/mL. Allow slight foaming to dissipate by letting vial stand undisturbed. Do not use bacteriostatic water. Mix by gently swirling to dissolve; complete dissolution should occur within 3 min. Do not shake. Solution should be colorless to pale yellow. Use solution within 8 hr.
- Withdraw 2.0 mL of reconstituted solution and instill into occluded catheter. After 30 min dwell time, attempt to aspirate blood. If catheter remains occluded, allow 120 min dwell time. If catheter function is not restored after one dose, second dose may be instilled. If catheter function is restored, aspirate 4–5 mL of blood to remove Cathflo Activase and residual clot. Gently irrigate catheter with 0.9% NaCl.

Reteplase

IV Administration

- **pH:** 5.7–6.3.
- **Direct IV:** Reconstitute using diluent, needle, syringe, and dispensing pin provided. Reconstitute only with sterile water for injection without preservatives. Solution is colorless. Do not administer solutions that are discolored or contain a precipitate. Slight foaming may occur; allow vial to stand undisturbed for several min to dissipate bubbles. Reconstitute immediately before use. Stable for 4 hr at room temperature. **Concentration:** Administer undiluted. **Rate:** Administer each bolus over 2 min into an IV line containing D5W; flush line before and after bolus.
- **Y-Site Incompatibility:** bivalirudin, heparin, No other medication should be infused or injected into line used for reteplase.

Streptokinase

IV Administration

- **pH:** 6.5.
- **Intracoronary:** Dilute 250,000 IU vial to a total volume of 125 mL with 0.9% NaCl or D5W. Administer 20,000 IU (10 mL) via bolus injection.
- **Rate:** Intracoronary bolus is administered over 15 sec–2 min.
- **Intermittent Infusion:** Reconstitute with 5 mL of 0.9% NaCl or D5W (direct to sides of vial) and swirl gently; do not shake. **Diluent:** Dilute further with 0.9% NaCl for a total volume of 45–500 mL (45 mL

★ = Canadian drug name. ⚠ = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

for MI, 90 mL for deep vein thrombosis or pulmonary embolism). Solution is slightly yellow in color. Administer through 0.8-micron pore-size filter. Use reconstituted solution within 24 hr. **Rate:** Administer dose for MI within 60 min.

- Intracoronary bolus should be followed by an intracoronary maintenance infusion of 2000 IU/min for 60 min.
- Loading dose for *deep vein thrombosis or pulmonary embolism* is administered over 30 min, followed by an infusion of 100,000 IU/hr.
- Use infusion pump to ensure accurate dose.
- **Y-Site Compatibility:** alfentanil, amikacin, aminophylline, ascorbic acid, atracurium, atropine, aztreonam, benzotropine, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cefazolin, cefonoxid, cefoperazone, cefotaxime, cefotetan, ceftiofex, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, clindamycin, cyanocobalamin, cyclosporine, dexamethasone, digoxin, diphenhydramine, dobutamine, dopamine, doxycycline, enalaprilat, ephedrine, epinephrine, epoetin alfa, erythromycin, esmolol, famotidine, fentanyl, fluconazole, folic acid, furosemide, gentamicin, glycopyrrolate, heparin, hydrocortisone, imipenem/cilastatin, indomethacin, insulin, isoproterenol, ketorolac, labetalol, lidocaine, magnesium sulfate, mannitol, meperidine, methoxamine, methylprednisolone, metoclopramide, metoprolol, midazolam, morphine, multivitamins, nafcillin, naloxone, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxacillin, oxytocin, penicillin G, pentazocine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, potassium chloride, procainamide, propranolol, pyridoxime, ranitidine, sodium bicarbonate, succinylcholine, sufentanil, theophylline, thiamine, ticarcillin/clavulanate, tobramycin, trimetaphan, verapamil.
- **Y-Site Incompatibility:** azathioprine, bivalirudin, chlorpromazine, dantrolene, diazepam, diazoxide, ganciclovir, hydroxyzine, nalbuphine, pentamidine, phenytoin, prochlorperazine, promethazine, trimethoprim/sulfamethoxazole, vancomycin.
- **Additive Incompatibility:** Do not admix with any other medication.
- **Cannula/Catheter Clearance:** Dilute 250,000 IU in 2 mL of 0.9% NaCl or D5W.
- **Rate:** Administer slowly, over 25–35 min, into each occluded limb of cannula, and then clamp for at least 2 hr. Aspirate contents carefully and flush lines with 0.9% NaCl.

Tenecteplase

IV Administration

- **pH:** 7.3.
- **Intermittent Infusion:** Vials are packaged with sterile water for injection (without preservatives) to

be used as diluent. Do not use bacteriostatic water for injection. Do not discard shield assembly. To reconstitute aseptically withdraw 10 mL of diluent and inject into the tenecteplase vial, directing the stream into the powder. Slight foaming may occur; large bubbles will dissipate if left standing undisturbed for several minutes. Swirl gently until contents are completely dissolved; do not shake. **Concentration:** Solution containing 5 mg/mL is clear and colorless to pale yellow. Withdraw dose from reconstituted vial with the syringe and discard unused portion. Once dose is in syringe, stand the shield vertically on a flat surface (with green side down) and passively recap the red hub cannula. Remove the entire shield assembly, including the red hub cannula, by twisting counter clockwise. Shield assembly also contains the clear-ended blunt plastic cannula; retain for split septum IV access. Reconstitute immediately before use. May be refrigerated and administered within 8 hr. **Rate:** Administer as a single IV bolus over 5 seconds.

- **Y-Site Incompatibility:** Precipitate forms in line when administered with dextrose-containing solutions. Flush line with saline-containing solution prior to and following administration of tenecteplase.

- **Additive Incompatibility:** Do not admix.

Patient/Family Teaching

- Explain purpose of medication and the need for close monitoring to patient and family. Instruct patient to report hypersensitivity reactions (rash, dyspnea) and bleeding or bruising.
- Explain need for bedrest and minimal handling during therapy to avoid injury. Avoid all unnecessary procedures such as shaving and vigorous tooth brushing.

Evaluation/Desired Outcomes

- Lysis of thrombi and restoration of blood flow.
- Prevention of neurologic sequelae in acute ischemic stroke.
- Cannula or catheter patency.

tiagabine (tye-a-ga-been)

Gabitril

Classification

Therapeutic: anticonvulsants

Pregnancy Category C

Indications

Adjunctive treatment of partial seizures.

Action

Enhances the activity of gamma-aminobutyric acid, an inhibitory neurotransmitter. **Therapeutic Effects:** Decreased frequency of seizures.

Pharmacokinetics

Absorption: 90% absorbed following oral administration.

Distribution: Unknown.

Protein Binding: 96%.

Metabolism and Excretion: Mostly metabolized by the liver; 2% excreted unchanged in urine.

Half-life: *Without enzyme-inducing antiepileptic drugs*—7–9 hr; *with enzyme-inducing antiepileptic drugs*—4–7 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	45 min	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: All patients (may ↑ risk of suicidal thoughts/behaviors); Hepatic impairment (↓ dose/increased interval may be necessary); Patients receiving concurrent non–enzyme-inducing antiepileptic drug therapy such as valproates (may require lower doses and/or slower titration); Using tiagabine for off-label uses or other conditions leading to ↑ levels (may ↑ risk of new onset seizures); **OB, Lactation, PEDI:** Pregnancy, lactation, or children <12 yr (safety not established).

Adverse Reactions/Side Effects

CNS: **SUICIDAL THOUGHTS**, dizziness, drowsiness, nervousness, weakness, cognitive impairment, confusion, difficulty concentrating, hallucinations, headache, mental depression, personality disorder. **EENT:** abnormal vision, ear pain, tinnitus. **Resp:** dyspnea, epistaxis. **CV:** chest pain, edema, hypertension, palpitations, syncope, tachycardia. **GI:** abdominal pain, gingivitis, nausea, stomatitis. **GU:** dysmenorrhea, dysuria, metrorrhagia, urinary incontinence. **Derm:** alopecia, dry skin, rash, sweating. **Metab:** weight gain, weight loss. **MS:** arthralgia, neck pain. **Neuro:** ataxia, tremors. **Misc:** allergic reactions, chills, lymphadenopathy.

Interactions

Drug-Drug: Carbamazepine, phenytoin, primidone, and phenobarbital induce metabolism and ↓ blood levels; although concurrent therapy is usually necessary, adjustments may be required when altering regimens.

Route/Dosage

PO (Adults >18 yr): 4 mg once daily initially for 1 wk; may ↑ by 4–8 mg/day at weekly intervals, up to 56 mg/day in 2–4 divided doses.

PO (Children 12–18 yr): 4 mg once daily initially for 1 wk; may ↑ by 4 mg/day after 1 wk, then may ↑ by

4–8 mg/day at weekly intervals, up to 32 mg/day in 2–4 divided doses.

Availability (generic available)

Tablets: 2 mg, 4 mg, 12 mg, 16 mg.

NURSING IMPLICATIONS

Assessment

- Assess location, duration, and characteristics of seizure activity.
- Assess mental status. May cause impaired concentration, speech or language problems, confusion, fatigue, and drowsiness. Symptoms may decrease with dose reduction or discontinuation.
- **Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.**
- **Toxicity and Overdose:** Therapeutic serum levels have not been determined. However, levels may be monitored prior to and following changes in the therapeutic regimen.

Potential Nursing Diagnoses

Risk for injury (Side Effects)

Implementation

- **Do not confuse tiagabine with tizanidine.**
- **PO:** Administer with food.
- Discontinue tiagabine gradually. Abrupt discontinuation may cause increase in seizure frequency.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as possible unless almost time for next dose. Do not double doses. Do not discontinue abruptly; may cause increase in frequency of seizures. Instruct patient to read the *Medication Guide* before starting and with each Rx refill, changes may occur.
- Advise patient to notify health care professional immediately if frequency of seizures increases.
- May cause dizziness. Caution patient to avoid driving or activities requiring alertness until response to medication is known. Do not resume driving until physician gives clearance based on control of seizure disorder.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking, other unusual changes in behavior or mood occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal

★ = Canadian drug name. † = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

products being taken and to consult with health care professional before taking other medications.

- Instruct patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in the frequency or cessation of seizures.

REMS

ticagrelor (tye-ka-grel-or) Brilinta

Classification

Therapeutic: antiplatelet agents

Pharmacologic: platelet aggregation inhibitors

Pregnancy Category C

Indications

To decrease the incidence of thrombotic cardiovascular events associated with acute coronary syndrome (ACS).

Action

Both parent drug and its active metabolite inhibit platelet aggregation by reversibly interacting with platelet P₂Y₁₂ADP-receptors, preventing signal transduction and platelet activation. **Therapeutic Effects:** Reduced sequelae of ACS including cardiovascular death, MI and stroke.

Pharmacokinetics

Absorption: 36% absorbed following oral administration.

Distribution: Unknown.

Protein Binding: 99% for ticagrelor and its active metabolite.

Metabolism and Excretion: Mostly metabolized in the liver (CYP3A4 enzyme system, some metabolism by CYP3A5) with conversion to an active metabolite (AR-C124910XX); excretion primarily via biliary secretion; <1% excreted unchanged or as active metabolite in urine.

Half-life: *Ticagrelor*—7 hr; *Active metabolite*—9 hr.

TIME/ACTION PROFILE (inhibition of platelet aggregation)

ROUTE	ONSET	PEAK	DURATION
PO	within 30 min	4 hr	5 days†

† Following discontinuation.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Active bleeding; History of intracranial bleeding; Severe hepatic impairment (increased risk of bleeding); Impending coronary artery bypass graft (CABG) surgery or other surgery (discontinue 5 days prior); **Lactation:** Avoid breast feeding; Strong inhibitors/inducers of CYP3A enzyme system (avoid concurrent use if possible).

Use Cautiously in: Moderate hepatic impairment (consider risks of increased levels); Hypotension following recent CABG or percutaneous coronary intervention (PCI) in patients receiving ticagrelor (consider bleeding as a cause); **Geri:** Some elderly patients may be more sensitive to effects; **OB:** Use only during pregnancy if potential maternal benefit justifies potential risk to fetus; **Pedi:** Safe and effective use has not been established.

Adverse Reactions/Side Effects

CV: bradycardia. **Resp:** dyspnea. **Endo:** gynecomastia. **Hemat:** **BLEEDING.** **Misc:** hypersensitivity reactions including **ANGIOEDEMA.**

Interactions

Drug-Drug: Strong inhibitors of CYP3A4/5 including atazanavir, clarithromycin, indinavir, intriconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, saquinavir, telithromycin and voriconazole ↑ levels and the risk of bleeding and should be avoided. **Potent inducers of CYP3A** including carbamazepine, dexamethasone, phenobarbital, phenytoin, rifampin may ↓ levels and effectiveness and should be avoided. Concurrent use of lovastatin or simvastatin in doses >40 mg/day ↑ risk of statin-related adverse reactions. Effectiveness is ↓ by aspirin >100 mg/day (maintain aspirin at 75–100 mg/day). May alter digoxin levels (monitoring recommended). Risk of bleeding ↑ by anticoagulants, fibrinolytics and chronic NSAIDs.

Route/Dosage

PO (Adults): *Loading dose*—180 mg; followed by *maintenance dose*—90 mg twice daily.

Availability

Tablets: 90 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for symptoms of stroke, peripheral vascular disease, or MI periodically during therapy.
- Observe patient for signs and symptoms of hypersensitivity reactions (rash, facial swelling, pruritus, laryngeal edema, wheezing). Discontinue drug and notify health care professional immediately if symptoms occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in case of anaphylactic reaction.

- **Lab Test Considerations:** May cause ↑ serum uric acid and ↑ serum creatinine.

Potential Nursing Diagnoses

Risk for injury (Adverse Reactions)

Implementation

- Administer 180 mg (two 90 mg tablets) as a loading dose, followed by 90 mg twice daily. After initial 325 mg loading dose of aspirin, administer maintenance dose of 75–100 mg daily. Administer without regard for food.
- Patients who have received a loading dose of clopidogrel may be started on ticagrelor.
- Discontinue ticagrelor 5 days before planned surgical procedures. If ticagrelor must be temporarily discontinued, restart as soon as possible. Premature discontinuation of therapy may increase risk of myocardial infarction, stent thrombosis, and death.

Patient/Family Teaching

- Instruct patient to take ticagrelor exactly as directed. Take missed doses as soon as possible unless almost time for next dose; do not double doses. Do not discontinue ticagrelor without consulting health care professional; may increase risk of cardiovascular events. Advise patient to read the *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- Advise patient that daily aspirin should not exceed 100 mg and to avoid taking other medications that contain aspirin.
- Inform patient that they will bleed and bruise more easily and it will take longer to stop bleeding. Advise patient to notify health care professional promptly if unusual, prolonged, or excessive bleeding or blood in stool or urine occurs.
- Inform patient that ticagrelor may cause shortness of breath which usually resolved during therapy. Advise patient to notify health care professional if unexpected or severe shortness of breath or symptoms of hypersensitivity reactions occur.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery or dental procedure. Prescriber should be consulted before stopping ticagrelor.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially aspirin or NSAIDs.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decreased thrombotic cardiovascular events in patients with acute coronary syndrome (ACS).

ticarcillin/clavulanate (tye-kar-sil-in/klav-yoo-la-nate) Timentin

Classification

Therapeutic: anti-infectives

Pharmacologic: extended spectrum penicillins

Pregnancy Category B

Indications

Treatment of: Skin and skin structure infections, Bone and joint infections, Septicemia, Lower respiratory tract infections, Intra-abdominal, gynecologic, and urinary tract infections.

Action

Binds to bacterial cell wall membrane, causing cell death. Addition of clavulanate enhances resistance to beta-lactamase, an enzyme that can inactivate penicillins. **Therapeutic Effects:** Bactericidal action.

Spectrum: Similar to penicillin but extended to include several gram-negative aerobic pathogens, notably: *Pseudomonas aeruginosa*, *Escherichia coli*, *Citrobacter*, *Enterobacter*, *Haemophilus influenzae*, *Klebsiella*, *Serratia marcescens*. Active against some anaerobic bacteria, including bacteroides.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Widely distributed. Enters CSF well when meninges are inflamed. Crosses the placenta; enters breast milk in low concentrations.

Metabolism and Excretion: 10% of ticarcillin is metabolized by the liver; 90% excreted unchanged by the kidneys. Clavulanate is metabolized by the liver.

Half-life: *Ticarcillin* — 1.1 hr (↑ in renal impairment); *clavulanate* — 1.1 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	4–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to penicillins (cross-sensitivity with cephalosporins may occur).

Use Cautiously in: Renal impairment (dose ↓ and/or ↑ interval required if CrCl < 60 mL/min); HF (due to high sodium content); **OB, Lactation:** Safety not established; **Pedi:** Children < 3 mo (safety not established).

Adverse Reactions/Side Effects

CNS: SEIZURES (high doses), confusion, lethargy. **CV:** CHF, arrhythmias. **GI:** PSEUDOMEMBRANOUS COLITIS, di-

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

arrhea, nausea. **GU:** hematuria (children only), hemorrhagic cystitis. **Derm:** rash, urticaria. **F and E:** hypokalemia, hyponatremia. **Hemat:** bleeding, blood dyscrasias, ↑ bleeding time. **Local:** phlebitis. **Metab:** metabolic alkalosis. **Misc:** hypersensitivity reactions including **ANAPHYLAXIS**, superinfection.

Interactions

Drug-Drug: Probenecid ↓ renal excretion and ↑ blood levels.

Route/Dosage

Ticarcillin/clavulanate contains 4.51 mEq sodium/g and 0.15 mEq potassium/g of ticarcillin/clavulanate. 3 g ticarcillin plus 100 mg clavulanate labeled as 3.1 g combined potency. Dosing is based on ticarcillin component.

IV (Adults and Children >16 yr): 3 g ticarcillin q 4–6 hr.

IV (Children 3 mo–16 yr): <60 kg—Mild to moderate infection: 50 mg ticarcillin/kg q 6 hr; severe infection: 50 mg ticarcillin/kg q 4 hr. ≥60 kg—Mild to moderate infection: 3 g ticarcillin q 6 hr; severe infection: 3 g ticarcillin q 4 hr.

Renal Impairment

IV (Adults): Give loading dose of 3 g ticarcillin × 1 dose, followed by maintenance dose based on *CCr*. *CCr* 30–60 mL/min—2 g ticarcillin q 4 hr; 10–30 mL/min—2 g ticarcillin q 8 hr; *CCr* <10 mL/min—2 g ticarcillin q 12 hr; *CCr* <10 mL/min with hepatic dysfunction—2 g ticarcillin q 24 hr; *Peritoneal dialysis*—3 g ticarcillin q 12 hr; *Hemodialysis*—2 g ticarcillin q 12 hr supplemented with 3 g ticarcillin after each dialysis session.

Availability

Powder for injection: 3.1 g/vial, 31 g/vial. **Pre-mixed infusion:** 3.1 g/100 mL.

NURSING IMPLICATIONS

Assessment

- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain a history before initiating therapy to determine use of and reactions to penicillins or cephalosporins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue drug and notify physician immediately if these problems occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in case of anaphylactic reaction.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be re-

ported to health care professional promptly as a sign of pseudomembranous colitis. May begin up to several weeks following cessation of therapy.

- Lab Test Considerations:** Evaluate renal and hepatic function, CBC, serum potassium, and bleeding times prior to and routinely throughout therapy.
- May cause false-positive urine protein testing and increased BUN, creatinine, AST, ALT, serum bilirubin, alkaline phosphatase, LDH, and uric acid levels. May also cause ↑ bleeding time.
- May cause hyponatremia and hypokalemia with high doses.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)

Implementation

IV Administration

- IV:** Change IV sites every 48 hr to prevent phlebitis.
- Intermittent Infusion:** Add 13 mL of sterile water for injection or 0.9% NaCl for injection to each 3.1-g vial, to provide a concentration of ticarcillin 200 mg/mL and clavulanic acid 6.7 mg/mL. **Diluent:** Further dilute in 0.9% NaCl, D5W, or LR. Reconstituted vials stable for 24 hr at room temperature or 72 hr if refrigerated. Infusion is stable for 24 hr at room temperature. If refrigerated, infusion is stable for 3 days (diluted in D5W) or 7 days (if diluted in 0.9% NaCl or LR). **Concentration:** 10–100 mg/mL. **Rate:** Infuse over 30 min.
- Y-Site Compatibility:** alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid, atropine, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone sodium phosphate, dexmedetomidine, digoxin, diltiazem, diphenhydramine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, enalaprilat, ephedrine, epinephrine, epoetin alfa, epifibatide, esmolol, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid, furosemide, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone sodium succinate, hydromorphone, ifosfamide, imipenem/cilastatin, indomethacin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, methotrexate, methylglutamate, methylprednisolone sodium succinate, metoclopra-

midate, metoprolol, metronidazole, milrinone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, penicillin G, perphenazine, phenobarbital, phentolamine, phenylephrine, phytonadione, potassium acetate, potassium chloride, procainamide, prochlorperazine, propofol, propranolol, pyridoxime, ranitidine, remifentanyl, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiopental, tigecycline, tirofiban, tobramycin, tolazoline, trastuzumab, trimetaphan, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, voriconazole, zolnedronic acid.

- **Y-Site Incompatibility:** acyclovir, alemtuzumab, amphotericin B cholesteryl, azithromycin, caspofungin, chlorpromazine, dantrolene, diazepam, dioxide, dobutamine, epirubicin, etidronate, ganciclovir, haloperidol, hydroxyzine, idarubicin, mitoxantrone, mycophenolate, papaverine, pentamidine, pentazocine, phenytoin, promethazine, protamine, quinupristin/dalfopristin, tranexamic acid, trimethoprim/sulfamethoxazole. If aminoglycosides and penicillins must be administered concurrently, administer in separate sites at least 1 hr apart.

Patient/Family Teaching

- Advise patient to report signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools) and allergy.
- **Caution patient to notify health care professional if fever and diarrhea occur, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional. May occur up to several weeks after discontinuation of medication.**

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

tigecycline (tye-gi-sye-kleen) Tygacil

Classification

Therapeutic: anti-infectives

Pharmacologic: glycyclines

Pregnancy Category D

Indications

Complicated skin/skin structure infections, complicated intra-abdominal infections, or community-acquired bacterial pneumonia caused by susceptible bacteria (Should only be used when alternative treatments are not suitable; should NOT be used for diabetic foot infections).

Action

Inhibits bacterial protein synthesis by binding to the 30S ribosomal subunit. **Therapeutic Effects:** Resolution of infection. **Spectrum:** Active against the following Gram-positive bacteria: *Enterococcus faecalis* (vancomycin-susceptible strains only), *Staphylococcus aureus* (methicillin-sensitive and methicillin-resistant strains), *Streptococcus agalactiae*, *Streptococcus anginosus*, *Streptococcus pneumoniae*, and *Streptococcus pyogenes*. Also active against these Gram-positive organisms: *Citrobacter freundii*, *Enterobacter cloacae*, *Escherichia coli*, *Haemophilus influenzae* (beta-lactamase negative strains only), *Legionella pneumophila*, *Klebsiella oxytoca*, and *Klebsiella pneumoniae*. Additionally active against the following anaerobes: *Bacteroides fragilis*, *Bacteroides thetaiotaomicron*, *Bacteroides uniformis*, *Bacteroides vulgatus*, *Clostridium perfringens*, and *Peptostreptococcus micros*.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Widely distributed with good penetration into gall bladder, lung, and colon; crosses the placenta.

Metabolism and Excretion: Minimal metabolism; primary route of elimination is biliary/fecal excretion of unchanged drug and metabolites (59%), 33% renal (22% unchanged).

Half-life: 27.1 hr (after 1 dose); 42.4 hr after multiple doses.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Diabetic foot infections; Hospital-acquired or ventilator-associated pneumonia; **Pedi:** Children.

Use Cautiously in: Complicated intra-abdominal infections due to perforation; Severe hepatic impairment (↓ maintenance dose recommended); **Geri:** May be more sensitive to adverse effects; **OB, Lactation:** Use in pregnancy only when potential maternal benefit outweighs fetal risk; use cautiously during lactation.

☼ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Adverse Reactions/Side Effects

CNS: somnolence. **Derm:** STEVENS-JOHNSON SYNDROME. **GI:** PANCREATITIS, PSEUDOMEMBRANOUS COLITIS, nausea, vomiting, altered taste, anorexia, dry mouth, hepatotoxicity, jaundice. **GU:** ↑ serum creatinine. **Endo:** hyperglycemia, hypoglycemia. **F and E:** hypocalcemia, hyponatremia. **Resp:** pneumonia. **Local:** injection site reactions. **Misc:** DEATH, allergic reactions.

Interactions

Drug-Drug: May ↓ the effectiveness of **hormonal contraceptives**. Effects on **warfarin** are unknown (monitoring recommended).

Route/Dosage

IV (Adults >18 yr): 100 mg initially, then 50 mg every 12 hr for 5–14 days (skin/skin structure infections and intra-abdominal infections) or 7–14 days (pneumonia).

Hepatic Impairment

IV (Adults >18 yr): *Child-Pugh C*—100 mg initially, then 25 mg every 12 hr.

Availability

Lyophilized powder for reconstitution: 50 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain specimens for culture and sensitivity before initiating therapy. 1st dose may be given before receiving results.
- Before initiating therapy, obtain a history of tetracycline hypersensitivity; may also have an allergic response to tigecycline.
- Monitor bowel function.** Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of pseudomembranous colitis. May begin up to several weeks following cessation of therapy.
- Assess patient for signs of pancreatitis (nausea, vomiting, abdominal pain, increased serum lipase or amylase) periodically during therapy. May require discontinuation of therapy.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.
- Lab Test Considerations:** May cause anemia, leukocytosis, and thrombocytopenia.
- May cause ↑ serum alkaline phosphatase, amylase, bilirubin, LDH, AST, and ALT.

- May cause hyperglycemia, hypokalemia, hypoproteinemia, hypocalcemia, hyponatremia, and ↑ BUN level.

Potential Nursing Diagnoses

Risk for infection (Indications)

Implementation

- May cause yellow-brown discoloration and softening of teeth and bones if administered prenatally or during early childhood. Not recommended for children under 8 yr of age or during pregnancy or lactation unless used for the treatment of anthrax.

IV Administration

- Intermittent Infusion:** Reconstitute each vial with 5.3 mL of 0.9% NaCl or D5W to achieve a concentration of 10 mg/mL. **Diluent:** Dilute further in 100 mL of D5W, LR, or 0.9% NaCl. Reconstituted solution should be yellow to orange in color. Do not administer solutions that are discolored or contain particulate matter. Infusion is stable for up to 24 hr at room temperature or for up to 48 hr if refrigerated. **Concentration:** Final concentration of infusion should be ≤1 mg/mL. **Rate:** Infuse over 30–60 min. Flush line before and after infusion with 0.9% NaCl or D5W.
- Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B liposome, ampicillin, ampicillin/sulbactam, argatroban, azithromycin, aztreonam, bivalirudin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dextrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doripenem, doxorubicin hydrochloride, doxorubicin liposome, droperidol, enalaprilat, epinephrine, epitifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, lansoprazole, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meclizine, melphalan, meperidine, meropenem, mesna, methohexital, methotrexate, methylodopate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, mor-

phine, moxifloxacin, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, pentamidine, pentazocine, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propofol, propranolol, ranitidine, remifentanyl, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, telavancin, teniposide, theophylline, thiopental, thiotepa, ticarcillin/clavulanate, tirofiban, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, vinblastine, vincristine, vinorelbine, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** amiodarone, amphotericin B colloidal, amphotericin B lipid complex, bleomycin, chloramphenicol, chlorpromazine, dantrolene, diazepam, epirubicin, esomeprazole, hydralazine, idarubicin, nicardipine, phenytoin, quinupristin/dalfopristin, verapamil.

Patient/Family Teaching

- Advise patient that full course of therapy should be completed, even if feeling better. Skipping doses or not completing full course of therapy may result in decreased effectiveness and increased risk of bacterial resistance.
- **Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.**
- Advise patient to report the signs of superinfection (black, furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools). Skin rash, pruritus, and urticaria should also be reported.
- Advise female patient to use a nonhormonal method of contraception while taking tigecycline and until next menstrual period.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of infection.

tiiconazole, See ANTIFUNGALS (VAGINAL).

tiotropium (tye-o-trope-ee-yum)

Spiriva

Classification

Therapeutic: bronchodilators

Pharmacologic: anticholinergics

Pregnancy Category C

Indications

Long-term maintenance treatment of bronchospasm due to COPD. Reducing exacerbations in patients with COPD.

Action

Acts as anticholinergic by selectively and reversibly inhibiting M₃ receptors in smooth muscle of airways.

Therapeutic Effects: Decreased incidence and severity of bronchospasm.

Pharmacokinetics

Absorption: 19% absorbed following inhalation.

Distribution: Extensive tissue distribution; due to route of administration ↑ concentrations occur in lung.

Metabolism and Excretion: 74% excreted unchanged in urine; 25% of absorbed drug is metabolized.

Half-life: 5–6 days.

TIME/ACTION PROFILE (bronchodilation)

ROUTE	ONSET	PEAK	DURATION
inhaln	rapid	5 min	24 hr

T

Contraindications/Precautions

Contraindicated in: Hypersensitivity to tiotropium or ipratropium; Concurrent ipratropium.

Use Cautiously in: Hypersensitivity to atropine or milk proteins; Narrow-angle glaucoma, prostatic hyperplasia, bladder neck obstruction (may worsen condition); CCR ≤50 mL/min (monitor closely); **OB, Lactation, Pedi:** Pregnancy, lactation, or children (safety not established).

Adverse Reactions/Side Effects

EENT: glaucoma. **Resp:** paradoxical bronchospasm.

CV: tachycardia. **GI:** dry mouth, constipation. **GU:** urinary difficulty, urinary retention. **Derm:** rash.

Misc: hypersensitivity reactions including **ANGIO-EDEMA**.

Interactions

Drug-Drug: Should not be used concurrently with ipratropium due to risk of additive anticholinergic effects.

Route/Dosage

Inhaln (Adults): 18 mcg once daily.

✳ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Availability

Dry powder capsules for inhalation: 18 mcg.

Cost: \$317.33/30 capsules.

NURSING IMPLICATIONS

Assessment

- **Inhaln:** Assess respiratory status (rate, breath sounds, degree of dyspnea, pulse) before administration and at peak of medication. Consult health care professional about alternative medication if severe bronchospasm is present; onset of action is too slow for patients in acute distress. If paradoxical bronchospasm (wheezing) occurs, withhold medication and notify health care professional immediately.

Potential Nursing Diagnoses

Ineffective airway clearance (Indications)

Risk for activity intolerance (Indications)

Implementation

- **Do not confuse Spiriva (tiotropium) with Inspira (eplerenone).**
- **Inhaln:** See Appendix D for administration of inhalation medications.

Patient/Family Teaching

- Instruct patient to take medication as directed. Capsules are for inhalation only and must not be swallowed. Take missed doses as soon as remembered unless almost time for the next dose; space remaining doses evenly during day. Do not double doses.
- Advise patient that tiotropium is not to be used for acute bronchospasm attacks, but may be continued during an acute exacerbation.
- Instruct patient in proper use and cleaning of the Handihaler inhaler. Review the *Patient's Instructions for Use* guide with patient. Capsules should be stored in sealed blisters; remove immediately before use or effectiveness of capsules is reduced. Tear blister strip carefully to expose only one capsule at a time. Discard capsules that are inadvertently exposed to air. *Spiriva* should be administered only via the Handihaler and the Handihaler should not be used with other medications. When disposing of capsule, tiny amount of powder left in capsule is normal.
- Advise patient to notify health care professional immediately if signs and symptoms of angioedema (swelling of the lips, tongue, or throat, itching, rash) or signs of glaucoma (eye pain or discomfort, blurred vision, visual halos or colored images in association with red eyes from conjunctival congestion and corneal edema) occur.
- Caution patient to avoid spraying medication in eyes; may cause blurring of vision and pupil dilation.
- Advise patient that rinsing mouth after using inhaler, good oral hygiene, and sugarless gum or

candy may minimize dry mouth; usually resolves with continued treatment.

- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, including eye drops.
- Advise patient to inform health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decreased dyspnea.
- Improved breath sounds.
- Fewer exacerbations in patients with COPD.

tipranavir (ti-pran-a-veer) Aptivus

Classification

Therapeutic: antiretrovirals

Pharmacologic: protease inhibitors

Pregnancy Category C

Indications

Advanced HIV disease resistant to more than one protease inhibitor (must be used with ritonavir).

Action

Inhibits processing of viral polyproteins, preventing formation of mature virions. **Therapeutic Effects:** Decreased viral load and sequelae of HIV infection.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Unknown.

Protein Binding: >99.9%.

Metabolism and Excretion: Rapidly and extensively metabolized (primarily by CYP3A4), requiring co-administration with ritonavir as a metabolic inhibitor to achieve therapeutic blood levels; eliminated mostly in feces, minimal renal excretion.

Half-life: 5.5–6 hr.

TIME/ACTION PROFILE (blood levels*)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	2 hr	12 hr

* With ritonavir

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Moderate to severe hepatic impairment (Child-Pugh Class B or C); Concurrent use of some antiarrhythmics (amiodarone, flecainide, propafenone, quinidine), ergot derivatives, sildenafil (Revatio), alfuzosin, midazolam (oral) or triazolam.

Use Cautiously in: Known sulfonamide allergy (contains sulfa moiety); Pre-existing liver disease

(may ↑ risk of hepatotoxicity); History of or risk factors for diabetes (may cause hyperglycemia); Hemophilia (may ↑ risk of bleeding); Patients at ↑ risk for bleeding.

Adverse Reactions/Side Effects

CV: INTRACRANIAL HEMORRHAGE, fatigue, headache. **GI:** HEPATOTOXICITY, abdominal pain, diarrhea, nausea, vomiting. **Derm:** rash (↑ in women and peds). **Endo:** hyperglycemia. **Metab:** ↑ cholesterol, ↑ triglycerides. **Misc:** allergic reactions, bleeding, fat redistribution, fever, immune reconstitution syndrome.

Interactions

Drug-Drug: ↑ blood levels and risk of toxicity from some **antiarrhythmics** (amiodarone, flecainide, propafenone, quinidine), **ergot derivatives** (dihydroergotamine, ergonovine, ergotamine, methylergonovine), sildenafil (Revatio), alfuzosin, midazolam (oral), and triazolam; concurrent use **contraindicated**. ↑ risk of myopathy with **atorvastatin**; avoid concurrent use. May ↑ risk of adverse effects with **salmeterol**; concurrent use not recommended. May ↑ **bosentan** levels; initiate bosentan at 62.5 mg once daily or every other day; if patient already receiving bosentan, discontinue bosentan at least 36 hr before initiation of tipranavir and then restart bosentan at least 10 days later at 62.5 mg once daily or every other day. May ↑ **tadalafil** (Adcirca) levels; initiate tadalafil (Adcirca) at 20 mg once daily; if patient already receiving tadalafil (Adcirca), discontinue tadalafil (Adcirca) at least 24 hr before initiation of tipranavir and then restart tadalafil (Adcirca) at least 7 days later at 20 mg once daily. May ↑ **colchicine** levels; ↓ dose of colchicine; do not administer colchicine if patients have renal or hepatic impairment. May ↓ levels of **raltegravir**. Concurrent use with **ritonavir** may lead to intracranial hemorrhage. **Antacids** ↓ absorption (separate dosing). **Hormonal contraceptives** may ↑ risk of rash. May ↓ effectiveness of **hormonal contraceptives**. ↑ risk of bleeding with **antiplatelets**, **anticoagulants**, or **vitamin E**. **Enfuvirtide** may ↑ levels.

Route/Dosage

PO (Adults): 500 mg twice daily with ritonavir 200 mg twice daily.

PO (Children ≥2 yr): 14 mg/kg (max: 500 mg/dose) twice daily with ritonavir 6 mg/kg (max: 200 mg/dose) twice daily; if intolerance develops, may ↓ dose to tipranavir 12 mg/kg twice daily with ritonavir 5 mg/kg twice daily.

Availability

Capsules: 250 mg. **Oral solution (buttermint-butter toffee):** 100 mg/mL (contains vitamin E 116 IU/mL).

NURSING IMPLICATIONS

Assessment

- Assess for change in severity of HIV symptoms and for symptoms of opportunistic infections during therapy.
- Monitor for hepatitis (fatigue, malaise, anorexia, nausea, jaundice, bilirubinuria, acholic stools, liver tenderness, hepatomegaly).
- Assess for sulfa allergy. May be cross sensitive.
- **Lab Test Considerations:** Monitor viral load and CD4 counts regularly during therapy.
- May cause ↑ AST and ↑ ALT; monitor prior to and frequently during therapy. Discontinue tipranavir if symptomatic ↑ of AST and ALT of 10 times the upper limit of normal or symptomatic ↑ of AST and ALT of 5–10 times the upper limit of normal and bilirubin ↑ 2.5 time the upper limit of normal occur.
- Monitor triglyceride and cholesterol levels prior to and periodically during therapy; may cause ↑.
- May cause hyperglycemia. Monitor blood glucose carefully, especially in patients with diabetes.

Potential Nursing Diagnoses

Risk for infection (Indications)

Noncompliance (Patient/Family Teaching)

Implementation

- **PO:** Administer tipranavir with ritonavir tablets twice daily with meals. Administer tipranavir with ritonavir capsules with or without meals. Swallow capsules whole, do not open or chew. Bioavailability is increased with high fat meal.
- Store capsules in refrigerator. Use within 60 days of opening bottle. Write opening date on label; do not use after expiration date written. If used away from home, bottle may be kept at room temperature in a cool place.

Patient/Family Teaching

- Emphasize the importance of taking tipranavir as directed, at evenly spaced times throughout day. Patients should read the *Patient Package Insert* before initiating therapy and with each prescription refill. Do not take more than prescribed amount and do not stop taking without consulting health care professional. Take missed doses as soon as remembered; do not double doses.
- Advise patients taking oral solution not to take supplemental vitamin E greater than a standard multivitamin; oral solution contains 116 IU/mL of vitamin E which is higher than the RDA (adults 30 IU, pediatrics approximately 10 IU).
- Instruct patient that tipranavir should not be shared with others.

✳ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Inform patient that tipranavir does not cure AIDS or prevent associated or opportunistic infections. Tipranavir does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom during sexual contact and to avoid sharing needles or donating blood to prevent spreading the AIDS virus to others.
- Advise patients to stop taking tipranavir and ritonavir and notify health care professional immediately if signs of hepatitis (fatigue, malaise, anorexia, nausea, jaundice) or unusual bleeding occur. May require discontinuation of therapy.
- Inform patient that tipranavir may cause hyperglycemia. Advise patient to notify health care professional if increased thirst or hunger; unexplained weight loss; increased urination; fatigue; or dry, itchy skin occurs.
- Inform patient that redistribution and accumulation of body fat may occur, causing central obesity, dorsocervical fat enlargement (buffalo hump), peripheral wasting, breast enlargement, and cushingoid appearance. The cause and long-term effects are not known.
- Advise women taking hormonal contraceptives to use a nonhormonal form of contraception during tipranavir therapy, and of increased risk of rash.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and improvement in CD4 cell counts.

HIGH ALERT

tirofiban (tye-roe-fye-ban)

Aggrastat

Classification

Therapeutic: antiplatelet agents

Pharmacologic: glycoprotein IIb/IIIa inhibitors

Pregnancy Category B

Indications

Treatment of acute coronary syndrome (unstable angina/non-Q-wave MI), including patients who will be managed medically and those who will undergo percutaneous transluminal angioplasty (PTCA) or atherectomy. Used concurrently with aspirin and heparin.

Action

Decreases platelet aggregation by reversibly antagonizing the binding of fibrinogen to the glycoprotein IIb/IIIa binding site on platelet surfaces. **Therapeutic Effects:** Inhibition of platelet aggregation resulting in decreased incidence of new MI, death, or refractory ischemia with the need for repeat cardiac procedures.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Excreted mostly unchanged by the kidneys (65%); 25% excreted unchanged in feces.

Half-life: 2 hr.

TIME/ACTION PROFILE (effects on platelet function)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	30 min†	brief‡

† >90% inhibition of platelet aggregation at end of initial 30-min infusion

‡ Inhibition is reversible following cessation of infusion

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Active internal bleeding or history of bleeding within previous 30 days; History of intracranial hemorrhage, intracranial neoplasm, arteriovenous malformation or aneurysm; History of thrombocytopenia during previous tirofiban therapy; History of hemorrhagic stroke or other stroke within 30 days; Major surgical procedure or severe physical trauma within 30 days; History, symptoms, or other findings associated with aortic aneurysm; Severe hypertension (systolic BP >180 mm Hg and/or diastolic BP >110 mm Hg); Concurrent use of other glycoprotein IIb/IIIa receptor antagonists; Acute pericarditis; **Lactation:** Lactation.

Use Cautiously in: Platelet count <150,000/mm³; Hemorrhagic retinopathy; Female patients (↑ risk of bleeding); Severe renal insufficiency (↓ rate of infusion by 50% if CCr <30 mL/min); **OB, Pedi:** Safety not established; use in pregnancy only if clearly needed;

Geri: ↑ risk of bleeding.

Adverse Reactions/Side Effects

Noted for patients receiving heparin and aspirin in addition to tirofiban.

CNS: dizziness, headache. **CV:** bradycardia, coronary dissection, edema, vasovagal reaction. **GI:** nausea.

Derm: hives, rash. **Hemat:** bleeding, thrombocytopenia. **MS:** leg pain. **Misc:** fever, hypersensitivity reactions, pelvic pain, sweating.

Interactions

Drug-Drug: Concurrent use of **aspirin**, **NSAIDs**, **warfarin**, **heparin**, **heparin-like agents**, **abcixi-**

mab, eptifibatide, clopidogrel, ticlopidine, or dipyridamole may ↑ risk of bleeding, although these agents are frequently used together or in sequence. Risk of bleeding may be ↑ by concurrent use of cefotetan, cefoperazone, or valproic acid.

Drug-Natural Products: ↑ anticoagulant effect and bleeding risk with anise, arnica, chamomile, clove, dong quai, fenugreek, feverfew, garlic, ginger, ginkgo, Panax ginseng, licorice, and others.

Route/Dosage

IV (Adults): 0.4 mcg/kg/min for 30 min, then 0.1 mcg/kg/min, continued throughout angiography and for 12–24 hr after angioplasty or atherectomy.

Renal Impairment

IV (Adults): *CCr* <30 mL/min—0.2 mcg/kg/min for 30 min, then 0.05 mcg/kg/min, continued throughout angiography and for 12–24 hr after angioplasty or atherectomy.

Availability

Premixed solution for infusion: 5 mg/100 mL (50 mcg/mL) in 100-mL single-dose containers, 12.5 mg/250 mL (50 mcg/mL) in 250-mL single-dose containers.

NURSING IMPLICATIONS

Assessment

- Assess for bleeding. Most common is oozing from the arterial access site for cardiac catheterization. Arterial and venous punctures, IM injections, and use of urinary catheters, nasotracheal intubation, and nasogastric tubes should be minimized. Non-compressible sites for IV access should be avoided. If bleeding cannot be controlled with pressure, discontinue tirofiban and heparin immediately.
- During vascular access, avoid puncturing posterior wall of femoral artery. Maintain bedrest with head of bed elevated 30° and affected limb restrained in a straight position while the vascular sheath is in place. Heparin should be discontinued for 3–4 hr and activated clotting time (ACT) <180 sec or activated partial thromboplastin time (aPTT) <45 sec prior to pulling the sheath. Use compressive techniques to obtain hemostasis and monitor closely. Sheath hemostasis should be maintained for >4 hr before discharge from the hospital.
- Monitor for signs of thrombocytopenia (chills, low-grade fever) during therapy.
- Lab Test Considerations:** Assess hemoglobin, hematocrit, and platelet count prior to tirofiban therapy, within 6 hr following loading infusion, and at least daily during therapy (more frequently if evi-

dence of significant decline). May cause ↓ hemoglobin and hematocrit.

- If platelet count ↓ to <90,000/mm³, perform additional platelet counts to rule out pseudothrombocytopenia. If thrombocytopenia is confirmed, tirofiban and heparin should be discontinued and condition monitored and treated.
- To monitor unfractionated heparin, assess aPTT 6 hr after the start of heparin infusion. Adjust heparin to maintain aPTT at approximately 2 times control.
- May cause presence of urine and fecal occult blood.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)

Implementation

- Do not confuse Aggrastat (tirofiban) with argatroban.
- High Alert:** Use of antiplatelet medications has resulted in patient harm and/or death from internal hemorrhage or intracranial bleeding. Have second practitioner independently check original order, dosage calculations, and infusion pump settings.
- Most patients receive heparin and aspirin concurrently with tirofiban.
- Do not administer solutions that are discolored or contain particulate matter. Discard unused portion.

IV Administration

- pH:** 5.5–6.5.
- Intermittent Infusion:** **Diluent:** Tirofiban injection premix is ready for administration and dose not require any further dilution. **Concentration:** 50 mcg/mL. **Rate:** Based on patient's weight (see Route/Dosage section).
- Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, arsenic trioxide, atracurium, atropine, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate, capreomycin, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxacurium, doxorubicin, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famoti-

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

dine, fenoldopam, fentanyl, fluconazole, fludarbaine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlor-ethamine, melphalan, meperidine, meropenem, mesna, methylhexital, methotrexate, methylglutamate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, pentobarbital, phenobarbital, phenolamine, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, ranitidine, remifentanyl, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin/clavulanate, tigecycline, tobramycin, topotecan, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** amphotericin B colloidal, amphotericin B lipid complex, dantrolene, diazepam, phenytoin.

Patient/Family Teaching

- Inform patient of the purpose of tirofiban.
- Instruct patient to notify health care professional immediately if any bleeding is noted.

Evaluation/Desired Outcomes

- Inhibition of platelet aggregation resulting in decreased incidence of new MI, death, or refractory ischemia with the need for repeat cardiac procedures.

tiZANidine (tye-zan-i-deen)

Zanaflex

Classification

Therapeutic: antispasticity agents (centrally acting)

Pharmacologic: adrenergics

Pregnancy Category C

Indications

Increased muscle tone associated with spasticity due to multiple sclerosis or spinal cord injury.

Action

Acts as an agonist at central alpha-adrenergic receptor sites. Reduces spasticity by increasing presynaptic inhibition of motor neurons. **Therapeutic Effects:** Decreased spasticity, allowing better function.

Pharmacokinetics

Absorption: Completely absorbed after oral administration but rapidly metabolized, resulting in 40% bioavailability.

Distribution: Widely distributed.

Metabolism and Excretion: 95% metabolized by the liver.

Half-life: 2.5 hr.

TIME/ACTION PROFILE (reduced muscle tone)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–2 hr	3–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Renal impairment; Concurrent antihypertensive therapy; **OB, Lactation, Pedi:** Safety not established; **Geri:** Dose ↓ may be necessary due to ↓ clearance.

Exercise Extreme Caution in: Impaired hepatic function.

Adverse Reactions/Side Effects

CNS: anxiety, depression, dizziness, sedation, weakness, dyskinesia, hallucinations, nervousness. **EENT:** blurred vision, pharyngitis, rhinitis. **CV:** hypotension, bradycardia. **GI:** abdominal pain, diarrhea, dry mouth, dyspepsia, constipation, hepatocellular injury, ↑ liver enzymes, vomiting. **GU:** urinary frequency. **Derm:** rash, skin ulcers, sweating. **MS:** back pain, myasthenia, paresthesia. **Misc:** fever, speech disorder.

Interactions

Drug-Drug: Levels and effects ↑ by concurrent use of **hormonal contraceptives** or **alcohol**. ↑ risk of hypotension with **alpha₂-adrenergic agonist antihypertensives** (avoid concurrent use). ↑ CNS depression may occur with **alcohol** or other **CNS depressants** including some **antidepressants**, **sedative/hypnotics**, **antihistamines**, and **opioid analgesics**. Concurrent **CYP1A2 inhibitors** (**ciprofloxacin**, **fluvoxamine** and others) may ↑ levels and risk of hypotension and excessive sedation.

Route/Dosage

Tablets are not interchangeable with capsules

PO (Adults): 4 mg q 6–8 hr initially (no more than 3 doses/24 hr); ↑ by 2–4 mg/dose up to 8 mg/dose or 24 mg/day (not to exceed 36 mg/day). Some patients may tolerate twice-daily dosing.

Availability (generic available)

Tablets: 2 mg, 4 mg. **Cost:** *Generic*—2 mg \$35.39/100, 4 mg \$47.93/100. **Capsules:** 2 mg, 4 mg, 6 mg. **Cost:** *Generic*—2 mg \$406.72/150, 4 mg \$515.53/150, 6 mg \$773.24/150.

NURSING IMPLICATIONS

Assessment

- Assess muscle spasticity before and periodically during therapy.
- Monitor BP and pulse, especially during dose titration. May cause orthostatic hypotension, bradycardia, dizziness, and, rarely, syncope. Effects are usually dose related.
- Observe patient for drowsiness, dizziness, and asthenia. A change in dose may alleviate these problems.
- **Lab Test Considerations:** Monitor liver function tests before and at 1, 3, and 6 mo of therapy. May cause ↑ in serum glucose, alkaline phosphatase, AST, and ALT levels.

Potential Nursing Diagnoses

Impaired physical mobility (Indications)

Risk for injury (Adverse Reactions)

Implementation

- **Do not confuse tizanidine with tiagabine.**
- Doses should be titrated carefully to prevent side effects.
- **PO:** May be taken without regard to meals.

Patient/Family Teaching

- Instruct patient to take tizanidine as directed. Tizanidine may need to be discontinued gradually.
- May cause dizziness and drowsiness. Advise patient to avoid driving or other activities requiring alertness until response to drug is known.
- Instruct patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient to avoid concurrent use of alcohol or other CNS depressants while taking this medication.

Evaluation/Desired Outcomes

- Decrease in muscle spasticity with an increased ability to perform activities of daily living.

tobramycin, See AMINOGLYCOSIDES.

tocilizumab (toe-si-liz-oo-mab)

Actemra

Classification

Therapeutic: antirheumatics, immunosuppressants

Pharmacologic: interleukin antagonists

Pregnancy Category C

Indications

Treatment of adults with moderately- to severely-active rheumatoid arthritis who have not responded to one or more disease-modifying antirheumatic drugs [DMARDs]) (as monotherapy or with methotrexate or other non-biologic DMARDs). Active systemic juvenile idiopathic arthritis (as monotherapy or with methotrexate). Active polyarticular juvenile idiopathic arthritis (as monotherapy or with methotrexate).

Action

Acts as an inhibitor of interleukin-6 (IL-6) receptors by binding to them. IL-6 is a mediator of various inflammatory processes. **Therapeutic Effects:** Slowed progression of rheumatoid arthritis or systemic/polyarticular juvenile idiopathic arthritis.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: 4 mg/kg dose—up to 11 days; 8 mg/kg—up to 13 days.

TIME/ACTION PROFILE (improvement)

ROUTE	ONSET	PEAK	DURATION
IV	within 1 mo	4 mo	unknown
Subcut	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Serious infections; Active hepatic disease/impairment; Absolute neutrophil count (ANC) <2000/mm³ (<500/mm³ while on therapy) or platelet count below 100,000/mm³ (<50,000/mm³ while on therapy); **Lactation:** Not recommended.

Use Cautiously in: Patients at risk for GI perforation, including patients with diverticulitis; Renal or hepatic impairment; Patients with tuberculosis risk factors; **Geri:** ↑ risk of adverse reactions; **OB:** Use only if potential benefit justifies potential risk to fetus; **Pedi:** Children <2 yr (safety not established).

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Adverse Reactions/Side Effects

CNS: headache, dizziness. **EENT:** nasopharyngitis.

Resp: upper respiratory tract infections. **CV:** hypertension. **GI:** GASTROINTESTINAL PERFORATION, ↑ liver

enzymes. **Derm:** rash. **Hemat:** NEUTROPENIA,

THROMBOCYTOPENIA. **Metab:** ↑ lipids. **Misc:** ANAPHY-

LAXIS, SERIOUS INFECTIONS INCLUDING TUBERCULOSIS, DISSEMINATED FUNGAL INFECTIONS AND INFECTIONS WITH

OPPORTUNISTIC PATHOGENS, hypersensitivity reactions including ANAPHYLAXIS, infusion reactions.

Interactions

Drug-Drug: May alter the activity of CYP450 enzymes; the effects of the following drugs should be monitored: cyclosporine, theophylline, warfarin, hormonal contraceptives, atorvastatin and lovastatin. Other drugs which are substrates for this system should also be monitored; effect may persist for several weeks after discontinuation. May ↓ antibody response to and ↑ risk of adverse reactions to live virus vaccines; do not administer concurrently.

Route/Dosage

Rheumatoid Arthritis

IV (Adults): 4 mg/kg every 4 wk; may be ↑ to 8 mg/kg given every 4 wk based on clinical response.

Subcut (Adults <100 kg): 162 mg every 2 wk, may ↑ to every wk based on clinical response.

Subcut (Adults ≥100 kg): 162 mg every wk.

Systemic Juvenile Idiopathic Arthritis

IV (Children ≥2 yr and <30 kg): 12 mg/kg every 2 wk.

IV (Children ≥2 yr and ≥30 kg): 8 mg/kg every 2 wk.

Polyarticular Juvenile Idiopathic Arthritis

IV (Children ≥2 yr and <30 kg): 10 mg/kg every 4 wk.

IV (Children ≥2 yr and ≥30 kg): 8 mg/kg every 4 wk.

Availability

Solution for IV infusion (requires dilution): 20 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess pain and range of motion before and periodically during therapy.
- Assess for signs of infection (fever, dyspnea, flu-like symptoms, frequent or painful urination, redness or swelling at the site of a wound), including tuberculosis, prior to injection. Tocilizumab is contraindicated in patients with active infection. Monitor new infections closely; most common are upper respiratory tract infections, bronchitis, and urinary tract infections. Signs and symptoms of inflammation

may be lessened due to suppression from tocilizumab. Infections may be fatal, especially in patients taking immunosuppressive therapy. If patient develops a serious infection, discontinue tocilizumab until infection is controlled.

- Monitor for injection site reactions (redness and/or itching, rash, hemorrhage, bruising, pain, or swelling). Rash will usually disappear within a few days. Application of a towel soaked in cold water may relieve pain or swelling.
- Monitor patient for signs of anaphylaxis (urticaria, dyspnea, facial edema) following injection. Medications (antihistamines, corticosteroids, epinephrine) and equipment should be readily available in the event of a severe reaction. Discontinue tocilizumab immediately if anaphylaxis or other severe allergic reaction occurs.
- Assess patient for latent tuberculosis with a tuberculin skin test prior to initiation of therapy. Treatment of latent tuberculosis should be started before therapy with tocilizumab.
- Assess for signs and symptoms of systemic fungal infections (fever, malaise, weight loss, sweats, cough, dyspnea, pulmonary infiltrates, serious systemic illness with or without concomitant shock). Ascertain if patient lives in or has traveled to areas of endemic mycoses. Consider empiric antifungal treatment for patients at risk of histoplasmosis and other invasive fungal infections until the pathogens are identified. Consult with an infectious diseases specialist. Consider stopping tocilizumab until the infection has been diagnosed and adequately treated.
- Lab Test Considerations:** Assess CBC with platelet count and liver function prior to initiating therapy and every 4–8 wks during therapy. Do not administer tocilizumab to patients with an absolute neutrophil count (ANC) <2000/mm³, platelet count <100,000/mm³, or ALT or AST above 1.5 times the upper limit of normal (ULN).
- If ANC >1000/mm³, maintain dose. If ANC 500–1000/mm³, interrupt IV tocilizumab until ANC >1000/mm³, then resume at 4 mg/kg and ↑ to 8 mg/kg as clinically appropriate or reduce subcut tocilizumab to every other week and increase frequency to every week as clinically appropriate. If ANC <500/mm³, discontinue tocilizumab.*
- If platelet count 50,000–100,000/mm³, interrupt dosing until platelet count is >100,000/mm³ then resume IV dosing at 4 mg/kg and ↑ to 8 mg/kg as clinically appropriate or reduce subcut tocilizumab to every other week and increase frequency to every week as clinically appropriate. If platelet count is <50,000/mm³, discontinue tocilizumab.*
- If liver enzymes persistently ↑ >1–3x ULN, reduce IV tocilizumab dose to 4 mg/kg and reduce subcut injection to every other week or interrupt*

until AST/ALT have normalized. *If* $>3-5 \times \text{ULN}$ (confirmed by repeat testing), interrupt toclizumab until $<3 \times \text{ULN}$ and follow recommendations for $\uparrow >1-3 \times \text{ULN}$. *If persistent* $\uparrow >1-3 \times \text{ULN}$ or $>5 \times \text{ULN}$, discontinue toclizumab.

- Monitor lipid levels every 4–8 wks following initiation of therapy, then at 6 month intervals. May cause $\uparrow$ total cholesterol, triglycerides, LDL cholesterol, and/or HDL cholesterol.

Potential Nursing Diagnoses

Chronic pain (Indications)

Risk for infection (Adverse Reactions)

Implementation

- Administer a tuberculin skin test prior to administration of toclizumab. Patients with latent TB should be treated for TB prior to therapy.
- Immunizations should be current prior to initiating therapy. Patients on toclizumab may receive concurrent vaccinations, except for live vaccines.
- Do not administer solutions that are discolored or contain particulate matter. Discard unused solution.
- Other DMARDs should be continued during toclizumab therapy.
- **Children:** Do not change dose based on single visit weight; weight fluctuates.
- To switch from IV to Subcut, administer next dose Subcut instead of IV.
- **Subcut:** Only for adult patients with RA. Solution is clear and colorless to pale yellow; do not administer solutions that are discolored or contain particulate matter. Rotate injection sites; avoid sites with moles, scars, areas where skin is tender, bruised, red, hard, or not intact.

IV Administration

- **Intermittent Infusion:** **Diluent:** Withdraw volume of 0.9% NaCl from a 100 mL bag (50 mL bag for children <30 kg) equal to volume of solution required for patient's dose. Slowly add toclizumab from each vial to infusion bag. Invert slowly to mix; avoid foaming. Do not infuse solutions that are discolored or contain particulate matter. Diluted solution is stable for 24 hr if refrigerated or at room temperature; protect from light. Allow solution to reach room temperature before infusing. **Rate:** Infuse over 60 min. Do not administer via IV push or bolus.
- **Y-Site Incompatibility:** Do not infuse concomitantly in the same line with other drugs.

Patient/Family Teaching

- Instruct patient on the purpose for toclizumab. If a dose is missed, contact health care professional to schedule next infusion. Instruct patient and care-

giver in correct technique for subcut injections and care and disposal of equipment.

- **Caution patient to notify health care professional immediately if signs of infection** (fever, sweating, chills, muscle aches, cough, shortness of breath, blood in phlegm, weight loss, warm, red or painful skin or sores, diarrhea or stomach pain, burning on urination, urinary frequency, feeling tired), fever and stomach-area pain that does not go away, change bowel habits, severe rash, swollen face, or difficulty breathing occurs while taking. If signs and symptoms of anaphylaxis occur, discontinue injections and notify health care professional immediately.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Instruct patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding. Pregnant women should be encouraged to participate in the pregnancy registry by calling 1-877-311-8972.

Evaluation/Desired Outcomes

- Decreased pain and swelling with decreased rate of joint destruction in patients with rheumatoid arthritis, systemic idiopathic juvenile arthritis, or polyarticular juvenile idiopathic arthritis.

T

REMS

tofacitinib (toe-fa-sye-ti-nib)

Xeljanz

Classification

Therapeutic: antirheumatics

Pharmacologic: kinase inhibitors

Pregnancy Category C

Indications

Treatment of adults with moderately to severely active rheumatoid arthritis who have had an inadequate response/intolerance to methotrexate. Can be used as monotherapy or with methotrexate or other nonbiologic disease-modifying antirheumatic drugs (DMARDs). Not be used with biologic DMARDs or potent immunosuppressants including azathioprine and cyclosporine.

Action

Acts as a Janus kinase (JAK) inhibitor. Some results of inhibition include decreased hematopoiesis and immune cell function. Decreases circulating killer cells,

☼ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

increases in B cell count and decreases serum C-reactive protein (CRP). **Therapeutic Effects:** Improvement in clinical and symptomatic parameters of rheumatoid arthritis.

Pharmacokinetics

Absorption: Well absorbed following oral administration (74%).

Distribution: Distributes equally between red blood cells and plasma.

Metabolism and Excretion: 70% metabolized by the liver (primarily CYP3A4 with some contribution from CYP2C19). 30% renal excretion of the parent drug.

Half-life: 3 hr.

TIME/ACTION PROFILE (clinical improvement)

ROUTE	ONSET	PEAK	DURATION
PO	within 2 wk	3 mo	unknown

Contraindications/Precautions

Contraindicated in: Active infection; Administration of live vaccines; Severe hepatic impairment; Lymphocyte count <500 cells/mm³, absolute neutrophil count (ANC) <1000 cells/mm³, or hemoglobin levels <9 g/dL; **Lactation:** Should not be used in nursing mothers.

Use Cautiously in: Patients with risk of gastric perforation; **Geri:** Infection risk may be ↑; **OB:** Use during pregnancy only if potential benefit justifies potential fetal risk; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: fatigue, headache, insomnia. **CV:** peripheral edema. **GI:** GASTRIC PERFORATION, abdominal pain, diarrhea, dyspepsia, gastritis, ↑ liver enzymes, vomiting. **GU:** ↑ serum creatinine. **Derm:** erythema, pruritus, rash. **F and E:** dehydration. **Metab:** ↑ lipids. **MS:** arthralgia, joint swelling, musculoskeletal pain, tendonitis. **Neuro:** paresthesia. **Misc:** SERIOUS INFECTIONS including tuberculosis, invasive fungal infections, bacterial, viral, and other infections due to opportunistic pathogens, ↑ risk of malignancy, fever.

Interactions

Drug-Drug: May ↑ risk of adverse reactions and ↓ antibody response to live vaccines (avoid concurrent use). Blood levels and effects may be ↑ by strong CYP3A4 inhibitors including ketoconazole or moderate CYP3A4 inhibitors/strong CYP2C19 inhibitors including fluconazole; dose ↓ recommended. Blood levels and effectiveness may be ↓ strong CYP3A4 inducers including rifampin. ↑ risk of immunosuppression when used concurrently with other potent immunosuppressants including azathioprine, cyclosporine, tacrolimus, antineoplastics or radiation therapy.

Route/Dosage

PO (Adults): 5 mg twice daily; *Concurrent use of strong CYP3A4 inhibitors or moderate CYP3A4 inhibitors/strong CYP2C19 inhibitors*—5 mg once daily; dosage adjustments recommended for neutropenia, anemia or infection.

Renal Impairment

PO (Adults): Moderate to severe renal impairment—5 mg once daily.

Hepatic Impairment

PO (Adults): Moderate hepatic impairment—5 mg once daily.

Availability

Tablets: 5 mg.

NURSING IMPLICATIONS

Assessment

- Assess pain and range of motion before and periodically during therapy.
- Assess for signs of infection (fever, dyspnea, flu-like symptoms, frequent or painful urination, redness or swelling at the site of a wound), including tuberculosis, prior to and periodically during therapy. Tofacitinib is contraindicated in patients with active infection. New infections should be monitored closely; most common are upper respiratory tract infections, bronchitis, and urinary tract infections. Infections may be fatal, especially in patients taking immunosuppressive therapy.
- Assess for signs and symptoms of systemic fungal infections (fever, malaise, weight loss, sweats, cough, dyspnea, pulmonary infiltrates, serious systemic illness with or without concomitant shock). Ascertain if patient lives in or has traveled to areas of endemic mycoses. Consider empiric antifungal treatment for patients at risk of histoplasmosis and other invasive fungal infections until the pathogens are identified. Consult with an infectious diseases specialist. Consider stopping tofacitinib until the infection has been diagnosed and adequately treated.
- **Lab Test Considerations:** Monitor CBC prior to and periodically during therapy. Do not initiate tofacitinib in patients with lymphocyte count <500 cells/mm³, an absolute neutrophil count (ANC) <1000 cells/mm³, or who have hemoglobin level <9 g/dL.
- Monitor lymphocyte count at baseline and every 3 mo thereafter. *If lymphocyte count ≥ 500 cells/mm³ maintain dose. If lymphocyte count <500 cells/mm³ and confirmed by repeat testing, discontinue tofacitinib.*
- Monitor neutrophil count at baseline, after 4–8 wks of therapy, and every 3 mo thereafter. *If ANC >1000 cells/mm³, maintain dose. If ANC 500–1000 cells/mm³, for persistent decreases in this range, interrupt dosing until ANC is >1000 cells/*

mm³. *If ANC <500 cells/mm³ and confirmed by repeat testing*, discontinue tofacitinib.

- Monitor hemoglobin at baseline, after 4–8 wks of therapy, and every 3 mo thereafter. *If hemoglobin ≤2 g/dL decrease and ≥9.0 g/dL and confirmed by repeat testing*, maintain dose. *If hemoglobin >2 dL decrease and <8.0 g/dL*, interrupt administration of tofacitinib until hemoglobin values have normalized.
- Monitor liver enzymes prior to and periodically during therapy.
- Monitor total cholesterol, LDL cholesterol, HDL cholesterol 4–8 wks following initiation of therapy.

Potential Nursing Diagnoses

Impaired physical mobility (Indications)

Risk for infection (Adverse Reactions)

Implementation

- Administer a tuberculin skin test prior to administration of tofacitinib. Patients with active latent TB should be treated for TB prior to therapy.
- Immunizations should be current prior to initiating therapy. Patients on tofacitinib should not receive live vaccines.
- **PO:** Administer twice daily without regard to food.

Patient/Family Teaching

- Instruct patient to take tofacitinib as directed. Advise patient to read Medication Guide before starting and with each Rx refill in case of changes.
- **Caution patient to notify health care professional immediately if signs of infection (fever, sweating, chills, muscle aches, cough, shortness of breath, blood in phlegm, weight loss, warm, red, or painful skin or sores, diarrhea or stomach pain, burning on urination or urinating more often than normal, feeling very tired) or stomach or intestinal perforation (fever, stomach-area pain that does not go away, change in bowel habits) occur.**
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and with health care professional before taking other medications.
- Instruct patient to notify health care professional of medication regimen prior to treatment or surgery.
- Inform patient of increased risk of lymphoma and other cancers.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding. Encourage patient to contact the pregnancy registry by calling 1-877-311-8972 if pregnant.
- Emphasize the importance of follow-up lab tests to monitor for adverse reactions.

Evaluation/Desired Outcomes

- Decreased pain and swelling with improved physical functioning and decreased rate of joint destruction in patients with rheumatoid arthritis.

tolcapone (tole-ka-pone)

Tasmar

Classification

Therapeutic: antiparkinson agents

Pharmacologic: catechol-*O*-methyltransferase inhibitors

Pregnancy Category C

Indications

Management of Parkinson's disease with carbidopa/levodopa in patients without severe movement abnormalities who do not respond to other treatment.

Action

Acts as a selective and reversible inhibitor of the enzyme catechol-*O*-methyltransferase. Inhibition of this enzyme prevents the breakdown of levodopa, greatly increasing its availability to the CNS. **Therapeutic Effects:** Prolongs duration of response to levodopa without end-of-dose motor fluctuations. Decreased signs and symptoms of Parkinson's disease.

Pharmacokinetics

Absorption: Rapidly absorbed following oral administration with 65% bioavailability.

Distribution: Unknown.

Protein Binding: >99% bound to plasma proteins.

Metabolism and Excretion: Mostly metabolized by the liver; <0.5% excreted unchanged in urine.

Half-life: 2–3 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1.7 hr	8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent MAO inhibitor therapy; Clinical evidence of liver disease.

Use Cautiously in: Severe renal impairment (safety not established if CCr <25 mL/min); **OB: Lactation:** Safety not established.

Adverse Reactions/Side Effects

CNS: headache, sleep disorder, hallucinations, syncope, urges (gambling, sexual). **CV:** orthostatic hypotension. **GI:** HEPATOTOXICITY, HEPATIC FAILURE, constipation, diarrhea, anorexia, ↑ liver enzymes, nausea, vomiting. **GU:** hematuria, yellow discoloration of

☼ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

urine. **Derm:** ↑ sweating, melanoma. **Neuro:** dyskinesia, dystonia.

Interactions

Drug-Drug: Concurrent use with **MAO inhibitors** is not recommended; both agents inhibit the metabolic pathways of catecholamines. May ↑ the effects of **methyl dopa**, **apomorphine**, **dobutamine**, or **isoproterenol**; dose reduction may be necessary. ↑ the bioavailability of **levodopa** by two-fold; this is a desired effect.

Route/Dosage

PO (Adults): 100 mg 3 times daily; may be cautiously ↑ to 200 mg 3 times daily if benefit is justified.

Availability

Tablets: 100 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for signs and symptoms of Parkinson's disease (tremor, muscle weakness and rigidity, ataxic gait) prior to and throughout therapy.
- Assess BP periodically during therapy.
- Monitor for signs and symptoms of liver dysfunction (persistent nausea, fatigue, lethargy, anorexia, jaundice, dark urine, pruritus, right upper quadrant tenderness) periodically during therapy.
- **Lab Test Considerations:** Monitor liver function tests before every 2–4 wk for the first 6 mo following initiation or dose increase and periodically thereafter. Discontinue tolcapone if liver function tests reach two times the upper limit of normal or if jaundice occurs; do not reinstate.

Potential Nursing Diagnoses

Impaired physical mobility (Indications)
Risk for injury (Indications, Side Effects)

Implementation

- **PO:** Administer 1st dose of the day of tolcapone together with carbidopa/levodopa. Administer subsequent doses 6 and 12 hr later.
- May be administered without regard to food.

Patient/Family Teaching

- Instruct patient to take medication as directed. Caution patient not to discontinue medication without consulting health care professional. Abrupt discontinuation or rapid dose reduction may result in neuroleptic malignant syndrome (elevated temperature, muscular rigidity, altered consciousness).
- Caution patient to make position changes slowly to minimize orthostatic hypotension, especially at the beginning of therapy.
- May affect mental and/or motor performance. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.

- Advise patient to avoid taking alcohol or other CNS depressants concurrently with tolcapone.
- Inform patient and caregiver that hallucinations, nausea, dyskinesia, or dystonia may occur during tolcapone therapy.
- Advise patient to notify health care professional if symptoms of liver failure (clay-colored stools, jaundice, fatigue, loss of appetite, lethargy), suspicious or unusual skin changes, hallucinations, or new or increased gambling, sexual, or other intense urges occur.
- Advise patient to notify health care professional if pregnancy is planned or suspected.
- Instruct patient to notify health care professional if persistent diarrhea occurs.
- Emphasize the importance of routine follow-up exams.

Evaluation/Desired Outcomes

- Decrease in signs and symptoms of Parkinson's disease.

tolnaftate, See ANTIFUNGALS (TOPICAL).

 **tolterodine** (tol-ter-oh-deen)
Detrol, Detrol LA

Classification

Therapeutic: urinary tract antispasmodics
Pharmacologic: anticholinergics

Pregnancy Category C

Indications

Treatment of overactive bladder function that results in urinary frequency, urgency, or urge incontinence.

Action

Acts as a competitive muscarinic receptor antagonist resulting in inhibition of cholinergically mediated bladder contraction. **Therapeutic Effects:** Decreased urinary frequency, urgency, and urge incontinence.

Pharmacokinetics

Absorption: Well absorbed (77%) following oral administration.

Distribution: Unknown.

Protein Binding: 96.3%.

Metabolism and Excretion: Extensively metabolized by the liver (primarily by CYP2D6 isoenzyme)  (the CYP2D6 enzyme system exhibits genetic polymorphism; ~7% of population may be poor metabolizers and may have significantly ↑ tolterodine concentrations and an ↑ risk of adverse effects); one metabolite (5-hydroxymethyltolterodine) is active; other metabolites are excreted in urine.

Half-life: *Tolterodine*—1.9–3.7 hr; *5-hydroxymethyltolterodine*—2.9–3.1 hr.

TIME/ACTION PROFILE (effects on bladder function)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to tolterodine or fesoterodine; Urinary retention; Gastric retention; Uncontrolled angle-closure glaucoma; **Lactation:** Lactation.

Use Cautiously in: GI obstructive disorders, including pyloric stenosis (↑ risk of gastric retention); Significant bladder outflow obstruction (↑ risk of urinary retention); Controlled angle-closure glaucoma; Myasthenia gravis; Significant hepatic impairment (lower doses recommended); Impaired renal function; **OB:** Safety not established; use only if potential maternal benefit justifies potential risk to fetus; **Pedi:** Safety not established.

Adverse Reactions/Side Effects

CNS: headache, dizziness, sedation. **EENT:** blurred vision, dry eyes. **GI:** dry mouth, constipation, dyspepsia. **Derm:** STEVENS-JOHNSON SYNDROME. **Misc:** ANAPHYLAXIS, ANGIOEDEMA.

Interactions

Drug-Drug: Erythromycin, clarithromycin, ketoconazole, itraconazole, and miconazole may inhibit metabolism and ↑ effects.

Route/Dosage

PO (Adults): 2 mg twice daily as tablets; may be lowered depending on response or 2–4 mg once daily as extended-release capsules.

PO (Adults with impaired hepatic function or concurrent enzyme inhibitors): 1 mg twice daily.

Availability (generic available)

Tablets: 1 mg, 2 mg. **Cost:** *Generic*—1 mg \$198.55/60, 2 mg \$203.79/60. **Extended-release capsules:** 2 mg, 4 mg. **Cost:** 2 mg \$458.03/60, 4 mg \$447.85/60.

NURSING IMPLICATIONS

Assessment

- Assess patient for urinary urgency, frequency, and urge incontinence periodically during therapy.
- Monitor for signs and symptoms of anaphylaxis and angioedema (difficulty breathing, upper airway obstruction, fall in BP, rash, swelling of face or neck). Have emergency equipment readily available.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome or toxic epider-

mal necrolysis. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.

Potential Nursing Diagnoses

Impaired urinary elimination (Indications)

Urinary retention (Indications)

Implementation

- PO:** Administer without regard to food.
- Extended-release capsules should be swallowed whole; do not open, crush, dissolve, or chew.

Patient/Family Teaching

- Instruct patient to take tolterodine as directed.
- May cause dizziness and blurred vision. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient to notify health care professional immediately if rash or signs and symptoms of anaphylaxis or angioedema occur.

Evaluation/Desired Outcomes

- Decreased urinary frequency, urgency, and urge incontinence.

tolvaptan (tol-vap-tan)

Samsca

Classification

Therapeutic: electrolyte modifiers

Pharmacologic: vasopressin antagonists

Pregnancy Category C

Indications

Treatment of significant hypervolemic and euvoletic hyponatremia (serum sodium <125 mEq/L or less marked symptomatic hyponatremia that has resisted correction by fluid restriction), including patients with heart failure and Syndrome of Inappropriate Antidiuretic Hormone (SIADH).

Action

Acts as a selective vasopressin V₂-receptor antagonist, resulting in increased renal water excretion and increased serum sodium. **Therapeutic Effects:** Correction of hyponatremia.

Pharmacokinetics

Absorption: 40% absorbed following oral administration.

Distribution: >99%.

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Metabolism and Excretion: Extensively metabolized primarily by the CYP3A4 enzyme system; no renal elimination.

Half-life: 12 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	within 8 hr	2–4 hr†	7 days

† Blood level

Contraindications/Precautions

Contraindicated in: Urgent need to acutely raise serum sodium; Patients who cannot appropriately sense/respond to thirst; Hypovolemic hyponatremia; Concurrent use of strong or moderate CYP3A inhibitors; Anuria; Liver disease; **Lactation:** Avoid use.

Use Cautiously in: Severe malnutrition, alcoholism or advanced liver disease (↑ risk of osmotic demyelination; correct electrolyte abnormalities at a slower rates); Cirrhosis (↑ risk of GI bleeding, use only when the need to treat outweighs risk); **Geri:** May have ↑ sensitivity to effects; **OB:** Use only if the potential benefit justifies the potential risk to the fetus; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: weakness. **GI:** **HEPATOTOXICITY**, constipation, dry mouth. **GU:** polyuria. **F and E:** thirst. **Metab:** hyperglycemia. **Neuro:** osmotic demyelination.

Interactions

Drug-Drug: Strong inhibitors of the CYP3A enzyme system including ketoconazole, clarithromycin, itraconazole, telithromycin, saquinavir, nelfinavir, ritonavir, and nefazodone ↑ levels and may ↑ effects and risk of toxicity; concurrent use should be avoided. **Moderate CYP 3A inhibitors** including erythromycin, fluconazole, aprepitant, diltiazem, and verapamil may have a similar effect and should also be avoided. **Inducers of the CYP3A enzyme system** including rifampin can ↓ blood levels and effectiveness; dosage adjustments may be necessary. Levels and risk of toxicity are also ↑ **P-gp inhibitors** including cyclosporine; dosage adjustments may be necessary. May ↑ **digoxin** levels; monitor carefully. May ↑ risk of hyperkalemia with **angiotensin receptor blockers**, **ACE inhibitors**, and **potassium-sparing diuretics**.

Drug-Food: Grapefruit juice ↑ levels and the risk of toxicity; avoid concurrent use.

Route/Dosage

PO (Adults): 15 mg once daily initially; may be ↑ at intervals of at least one day to 30 mg once daily, up to a maximum of 60 mg once daily. Do not use for longer than 30 days.

Availability

Tablets: 15 mg, 30 mg.

NURSING IMPLICATIONS

Assessment

- Monitor neurologic status and assess for signs and symptoms of osmotic demyelination syndrome (trouble speaking, dysphagia, drowsiness, confusion, mood changes, involuntary movements, weakness, seizures), especially during initiation and after titration. If a rapid ↑ in sodium or symptoms occur, discontinue tolvaptan and consider administration of hypotonic fluid.
- Monitor fluid balance. If hypovolemia occurs interrupt or discontinue tolvaptan and provide supportive care (monitor vital signs, balance fluid and electrolytes).
- **Monitor for signs and symptoms of liver injury** (fatigue, anorexia, right upper abdominal discomfort, dark urine, jaundice) periodically during therapy. If symptoms occur, discontinue therapy.
- **Lab Test Considerations:** Monitor serum sodium levels frequently during initiation and dose titration and periodically during therapy. Too rapid correction of hyponatremia (>12 mEq/L/24 hr) can cause osmotic demyelination syndrome.
- Monitor serum potassium in patients with serum potassium >5 mEq/L or taking medication known to ↑ potassium.

Potential Nursing Diagnoses

Risk for imbalanced fluid volume (Indications)

Implementation

- Initiate and re-initiate therapy in a hospital.
- Avoid fluid restriction during first 24 hr of therapy.
- **PO:** Administer once daily without regard to meals.

Patient/Family Teaching

- Instruct patient to take tolvaptan as directed. Avoid drinking grapefruit juice during therapy; may cause ↑ levels. Take missed doses as soon as remembered, but not if just before next dose; do not double doses. Do not stop and restart therapy. Restarting therapy may require hospitalization.
- Inform patients they can continue fluid ingestion in response to thirst during therapy and should have water available to drink at all times during therapy. Following discontinuation of therapy, resume fluid restriction.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.

- Advise patient to notify health care professional if signs of dehydration (vomiting, diarrhea, inability to drink normally, dizziness, feeling faint) or bleeding (vomiting bright red blood, dark blood clots, or coffee-ground-like material; black, tarry stools; bloody stools).
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Normalization of serum sodium levels. Therapy should be limited to 30 days.

topiramate (toe-peer-i-mate)

Topamax, Trokendi XR

Classification

Therapeutic: anticonvulsants, mood stabilizers

Pregnancy Category D

Indications

Seizures including: partial-onset, primary generalized tonic-clonic, seizures due to Lennox-Gastaut syndrome. Prevention of migraine headache in adults (immediate-release only). **Unlabeled Use:** Adjunct in treatment of bipolar disorder. Infantile spasms.

Action

Action may be due to: Blockade of sodium channels in neurons, Enhancement of gamma-aminobutyrate (GABA), an inhibitory neurotransmitter, Prevention of activation of excitatory receptors. **Therapeutic Effects:** Decreased incidence of seizures. Decreased incidence/severity of migraine headache.

Pharmacokinetics

Absorption: Well absorbed (80%) after oral administration.

Distribution: Unknown.

Metabolism and Excretion: 70% excreted unchanged in urine.

Half-life: 21 hr; *Extended-release*—31 hr.

TIME/ACTION PROFILE (blood levels†)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2 hr	12 hr
PO-ER	unknown	24 hr	unknown

†After single dose

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Recent alcohol use (within 6 hr before and after use of extended-

release product); Metabolic acidosis (on metformin) (with extended-release product only); **Lactation:** Lactation.

Use Cautiously in: All patients (may ↑ risk of suicidal thoughts/behaviors); Renal impairment (dose reduction recommended if CCr <70 mL/min/1.73 m²); Hepatic impairment; Dehydration; Patients predisposed to metabolic acidosis; Patients allergic to sulfa; **OB:** May ↑ risk for cleft palate and/or cleft lip in infants exposed during pregnancy; use only if maternal benefit outweighs fetal risk; **Pedi:** Children are more prone to oligohydrosis and hyperthermia; safety in children <2 yr (immediate-release) and <6 yr (extended-release) not established; **Geri:** Consider age-related ↓ in renal/hepatic impairment, concurrent disease states and drug therapy.

Adverse Reactions/Side Effects

CNS: ↑ **SEIZURES**, **SUICIDAL THOUGHTS**, dizziness, drowsiness, fatigue, impaired concentration/memory, nervousness, psychomotor slowing, speech problems, sedation, aggressive reaction, agitation, anxiety, cognitive disorders, confusion, depression, malaise, mood problems. **EENT:** abnormal vision, diplopia, nystagmus, acute myopia/secondary angle closure glaucoma. **GI:** nausea, abdominal pain, anorexia, constipation, dry mouth, encephalopathy, hyperammonemia. **GU:** kidney stones. **Derm:** oligohydrosis (↑ in children). **F and E:** hyperchloremic metabolic acidosis. **Hemat:** leukopenia. **Metab:** weight loss, hyperthermia (↑ in children). **Neuro:** ataxia, paresthesia, tremor. **Misc:** fever.

Interactions

Drug-Drug: **Alcohol** use within 6 hr before or after use of extended-release product may significantly alter topiramate levels; use during this time frame contraindicated. Levels and effects may be ↓ by phenytoin, carbamazepine, or valproic acid. May ↑ levels and effects of phenytoin, amitriptyline, or lithium. May ↓ levels and effects of hormonal contraceptives, risperidone, or valproic acid. ↑ risk of CNS depression with alcohol or other CNS depressants. **Carbonic anhydrase inhibitors** (e.g. acetazolamide or zonisamide) may ↑ risk of metabolic acidosis and kidney stones. Concurrent use with **valproic acid** may ↑ risk of hyperammonemia, encephalopathy, and hypothermia.

Route/Dosage

Epilepsy (monotherapy)

PO (Adults and children ≥10 yr): *Immediate-release*—25 mg twice daily initially, gradually ↑ at

★ = Canadian drug name. ‡ = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

weekly intervals to 200 mg twice daily over a 6-wk period; *Extended-release*—50 mg once daily initially, gradually ↑ at weekly intervals to 400 mg once daily over a 6-wk period.

PO (Children 2–<10 yr and ≤11 kg): Immediate-release—25 mg once daily in the evening initially, gradually ↑ at weekly intervals to 75 mg twice daily over a 5–7-wk period; if needed may continue to titrate dose on a weekly basis up to 125 mg twice daily.

PO (Children 2–<10 yr and 12–22 kg): Immediate-release—25 mg once daily in the evening initially, gradually ↑ at weekly intervals to 100 mg twice daily over a 5–7-wk period; if needed may continue to titrate dose on a weekly basis up to 150 mg twice daily.

PO (Children 2–<10 yr and 23–31 kg): Immediate-release—25 mg once daily in the evening initially, gradually ↑ at weekly intervals to 100 mg twice daily over a 5–7-wk period; if needed may continue to titrate dose on a weekly basis up to 175 mg twice daily.

PO (Children 2–<10 yr and 32–38 kg): Immediate-release—25 mg once daily in the evening initially, gradually ↑ at weekly intervals to 125 mg twice daily over a 5–7-wk period; if needed may continue to titrate dose on a weekly basis up to 175 mg twice daily.

PO (Children 2–<10 yr and >38 kg): Immediate-release—25 mg once daily in the evening initially, gradually ↑ at weekly intervals to 125 mg twice daily over a 5–7-wk period; if needed may continue to titrate dose on a weekly basis up to 200 mg twice daily.

Renal Impairment

PO (Adults): *CCr*<70 mL/min—↓ dose by 50%.

Epilepsy (adjunctive therapy)

PO (Adults and Children ≥17 yr): Immediate-release—25–50 mg/day initially, ↑ by 25–50 mg/day at weekly intervals up to 200–400 mg/day in 2 divided doses (200–400 mg/day in 2 divided doses for partial seizures or Lennox-Gastaut syndrome and 400 mg/day in 2 divided doses for primary generalized tonic-clonic seizures); *Extended-release*—25–50 mg once daily initially, ↑ by 25–50 mg/day at weekly intervals up to 200–400 mg once daily (for partial seizures or Lennox-Gastaut syndrome) and 400 mg once daily (for primary generalized tonic-clonic seizures).

PO (Children 2–16 yr): Immediate-release—25 mg once daily at night initially for first wk, ↑ at 1–2 wk intervals by 1–3 mg/kg/day up to 5–9 mg/kg/day in 2 divided doses.

PO (Children 6–16 yr): Extended-release—25 mg once daily at night initially for first wk, ↑ at 1–2

wk intervals by 1–3 mg/kg/day up to 5–9 mg/kg/day given once daily at night.

Renal Impairment

PO (Adults): *CCr*<70 mL/min—↓ dose by 50%.

Migraine prevention

PO (Adults): 25 mg at night initially, ↑ by 25 mg/day at weekly intervals up to target dose of 100 mg/day in 2 divided doses.

Renal Impairment

PO (Adults): *CCr*<70 mL/min—↓ dose by 50%.

Availability (generic available)

Sprinkle capsules: 15 mg, 25 mg. **Cost:** *Generic*—15 mg \$144.97/60, 25 mg \$175.26/60. **Extended-release capsules:** 25 mg, 50 mg, 100 mg, 200 mg. **Tablets:** 25 mg, 50 mg, 100 mg, 200 mg. **Cost:** *Generic*—25 mg \$21.85/180, 50 mg \$33.03/180, 100 mg \$41.48/180, 200 mg \$54.38/180. **In combination with:** phentermine (Qsymia). See Appendix B.

NURSING IMPLICATIONS

Assessment

- **Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.**
- **Seizures:** Assess location, duration, and characteristics of seizure activity.
- **Migraines:** Assess pain location, intensity, duration, and associated symptoms (photophobia, phonophobia, nausea, vomiting) during migraine attack. Monitor frequency and intensity of pain on pain scale.
- **Bipolar Disorder:** Assess mental status (mood, orientation, behavior) and cognitive abilities before and periodically during therapy.
- **Lab Test Considerations:** Monitor CBC with differential and platelet count before therapy to determine baseline levels and periodically during therapy. Frequently causes anemia.
- Hepatic function should be monitored periodically throughout therapy. May cause ↑ AST and ALT levels.
- Evaluate serum bicarbonate prior to and periodically during therapy. If metabolic acidosis occurs, dosing taper or discontinuation may be necessary.

Potential Nursing Diagnoses

Risk for injury (Indications, Side Effects)

Disturbed thought process (Indications)

Implementation

- Implement seizure precautions.
- **Do not confuse Topamax (topiramate) with Toprol XL (metoprolol).**
- **PO:** May be administered without regard to meals.

- Do not break/crush tablets because of bitter taste.
- Contents of the sprinkle capsules can be sprinkled on a small amount (teaspoon) of soft food, such as applesauce, custard, ice cream, oatmeal, pudding, or yogurt. To open, hold the capsule upright so that you can read the word "TOP." Carefully twist off the clear portion of the capsule. It may be best to do this over the small portion of the food onto which you will be pouring the sprinkles. Sprinkle the entire contents of the capsule onto the food. Be sure the patient swallows the entire spoonful of the sprinkle/food mixture immediately without chewing. Follow with fluids immediately to make sure all of the mixture is swallowed. Never store a sprinkle/food mixture for use at another time.
- A 6 mg/mL oral suspension may be compounded by pharmacy for pediatric patients.
- Swallow extended-release capsules (Trokendi XR™) whole; do not sprinkle on food, or break, crush, dissolve, or chew.

Patient/Family Teaching

- Instruct patient to take topiramate exactly as directed. Take missed doses as soon as possible but not just before next dose; do not double doses. Notify health care professional if more than 1 dose is missed. Medication should be gradually discontinued to prevent seizures and status epilepticus. Instruct patient to read the *Medication Guide* before starting and with each Rx refill, changes may occur.
- May cause decreased sweating and increased body temperature. Advise patients, especially parents of pediatric patients, to provide adequate hydration and monitoring, especially during hot weather.
- May cause dizziness, drowsiness, confusion, and difficulty concentrating. Caution patients to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to maintain a fluid intake of 2000–3000 mL of fluid/day to prevent the formation of kidney stones.
- Instruct patient to notify health care professional immediately if periorbital pain or blurred vision occur. Medication should be discontinued if ocular symptoms occur. May lead to permanent loss of vision.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or

worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking, other unusual changes in behavior or mood occur.

- Inform patients that topiramate may cause encephalopathy. If signs and symptoms (unexplained lethargy, vomiting, changes in mental status) occur, notify health care professional.
- Caution patient to make position changes slowly to minimize orthostatic hypotension.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise patient not to take alcohol or other CNS depressants concurrently with this medication. Avoid alcohol 6 hrs before and 6 hrs after taking Trokendi XR™.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Advise patient to use sunscreen and wear protective clothing to prevent photosensitivity reactions.
- Advise patient to use a nonhormonal form of contraception while taking topiramate; may make hormonal contraceptives less effective. Notify health care professional if pregnancy is planned or suspected or if breast feeding. If pregnancy occurs, encourage patient to enroll in the North American Drug Pregnancy Registry by calling 1-877-376-3872.
- Advise patient to carry identification describing disease and medication regimen at all times.

Evaluation/Desired Outcomes

- Absence or reduction of seizure activity.
- Decrease in incidence and severity of migraine headaches.
- Remission of manic symptoms.

HIGH ALERT

topotecan (toe-poe-tee-kan)
Hycamtin

Classification

Therapeutic: antineoplastics

Pharmacologic: enzyme inhibitors

Pregnancy Category D

Indications

IV: Metastatic ovarian cancer that has not responded to previous chemotherapy. Small cell lung cancer

🍁 = Canadian drug name. ⚠️ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

unresponsive to first line therapy. **PO:** Relapsed small cell lung cancer in patients with a complete or partial prior response and who are at least 45 days from the end of first-line chemotherapy. Stage IV-B persistent or recurrent cervical cancer not amenable to treatment with surgery or radiation (with cisplatin).

Action

Interferes with DNA synthesis by inhibiting the enzyme topoisomerase. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: 30% excreted in urine; small amounts metabolized by the liver.

Half-life: *PO*—3–6 hr; *IV*—2–3 hr.

TIME/ACTION PROFILE (effects on WBCs)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–2 hr	24 hr
IV	within days	11 days	7 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Pre-existing severe myelosuppression; **OB, Lactation:** Pregnancy or lactation.

Use Cautiously in: Impaired renal function ($\downarrow$ dose if $CCr < 40$ mL/min); Platelet count $< 25,000$ cells/mm³ ($\downarrow$ dose); History of interstitial lung disease, pulmonary fibrosis, lung cancer, thoracic radiation, or use of pneumotoxic drugs or colony stimulating factors; **Geri:** May require dose $\downarrow$ due to age-related $\downarrow$ in renal function.

Adverse Reactions/Side Effects

CNS: headache, fatigue, weakness. **Resp:** INTERSTITIAL LUNG DISEASE, dyspnea. **GI:** abdominal pain, diarrhea, nausea, vomiting, anorexia, constipation, $\uparrow$ liver enzymes, stomatitis. **Derm:** alopecia. **Hemat:** anemia, leukopenia, thrombocytopenia. **MS:** arthralgia.

Interactions

Drug-Drug: Neutropenia is prolonged by concurrent use of **filgrastim** (do not use until day 6; 24 hr following completion of topotecan). $\uparrow$ myelosuppression with other **antineoplastics** (especially **cisplatin**) or **radiation therapy**. May $\downarrow$ antibody response to and $\uparrow$ risk of adverse reactions from **live virus vaccines**.

Route/Dosage

PO (Adults): 2.3 mg/m²/day for 5 days repeated every 21 days (round calculated oral dose to nearest

0.25 mg and prescribe the minimum number of 1 mg and 0.25 mg capsules with the same number of capsules prescribed for each of the 5 days).

IV (Adults): *Ovarian and Small Cell Lung Cancer*—1.5 mg/m²/day for 5 days starting on day 1 of a 21-day course; *Cervical Cancer*—75 mg/m² on Days 1, 2, and 3 followed by cisplatin on Day 1 and repeated every 21 days.

Renal Impairment

PO (Adults): *Ovarian and Small Cell Lung Cancer*—*CCr* 30–49 mL/min—1.8 mg/m²/day starting on day 1 of a 21-day course.

IV (Adults): *CCr* 20–39 mL/min—0.75mg/m²/day for 5 days starting on day 1 of a 21-day course. *Cervical Cancer*—Administer at standard doses only if serum creatinine is ≤ 1.5 mg/dL. Do not administer if serum creatinine > 1.5 mg/dL.

Availability (generic available)

Capsules: 0.25 mg, 1 mg. **Powder for injection:** 4 mg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs frequently during administration.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae; guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Nausea and vomiting are common. Pretreatment with antiemetics should be considered.
- Assess IV site frequently for extravasation, which causes mild local erythema and bruising.
- Monitor for signs and symptoms of interstitial lung disease (cough, fever, dyspnea, hypoxia). Discontinue topotecan if interstitial lung disease is confirmed.
- **Lab Test Considerations:** Monitor CBC with differential and platelet count prior to administration and frequently during therapy. Baseline neutrophil count of ≥ 1500 cells/mm³ and platelet count of $\geq 100,000$ cells/mm³ are required before first dose. The nadir of neutropenia occurs in 11 days, with a duration of 7 days. The nadir of thrombocytopenia occurs in 15 days, with a duration of 5 days. The nadir of anemia occurs in 15 days. Subsequent doses should not be administered until neutrophils recover to > 1000 cells/mm³, platelets recover to

>100,000 cells/mm³, and hemoglobin levels recover to 9.0 mg/dL. If severe neutropenia occurs during any course, subsequent doses should be reduced by 0.25 mg/m² or filgrastim may be administered following the subsequent course of therapy starting on day 6, 24 hr after the completion of topotecan.

- Monitor liver function. May cause transient ↑ in AST, ALT, and bilirubin concentrations.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)

Implementation

- **High Alert:** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double check single, daily, and course-of-therapy dose limits; have second practitioner independently double check original order, dose calculations and infusion pump settings.
- **PO:** May be taken without regard to food. Capsules must be swallowed whole; do not open, crush, or chew. If patient vomits after taking dose, do not replace dose.

IV Administration

- **pH:** 2.5–3.5.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers.
- **Intermittent Infusion:** Reconstitute each vial with 4 mL of sterile water for injection. **Diluent:** Dilute further in D5W or 0.9% NaCl. Infusion is stable for 24 hr at room temperature or up to 7 days if refrigerated. Solution is yellow to yellow-green. **Concentration:** 10–50 mcg/mL. **Rate:** Infuse over 30 min.
- **Y-Site Compatibility:** alemtuzumab, anidulafungin, argatroban, bivalirudin, carboplatin, caspofungin, cisplatin, cyclophosphamide, dactinomycin, daptomycin, dexmedetomidine, doxorubicin, etoposide, fenoldopam, gemcitabine, granisetron, ifosfamide, levofloxacin, meperidine, methylprednisolone, metoclopramide, nesiritide, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, pamidronate, prochlorperazine, teniposide, thiopeta, tigecycline, tirofiban, vincristine, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** amphotericin B lipid complex, dexamethasone sodium phosphate, ertapenem, fluorouracil, mitomycin, pantoprazole, pemetrexed, rituximab, trastuzumab.

Patient/Family Teaching

- Instruct patient to take as directed. If patient vomits after taking, do not replace dose; notify health care professional. Do not take missed doses; take next scheduled dose and notify health care professional. If any capsules are broken or leaking, do not touch with bare hands; dispose of capsules and wash hands with soap and water. Patient should be instructed to read the Patient Information guide prior to first dose and with each refill; new information may be available.
- May cause drowsiness or sleepiness during and for several days after therapy. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Instruct patient to notify health care professional if fever; chills; sore throat; signs of infection; bleeding gums; bruising; petechiae; blood in urine, stool, emesis or signs and symptoms of interstitial lung disease occur. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Patient should be cautioned not to drink alcoholic beverages or take products containing aspirin or NSAIDs.
- May cause diarrhea. Advise patient to notify health care professional if diarrhea with fever or stomach pain or cramps or diarrhea that occurs more than 3 times/day.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Discuss with patient the possibility of hair loss. Explore methods of coping.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Advise patient that this medication may have teratogenic effects. Contraception should be used during therapy and breast feeding avoided.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in size and spread of malignancy.

* = Canadian drug name. = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

torsemide (tore-se-mide)

Demadex

Classification

Therapeutic: antihypertensives

Pharmacologic: loop diuretics

Pregnancy Category B**Indications**

Edema due to: HF, Hepatic or renal disease. Hypertension.

Action

Inhibits the reabsorption of sodium and chloride from the loop of Henle and distal renal tubule. Increases renal excretion of water, sodium, chloride, magnesium, hydrogen, and calcium. Effectiveness persists in impaired renal function. **Therapeutic Effects:** Diuresis and subsequent mobilization of excess fluid (edema, pleural effusions). Decreased BP.

Pharmacokinetics

Absorption: 80% absorbed after oral administration.

Distribution: Widely distributed.

Protein Binding: $\geq 99\%$.

Metabolism and Excretion: 80% metabolized by liver, 20% excreted in urine.

Half-life: 3.5 hr.

TIME/ACTION PROFILE (diuretic effect)

ROUTE	ONSET	PEAK	DURATION
PO	within 60 min	60–120 min	6–8 hr
IV	within 10 min	within 60 min	6–8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with thiazides and sulfonamides may occur; Hepatic coma or anuria.

Use Cautiously in: Severe liver disease (may precipitate hepatic coma; concurrent use with potassium-sparing diuretics may be necessary); Electrolyte depletion; Diabetes mellitus; Increasing azotemia; **OB, Lactation, Pedi:** Safety not established; **Geri:** May have ↑ risk of side effects, especially hypotension and electrolyte imbalance, at usual doses.

Adverse Reactions/Side Effects

CNS: dizziness, headache, nervousness. **EENT:** hearing loss, tinnitus. **CV:** hypotension. **GI:** constipation, diarrhea, dry mouth, dyspepsia, nausea, vomiting. **GU:** ↑ BUN, excessive urination. **Derm:** STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, photosensitivity, rash. **Endo:** hyperglycemia, hyperuricemia. **F and E:** dehydration, hypocalcemia, hypochloremia,

hypokalemia, hypomagnesemia, hyponatremia, hypovolemia, metabolic alkalosis. **MS:** arthralgia, muscle cramps, myalgia.

Interactions

Drug-Drug: ↑ hypotension with **antihypertensives, nitrates**, or acute ingestion of **alcohol**. ↑ risk of hypokalemia with other **diuretics, amphotericin B, stimulant laxatives, and corticosteroids**. Hypokalemia may ↑ risk of **digoxin** toxicity and ↑ risk of arrhythmia in patients taking drugs that prolong the QT interval. May ↑ risk of **lithium** toxicity. ↑ risk of ototoxicity with **aminoglycosides**. **NSAIDs** may ↓ effects. ↑ risk of **salicylate** toxicity (with use of high-dose **salicylate** therapy). **Cholestyramine** may ↓ absorption.

Route/Dosage**HF**

PO, IV (Adults): 10–20 mg once daily; dose may be doubled until desired effect is obtained (maximum daily dose = 200 mg).

Chronic Renal Failure

PO, IV (Adults): 20 mg once daily; dose may be doubled until desired effect is obtained (maximum daily dose = 200 mg).

Hepatic Cirrhosis

PO, IV (Adults): 5–10 mg once daily (with aldosterone antagonist or potassium-sparing diuretic); dose may be doubled until desired effect is obtained (maximum daily dose = 40 mg).

Hypertension

PO, IV (Adults): 2.5–5 mg once daily, may be ↑ to 10 mg once daily after 4–6 wk (if still not effective, add another agent).

Availability (generic available)

Tablets: 5 mg, 10 mg, 20 mg, 100 mg. **Cost:** *Generic* — 5 mg \$63.42/100, 10 mg \$70.27/100, 20 mg \$82.08/100, 100 mg \$304.00/100. **Injection:** 10 mg/mL.

NURSING IMPLICATIONS**Assessment**

- Assess fluid status during therapy. Monitor daily weight, intake and output ratios, amount and location of edema, lung sounds, skin turgor, and mucous membranes. Notify health care provider if thirst, dry mouth, lethargy, weakness, hypotension, or oliguria occurs.
- Monitor BP and pulse before and during administration. Monitor frequency of prescription refills to determine adherence in patients treated for hypertension.

- Assess patients receiving digoxin for anorexia, nausea, vomiting, muscle cramps, paresthesia, and confusion. Patients taking digoxin are at increased risk of digoxin toxicity due to potassium-depleting effect of the diuretic. Potassium supplements or potassium-sparing diuretics may be used concurrently to prevent hypokalemia.
- Assess patient for tinnitus and hearing loss. Audiometry is recommended for patients receiving prolonged high-dose IV therapy. Hearing loss is most common following rapid or high-dose IV administration in patients with decreased renal function or those taking other ototoxic drugs.
- Assess for allergy to sulfonamides.
- **Assess patient for skin rash frequently during therapy. Discontinue torsemide at first sign of rash; may be life-threatening. Stevens-Johnson syndrome or toxic epidermal necrolysis may develop. Treat symptomatically; may recur once treatment is stopped.**
- **Geri:** Diuretic use is associated with increased risk for falls in older adults. Assess falls risk and implement fall prevention strategies.
- **Lab Test Considerations:** Monitor electrolytes, renal and hepatic function, serum glucose, and uric acid levels before and periodically during therapy. May cause ↓ serum sodium, potassium, calcium, and magnesium concentrations. May also cause ↑ BUN, serum glucose, creatinine, and uric acid levels.
- Caution patient to change positions slowly to minimize orthostatic hypotension. Caution patient that the use of alcohol, exercise during hot weather, or standing for long periods during therapy may enhance orthostatic hypotension.
- Instruct patient to consult health care professional regarding a diet high in potassium (see Appendix M).
- Advise patient to contact health care professional if they gain more than 2–3 lb/day.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any OTC medications concurrently with this therapy.
- Instruct patient to notify health care professional of medication regimen prior to treatment or surgery.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- **Advise patient to contact health care professional immediately if rash muscle weakness, cramps, nausea, dizziness, numbness, or tingling of extremities occurs.**
- Advise diabetic patients to monitor blood glucose closely; may cause increased blood glucose levels.
- Emphasize the importance of routine follow-up examinations.
- **Hypertension:** Advise patients on antihypertensive regimen to continue taking medication even if feeling better. Torsemide controls but does not cure hypertension.
- Reinforce the need to continue additional therapies for hypertension (weight loss, exercise, restricted sodium intake, stress reduction, regular exercise, moderation of alcohol consumption, cessation of smoking).

Potential Nursing Diagnoses

Excess fluid volume (Indications)

Risk for deficient fluid volume (Side Effects)

Implementation

- Administer medication in the morning to prevent disruption of sleep cycle.
- IV is preferred over IM for parenteral administration.
- **PO:** May be taken with food or milk to minimize gastric irritation.

IV Administration

- **Direct IV:** **Diluent:** Administer undiluted. **Concentration:** 10 mg/mL. **Rate:** Administer slowly over 2 min.
- May also be administered as a continuous infusion.
- **Y-Site Compatibility:** milrinone, nesiritide.

Patient/Family Teaching

- Instruct patient to take torsemide as directed. Take missed doses as soon as possible; do not double doses.

Evaluation/Desired Outcomes

- Decrease in edema.
- Decrease in abdominal girth and weight.
- Increase in urinary output.
- Decrease in BP.

traMADol (tra-ma-dol)

Conzip, ❄ Durela, ❄ Ralivia, ❄ Tridural, Ultram, Ultram ER, ❄ Zytram XL

Classification

Therapeutic: analgesics (centrally acting)

Pregnancy Category C

❄ = Canadian drug name. ❄ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Indications

Moderate to moderately severe pain (extended-release formulations indicated for patients who require around-the-clock pain management).

Action

Binds to μ -opioid receptors. Inhibits reuptake of serotonin and norepinephrine in the CNS. **Therapeutic Effects:** Decreased pain.

Pharmacokinetics

Absorption: *Immediate-release*—75% absorbed after oral administration; *Extended-release (Ultram)*—85–90% (compared with immediate-release).

Distribution: Crosses the placenta; enters breast milk.

Metabolism and Excretion: Mostly metabolized by the liver; one metabolite has analgesic activity; 30% is excreted unchanged in urine.

Half-life: *Tramadol*—6–8 hr, *ER*—7.9 hr; *active metabolite*—7–9 hr; both are $\uparrow$ in renal or hepatic impairment.

TIME/ACTION PROFILE (analgesia)

ROUTE	ONSET	PEAK	DURATION
PO	1 hr	2–3 hr	4–6 hr
ER	unknown	12 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with opioids may occur; Patients who are acutely intoxicated with alcohol, sedatives/hypnotics, centrally acting analgesics, opioid analgesics, or psychotropic agents; Patients who are physically dependent on opioid analgesics (may precipitate withdrawal); **OB, Lactation:** Pregnancy or lactation; *ER only*— $CCr < 30$ mL/min or hepatic impairment.

Use Cautiously in: **Geri:** *Immediate-release*—Not to exceed 300 mg/day in patients > 75 yr; *ER*—Use with extreme caution in patients > 75 yr; Patients with a history of epilepsy or risk factors for seizures; Renal impairment ($\uparrow$ dosing interval recommended if $CCr < 30$ mL/min); Hepatic impairment ($\uparrow$ dosing interval recommended in patients with cirrhosis); Patients receiving MAO inhibitors, neuroleptics, SSRIs, or TCAs, or other CNS depressants; Patients who are suicidal or prone to addiction ($\uparrow$ risk of suicide); Excessive use of alcohol ($\uparrow$ risk of suicide); $\uparrow$ intracranial pressure or head trauma; Patients with a history of opioid dependence or who have recently received large doses of opioids; **Pedi:** Children < 16 yr (safety not established).

Adverse Reactions/Side Effects

CNS: **SEIZURES**, dizziness, headache, somnolence, anxiety, CNS stimulation, confusion, coordination disturbance, euphoria, malaise, nervousness, sleep disorder, weakness. **EENT:** visual disturbances. **CV:** vasodilation. **GI:** constipation, nausea, abdominal pain, anorexia, diarrhea, dry mouth, dyspepsia, flatulence, vomiting. **GU:** menopausal symptoms, urinary retention/frequency. **Derm:** pruritus, sweating. **Neuro:** hypertonia. **Misc:** **SEROTONIN SYNDROME**, physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: $\uparrow$ risk of CNS depression when used concurrently with other CNS depressants, including alcohol, antihistamines, sedative/hypnotics, opioid analgesics, anesthetics, or psychotropic agents. $\uparrow$ risk of seizures with high doses of penicillins, cephalosporins, phenothiazines, opioid analgesics, or antidepressants. Carbamazepine $\uparrow$ metabolism and $\downarrow$ effectiveness of tramadol (increased doses may be required). Use cautiously in patients who are receiving MAO inhibitors ($\uparrow$ risk of adverse reactions). Quinidine, fluoxetine, paroxetine, amitriptyline, ketoconazole, and erythromycin may $\uparrow$ levels. $\uparrow$ risk of serotonin syndrome when used with SSRI and SNRI antidepressants, TCAs, MAO inhibitors, 5HT₁ agonists, CYP2D6 inhibitors, and CYP3A4 inhibitors.

Drug-Natural Products: Concomitant use of kava-kava, valerian, or chamomile can $\uparrow$ CNS depression. $\uparrow$ risk of serotonin syndrome when used with St. John's wort.

Route/Dosage

Immediate-release

PO (Adults ≥ 18 yr): *Rapid titration*—50–100 mg q 4–6 hr (not to exceed 400 mg/day [300 mg in patients > 75 yr]). *Gradual titration*—25 mg/day initially, $\uparrow$ by 25 mg/day q 3 days to reach dose of 25 mg 4 times daily, then $\uparrow$ by 50 mg/day q 3 days to reach dose of 50 mg 4 times daily; may then use 50–100 mg q 4–6 hr (maximum dose = 400 mg/day).

Renal Impairment

PO (Adults): $CCr < 30$ mL/min— $\uparrow$ dosing interval to q 12 hr (not to exceed 200 mg/day).

Hepatic Impairment

PO (Adults): 50 mg q 12 hr.

Extended-release

PO (Adults): *Ultram ER and Conzip (not currently receiving immediate-release)*—100 mg once daily

initially, may then titrate q 5 days up to 300 mg/day; *Ultram ER and Conzip (currently receiving immediate-release)*—calculate 24-hr total dose of immediate-release product and give same dose (rounded down to next lowest 100-mg increment) of ER once daily (maximum dose = 300 mg/day).

Availability (generic available)

Tablets: 50 mg. **Cost:** *Generic*—\$83.40/100. **Extended-release capsules (Conzip):** 100 mg, 200 mg, 300 mg. **Cost:** 100 mg \$232.19/30, 200 mg \$289.79/30, 300 mg \$365.98/30. **Extended-release tablets (Ultram ER):** 100 mg, 200 mg, 300 mg. **Cost:** *Generic*—100 mg \$126.95/30, 200 mg \$209.95/30, 300 mg \$292.93/30. **In combination with:** acetaminophen (Ultracet). See Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess type, location, and intensity of pain before and 2–3 hr (peak) after administration.
- Assess BP and respiratory rate before and periodically during administration. Respiratory depression has not occurred with recommended doses.
- Assess bowel function routinely. Prevention of constipation should be instituted with increased intake of fluids and bulk and with laxatives to minimize constipating effects.
- Assess previous analgesic history. Tramadol is not recommended for patients dependent on opioids or who have previously received opioids for more than 1 wk; may cause opioid withdrawal symptoms.
- Prolonged use may lead to physical and psychological dependence and tolerance, although these may be milder than with opioids. This should not prevent patient from receiving adequate analgesia. Most patients who receive tramadol for pain do not develop psychological dependence. If tolerance develops, changing to an opioid agonist may be required to relieve pain.
- **Monitor patient for seizures.** May occur within recommended dose range. Risk is increased with higher doses and in patients taking antidepressants (SSRIs, SNRIs, tricyclics, or MAO inhibitors), opioid analgesics, or other drugs that decrease the seizure threshold. Also monitor for serotonin syndrome (mental-status changes (e.g., agitation, hallucinations, coma), autonomic instability (e.g., tachycardia, labile BP, hyperthermia), neuromuscular aberrations (e.g., hyperreflexia, incoordination) and/or gastrointestinal symptoms (e.g., nausea, vomiting, diarrhea) in patients taking these drugs concurrently.

- **Lab Test Considerations:** May cause ↑ serum creatinine, ↑ liver enzymes, ↓ hemoglobin, and proteinuria.
- **Toxicity and Overdose:** Overdose may cause respiratory depression and seizures. Naloxone may reverse some, but not all, of the symptoms of overdose. Treatment should be symptomatic and supportive. Maintain adequate respiratory exchange. Hemodialysis is not helpful because it removes only a small portion of administered dose. Seizures may be managed with barbiturates or benzodiazepines; naloxone increases risk of seizures.

Potential Nursing Diagnoses

Acute pain (Indications)

Risk for injury (Side Effects)

Implementation

- **Do not confuse tramadol with trazodone.**
- Tramadol is considered to provide more analgesia than codeine 60 mg but less than combined aspirin 650 mg/codeine 60 mg for acute postoperative pain.
- For chronic pain, daily doses of 250 mg of tramadol provide pain relief similar to that of 5 doses/day of acetaminophen 300 mg/codeine 30 mg, 5 doses/day of aspirin 325 mg/codeine 30 mg, or 2–3 doses/day of acetaminophen 500 mg/oxycodeone 5 mg.
- Explain therapeutic value of medication before administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Tramadol should be discontinued gradually after long-term use to prevent withdrawal symptoms.
- **PO:** Tramadol may be administered without regard to meals. Swallow extended-release tablets and capsules whole; do not crush, break, dissolve, or chew.

Patient/Family Teaching

- Instruct patient on how and when to ask for pain medication.
- May cause dizziness and drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants with this medication. Advise patient to notify health care professional before taking other RX, OTC, or herbal products concurrently.

★ = Canadian drug name. ⚡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Advise patient to notify health care professional if seizures or if symptoms of serotonin syndrome occur.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.
- Advise female patients to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.

trandolapril, See ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS.

tranylcypromine, See MONOAMINE OXIDASE (MAO) INHIBITORS.

HIGH ALERT

trastuzumab
(traz-too-zoo-mab)
Herceptin

Classification

Therapeutic: antineoplastics

Pharmacologic: monoclonal antibodies

Pregnancy Category D

Indications

First-line treatment of metastatic breast cancer (with paclitaxel) that displays overexpression of the human epidermal growth factor receptor 2 (HER2) protein. **⚠** Treatment of HER2—overexpressing metastatic breast cancer (as monotherapy) in patients who have already received other chemotherapy regimens. Adjuvant treatment of HER2—overexpressing node positive or node negative breast cancer (to be used alone after multi-modality anthracycline-based therapy or as part of one of the following regimens: doxorubicin, cyclophosphamide, and either paclitaxel or docetaxel; with docetaxel and carboplatin). Treatment of HER2—overexpressing metastatic gastric or gastroesophageal adenocarcinoma (with cisplatin and capecitabine or 5-fluorouracil) in patients who have not received prior treatment for metastatic disease.

Action

⚠ A monoclonal antibody that binds to HER2 sites in breast cancer tissue and inhibits proliferation of cells that overexpress HER2 protein. **Therapeutic Effects:** Regression of breast, gastric, or gastroesophageal cancer and metastases.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Binds to HER2 proteins.

Metabolism and Excretion: Unknown.

Half-life: 10-mg dose—1.7 days; 500-mg dose—12 days.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: None known.

Use Cautiously in: Pre-existing pulmonary conditions; Hypersensitivity to trastuzumab, Chinese hamster ovary cell proteins, or other components of the product; Hypersensitivity to benzyl alcohol (use sterile water for injection instead of bacteriostatic water, which accompanies the vial); **Geri:** May have ↑ risk of cardiac dysfunction; **OB, Lactation:** Use during pregnancy only if clearly needed (can cause fetal harm); not recommended for use during lactation; **Pedi:** Safety not established.

Exercise Extreme Caution in: Patients with pre-existing cardiac dysfunction.

Adverse Reactions/Side Effects

CNS: dizziness, headache, insomnia, weakness, depression. **Resp:** **INTERSTITIAL PNEUMONITIS, PULMONARY EDEMA, PULMONARY FIBROSIS**, dyspnea, increased cough, pharyngitis, rhinitis, sinusitis. **CV:** **ARRHYTHMIAS, HF**, hypertension, tachycardia. **GI:** **abdominal pain**, anorexia, diarrhea, nausea, vomiting. **Derm:** **rash**, acne, herpes simplex. **F and E:** edema. **Hemat:** anemia, leukopenia. **MS:** **back pain**, arthralgia, bone pain. **Neuro:** neuropathy, paresthesia, peripheral neuritis. **Misc:** **HYPERSENSITIVITY REACTIONS, chills, fever, infection, pain**, allergic reactions, flu-like syndrome.

Interactions

Drug-Drug: Concurrent anthracycline (daunorubicin, doxorubicin, or idarubicin) therapy may ↑ risk of cardiotoxicity. Blood levels are ↑ by concurrent **paclitaxel**.

Route/Dosage

Adjuvant Treatment of Breast Cancer

IV (Adults): During and following paclitaxel, docetaxel, or docetaxel/carboplatin—4 mg/kg initially, then 2 mg/kg weekly during chemotherapy for the first 12 wk (paclitaxel or docetaxel) or 18 wk (docetaxel/carboplatin); one wk after the last weekly dose, give 6 mg/kg q 3 wk; As single agent within 3 wk following

completion of multi-modality, anthracycline-based chemotherapy regimens—8 mg/kg initially, then 6 mg/kg q 3 wk.

Metastatic Breast Cancer

IV (Adults): 4 mg/kg initially, then 2 mg/kg weekly until disease progresses.

Metastatic Gastric Cancer

IV (Adults): 8 mg/kg initially, then 6 mg/kg q 3 wk until disease progresses.

Availability

Lyophilized powder for injection: 440 mg/vial with 20 mL bacteriostatic water for injection (contains benzyl alcohol).

NURSING IMPLICATIONS

Assessment

- Assess for infusion-related symptoms (chills, fever, nausea, vomiting, pain [in some cases at tumor sites], headache, dizziness, dyspnea, hypotension, rash, and asthenia) following initial infusion. Severe reactions (bronchospasm, anaphylaxis, angioedema, hypoxia, severe hypotension) may occur during or immediately following the initial infusion. May be treated with epinephrine, corticosteroids, diphenhydramine, bronchodilators, and oxygen. Discontinue if dyspnea or severe hypotension occurs and discontinue permanently if severe reaction occurs.
- Assess for signs and symptoms of HF (dyspnea, increased cough, paroxysmal nocturnal dyspnea, peripheral edema, S₃ gallop, reduced ejection fraction) prior to and frequently during therapy. Baseline cardiac assessment of history, physical exam, and left ventricular ejection fraction (LVEF) with ECG or multiple gated acquisition (MUGA) scan. Monitor LVEF every 3 mo and at completion of therapy, every 6 mo for 2 yr. Withhold trastuzumab for $\geq 16\%$ absolute decrease in LVEF from pre-treatment values or an LVEF value below institutional limits of normal and $\geq 10\%$ absolute decrease in LVEF from pretreatment values. Repeat LVEF measures every 4 wk if dose is withheld. HF associated with trastuzumab may be severe, resulting in cardiac failure, death, and stroke. Trastuzumab should be discontinued upon the development of significant HF.
- Monitor patient for signs of pulmonary hypersensitivity reactions (dyspnea, pulmonary infiltrates, pleural effusion, noncardiogenic pulmonary

edema, pulmonary insufficiency, hypoxia, acute respiratory distress syndrome). Patients with symptomatic pulmonary disease or extensive lung tumor involvement are at increased risk. Infusion should be discontinued if severe symptoms occur.

- **Lab Test Considerations:**  HER2 protein over-expression is used to determine whether treatment with trastuzumab is indicated. HER2 protein over-expression is detected by HercepTest™ (IHC assay) and PathVysion™ (FISH assay).
- May cause anemia and leukopenia.

Potential Nursing Diagnoses

Diarrhea (Adverse Reactions)

Risk for infection (Adverse Reactions)

Implementation

- **High Alert:** Do not confuse trastuzumab (Herceptin) with ado-trastuzumab (Kadcyla).
- **High Alert:** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double check single, daily, and course-of-therapy dose limits; have second practitioner independently double check original order, dose calculations and infusion pump settings.
- May be administered in the outpatient setting.

IV Administration

- **Intermittent Infusion:** Reconstitute each vial with 20 mL of bacteriostatic water for injection, directing the stream of diluent into lyophilized cake of trastuzumab. **Concentration:** 21 mg/mL. Swirl the vial gently; do not shake. May foam slightly; allow the vial to stand undisturbed for 5 min. Solution should be clear to slightly opalescent and colorless to pale yellow, without particulate matter. Label vial immediately in the area marked “Do not use after” with the date 28 days from the date of reconstitution. Stable for 24 hr at room temperature or 28 days if refrigerated. If patient is allergic to benzyl alcohol, use sterile water for injection for reconstitution. Use immediately and discard any unused portion. **Diluent:** Calculate to volume required for the desired dose, withdraw, and add it to an infusion containing 250 mL of 0.9% NaCl. Invert bag gently to mix. **Rate:** Infuse the 4 mg/kg loading dose over 90 min and the weekly 2 mg/kg dose over 30 min or 6 mg/kg over 90 min every 3 wk if the loading dose was well tolerated. Do not administer as an IV push or bolus.
- **Y-Site Compatibility:** acyclovir, amifostine, aminophylline, ampicillin, ampicillin/sulbactam, bleomycin, bumetanide, buprenorphine, busulfan,

T

✳ = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

butorphanol, calcium gluconate, carboplatin, carmustine, cefazolin, ceftazidime, ceftriaxone, cefuroxime, ciprofloxacin, cisplatin, cyclophosphamide, cytarabine, dactinomycin, daunorubicin hydrochloride, dexamethasone, digoxin, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxorubicin liposome, doxycycline, droperidol, enalaprilat, etoposide phosphate, famotidine, fentanyl, filgrastim, flouxuridine, fluconazole, fluorouracil, ganciclovir, gemcitabine, gentamicin, gransietron, haloperidol, heparin, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, leucovorin, lorazepam, magnesium sulfate, mannitol, meperidine, mesna, methotrexate, methylprednisolone, metoclopramide, metronidazole, mitomycin, mitoxantrone, paclitaxel, pentamidine, potassium chloride, prochlorperazine, promethazine, ranitidine, remifentanyl, sargramostim, sodium bicarbonate, teniposide, theophylline, thiotepa, ticarcillin/clavulanate, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vinblastine, vincristine, vinorelbine, zidovudine.

- **Y-Site Incompatibility:** aldesleukin, amikacin, amphotericin B colloidal, aztreonam, cefoperazone, cefotaxime, cefotetan, cefoxitin, chlorpromazine, clindamycin, cyclosporine, fludabine, furosemide, idarubicin, irinotecan, levofloxacin, levorphanol, morphine, nalbuphine, ondansetron, piperacillin/tazobactam, streptozocin, topotecan.
- **Additive Incompatibility:** Do not dilute trastuzumab with or add to solutions containing dextrose. Do not mix or dilute with other drugs.

Patient/Family Teaching

- **Instruct patient to notify health care professional promptly if new onset or worsening shortness of breath, cough, swelling of the ankles/legs, swelling of the face, palpitations, weight gain of more than 5 pounds in 24 hours, dizziness or loss of consciousness occur. Caution patient to avoid crowds and persons with known infections.**
- May cause teratogenic effects. Caution patient to use contraception during and for at least 6 mo following completion of therapy and to avoid breast feeding.
- Advise patient not to receive any vaccinations without advice of health care professional.

Evaluation/Desired Outcomes

- Regression of breast, gastric, or gastroesophageal cancer and metastases.

traZODone (traz-oh-done)

Desyret,  Oleptro,  Trazorel

Classification

Therapeutic: antidepressants

Pregnancy Category C

Indications

Major depression. **Unlabeled Use:** Insomnia, chronic pain syndromes, including diabetic neuropathy, and anxiety.

Action

Alters the effects of serotonin in the CNS. **Therapeutic Effects:** Antidepressant action, which may develop only over several weeks.

Pharmacokinetics

Absorption: Well absorbed after oral administration.

Distribution: Widely distributed.

Protein Binding: 89–95%.

Metabolism and Excretion: Extensively metabolized by the liver (CYP3A4 enzyme system); minimal excretion of unchanged drug by the kidneys.

Half-life: 5–9 hr (immediate-release).

TIME/ACTION PROFILE (antidepressant effect)

ROUTE	ONSET	PEAK	DURATION
PO	1–2 wk	2–4 wk	wks

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Recovery period after MI; Concurrent electroconvulsive therapy; Concurrent use of MAO inhibitors or MAO-like drugs (linezolid or methylene blue).

Use Cautiously in: Cardiovascular disease; Suicidal behavior; May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; Severe hepatic or renal disease (dose ↓ recommended); **Lactation:** Discontinue drug or bottle feed; **Pedi:** Suicide risk may be greater in children and adolescents; safe use not established; **Geri:** Initial dose ↓ recommended; use extended-release tablets with caution.

Adverse Reactions/Side Effects

CNS: **SUICIDAL THOUGHTS,** drowsiness, confusion, dizziness, fatigue, hallucinations, headache, insomnia, nightmares, slurred speech, syncope, weakness.

EENT: blurred vision, tinnitus. **CV:** hypotension, arrhythmias, chest pain, hypertension, palpitations, QT interval prolongation, tachycardia. **GI:** dry mouth, altered taste, constipation, diarrhea, excess salivation,

flatulence, nausea, vomiting. **GU:** hematuria, erectile dysfunction, priapism, urinary frequency. **Derm:** rash. **Hemat:** anemia, leukopenia. **MS:** myalgia. **Neuro:** tremor.

Interactions

Drug-Drug: Serious, potentially fatal reactions (hyperthermia, rigidity, myoclonus, autonomic instability, with fluctuating vital signs and extreme agitation, which may proceed to delirium and coma) may occur with concurrent **MAO inhibitors**. MAO inhibitors should be stopped at least 14 days before trazodone therapy. Trazodone should be stopped at least 14 days before MAO inhibitor therapy. Concurrent use with **MAO-inhibitor like drugs**, such as **linezolid** or **methylene blue** may ↑ risk of serotonin syndrome; concurrent use contraindicated; do not start therapy in patients receiving **linezolid** or **methylene blue**; if **linezolid** or **methylene blue** need to be started in a patient receiving trazodone, immediately discontinue trazodone and monitor for signs/symptoms of serotonin syndrome for 2 wk or until 24 hr after last dose of linezolid or methylene blue, whichever comes first (may resume trazodone therapy 24 hr after last dose of linezolid or methylene blue). May ↑ **digoxin** or **phenytoin** serum levels. ↑ CNS depression with other CNS depressants, including **alcohol**, **opioid analgesics**, and **sedative/hypnotics**. ↑ hypotension with **anti-hypertensives**, acute ingestion of **alcohol**, or **ni- trates**. Concurrent use with **fluoxetine** ↑ levels and risk of toxicity from trazodone. **Drugs that inhibit the CYP3A4 enzyme system**, including **ritonavir** **indinavir** and **ketoconazole** ↑ levels and the risk of toxicity. **Drugs that induce the CYP3A4 enzyme system**, including **carbamazepine** ↓ levels and may decrease effectiveness. Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **fentanyl**, **buspirone**, **tramadol** and **triptans** ↑ risk of serotonin syndrome. ↑ risk of bleeding with **NSAIDs**, **aspirin**, **clopidogrel**, or **warfarin**.

Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression. ↑ risk of serotonergic side effects including serotonin syndrome with **St. John's wort** and **SAME**.

Route/Dosage

Depression

PO (Adults): *Immediate-release*—150 mg/day in 3 divided doses; ↑ by 50 mg/day q 3–4 days until desired response (not to exceed 400 mg/day in outpatients or 600 mg/day in hospitalized patients).

PO (Geriatric Patients): 75 mg/day in divided doses initially; may be ↑ q 3–4 days.

Insomnia

PO (Adults): 25–100 mg at bedtime.

Availability (generic available)

Tablets (immediate-release): 50 mg, 100 mg, 150 mg, 300 mg. **Cost: Generic**—All strengths \$10.83/100. **Tablets (extended-release) (Oleptro):** ★ 150 mg, ★ 300 mg.

NURSING IMPLICATIONS

Assessment

- Monitor BP and pulse rate before and during initial therapy. Monitor ECGs in patients with pre-existing cardiac disease before and periodically during therapy to detect arrhythmias.
- Assess for possible sexual dysfunction.
- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyper-reflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).
- **Depression:** Assess mental status (orientation, mood, and behavior) frequently.
- Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤24 yr. After starting therapy, children, adolescents, and young adults should be seen by health care professional at least weekly for 4 wk, every 3 wk for next 4 wk, and on advice of health care professional thereafter.
- **Pain:** Assess location, duration, intensity, and characteristics of pain before and periodically during therapy. Use pain scale to assess effectiveness of medicine.
- **Lab Test Considerations:** Assess CBC and renal and hepatic function before and periodically during therapy. Slight, clinically insignificant ↓ in leukocyte and neutrophil counts may occur.

Potential Nursing Diagnoses

Ineffective coping (Indications)

Sexual dysfunction (Side Effects)

Implementation

- Do not confuse trazodone with tramadol.
- **PO:** Administer with or immediately after meals to minimize side effects (nausea, dizziness) and allow

★ = Canadian drug name. ⚡ = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

maximum absorption of trazodone. A larger portion of the total daily dose may be given at bedtime to decrease daytime drowsiness and dizziness.

- **Olepro** should be administered on an empty stomach at bedtime and swallowed whole or broken along scored lines; do not chew or crush.

Patient/Family Teaching

- Instruct patient to take medication as directed. If a dose is missed, take as soon as remembered. Do not take if within 4 hr of next scheduled dose; do not double doses. **Olepro** should be taken at bedtime. Consult health care professional before discontinuing medication; gradual dose reduction is necessary to prevent aggravation of condition. Advise patient to read *Medication Guide* prior starting therapy and with each Rx refill in case of changes.
- May cause drowsiness and blurred vision. Caution patient to avoid driving and other activities requiring alertness until response to drug is known.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient to avoid concurrent use of alcohol or other CNS depressant drugs.
- Advise patient, family, and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide, new or worse depression or anxiety, agitation or restlessness, panic attacks, insomnia, new or worse irritability, aggressiveness, acting on dangerous impulses, mania, or other changes in mood or behavior or if symptoms of serotonin syndrome occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially aspirin and NSAIDs.
- Inform patient that frequent rinses, good oral hygiene, and sugarless candy or gum may diminish dry mouth. Health care professional should be notified if this persists >2 wk. An increase in fluid intake, fiber, and exercise may prevent constipation.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Instruct patient to notify health care professional if priapism, irregular heartbeat, fainting, confusion, skin rash, or tremors occur or if dry mouth, nausea and vomiting, dizziness, headache, muscle aches, constipation, or diarrhea becomes pronounced.
- Instruct patient to notify health care professional if signs of serotonin syndrome (mental status

changes: agitation, hallucinations, coma; autonomic instability: tachycardia, labile BP, hyperthermia; neuromuscular aberrations: hyperreflexia, incoordination; and/or gastrointestinal symptoms: nausea, vomiting, diarrhea) occur.

- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the importance of follow-up exams to evaluate progress.

Evaluation/Desired Outcomes

- Resolution of depression.
- Increased sense of well-being.
- Renewed interest in surroundings.
- Increased appetite.
- Improved energy level.
- Improved sleep.
- Decrease in severity of pain in chronic pain syndromes. Therapeutic effects are usually seen within 1 wk, although 4 wk may be required to obtain significant therapeutic results.

triamcinolone, See CORTICOSTEROIDS (NASAL), CORTICOSTEROIDS (SYSTEMIC), and CORTICOSTEROIDS (TOPICAL/LOCAL).

triamterene, See DIURETICS (POTASSIUM-SPARING).

triazolam (trye-az-oh-lam)

★ Apo-Triazo, ★ Gen-Triazolam, Halcion, ★ Novo-Triolam, ★ Nu-Triazo

Classification

Therapeutic: sedative/hypnotics
Pharmacologic: benzodiazepines

Schedule IV

Pregnancy Category X

Indications

Short-term management of insomnia.

Action

Acts at many levels in the CNS, producing generalized depression. Effects may be mediated by GABA, an inhibitory neurotransmitter. **Therapeutic Effects:** Relief of insomnia.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Widely distributed, crosses blood-brain barrier. Probably crosses the placenta and enters breast milk.

Protein Binding: 89%.

Metabolism and Excretion: Metabolized by the liver.

Half-life: 1.6–5.4 hr.

TIME/ACTION PROFILE (sedation)

ROUTE	ONSET	PEAK	DURATION
PO	15–30 min	6–8 hr	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with other benzodiazepines may occur; Pre-existing CNS depression; Uncontrolled severe pain; **OB:**

Lactation: **Pedi:** Safety not established.

Use Cautiously in: Pre-existing hepatic dysfunction (dose ↓ recommended); History of suicide attempt or drug addiction; **Geri:** Appears on Beers list and is associated with ↑ risk of falls (↓ dose required); ↑ sensitivity to benzodiazepines.

Adverse Reactions/Side Effects

CNS: abnormal thinking, behavior changes, dizziness, excessive sedation, hangover, headache, anterograde amnesia, confusion, hallucinations, sleep—driving, lethargy, mental depression, paradoxical excitation.

EENT: blurred vision. **GI:** constipation, diarrhea, nausea, vomiting. **Derm:** rashes. **Misc:** physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: **Cimetidine**, **erythromycin**, **fluconazole**, **itraconazole**, **ketoconazole**, **indinavir**, **nel-finavir**, **ritonavir**, or **saquinavir** may ↓ metabolism and enhance actions of triazolam; combination should be avoided. Additive CNS depression with **alcohol**, **antidepressants**, **antihistamines**, and **opioid analgesics**. May ↓ effectiveness of **levodopa**. May ↑ toxicity of **zidovudine**. **Isoniazid** may ↓ excretion and ↑ effects of triazolam. Sedative effects may be ↓ by **theophylline**.

Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, **chamomile**, or **hops** can ↑ CNS depression.

Drug-Food: **Grapefruit juice** significantly ↑ blood levels and effects.

Route/Dosage

PO (Adults): 0.125–0.25 mg (up to 0.5 mg) at bedtime.

PO (Geriatric Patients or Debilitated Patients): 0.125 mg at bedtime initially; may be ↑ as needed.

Availability (generic available)

Tablets: 0.125 mg, 0.25 mg.

NURSING IMPLICATIONS

Assessment

- Assess sleep patterns prior to and periodically throughout therapy.
- **Geri:** Assess CNS effects and risk of falls. Institute falls prevention strategies.
- Prolonged high-dose therapy may lead to psychological or physical dependence. Restrict the amount of drug available to patient, especially if patient is depressed, suicidal, or has a history of addiction.

Potential Nursing Diagnoses

Insomnia (Indications)

Risk for injury (Side Effects)

Implementation

- Supervise ambulation and transfer of patients following administration. Remove cigarettes. Side rails should be raised and call bell within reach at all times.
- **PO:** Administer with food if GI irritation becomes a problem.

Patient/Family Teaching

- Instruct patient to take triazolam exactly as directed. Discuss the importance of preparing environment for sleep (dark room, quiet, avoidance of nicotine and caffeine). If less effective after a few weeks, consult health care professional; do not increase dose.
- May cause daytime drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- **Geri:** Instruct patient and family how to reduce falls risk at home.
- Advise patient to avoid the use of alcohol and other CNS depressants and to consult health care professional prior to using OTC preparations that contain antihistamines or alcohol.
- Advise patient to inform health care professional if pregnancy is planned or suspected or if confusion, depression, or persistent headaches occur. Instruct family or caregiver to notify health care professional if personality changes occur.
- Instruct patient to notify health care professional if an increase in daytime anxiety occurs. May occur after as few as 10 days of therapy. May require discontinuation of triazolam.
- Emphasize the importance of follow-up appointments to monitor progress.

Evaluation/Desired Outcomes

- Improvement in sleep patterns, which may not be noticeable until the 3rd day of therapy.

✶ = Canadian drug name. ⚠ = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

tricalcium phosphate, See **CALCIUM SALTS**.

trimethoprim/ sulfamethoxazole

(trye-meth-oh-prim/sul-fa-meth-ox-a-zole)

Bactrim, Bactrim DS, ★ Protrin DF, Septra, Septra DS, Sulfatrim, TMP/SMX, TMP/SMZ, ★ Trisulfa DS, ★ Trisulfa S

Classification

Therapeutic: anti-infectives, antiprotozoals
Pharmacologic: folate antagonists, sulfonamides

Pregnancy Category C

Indications

Treatment of: Bronchitis, *Shigella* enteritis, Otitis media, *Pneumocystis jirovecii* pneumonia (PCP), Urinary tract infections, Traveler's diarrhea. Prevention of PCP in HIV-positive patients. **Unlabeled Use:** Biliary tract infections, osteomyelitis, burn and wound infections, chlamydial infections, endocarditis, gonorrhea, intra-abdominal infections, nocardiosis, rheumatic fever prophylaxis, sinusitis, eradication of meningococcal carriers, prophylaxis of urinary tract infections, and an alternative agent in the treatment of chancroid. Prevention of bacterial infections in immunosuppressed patients.

Action

Combination inhibits the metabolism of folic acid in bacteria at two different points. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Active against many strains of gram-positive aerobic pathogens including: *Streptococcus pneumoniae*, *Staphylococcus aureus*, Group A beta-hemolytic streptococci, *Nocardia*, *Enterococcus*. Has activity against many aerobic gram-negative pathogens, such as: *Acinetobacter*, *Enterobacter*, *Klebsiella pneumoniae*, *Escherichia coli*, *Proteus mirabilis*, *Shigella*, *Xanthomonas maltophilia*, *Haemophilus influenzae*, including ampicillin-resistant strains. *P. jirovecii*. Not active against *Pseudomonas aeruginosa*.

Pharmacokinetics

Absorption: Well absorbed from the GI tract.

Distribution: Widely distributed. Crosses the blood-brain barrier and placenta and enters breast milk.

Protein Binding: TMP: 45%; SMX: 68%.

Metabolism and Excretion: Some metabolism by the liver (20%); remainder excreted unchanged by the kidneys.

Half-life: *Trimethoprim*—6–11 hr; *sulfamethoxazole*—9–12 hr, both prolonged in renal failure.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	2–4 hr	6–12 hr
IV	rapid	end of infusion	6–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to sulfonamides or trimethoprim; History of drug-induced immune thrombocytopenia due to sulfonamides or trimethoprim; Megaloblastic anemia secondary to folate deficiency; Severe hepatic or renal impairment; **OB, Lactation, Pedi:** Pregnancy, lactation, or children <2 mo (can cause kernicterus in neonates). Exception: neonates born to HIV-infected mothers (prophylaxis should be initiated at 4–6 weeks of age).

Use Cautiously in: Mild to moderate hepatic or renal impairment (dose ↓ required if CCr <30 mL/min); Glucose-6-phosphate dehydrogenase deficiency (↑ risk hemolysis); HIV-positive patients (↑ incidence of adverse reactions).

Adverse Reactions/Side Effects

CV: hypotension. **CNS:** fatigue, hallucinations, headache, insomnia, mental depression, kernicterus in neonates. **F and E:** hyperkalemia, hyponatremia. **GI:** PSEUDOMEMBRANOUS COLITIS, HEPATIC NECROSIS, nausea, vomiting, diarrhea, stomatitis, hepatitis, cholestatic jaundice, pancreatitis. **GU:** crystalluria. **Derm:** ERYTHEMA MULTIFORME, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, rash, photosensitivity. **Endo:** hypoglycemia. **Hemat:** AGRANULOCYTOSIS, APLASTIC ANEMIA, hemolytic anemia, leukopenia, megaloblastic anemia, thrombocytopenia. **Local:** phlebitis at IV site. **Misc:** fever.

Interactions

Drug-Drug: May ↑ half-life, ↓ clearance, and exaggerate folic acid deficiency caused by **phenytoin**. May ↑ effects of **sulfonylureas**, **pioglitazone**, **rosiglitazone**, **repaglinide**, **phenytoin**, **digoxin**, and **warfarin**. May ↑ toxicity of **methotrexate**. ↑ risk of thrombocytopenia from **thiazide diuretics** (↑ in geriatric patients). ↓ levels of and ↑ risk of nephrotoxicity with **cyclosporine**. Concurrent use with **ACE inhibitors** may ↑ risk of hyperkalemia. May ↓ the effects of **tricyclic antidepressants**. Concurrent use with **leucovorin** may result in treatment failure and ↑ risk of death (avoid concurrent use).

Route/Dosage

(TMP = trimethoprim; SMX = sulfamethoxazole).
Dosing based on TMP content.

Bacterial Infections

PO, IV (Adults and Children >2 mo): *Mild-moderate infections*—6–12 mg TMP/kg/day divided q 12 hr; *Serious infection/Pneumocystis*—15–20 mg TMP/kg/day/divided q 6–8 hr.

PO (Adults): *Urinary tract infection/chronic bronchitis*—1 double strength tablet (160 mg TMP/800 mg SMX) q 12 hr for 10–14 days.

Urinary Tract Infection Prophylaxis

PO, IV (Adults and Children >2 mo): 2 mg TMP/kg/dose daily or 5 mg TMP/kg/dose twice weekly.

P. jirovecii Pneumonia (Prevention)

PO (Adults): 1 double strength tablet (160 mg TMP/800 mg SMX) daily (may also be given 3 times weekly).

PO (Children >1 mo): 150 mg TMP/m²/day divided q 12 hr or given as a single dose on 3 consecutive days/wk (not to exceed 320 mg TMP/1600 mg SMX per day).

Availability (generic available)

Tablets:  20 mg TMP/100 mg SMX, 80 mg TMP/400 mg SMX, double strength—160 mg TMP/800 mg SMX.
Cost: *Generic*—80 mg TMP/400 mg SMX \$6.99/30, 160 mg TMP/800 mg SMX \$6.70/30. **Oral suspension (cherry, grape flavors):** 40 mg TMP/200 mg SMX per 5 mL. **Cost:** *Generic*—\$58.10/473 mL. **Injection:** 16 mg TMP/80 mg SMX per mL.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Inspect IV site frequently. Phlebitis is common.
- Assess patient for allergy to sulfonamides.**
- Monitor intake and output ratios. Fluid intake should be sufficient to maintain a urine output of at least 1200–1500 mL daily to prevent crystalluria and stone formation.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of pseudomembranous colitis. May begin up to several weeks following cessation of therapy.**

- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.
- Lab Test Considerations:** Monitor CBC and urinalysis periodically during therapy.
- May produce ↑ serum bilirubin, ↑ potassium, creatinine, and alkaline phosphatase.
- May cause hypoglycemia.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Noncompliance (Patient/Family Teaching)

Implementation

- Do not confuse DS (double-strength) formulations with single-strength formulations.**
- Do not administer medication IM.
- PO:** Administer around the clock with a full glass of water. Use calibrated measuring device for liquid preparations.

IV Administration

- Intermittent Infusion:** **Diluent:** Dilute each 5-mL of trimethoprim/sulfamethoxazole with 125 mL of D5W (stable for 24 hr at room temperature). May also dilute each 5-mL of drug with 75 mL of D5W if fluid restriction is required (stable for 6 hr at room temperature). Do not refrigerate. **Concentration:** Should not exceed 1.06 mg/mL. **Rate:** Infuse over 60–90 min.
- Y-Site Compatibility:** acyclovir, aldesleukin, alemtuzumab, allopurinol, amifostine, aminocaproic acid, amphotericin B cholesteryl, amphotericin B liposome, anidulafungin, argatroban, azithromycin, bivalirudin, blemoycin, carboplatin, carmustine, cefepime, ceftaroline, cisplatin, cyclophosphamide, cytarabine, dactinomycin, daptomycin, dexmedetomidine, diltiazem, docetaxel, doxorubicin liposome, eptifibatide, ertapenem, etoposide, etoposide phosphate, fenoldopam, filgrastim, fludarabine, fluorouracil, gemcitabine, granisetron, hetastarch, hydromorphone, ifosfamide, irinotecan, levofloxacin, linezolid, lorazepam, melphalan, methotrexate, metronidazole, milrinone, mitoxantrone, nicardipine, octreotide, oxaliplatin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, perphenazine, piperacillin/tazobactam, potassium acetate, remifentanyl, rituximab, sargramostim, sodium acetate, teniposide, thiotepa, tigecycline,

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

tirofiban, trastuzumab, vecuronium, vinblastine, vincristine, voriconazole, zidovudine, zolendronic acid.

- **Y-Site Incompatibility:** alfentanil, amikacin, aminophylline, amphotericin B colloidal, amphotericin B lipid complex, ampicillin, ampicillin/sulbactam, ascorbic acid, atropine, azathioprine, benztropine, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, caspofungin, cefazolin, cefotaxime, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, clindamycin, cyanocobalamin, cyclosporine, dantrolene, dexamethasone, dextroazepam, diazepam, diazoxide, digoxin, diphenhydramine, dobutamine, dolasetron, dopamine, doxorubicin, doxycycline, ephedrine, epinephrine, epirubicin, epoetin alfa, erythromycin, famotidine, fentanyl, fluconazole, folic acid, furosemide, ganciclovir, gentamicin, glycopyrrolate, haloperidol, heparin, hydralazine, hydrocortisone, hydroxyzine, idarubicin, imipenem/cilastatin, indomethacin, insulin, isoproterenol, ketamine, ketorolac, lidocaine, mannitol, mechlorethamine, metaraminol, methyl dopate, methylprednisolone, metoclopramide, metoprolol, midazolam, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxacillin, oxytocin, papaverine, penicillin G, pentamidine, pentazocine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phenytoin, phytonadione, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quinuapristin/dalfopristin, ranitidine, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, theophylline, thiamine, ticarcillin/clavulanate, tobramycin, tolazoline, vancomycin, verapamil, vinorelbine.

Patient/Family Teaching

- Instruct patient to take medication around the clock and to finish drug completely as directed, even if feeling well. Take missed doses as soon as remembered unless almost time for next dose. Advise patient that sharing of this medication may be dangerous.
- Instruct patient to notify health care professional if rash, or fever and diarrhea develop, especially if diarrhea contains blood, mucus, or pus. Advise patient not to treat diarrhea without consulting health care professional.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to notify health care professional if skin rash, sore throat, fever, mouth sores, or unusual bleeding or bruising occurs.

- Instruct patient to notify health care professional if symptoms do not improve within a few days.
- Emphasize importance of regular follow-up exams to monitor blood counts in patients on prolonged therapy.
- **Home Care Issues:** Instruct family or caregiver on dilution, rate, and administration of drug and proper care of IV equipment.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on organism and site of infection.
- Resolution of symptoms of traveler's diarrhea.
- Prevention of *Pneumocystis jirovecii* pneumonia in patients with HIV.

trospium (tros-pee-yum)
Sanctura, Sanctura XR, ★ Trosec

Classification

Therapeutic: urinary tract antispasmodics

Pharmacologic: antimuscarinics

Pregnancy Category C

Indications

Overactive bladder with symptoms of urge urinary incontinence, urgency and urinary frequency.

Action

Antagonizes the effect of acetylcholine at muscarinic receptors in the bladder; this parasympatholytic action reduces bladder smooth muscle tone. **Therapeutic**

Effects: Increased bladder capacity and decreased symptoms of overactive bladder.

Pharmacokinetics

Absorption: Less than 10% absorbed following oral administration; food significantly ↓ absorption.

Distribution: Mostly distributed to plasma.

Metabolism and Excretion: Of the 10% absorbed, 40% is metabolized. Unabsorbed drug is mainly excreted in feces. Of absorbed drug, 60% is eliminated in urine as unchanged drug via active tubular secretion.

Half-life: 20 hr.

TIME/ACTION PROFILE (anticholinergic effects)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	5–6 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Gastric or urinary retention, uncontrolled angle-closure glaucoma or risk for these conditions.

Use Cautiously in: Bladder outflow obstruction; Gastrointestinal obstructive disorders (ulcerative colitis, intestinal atony, myasthenia gravis); Controlled angle-closure glaucoma (use only if necessary and with careful monitoring); $\text{CCr} < 30 \text{ mL/min}$ (dose ↓ recommended); Moderate to severe hepatic impairment; **OB, Lactation:** Use only if benefit justifies risks to fetus/newborn; **Pedi:** Safety not established; **Geri:** May have ↑ sensitivity to anticholinergic effects; ↓ dose may be required.

Adverse Reactions/Side Effects

CNS: headache, confusion, dizziness, drowsiness, fatigue, hallucinations. **EENT:** blurred vision. **GI:** constipation, dry mouth, dyspepsia. **GU:** urinary retention, urinary tract infection. **Misc:** **ANGIOEDEMA**, fever, heat stroke.

Interactions

Drug-Drug: May interact with other drugs that compete for tubular secretion. **Metformin** may ↓ levels. ↑ risk of anticholinergic effects with other drugs having anticholinergic properties.

Route/Dosage

PO (Adults): 20 mg twice daily or 60 mg once daily (XR dose form).

PO (Adults ≥ 75 yr): Based on tolerability, dose may be ↓ to 20 mg once daily.

Renal Impairment

PO (Adults): $\text{CCr} < 30 \text{ mL/min}$ — 20 mg once daily at bedtime.

Availability (generic available)

Tablets: 20 mg. **Extended release tablets:** 60 mg.

NURSING IMPLICATIONS

Assessment

- Monitor voiding pattern and intake and output ratios.

Potential Nursing Diagnoses

Impaired urinary elimination (Indications)

Implementation

- **PO:** Administer 1 hr prior to meals or on an empty stomach.

Patient/Family Teaching

- Instruct patient to take as directed. If a dose is skipped, take next dose 1 hr prior to next meal.
- May cause drowsiness, dizziness, and blurred vision. Caution patient to avoid driving and other activities requiring alertness until response to medication is known. Advise patient to avoid alcohol; may increase drowsiness.
- Advise patient to notify health care professional immediately of signs and symptoms of angioedema (edema of the tongue or laryngopharynx, difficulty breathing) occur.
- Caution patient that heat prostration (fever and heat stroke due to decreased sweating) may occur when trospium is taken in a hot environment.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise female patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Increased bladder capacity and decreased symptoms of overactive bladder.

ulipristal, See CONTRACEPTIVES, HORMONAL.

valACYclovir

(val-ay-sye-kloe-veer)
Valtrex

Classification

Therapeutic: antivirals

Pregnancy Category B

Indications

Treatment of herpes zoster (shingles). Treatment/suppression of genital herpes. Reduction of transmission of genital herpes. Treatment of chickenpox. Treatment of herpes labialis (cold sores).

Action

Rapidly converted to acyclovir. Acyclovir interferes with viral DNA synthesis. **Therapeutic Effects:** Inhibited viral replication, decreased viral shedding, reduced time to healing of lesions. Reduced transmission of genital herpes.

Pharmacokinetics

Absorption: 54% bioavailable as acyclovir after oral administration of valacyclovir.

Distribution: CSF concentrations of acyclovir are 50% of plasma concentrations. Acyclovir crosses placenta; enters breast milk.

Metabolism and Excretion: Rapidly converted to acyclovir via intestinal/hepatic metabolism.

Half-life: 2.5–3.3 hr; up to 14 hr in renal impairment (acyclovir).

TIME/ACTION PROFILE (blood levels†)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1.5–2.5 hr	8–24 hr

†Acyclovir

Contraindications/Precautions

Contraindicated in: Hypersensitivity to valacyclovir or acyclovir.

Use Cautiously in: Renal impairment (↓ dose/↑ dosing interval recommended if CCr <50 mL/min);

OB, Lactation, Pedi: Pregnancy, lactation, or children <2 yr (safety not established); **Geri:** Dose ↓ may be necessary due to ↑ risk of acute renal failure and CNS side effects.

Adverse Reactions/Side Effects

CNS: headache, agitation, confusion, delirium, dizziness, encephalopathy, hallucinations, seizures, weak-

ness. **GI:** nausea, abdominal pain, anorexia, constipation, diarrhea. **GU:** **RENAL FAILURE**, crystalluria.

Hemat: **THROMBOTIC THROMBOCYTOPENIC PURPURA/HEMOLYTIC UREMIC SYNDROME** (very high doses in immunosuppressed patients).

Interactions

Drug-Drug: Probenecid and cimetidine ↑ blood levels; significant only in renal impairment. Concurrent use of other **nephrotoxic drugs** ↑ risk of adverse renal effects.

Route/Dosage

Herpes Zoster

PO (Adults): 1 g 3 times daily for 7 days.

Genital Herpes

PO (Adults): Initial treatment—1 g twice daily for 10 days. **Recurrence**—500 mg twice daily for 3 days. **Suppression of recurrence**—1 g once daily or 500 mg once daily in patients experiencing <10 recurrences/yr. **Suppression of recurrence in HIV-infected patients**—500 mg q 12 hr. **Reduction of transmission**—500 mg once daily for source partner.

Herpes Labialis

PO (Adults and Children ≥12 yr): 2 g then 2 g 12 hr later.

Chickenpox

PO (Children ≥2 yr): 20 mg/kg 3 times daily for 5 days (not to exceed 1 g 3 times daily).

Renal Impairment

PO (Adults): CCr 30–49 mL/min—1 g q 12 hr for herpes zoster treatment, no ↓ required for treatment of genital herpes; 1 g then 1 g 12 hr later for herpes labialis. **CCr 10–29 mL/min**—1 g q 24 hr for initial treatment of genital herpes, 500 mg q 24 hr for treatment of recurrent episodes of genital herpes, 500 mg q 48 hr for suppression of genital herpes in patients with 9 or fewer recurrences/yr, 500 mg q 24 hr for suppression of genital herpes in patients with ≥10 recurrences/yr or HIV-infected patients, 1 g q 24 hr for treatment of herpes zoster; 500 mg then 500 mg 12 hr later for herpes labialis. **CCr <10 mL/min**—500 mg q 24 hr for initial treatment of genital herpes, 500 mg q 24 hr for treatment of recurrent episodes of genital herpes, 500 mg q 48 hr for suppression of genital herpes in patients with 9 or fewer recurrences/yr, 500 mg q 24 hr for suppression of genital herpes in patients with ≥10 recurrences/yr or HIV-infected patients, 500 mg q 24 hr for treatment of herpes zoster; single 500 mg dose for herpes labialis.

★ = Canadian drug name. ‡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

U

Availability (generic available)

Tablets: 500 mg, 1 g. **Cost:** *Generic*—500 mg \$31.44/30, 1 g \$53.34/30.

NURSING IMPLICATIONS**Assessment**

- Assess lesions before and daily during therapy.
- **Monitor patient for signs of thrombotic thrombocytopenic purpura/hemolytic uremic syndrome (thrombocytopenia, microangiopathic hemolytic anemia, neurologic findings, renal dysfunction, fever).** Requires prompt treatment; may be fatal.

Potential Nursing Diagnoses

Risk for impaired skin integrity (Indications)

Risk for infection (Indications, Patient/Family Teaching)

Implementation

- **High Alert:** Do not confuse valacyclovir with valganciclovir. Do not confuse Valtrex (valacyclovir) with Valcyte (valganciclovir).
- **PO:** May be administered without regard to meals.
- **Herpes Zoster:** Implement valacyclovir therapy as soon as possible after the onset of signs or symptoms of herpes zoster; most effective if started within 48 hr of the onset of zoster rash. Efficacy of treatment started >72 hr after rash onset is unknown.
- **Genital Herpes and Herpes Labialis:** Implement treatment for genital herpes as soon as possible after onset of symptoms (tingling, itching, burning).
- **Chicken Pox:** Initiate therapy at the earliest sign or symptom; preferably within 24 hr of onset of rash.

Patient/Family Teaching

- Instruct patient to take valacyclovir exactly as directed for the full course of therapy. Take missed doses as soon as remembered if not just before next dose; do not double doses. Advise patient to read the *Patient Information* before starting therapy.
- Advise patient to maintain adequate hydration during therapy.
- Advise patient to notify health care professional promptly if nervous system symptoms (aggressive behavior, unsteady movement, shaky movements, confusion, speech problems, hallucinations, seizures, coma) occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Instruct female patients to notify health care professional if pregnancy is planned or suspected, or if breast feeding.
- **Herpes Zoster:** Inform patient that valacyclovir does not prevent the spread of infection to others. Precautions should be taken around others who

have not had chickenpox or varicella vaccine, or are immunosuppressed, until all lesions have crusted.

- **Genital Herpes and Herpes Labialis:** Inform patient that valacyclovir does not prevent the spread of herpes labialis to others. Advise patient to avoid contact with lesions while lesions or symptoms are present. Valacyclovir reduces transmission of genital herpes to others. Advise patient to practice safe sex (avoid sexual intercourse when lesions are present and wear a condom made of latex or polyurethane during sexual contact).

Evaluation/Desired Outcomes

- Decrease in time to full crusting, loss of vesicles, loss of ulcers, and development of crusts in patients with acute herpes zoster (shingles).
- Decrease in time to full crusting, loss of vesicles, loss of ulcers, and development of crusts in patients with genital herpes.
- Decrease in frequency of outbreaks in patients with genital herpes.
- Decrease in time to full crusting, loss of vesicles, loss of ulcers, and development of crusts in patients with herpes labialis. Decrease in transmission of genital herpes.
- Treatment of chickenpox.

valGANCiclovir (val-gan-sye-kloe-veer) Valcyte

Classification

Therapeutic: antivirals

Pregnancy Category C**Indications**

Treatment of cytomegalovirus (CMV) retinitis in patients with AIDS. Prevention of CMV disease in kidney, kidney/pancreas and heart transplant patients at risk.

Action

Valganciclovir is a prodrug which is rapidly converted to ganciclovir by intestinal and hepatic enzymes. CMV virus converts ganciclovir to its active form (ganciclovir phosphate) inside host cell, where it inhibits viral DNA polymerase. **Therapeutic Effects:** Antiviral effect directed preferentially against CMV-infected cells.

Pharmacokinetics

Absorption: 59.4% absorbed following oral administration, rapidly converted to ganciclovir.

Distribution: Unknown.

Metabolism and Excretion: Rapidly converted to ganciclovir; ganciclovir is mostly excreted by the kidneys.

Half-life: 4.1 hr (intracellular half-life of ganciclovir phosphate is 18 hr).

TIME/ACTION PROFILE (ganciclovir blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	2 hr	12–24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to valganciclovir or ganciclovir; **OB:** Pregnancy or planned pregnancy; **Lactation:** Lactation; Hemodialysis; Patients undergoing liver transplantation.

Use Cautiously in: Renal impairment (dosage ↓ recommended if CCr <60 mL/min); Pre-existing bone marrow depression; Previous or concurrent myelosuppressive drug therapy or radiation therapy; **Geri:** Age-related ↓ in renal function requires dosage reduction; **Pedi:** Children <4 mo (safety not established).

Adverse Reactions/Side Effects

CNS: **SEIZURES,** headache, insomnia, agitation, confusion, dizziness, hallucinations, psychosis, sedation.

GI: abdominal pain, diarrhea, nausea, vomiting. **GU:** renal impairment. **Hemat:** **NEUTROPENIA, THROMBOCYTOPENIA, anemia,** aplastic anemia, bone marrow depression, pancytopenia. **Neuro:** ataxia, paresthesia, peripheral neuropathy. **Misc:** fever, hypersensitivity reactions, infections.

Interactions

Drug-Drug: ↑ risk of hematologic toxicity with **zidovudine**. Blood levels and effects may be ↑ by **probenecid**. Patients with renal impairment may experience accumulation of metabolites of **mycophenolate** and valganciclovir. ↑ blood levels and risk of toxicity from **didanosine**.

Drug-Food: Food ↑ absorption.

Route/Dosage

Treatment of CMV Disease

PO (Adults): *Induction*—900 mg twice daily for 21 days; *Maintenance treatment or patients with inactive CMV retinitis*—900 mg once daily.

Renal Impairment

CCr 40–59 mL/min (Adults): *Induction*—450 mg twice daily for 21 days; *Maintenance treatment or patients with inactive CMV retinitis*—450 mg once daily.

Renal Impairment

CCr 25–39 mL/min (Adults): *Induction*—450 mg once daily for 21 days; *Maintenance treatment or patients with inactive CMV retinitis*—450 mg every 2 days.

Renal Impairment

CCr 10–24 mL/min (Adults): *Induction*—450 mg every 2 days for 21 days; *Maintenance treatment or patients with inactive CMV retinitis*—450 mg twice weekly.

Prevention of CMV Disease in Transplant Patients

PO (Adults): *Kidney/pancreas, or heart transplant*—900 mg once daily, starting 10 days prior to transplant and continued for 100 days after; *Kidney transplant*—900 mg once daily, starting 10 days prior to transplant and continued for 200 days after.

Renal Impairment

PO (Adults): *CCr 40–59 mL/min*—450 mg once daily; *CCr 25–39 mL/min*—450 mg every 2 days; *CCr 12–24 mL/min*—450 mg twice weekly.

PO (Children 4 mo–16 yr): *Kidney or heart transplant*—Dose is based on body surface area (BSA) and CCr. Dose = 7 × BSA × CCr (see prescribing information for equations used for BSA and CCr); all calculated doses should be rounded to nearest 25 mg (max = 900 mg) and administered as oral solution; should be started 10 days prior to transplant and continued for 100 days after.

Renal Impairment

PO (Adults): *CCr 40–59 mL/min*—450 mg once daily; *CCr 25–39 mL/min*—450 mg every 2 days; *CCr 12–24 mL/min*—450 mg twice weekly.

Availability

Tablets: 450 mg. **Oral solution (tutti-frutti flavor):** 50 mg/mL.

NURSING IMPLICATIONS

Assessment

- Diagnosis of CMV retinitis should be determined by ophthalmoscopy prior to treatment with valganciclovir.
- Culture for CMV (urine, blood, throat) may be taken prior to administration. However, a negative CMV culture does not rule out CMV retinitis. If symptoms do not respond after several weeks, resistance to valganciclovir may have occurred. Ophthalmologic exams should be performed weekly during induction and every 2 wk during maintenance or more frequently if the macula or optic nerve is threatened. Progression of CMV retinitis may occur during or following ganciclovir treatment.
- Assess for signs of infection (fever, chills, cough, hoarseness, lower back or side pain, sore throat, difficult or painful urination). Notify health care professional if these symptoms occur.
- Assess for bleeding (bleeding gums, bruising, petechiae, or guaiac stools, urine, and emesis). Avoid IM injections and taking rectal temperatures. Apply pressure to venipuncture sites for 10 min.
- **Lab Test Considerations:** May cause granulocytopenia, anemia, and thrombocytopenia. Monitor

☼ = Canadian drug name. ☼ = Genetic implication. ~~Strikethrough~~ = Discontinued.
*CAPITALS indicates life-threatening; underlines indicate most frequent.

neutrophil and platelet count closely throughout therapy. Do not administer if ANC $<500/\text{mm}^3$, platelet count $<25,000/\text{mm}^3$, or hemoglobin $<8 \text{ g/dL}$. Recovery begins within 3–7 days of discontinuation of therapy.

- Monitor BUN and serum creatinine at least once every 2 wk throughout therapy. May cause $\uparrow$ in serum creatinine.

Potential Nursing Diagnoses

Risk for infection (Indications, Patient/Family Teaching)

Implementation

- Do not confuse valganciclovir with valacyclovir. Do not confuse Valcyte (valganciclovir) with Valtrex (valacyclovir).
- **PO:** Administer tablets and oral solution with food. Adults should take tablets, not oral solution. **Handle valganciclovir tablets carefully. Do not break or crush. May be potentially teratogenic; avoid direct contact with broken or crushed tablets. If contact with the skin or mucous membranes occurs, wash thoroughly with soap and water and rinse eyes thoroughly with plain water.**
- Oral solution (50 mg/mL) must be prepared by the pharmacist prior to dispensing to the patient. Shake well prior to use. Use oral dispenser provided for accurate dose. Store oral solution in refrigerator for no longer than 49 days.

Patient/Family Teaching

- Instruct patient to take valganciclovir with food, as directed. Take missed doses as soon as remembered, unless almost time for next dose; do not double doses. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Inform patient that valganciclovir is not a cure for CMV retinitis. Progression of retinitis may continue in immunocompromised patients during and following therapy. Advise patients to have regular ophthalmic exams at least every 4–6 wk. Duration of therapy for CMV prevention is based on the duration and degree of immunosuppression.
- May cause seizures, sedation, dizziness, ataxia, and/or confusion. Caution patient not to drive or do other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional if fever; chills; sore throat; other signs of infection; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Patient should be cautioned not to drink alcoholic beverages or take products containing aspirin or NSAIDs.

- Advise patient that valganciclovir may have teratogenic effects. Women should use a nonhormonal during and for at least 30 days following therapy. If their female sexual partner can become pregnant, men should use a barrier method of contraception during and for at least 90 days following therapy. Advise male patient that valganciclovir may lower the amount of sperm in a man's body and cause fertility problems.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Emphasize the importance of frequent follow-up exams to monitor blood counts.

Evaluation/Desired Outcomes

- Management of the symptoms of CMV retinitis in patients with AIDS.
- Prevention of CMV disease in kidney, kidney/pancreas and heart transplant patients at risk.

VALPROATES

divalproex sodium
(dye-val-proe-ex soe-dee-um)
Depakote, Depakote ER, Depakote Sprinkle,  Epival

valproate sodium
(val-proe-ate soe-dee-um)
Depacon

valproic acid (val-proe-ik as-id)
Depakene

Classification

Therapeutic: anticonvulsants, vascular headache suppressants

Pregnancy Category D, X (migraines)

Indications

Monotherapy and adjunctive therapy for simple and complex absence seizures. Monotherapy and adjunctive therapy for complex partial seizures. Adjunctive therapy for patients with multiple seizure types, including absence seizures. **Divalproex sodium only.** Manic episodes associated with bipolar disorder. Prevention of migraine headache.

Action

Increase levels of GABA, an inhibitory neurotransmitter in the CNS. **Therapeutic Effects:** Suppression of seizure activity. Decreased manic episodes. Decreased frequency of migraine headaches.

Pharmacokinetics

Absorption: Well absorbed following oral administration; divalproex is enteric-coated, and absorption is delayed. ER form produces lower blood levels. IV administration results in complete bioavailability.

Distribution: Rapidly distributed into plasma and extracellular water. Cross blood-brain barrier and placenta; enters breast milk.

Protein Binding: 80–90%, decreased in neonates, elderly, renal impairment, or chronic hepatic disease.

Metabolism and Excretion: Mostly metabolized by the liver; minimal amounts excreted unchanged in urine.

Half-life: Adults: 9–16 hr.

TIME/ACTION PROFILE (onset = anti-convulsant effect; peak = blood levels)

ROUTE	ONSET	PEAK	DURATION
PO—liquid	2–4 days	15–120 min	6–24 hr
PO—capsules	2–4 days	1–4 hr	6–24 hr
PO—delayed-release products	2–4 days	3–5 hr	12–24 hr
PO—extended-release products	2–4 days	7–14 hr	24 hr
IV	2–4 days	end of infusion	6–24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hepatic impairment;  Known/suspected urea cycle disorders (may result in fatal hyperammonemic encephalopathy); Mitochondrial disorders caused by mutations in mitochondrial DNA polymerase gamma (↑ risk for potentially fatal hepatotoxicity); **Pedi:** Children <2 yr with suspected mitochondrial disorder caused by mutations in mitochondrial DNA polymerase gamma (↑ risk for potentially fatal hepatotoxicity); **OB:** Pregnancy (for migraines only).

Use Cautiously in: All patients (may ↑ risk of suicidal thoughts/behaviors); Bleeding disorders; History of liver disease; Organic brain disease; Bone marrow depression; Renal impairment; Women of childbearing potential; **Geri:** ↑ risk of adverse effects; **OB:** Use during pregnancy is linked to congenital anomalies, neural tube defects, clotting abnormalities, and hepatic dysfunction in the neonate as well as impaired cognitive development as the child matures. Use with extreme caution; **OB:** Women with childbearing potential; **Lactation:** Pass into breast milk. Consider discontinuing nursing when valproates are administered to the nursing mother.

Adverse Reactions/Side Effects

CNS: SUICIDAL THOUGHTS, agitation, dizziness, headache, insomnia, sedation, confusion, depression. **CV:** peripheral edema. **EENT:** visual disturbances. **GI:**

HEPATOTOXICITY, PANCREATITIS, abdominal pain, anorexia, diarrhea, indigestion, nausea, vomiting, constipation, ↑ appetite. Derm: alopecia, rashes. **Endo:** weight gain. **Hemat:** leukopenia, thrombocytopenia. **Metab:** HYPERAMMONEMIA. **Neuro:** HYPOTHERMIA, tremor, ataxia.

Interactions

Drug-Drug: ↑ risk of bleeding with warfarin. Blood levels and toxicity may be ↑ by aspirin, carbamazepine, chlorpromazine, cimetidine, erythromycin, or felbamate. ↑ CNS depression with other CNS depressants, including alcohol, antihistamines, antidepressants, opioid analgesics, MAO inhibitors, and sedative/hypnotics. MAO inhibitors and other antidepressants may ↓ seizure threshold and ↓ effectiveness of valproate. Carbamazepine, meropenem, phenobarbital, phenytoin, or rifampin may ↓ valproate blood levels. Valproate may ↑ toxicity of carbamazepine, diazepam, amitriptyline, nortriptyline, ethosuximide, lamotrigine, phenobarbital, phenytoin, topiramate, or zidovudine. Concurrent use with topiramate may ↑ risk of hypothermia and hyperammonemia with or without encephalopathy. Ertapenem, imipenem, or meropenem may ↓ valproate blood levels.

Route/Dosage

Regular-release and delayed-release formulations usually given in 2–4 divided doses daily; extended-release formulation (Depakote ER) usually given once daily.

Anticonvulsant

PO (Adults and Children >10 yr): Single-agent therapy (complex partial seizures)—Initial dose of 10–15 mg/kg/day in 1–4 divided doses; ↑ by 5–10 mg/kg/day weekly until therapeutic response achieved (not to exceed 60 mg/kg/day); when daily dose exceeds 250 mg, give in divided doses. **Polytherapy (complex partial seizures)**—Initial dose of 10–15 mg/kg/day; ↑ by 5–10 mg/kg/day weekly until therapeutic response achieved (not to exceed 60 mg/kg/day); when daily dosage exceeds 250 mg, give in divided doses.

PO (Adults and Children >2 yr [>10 yr for Depakote ER]): Simple and complex absence seizures—Initial dose of 15 mg/kg/day in 1–4 divided doses; ↑ by 5–10 mg/kg/day weekly until therapeutic response achieved (not to exceed 60 mg/kg/day); when daily dose exceeds 250 mg, give in divided doses.

IV (Adults and Children): Give same daily dose and at same frequency as was given orally; switch to oral formulation as soon as possible.

Rect (Adults and Children): Dilute syrup 1:1 with water for use as a retention enema. Give 17–20 mg/kg load, maintenance 10–15 mg/kg/dose q 8 hr.

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Mood Stabilizer

PO (Adults): *Depakote*—Initial dose of 750 mg/day in divided doses initially, titrated rapidly to desired clinical effect or trough plasma levels of 50–125 mcg/mL (not to exceed 60 mg/kg/day). *Depakote ER*—Initial dose of 25 mg/kg once daily; titrated rapidly to desired clinical effect of trough plasma levels of 85–125 mcg/mL (not to exceed 60 mg/kg/day).

Migraine Prevention

PO (Adults and Children ≥16 yr): *Depakote*—250 mg twice daily (up to 1000 mg/day). *Depakote ER*—500 mg once daily for 1 wk, then ↑ to 1000 mg once daily.

Availability

Valproic Acid (generic available)

Capsules: 250 mg, 500 mg. **Cost:** *Generic*—\$37.90/100. **Syrup:** 250 mg/5 mL.

Valproate Sodium (generic available)

Injection: 100 mg/mL.

Divalproex Sodium (generic available)

Delayed-release tablets (Depakote): 125 mg, 250 mg, 500 mg. **Cost:** 125 mg \$89.72/100, 250 mg \$176.23/100, 500 mg \$324.97/100. **Capsules-sprinkle:** 125 mg. **Cost:** \$137.53/100. **Extended-release tablets (Depakote ER):** 250 mg, 500 mg. **Cost:** 250 mg \$167.91/100, 500 mg \$295.36/100.

NURSING IMPLICATIONS

Assessment

- **Seizures:** Assess location, duration, and characteristics of seizure activity. Institute seizure precautions.
- **Bipolar Disorder:** Assess mood, ideation, and behavior frequently.
- **Migraine Prophylaxis:** Monitor frequency and intensity of migraine headaches.
- **Ger:** Assess geriatric patients for excessive somnolence.
- **Assess for suicidal tendencies, especially during early therapy.** Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤24 yr.
- **Lab Test Considerations:** Monitor CBC, platelet count, and bleeding time prior to and periodically during therapy. May cause leukopenia and thrombocytopenia.
- **Monitor hepatic function (LDH, AST, ALT, and bilirubin) and serum ammonia concentrations prior to and periodically during therapy.** May cause hepatotoxicity; monitor closely, especially during initial 6 mo of therapy; fatalities have occurred. Therapy should be discontinued if hyperammonemia occurs.
- May interfere with accuracy of thyroid function tests.
- May cause false-positive results in urine ketone tests.

- **Toxicity and Overdose:** Therapeutic serum levels range from 50–100 mcg/mL (50–125 mcg/mL for mania). Doses are gradually ↑ until a pre-dose serum concentration of at least 50 mcg/mL is reached. However, a good correlation among daily dose, serum level, and therapeutic effects has not been established. Monitor patients receiving near the maximum recommended 60 mg/kg/day for toxicity.

Potential Nursing Diagnoses

Risk for injury (Indications)

Implementation

- **Do not confuse *Depakote ER* and regular dose forms.** *Depakote ER* produces lower blood levels than *Depakote* dosing forms. If switching from *Depakote* to *Depakote ER*, increase dose by 8–20%.
- Single daily doses are usually administered at bedtime because of sedation.
- **PO:** Administer with or immediately after meals to minimize GI irritation. Extended-release and delayed-release tablets and capsules should be swallowed whole, do not open, break, or chew; will cause mouth or throat irritation and destroy extended release mechanism. Do not administer tablets with milk or carbonated beverages (may cause premature dissolution). Delayed-release divalproex sodium may cause less GI irritation than valproic acid capsules.
- Shake liquid preparations well before pouring. Use calibrated measuring device to ensure accurate dose. Syrup may be mixed with food or other liquids to improve taste.
- Sprinkle capsules may be swallowed whole or opened and entire capsule contents sprinkled on a teaspoonful of soft, cool food (applesauce, pudding). Do not chew mixture. Administer immediately; do not store for future use.
- To convert from valproic acid to divalproex sodium, initiate divalproex sodium at same total daily dose and dosing schedule as valproic acid. Once patient is stabilized on divalproex sodium, attempt administration 2–3 times daily.
- **Rect:** Dilute syrup 1:1 with water for use as a retention enema.

IV Administration

- **pH:** 7.6.
- **Intermittent Infusion:** **Diluent:** May be diluted in at least 50 mL of D5W, 0.9% NaCl, or LR. Solution is stable for 24 hr at room temperature. **Concentration:** 2 mg/mL. **Rate:** Infuse over 60 min (≤20 mg/min). Rapid infusion may cause increased side effects. Has been given as a one-time infusion of 1000 mg over 5–10 min @ 3 mg/kg/min up to 15 mg/kg in patients with no detectable valproate levels.
- **Y-Site Compatibility:** cefepime, ceftazidime.
- **Y-Site Incompatibility:** vancomycin.

Patient/Family Teaching

- Instruct patient to take medication as directed. If a dose is missed on a once-a-day schedule, take as soon as remembered that day. If on a multiple-dose schedule, take it within 6 hr of the scheduled time, then space remaining doses throughout the remainder of the day. Abrupt withdrawal may lead to status epilepticus.
- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until effects of medication are known. Tell patient not to resume driving until physician gives clearance based on control of seizure disorder.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially CNS depressants. Caution patient to avoid alcohol during therapy.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking, other unusual changes in behavior or mood occur.
- Instruct patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to notify health care professional if anorexia, abdominal pain, severe nausea and vomiting, yellow skin or eyes, fever, sore throat, malaise, weakness, facial edema, lethargy, unusual bleeding or bruising, pregnancy, or loss of seizure control occurs. Children <2 yr of age are especially at risk for fatal hepatotoxicity.
- May cause teratogenic effects. Instruct female patients to notify health care professional immediately if pregnancy is planned or suspected or if breast feeding. Advise pregnant patients taking valproates to enroll in the NAAED Pregnancy Registry by calling 1-888-233-2334; call must be made by patient. Registry Web site is www.aedpregnancyregistry.org.
- Advise patient to carry identification at all times describing medication regimen.
- Emphasize the importance of routine exams to monitor progress.

Evaluation/Desired Outcomes

- Decreased seizure activity.
- Decreased incidence of manic episodes in patients with bipolar disorders.
- Decreased frequency of migraine headaches.

valsartan, See ANGIOTENSIN II RECEPTOR ANTAGONISTS.

vancomycin (van-koe-mye-sin) Vancocin

Classification

Therapeutic: anti-infectives

Pregnancy Category C

Indications

IV: Treatment of potentially life-threatening infections when less toxic anti-infectives are contraindicated. Particularly useful in staphylococcal infections, including: Endocarditis, Meningitis, Osteomyelitis, Pneumonia, Septicemia, Soft-tissue infections in patients who have allergies to penicillin or its derivatives or when sensitivity testing demonstrates resistance to methicillin. **PO:** Treatment of staphylococcal enterocolitis or diarrhea due to *Clostridium difficile*. **IV:** Part of endocarditis prophylaxis in high-risk patients who are allergic to penicillin.

Action

Binds to bacterial cell wall, resulting in cell death.

Therapeutic Effects: Bactericidal action against susceptible organisms. **Spectrum:** Active against gram-positive pathogens, including: Staphylococci (including methicillin-resistant strains of *Staphylococcus aureus*), Group A beta-hemolytic streptococci, *Streptococcus pneumoniae*, *Corynebacterium*, *Clostridium difficile*, *Enterococcus faecalis*, *Enterococcus faecium*.

Pharmacokinetics

Absorption: Poorly absorbed from the GI tract.

Distribution: Widely distributed. Some penetration (20–30%) of CSF; crosses placenta.

Metabolism and Excretion: Oral doses excreted primarily in the feces; IV vancomycin eliminated almost entirely by the kidneys.

Half-life: Neonates: 6–10 hr; Children 3 mo–3 yr: 4 hr; Children >3 yr: 2–2.3 hr; Adults: 5–8 hr (↑ in renal impairment).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	12–24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Renal impairment (dosage reduction required if CCr ≤80 mL/min); Hearing im-

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

pairment; Intestinal obstruction or inflammation ($\uparrow$ systemic absorption when given orally); **OB, Lactation:** Safety not established.

Adverse Reactions/Side Effects

EENT: ototoxicity. **CV:** hypotension. **GI:** nausea, vomiting. **GU:** nephrotoxicity. **Derm:** rashes. **Hemat:** eosinophilia, leukopenia. **Local:** phlebitis. **MS:** back and neck pain. **Misc:** hypersensitivity reactions including **ANAPHYLAXIS**, chills, fever, "red man" syndrome (with rapid infusion), superinfection.

Interactions

Drug-Drug: May cause additive ototoxicity and nephrotoxicity with other **ototoxic** and **nephrotoxic drugs** (aspirin, aminoglycosides, cyclosporine, cisplatin, loop diuretics). May enhance neuromuscular blockade from **nondepolarizing neuromuscular blocking agents**. $\uparrow$ risk of histamine flush when used with **general anesthetics** in children.

Route/Dosage

Serious Systemic Infections

IV (Adults): 500 mg q 6 hr or 1 g q 12 hr (up to 4 g/day).

IV (Children >1 mo): 40 mg/kg/day divided q 6–8 hr *Staphylococcal CNS infection*—60 mg/kg/day divided q 6 hr, maximum dose: 1 g/dose.

IV (Neonates 1 wk–1 mo): <1200 g: 15 mg/kg/day q 24 hr. 1200–2000 g: 10–15 mg/kg/dose q 8–12 hr. >2000 g: 15–20 mg/kg/dose q 8 hr.

IV (Neonates <1 wk): <1200 g: 15 mg/kg/day q 24 hr. 1200–2000 g: 10–15 mg/kg/dose q 12–18 hr. >2000 g: 10–15 mg/kg/dose q 8–12 hr.

IT (Adults): 20 mg/day.

IT (Children): 5–20 mg/day.

IT (Neonates): 5–10 mg/day.

Endocarditis Prophylaxis in Penicillin-Allergic Patients

IV (Adults and Adolescents): 1-g single dose 1-hr preprocedure.

IV (Children): 20-mg/kg single dose 1-hr preprocedure.

Diarrhea Due to *C. difficile*

PO (Adults): 125 mg q 6 hr for 10 days.

PO (Children): 40 mg/kg/day divided into 3 or 4 doses for 7–10 days (not to exceed 2 g/day).

Staphylococcal Enterocolitis

PO (Adults): 500–2000 mg/day in 3–4 divided doses for 7–10 days.

PO (Children): 40 mg/kg/day in 3–4 divided doses for 7–10 days (not to exceed 2 g/day).

Renal Impairment

IV (Adults): An initial loading dose of 750 mg–1 g (not less than 15 mg/kg); serum level monitoring is

optimal for choosing maintenance dose in patients with renal impairment; these guidelines may be helpful. *CCr* 50–80 mL/min—1 g q 1–3 days; *CCr* 10–50 mL/min—1 g q 3–7 days; *CCr* <10 mL/min—1 g q 7–14 days.

Availability (generic available)

Capsules: 125 mg, 250 mg. **Injection:** 500-mg, 750-mg, 1-, 5-, 10-g vials.

NURSING IMPLICATIONS

Assessment

- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain specimens for culture and sensitivity prior to initiating therapy. First dose may be given before receiving results.
- Monitor IV site closely. Vancomycin is irritating to tissues and causes necrosis and severe pain with extravasation. Rotate infusion site.
- Monitor BP throughout IV infusion.
- Evaluate eighth cranial nerve function by audiometry and serum vancomycin levels prior to and throughout therapy in patients with borderline renal function or those >60 yr of age. Prompt recognition and intervention are essential in preventing permanent damage.
- Monitor intake and output ratios and daily weight. Cloudy or pink urine may be a sign of nephrotoxicity.
- Assess patient for signs of superinfection (black, furry overgrowth on tongue; vaginal itching or discharge; loose or foul-smelling stools). Report occurrence.
- **Observe patient for signs and symptoms of anaphylaxis** (rash, pruritus, laryngeal edema, wheezing). Discontinue drug and notify health care professional immediately if these problems occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in case of an anaphylactic reaction.
- **Pseudomembranous Colitis:** Assess bowel status (bowel sounds, frequency and consistency of stools, presence of blood in stools) throughout therapy.
- **Lab Test Considerations:** Monitor for casts, albumin, or cells in the urine or decreased specific gravity, CBC, and renal function periodically during therapy.
- May cause increased BUN levels.
- **Toxicity and Overdose:** Trough concentrations should not exceed 10 mcg/mL (mild-moderate infections) or 15–20 mcg/mL (for severe infections).

Potential Nursing Diagnoses

Risk for infection (Indications)

Disturbed sensory perception (auditory) (Side Effects)

Implementation

- Vancomycin must be given orally for treatment of staphylococcal enterocolitis and *C. difficile*-associated diarrhea. Orally administered vancomycin is not effective for other types of infections.
- **PO:** Use calibrated measuring device for liquid preparations. IV dose form may be diluted in 30 mL of water for oral or nasogastric tube administration. Resulting solution has bitter, unpleasant taste. May mix with a flavoring syrup to mask taste. Stable for 14 days if refrigerated.

IV Administration

- **pH:** 2.5–5.0.
- **Intermittent Infusion:** **Diluent:** To reconstitute, add 10 mL of sterile water for injection to 500-mg vial or 20 mL of sterile water for injection to 1-g vial for a concentration of 50 mg/mL. Dilute further with at least 100 mL of 0.9% NaCl, D5W, D5/0.9% NaCl, or LR for every 500 mg of vancomycin being administered. Reconstituted vials stable for 14 days if refrigerated. **Concentration:** ≤5 mg/mL. **Rate:** Infuse over at least 60 min (90 min for doses >1 g). Do not administer rapidly or as a bolus, to minimize risk of thrombophlebitis, hypotension, and “red-man (neck)” syndrome (sudden, severe hypotension; flushing and/or maculopapular rash of face, neck, chest, and upper extremities). May need to slow infusion further to 1.5–2 hr if red-man syndrome occurs.
- **IT:** **Diluent:** Dilute with preservative-free NS. **Concentration:** 1–5 mg/mL. **Rate:** Directly instill into ventricular cerebrospinal fluid.
- **Y-Site Compatibility:** acetylcysteine, acyclovir, aldesleukin, alemtuzumab, alfentanil, allopurinol, alprostadil, amifostine, amikacin, amiodarone, amscrine, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, azithromycin, benzotropine, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, dexamethasone, dexmedetomidine, dextrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doripenem, doxacurium, doxapram, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, enalaprilat,

ephedrine, epinephrine, epirubicin, epitifibatide, er-tapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, folic acid, gemcitabine, gentamicin, glycopyrrolate, granisetron, hetastarch, hydromorphone, ifosfamide, insulin, irinotecan, isoproterenol, ketamine, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meclizorethamine, melphalan, meperidine, meropenem, metaraminol, methylglutamate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, multivitamins, mycophenolate, nalbuphine, naloxone, nesiritide, nifedipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine, pentazocine, pentobarbital, perphenazine, phenobarbital, phenolamine, phenylephrine, phytonadione, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxime, ranitidine, remifentanyl, rifampin, sodium acetate, sodium bicarbonate, sodium citrate, succinylcholine, sufentanil, tacrolimus, teniposide, thiamine, thiopental, tigecycline, tirofiban, tobramycin, tolazoline, trastuzumab, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zolendronic acid.

- **Y-Site Incompatibility:** albumin, aminophylline, amphotericin B cholesteryl, amphotericin B colloidal, amphotericin lipid complex, amphotericin B liposome, azathioprine, bivalirudin, cefoperazone, chloramphenicol, dantrolene, daptomycin, diazepam, diazoxide, epoetin alfa, fluorouracil, furosemide, ganciclovir, heparin, ibuprofen, idarubicin, indomethacin, ketorolac, leucovorin calcium, methylprednisolone, mitomycin, moxifloxacin, phenytoin, rituximab, streptokinase, trimethoprim/sulfamethoxazole, valproate sodium.

Patient/Family Teaching

- Advise patients on oral vancomycin to take as directed. Take missed doses as soon as remembered unless almost time for next dose; do not double dose.
- Instruct patient to report signs of hypersensitivity, tinnitus, vertigo, or hearing loss.
- Advise patient to notify health care professional if no improvement is seen in a few days.
- Patients with a history of rheumatic heart disease or valve replacement need to be taught importance of using antimicrobial prophylaxis prior to invasive dental or medical procedures.

✳ = Canadian drug name. ⚡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of infection.
Length of time for complete resolution depends on organism and site of infection.
- Endocarditis prophylaxis.

REMS

vandetanib (van-det-a-nib)

Caprelsa

Classification

Therapeutic: antineoplastics

Pharmacologic: kinase inhibitors

Pregnancy Category D

Indications

Treatment of symptomatic/progressive medullary thyroid cancer in patients with unresectable, locally advanced, or metastatic disease.

Action

Inhibits tyrosine kinase; results in inhibited action of epidermal growth factor (EGFR), vascular endothelial cell growth factor (VEGF) and other kinase based actions. Inhibits endothelial cell migration/proliferation/survival and new blood vessel formation. Also inhibits EGFR-dependent cell survival. **Therapeutic Effects:** Decreased spread of thyroid cancer.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Unknown.

Metabolism and Excretion: Mostly metabolized by the liver; 44% excreted in feces, 25% in urine.

Half-life: 19 days.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	4–10 hr	24 hr

Contraindications/Precautions

Contraindicated in: Congenital long QT syndrome or QTcF interval >450 msec; Hypocalcemia (serum calcium should be within normal range), hypokalemia (serum potassium should >4.0 mEq/L and within normal range), or hypomagnesemia (serum magnesium should be within normal range); Concurrent use of strong inducers of the CYP3A4 enzyme system; **OB:** Can cause fetal harm; **Lactation:** Avoid breast feeding.

Use Cautiously in: Diarrhea (↑ risk of electrolyte abnormalities and risk of arrhythmias); Renal impairment (dose ↓ recommended for CCr <50 mL/min with close monitoring of QT interval); Moderate to severe

hepatic impairment (Child-Pugh Class B or C; safety and effectiveness not established); **OB:** Women with childbearing potential; **Pedi:** Safety and effectiveness not established.

Exercise Extreme Caution in: Concurrent use of other drugs known to prolong QT interval (avoid if possible; if medically necessary, monitoring is required).

Adverse Reactions/Side Effects

CNS: REVERSIBLE POSTERIOR LEUKOENCEPHALOPATHY SYNDROME, fatigue, headache, depression, insomnia, reversible posterior leukoencephalopathy. **Resp:** INTERSTITIAL LUNG DISEASE. **CV:** HEART FAILURE, ISCHEMIC CEREBROVASCULAR EVENTS, TORSADE DE POINTES, hypertension, QT interval prolongation. **GI:** abdominal pain, ↓ appetite, diarrhea, nausea, dyspepsia, intestinal perforation, vomiting. **GU:** proteinuria. **Derm:** STEVENS-JOHNSON SYNDROME, acne, photosensitivity reaction, rash, skin reactions, pruritus. **Endo:** hypothyroidism. **F and E:** hypocalcemia. **Hemat:** BLEEDING.

Interactions

Drug-Drug: Concurrent use of strong inducers of the CYP3A4 enzyme system including carbamazepine, dexamethasone, phenobarbital, phenytoin, rifabutin, rifampin, rifapentine, and phenobarbital; may ↓ levels and effectiveness and should be avoided. Concurrent use with other drugs that prolong the QT interval should be avoided including some antiarrhythmics (amiodarone, disopyramide, procainamide, sotalol, dofetilide), chloroquine, clarithromycin, dolasetron, granisetron, haloperidol, methadone, moxifloxacin, and pimozide.

Drug-Natural Products: St. John's Wort may ↓ levels and effectiveness and should be avoided.

Route/Dosage

PO (Adults): 300 mg once daily.

Renal Impairment

PO (Adults): CCr <50 mL/min—200 mg once daily.

Availability

Tablets: 100 mg, 300 mg.

NURSING IMPLICATIONS

Assessment

- May prolong QT intervals. Obtain ECG at baseline, at 2–4 wks, at 8–12 wks after starting therapy and every 3 mo thereafter. Use these parameters to assess QT interval following dose reduction for QT prolongation or dose interruption >2 wks. May require more frequent monitoring if diarrhea occurs.
- Assess patient for rash periodically during therapy. Mild to moderate skin reactions may include rash, acne, dry skin, dermatitis, and pruritus and may be treated with topical or systemic corticosteroids,

oral antihistamines, and topical and systemic antibiotics. Treatment of severe rash (Grade 3 or greater) may include systemic corticosteroids and discontinuation of treatment until improved. Upon improvement, may be restarted at a reduced dose.

- Assess for signs and symptoms of interstitial lung disease (hypoxia, pleural effusion, cough, dyspnea). If radiological changes occur with few or no symptoms, therapy may continue. If symptoms are moderate, consider interrupting therapy until symptoms improve. If symptoms are severe, discontinue therapy; permanent discontinuation should be considered. Treat with antibiotics and corticosteroids.
- Assess for signs and symptoms of heart failure (intake and output ratios, daily weight, peripheral edema, rales and crackles upon lung auscultation, dyspnea) periodically during therapy.
- Monitor BP during therapy. Control hypertension during therapy.
- Monitor for diarrhea. If severe diarrhea develops, hold therapy until resolved.
- Monitor for signs and symptoms of reversible posterior leukoencephalopathy syndrome (seizures, headache, visual disturbances, confusion, altered mental status); may require discontinuation of therapy.
- **Lab Test Considerations:** Monitor serum calcium, potassium, and magnesium periodically during therapy. Maintain serum potassium at ≥ 4 mEq/L. Maintain serum calcium and magnesium within normal limits. May require more frequent monitoring if diarrhea occurs.
- Monitor TSH at baseline, at 2–4 wks, at 8–12 wks, and every 3 mo thereafter in patients with thyroidectomy. If symptoms of hypothyroidism occur, check TSH levels and adjust thyroid replacement.
- May cause ↓ serum glucose, WBC, hemoglobin, neutrophils, and platelets.
- May cause ↑ serum ALT, creatinine, bilirubin, and glucose.

Potential Nursing Diagnoses

Activity intolerance

Implementation

- Only prescribers and pharmacies certified with the Caprelsa REMS program are able to prescribe and dispense vandetanib.
- Correct hypocalcemia, hypokalemia, and hypomagnesemia prior to therapy.
- **PO:** May be administered daily without regard to food. Swallow tablets whole, do not crush, break or chew. If unable to swallow tablet, tablet may be dispersed in a glass containing 2 ounces of non-carbonated water and stirred for approximately 10 min

until tablet is dispersed (will not completely dissolve). No other liquids should be used. Swallow dispersion immediately, then mix any residue with 4 ounces of non-carbonated water and swallow. Dispersion may also be administered through nasogastric or gastrostomy tubes. Avoid direct contact with crushed tablets with skin or mucous membranes. Wash thoroughly to avoid exposure.

Patient/Family Teaching

- Instruct patient to take vandetanib as directed. Take missed doses as soon as remembered unless within 12 hrs of next dose. Instruct patient to read *Medication Guide* prior to starting therapy and with each Rx refill in case of changes.
- Advise patients to notify health care professional if rash or signs and symptoms of interstitial lung disease or reversible posterior leukoencephalopathy syndrome. If diarrhea occurs, instruct patient to treat with antidiarrheal medications and notify health care professional if diarrhea becomes severe or persistent.
- May cause tiredness, weakness, or blurred vision. Caution patients to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to wear sunscreen and protective clothing during and for 4 mo after therapy is discontinued to prevent photosensitivity reactions.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort.
- Advise female patients to use effective contraception during and for 4 mo after therapy and to avoid breast feeding.
- Emphasize the importance of regular follow-up exams, ECGs, and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Decreased spread of thyroid cancer.

ildenafil (var-den-a-fil)

Staxyn, Levitra

Classification

Therapeutic: erectile dysfunction agents
Pharmacologic: phosphodiesterase type 5 inhibitors

Pregnancy Category B

Indications

Erectile dysfunction.

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Action

Increases cyclic guanosine monophosphate (cGMP) levels by inhibiting phosphodiesterase type 5 (PDE5) an enzyme responsible for the breakdown of cGMP. cGMP produces smooth muscle relaxation of the corpus cavernosum, which in turn promotes increased blood flow and subsequent erection. **Therapeutic Effects:** Enhanced blood flow to the corpus cavernosum and erection sufficient to allow sexual intercourse. Requires sexual stimulation.

Pharmacokinetics

Absorption: 15% absorbed following oral administration; absorption is rapid.

Distribution: Extensive tissue distribution; penetrates semen.

Protein Binding: 95%.

Metabolism and Excretion: Mostly metabolized by the liver (mainly CYP3A4 enzyme system, minor metabolism by CYP2C). M1 metabolite has anti-erectile dysfunction activity. Parent drug and metabolites are mostly excreted in feces. 2–6% renally eliminated.

Half-life: 4–6 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	rapid	0.5–2 hr	4 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of nitrates or nitric oxide donors; Unstable angina, recent history of stroke, life-threatening arrhythmias, HF or MI within 6 mo; End-stage renal disease requiring dialysis; Known hereditary degenerative retinal disorders; Moderate hepatic impairment (Child-Pugh B) (Staxyn only); Severe hepatic impairment (Child-Pugh C); Congenital or acquired QT prolongation or concurrent use of Class IA or III antiarrhythmics; Moderate or potent inhibitors of the CYP3A4 enzyme system (e.g. ketoconazole, itraconazole, ritonavir, indinavir, saquinavir, atazanavir, clarithromycin erythromycin) (Staxyn only); **Pedi:** Women, children or newborns.

Use Cautiously in: Other serious underlying cardiovascular disease or left ventricular outflow obstruction; Penile deformity; Underlying conditions predisposing to priapism including sickle cell anemia, multiple myeloma or leukemia; Bleeding disorders or active peptic ulcer diseases; History of sudden severe vision loss or non arteritic ischemic optic neuropathy (NAION); may ↑ risk of recurrence; Moderate or potent inhibitors of the CYP3A4 enzyme system (ketoconazole, itraconazole, ritonavir, indinavir, saquinavir, atazanavir, clarithromycin, erythromycin); need to ↓ dose of Levitra; Alpha adrenergic blockers (patients should be on stable dose of alpha blockers before starting vardenafil; should start therapy with tablets (Staxyn should not be used)); **Ger:** Have ↑ blood levels; ↓ dose required.

Adverse Reactions/Side Effects

CNS: headache, amnesia, dizziness. **EENT:** **HEARING LOSS, VISION LOSS**, rhinitis, sinusitis. **GI:** dyspepsia, nausea. **GU:** priapism. **Derm:** flushing. **Misc:** flu syndrome.

Interactions

Drug-Drug: Concurrent use of **nitrates** may cause serious, life-threatening hypotension and is contraindicated. Concurrent use of Class IA antiarrhythmics (such as **quinidine** or **procainamide**) or Class III antiarrhythmics (such as **amiodarone** or **sotalol**) ↑ risk of serious arrhythmias and should be avoided.

Concurrent use of alpha-adrenergic blockers may cause serious hypotension, lowest doses of each should be used initially. Strong inhibitors of CYP3A4 including **ritonavir**, **saquinavir**, **indinavir**, **atazanavir**, **ketoconazole**, **itraconazole**, and **clarithromycin** ↑ levels and the risk of adverse reactions; concurrent use of moderate inhibitors of CYP3A4 including **erythromycin** may also ↑ effects; concurrent use of any of these drugs is contraindicated with Staxyn; dose of Levitra must be ↓. ↑ risk of hypotension with **alpha adrenergic blockers** and acute ingestion of **alcohol**.

Route/Dosage

The tablets and orally disintegrating tablets are not interchangeable; the orally disintegrating tablets provide a higher level of systemic exposure compared to the tablets.

Levitra

PO (Adults): 10 mg taken 1 hr prior to sexual activity (range 5–20 mg; not to exceed one dose/24 hr); *Concurrent use of ritonavir*—single dose should not exceed 2.5 mg in any 72-hour period; *Concurrent use of indinavir, saquinavir, atazanavir, clarithromycin, ketoconazole 400 mg daily, or itraconazole 400 mg daily*—single dose should not exceed 2.5 mg/24 hr; *Concurrent use of ketoconazole 200 mg daily, itraconazole 200 mg daily, or erythromycin*—single dose should not exceed 5 mg/24 hr; *Concurrent use of stable alpha-blocker therapy (not on potent CYP3A4 inhibitor)*—5 mg initial dose; titrate as tolerated; *Concurrent use of stable alpha-blocker and potent CYP3A4 inhibitor therapy*—2.5 mg initial dose; titrate as tolerated.

PO (Geriatric Patients ≥65 yr): 5 mg initial dose; titrate as tolerated.

Hepatic Impairment

PO (Adults): *Moderate hepatic impairment (Child-Pugh B)*—May start with 5 mg dose (not to exceed 10 mg).

Staxyn

PO (Adults): 10 mg taken 1 hr prior to sexual activity (not to exceed one dose/24 hr).

Availability (generic available)

Tablets: 2.5 mg, 5 mg, 10 mg, 20 mg. **Orally disintegrating tablets (Staxyn):** 10 mg.

NURSING IMPLICATIONS**Assessment**

- Determine erectile dysfunction before administration. Vardenafil has no effect in the absence of sexual stimulation.

Potential Nursing Diagnoses

Sexual dysfunction (Indications)

Implementation

- **PO:** *Levitra* is usually administered 1 hr before sexual activity. May be administered 30 min to 4 hr before sexual activity.
- Administer *Staxyn* 1 hr before sexual activity. Orally disintegrating tablets should be left in the package until use. Remove from the blister pouch. Do not push tablet through the blister; peel open the blister pack with dry hands and place tablet on tongue. Tablet will dissolve rapidly and be swallowed with saliva. No liquid is needed to take the orally disintegrating tablet.
- May be administered without regard to food.

Patient/Family Teaching

- Instruct patient to take vardenafil approximately 30 min–1 hr before sexual activity and not more than once per day. Inform patient that sexual stimulation is required for an erection to occur after taking vardenafil.
- Advise patient that vardenafil is not indicated for use in women.
- Caution patient not to take vardenafil concurrently with alpha adrenergic blockers (unless on a stable dose) or nitrates. If chest pain occurs after taking vardenafil, instruct patient to seek immediate medical attention.
- Instruct patient to notify health care professional promptly if erection lasts longer than 4 hr or if sudden or decreased vision loss in one or both eyes, or loss or decrease in hearing, ringing in the ears, or dizziness occurs.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Inform patient that vardenafil offers no protection against sexually transmitted diseases. Counsel patient that protection against sexually transmitted diseases and HIV infection should be considered.

Evaluation/Desired Outcomes

- Male erection sufficient to allow intercourse.

REMS**varenicline (ver-en-i-cline)**

★ Champix, Chantix

Classification

Therapeutic: smoking deterrents
Pharmacologic: nicotine agonists

Pregnancy Category C**Indications**

Treatment of smoking cessation; in conjunction with nonpharmacologic support (educational materials/counseling).

Action

Selectively binds to $\alpha_4\beta_2$ nicotinic acetylcholine receptors, acting as a nicotine agonist; prevents the binding of nicotine to receptors. **Therapeutic Effects:** Decreased desire to smoke.

Pharmacokinetics

Absorption: 100% absorbed following oral administration.

Distribution: 24 hr.

Metabolism and Excretion: Minimally metabolized; 92% excreted in urine unchanged.

Half-life: 24 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	3–4 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **Lactation:** Lactation; **Pedi:** Safety not established.

Use Cautiously in: Severe renal impairment ($\downarrow$ dose recommended if $\text{CCr} < 30 \text{ mL/min}$); Stable cardiovascular disease (may $\uparrow$ risk of cardiovascular events); Psychiatric illness; **Geri:** Consider age-related $\downarrow$ in renal function; **OB:** Use only if maternal benefit outweighs fetal risk.

Adverse Reactions/Side Effects

CNS: STROKE, SUICIDAL THOUGHTS/BEHAVIOR, $\downarrow$ attention span, anxiety, depression, insomnia, irritability, dizziness, restlessness, abnormal dreams, agitation, aggression, amnesia, disorientation, dissociation, hostility, migraine, psychomotor hyperactivity. **EENT:** blurred vision, visual disturbances. **CV:** MYOCARDIAL INFARCTION, syncope. **GI:** diarrhea, gingivitis, nausea, $\uparrow$ appetite, constipation, dyspepsia, dysphagia, enterocolitis, eructation, flatulence, gallbladder disorder, GI bleeding, $\uparrow$ liver enzymes, vomiting. **Derm:** STEVEN-JOHNSON SYNDROME, flushing, hyperhidrosis, acne, dermatitis, dry skin. **Hemat:** anemia. **MS:** arthralgia.

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

back pain, musculoskeletal pain, muscle cramps, myalgia, restless legs. **Misc:** ANGIOEDEMA, accidental injury, chills, fever, hypersensitivity, mild physical dependence.

Interactions

Drug-Drug: Smoking cessation may ↓ metabolism of theophylline, warfarin, and insulin resulting in ↑ effects; careful monitoring is recommended. Risk of adverse reactions (nausea, vomiting, dizziness, fatigue, headache) may be ↑ with nicotine replacement therapy (nicotine transdermal patches).

Route/Dosage

PO (Adults): Treatment is started one week prior to planned smoking cessation (may also begin dosing and then quit smoking between days 8 and 35 of treatment); 0.5 mg once daily on the first three days, then 0.5 mg twice daily for the next 4 days, then 1 mg twice daily.

Renal Impairment

PO (Adults): $CCr <30 \text{ mL/min}$ —0.5 mg daily, may ↑ to 0.5 mg twice daily.

Availability

Tablets: 0.5 mg, 1 mg. **Cost:** All strengths \$237.71/56.

NURSING IMPLICATIONS

Assessment

- Assess for desire to stop smoking.
- Assess for nausea. Usually dose-dependent. May require dose reduction.
- Assess mental status and mood changes, especially during initial few months of therapy and during dose changes. Risk may be increased in children, adolescents, and adults ≤ 24 yr. Inform health care professional if patient demonstrates significant increase in signs of depression (depressed mood, loss of interest in usual activities, significant change in weight and/or appetite, insomnia or hypersomnia, psychomotor agitation or retardation, increased fatigue, feelings of guilt or worthlessness, slowed thinking or impaired concentration, suicide attempt or suicidal ideation). Restrict amount of drug available to patient.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.
- **Lab Test Considerations:** May cause anemia.

Potential Nursing Diagnoses

Ineffective coping (Indications)

Implementation

- **PO:** Administer after eating with a full glass of water.

Patient/Family Teaching

- Instruct patient to take varenicline as directed. Set a date to stop smoking. Start taking varenicline 1 wk before quit date. Begin with 0.5 mg/day for the first 3 days, then for the next 4 days take one 0.5 mg tablet in the morning and in the evening. After first 7 days, increase to 1 mg tablet in the morning and evening. Advise patient to read *Medication Guide* before starting therapy.
- Encourage patient to attempt to quit, even if they had early lapses after quit day.
- Advise patient to stop taking varenicline and contact health care professional promptly if agitation, depressed mood, any changes in behavior that are not typical of nicotine withdrawal, or if suicidal thoughts or behavior; rash with mucosal lesions or skin reaction, or chest pain, pressure, or dyspnea occur.
- Provide patient with educational materials and counseling to support attempts to quit smoking.
- Caution patient not to share varenicline with others. May be harmful.
- May cause blurred vision, dizziness, and disturbance in attention. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Inform patient that nausea, insomnia, and vivid, unusual, or strange dreams may occur and are usually transient. Advise patient to notify health care professional if these symptoms are persistent and bothersome; dose reduction may be considered.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications. Inform patient that some medications may require dose adjustments after quitting smoking.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Smoking cessation. Patients who have successfully stopped smoking at the end of 12 wk, should take an additional 12 wk course to increase the likelihood of long-term abstinence. Patients who do not succeed in stopping smoking during 12 wk of initial therapy or who relapse after treatment, should be encouraged to make another attempt once factors contributing to the failed attempt have been identified and addressed.

vasopressin (vay-soe-press-in)
Pitressin, ★ Pressyn

Classification

Therapeutic: hormones

Pharmacologic: antidiuretic hormones

Pregnancy Category C

Indications

Central diabetes insipidus due to deficient antidiuretic hormone. **Unlabeled Use:** Management of pulseless VT/VF unresponsive to initial shocks, asystole, or pulseless electrical activity (PEA) (ACLS guidelines). Vasodilatory shock. Gastrointestinal hemorrhage.

Action

Alters the permeability of the renal collecting ducts, allowing reabsorption of water. Directly stimulates musculature of GI tract. In high doses acts as a nonadrenergic peripheral vasoconstrictor. **Therapeutic Effects:** Decreased urine output and increased urine osmolality in diabetes insipidus.

Pharmacokinetics

Absorption: IM absorption may be unpredictable.

Distribution: Widely distributed throughout extracellular fluid.

Metabolism and Excretion: Rapidly degraded by the liver and kidneys; <5% excreted unchanged by the kidneys.

Half-life: 10–20 min.

TIME/ACTION PROFILE (antidiuretic effect)

ROUTE	ONSET	PEAK	DURATION
IM, subcut	unknown	unknown	2–8 hr
IV	unknown	unknown	30–60 min

Contraindications/Precautions

Contraindicated in: Chronic renal failure with increased BUN; Hypersensitivity to beef or pork proteins.

Use Cautiously in: Perioperative polyuria (increased sensitivity to vasopressin); Comatose patients; Seizures; Migraine headaches; Asthma; Heart failure; Cardiovascular disease; Renal impairment; **Pedi, Geri:** ↑ sensitivity to vasopressin effects.

Adverse Reactions/Side Effects

CNS: dizziness, “pounding” sensation in head. **CV:** MI, angina, chest pain. **GI:** abdominal cramps, belching, diarrhea, flatulence, heartburn, nausea, vomiting.

Derm: paleness, perioral blanching, sweating.

Neuro: trembling. **Misc:** allergic reactions, fever, water intoxication (higher doses).

Interactions

Drug-Drug: Antidiuretic effect may be ↓ by concurrent administration of alcohol, lithium, demeclocycline, heparin, or norepinephrine. Antidiuretic effect may be ↑ by concurrent administration of carbamazepine, chlorpropamide, clofibrate, tricyclic antidepressants, or fludrocortisone. Vasoconstrictor effect may be ↑ by concurrent administration of ganglionic blocking agents.

Route/Dosage

Diabetes insipidus

IM, Subcut (Adults): 5–10 units 2–4 times daily.

IM, Subcut (Children): 2.5–10 units 2–4 times daily.

IV (Adults and Children): 0.0005 units/kg/hr, double dose q 30 min as needed to a maximum of 0.01 units/kg/hr.

Pulseless VT/VF, Asystole, or PEA (ACLS guidelines)

IV (Adults): 40 units as a single dose (unlabeled).

IV (Children): 0.4 units/kg after resuscitation and at least 2 doses of epinephrine.

Vasodilatory shock

IV (Adults): 0.01–0.1 units/min, titrate to effect.

IV (Infants and Children): 0.0003–0.002 units/kg/min, titrate to effect.

GI Hemorrhage

IV (Adults): 0.2–0.4 units/min then titrate to maximum dose of 0.9 units/min; if bleeding stops continue same dose for 12 hr then taper off over 24–48 hr.

IV (Children): 0.002–0.005 units/kg/min then titrate to maximum dose of 0.01 units/kg/min; if bleeding stops continue same dose for 12 hr then taper off over 24–48 hr.

Availability (generic available)

Injection: 20 units/mL.

NURSING IMPLICATIONS

Assessment

- **Monitor BP, HR, and ECG periodically throughout therapy and continuously throughout cardiopulmonary resuscitation.**
- **Diabetes Insipidus:** Monitor urine osmolality and urine volume frequently to determine effects of medication. Assess patient for symptoms of dehydration (excessive thirst, dry skin and mucous membranes, tachycardia, poor skin turgor). Weigh patient daily, monitor intake and output, and assess for edema.
- **Lab Test Considerations:** Monitor urine specific gravity throughout therapy.
- Monitor serum electrolyte concentrations periodically during therapy.
- **Toxicity and Overdose:** Signs and symptoms of water intoxication include confusion, drowsiness, headache, weight gain, difficulty urinating, seizures, and coma.
- Treatment of overdose includes water restriction and temporary discontinuation of vasopressin until polyuria occurs. If symptoms are severe, adminis-

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

tration of mannitol, hypertonic dextrose, urea, and/or furosemide may be used.

Potential Nursing Diagnoses

Deficient fluid volume (Indications)

Excess fluid volume (Adverse Reactions)

Implementation

- Aqueous vasopressin injection may be administered subcut or IM for diabetes insipidus.
- Administer 1–2 glasses of water at the time of administration to minimize side effects (blanching of skin, abdominal cramps, nausea).

IV Administration

- **pH:** 2.5–4.5.
- **Direct IV: Diluent:** Administer undiluted. **Concentration:** 20 units/mL. **Rate:** Administer over 1–2 sec during pulseless VT/VF, asystole, or PEA.
- **Continuous Infusion: Diluent:** Dilute 100 units of vasopressin in 250 mL of 0.9% NaCl or D5W. **Concentration:** 0.4 units/mL. **Rate:** See Route/Dosage section.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, azathioprine, azithromycin, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate, carboplatin, carbmustine, cefepime, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, irinotecan, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechloroethamine, melphalan, meperidine, meropenem, metaraminol, methohexital, methotrexate, methoxamine, methyl-dopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, mitoxandron, morphine, moxifloxacin, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglyc-

erin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pantoprazole, papaverine, penicillin G, pentamidine, pentazocine, phenobarbital, phenolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxime, quinupristin/dalfopristin, ranitidine, remifentanyl, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, telavancin, teniposide, theophylline, thiamine, thiopental, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolasoline, trimetaphan, vancomycin, vecuronium, verapamil, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** amphotericin B colloidal, amphotericin B lipid complex, dantrolene, diazepam, diazoxide, indomethacin, pemetrexed, phenytoin.

Patient/Family Teaching

- Instruct patient to take medication as directed. Caution patient not to use more than prescribed amount. Take missed doses as soon as remembered, unless almost time for next dose.
- Advise patient to drink 1–2 glasses of water at time of administration to minimize side effects (blanching of skin, abdominal cramps, nausea). Inform patient that these side effects are not serious and usually disappear in a few minutes.
- Caution patient to avoid concurrent use of alcohol while taking vasopressin.
- Patients with diabetes insipidus should carry identification at all times describing disease process and medication regimen.

Evaluation/Desired Outcomes

- Decrease in urine volume.
- Relief of polydipsia.
- Increased urine osmolality in patients with central diabetes insipidus.
- Resolution of VT/VF.
- Improvement in signs of septic shock.

 **vemurafenib**
(vem-u-raf-e-nib)
Zelboraf

Classification

Therapeutic: antineoplastics

Pharmacologic: kinase inhibitors

Pregnancy Category D

Indications

☞ Treatment of unresectable or metastatic melanoma with BRAF ^{V600E} mutation.

Action

Inhibits mutated forms of the enzyme kinase. Inhibits proliferation that occurs in conjunction with activated BRAF proteins. **Therapeutic Effects:** Decreased spread of melanoma.

Pharmacokinetics

Absorption: Some absorption follows oral administration, bioavailability is not known.

Distribution: Unknown.

Protein Binding: >99%.

Metabolism and Excretion: Mostly metabolized by the liver (mostly by the CYP3A4 enzyme system), 1% eliminated in urine.

Half-life: 57 hr (range 30–120 hr).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	3 hr	12 hr

Contraindications/Precautions

Contraindicated in: **OB:** Should not be used during pregnancy, may cause fetal harm; **Lactation:** Breast feeding should be avoided; None noted.

Use Cautiously in: Pre-existing severe hepatic or renal impairment; **Geri:** Increased risk of cutaneous squamous cell carcinoma, nausea, decreased appetite, peripheral edema, keratoacanthoma and atrial fibrillation; Concurrent use of strong inducers/inhibitors of the CYP3A4 enzyme system or drugs that are substrates of CYP3A4, CYP1A2 or CYP2D6 enzyme systems; monitoring of effects and necessary dose adjustments may be necessary; **OB:** Patients with child-bearing potential; **Pedi:** safe and effective use in children <18 yr has not been established.

Adverse Reactions/Side Effects

CNS: fatigue, weakness, headache. **BENT:** iritis, retinal vein occlusion, uveitis. **Resp:** cough. **CV:** QTc prolongation, peripheral edema. **GI:** HEPATOTOXICITY, ↓ appetite, dysgeusia, nausea. **Derm:** **MALIGNANCY**, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, alopecia, dry skin, rash (↑ in females), pruritus, rash, photosensitivity (↑ in females), skin papilloma, keratoacanthoma (↑ in males). **GU:** ↑ creatinine (↑ in females). **MS:** arthralgia (↑ in females), myalgia, back pain, musculoskeletal pain. **Misc:** hypersensitivity reactions including ANAPHYLAXIS, fever.

Interactions

Drug-Drug: Concurrent use with agents with narrow therapeutic indices that are metabolized by

the CYP1A2 enzyme systems not recommended.

Consider dose ↓ of substrates. Strong CYP3A inhibitors, including atazanavir, clarithromycin, indinavir, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, saquinavir, telithromycin and voriconazole may ↑ levels and effects; avoid concurrent use. Strong inducers of CYP3A4 including carbamazepine, phenobarbital, phenytoin, rifabutin, rifampin, rifapentine may ↓ levels and effectiveness; avoid concurrent use. May ↑ risk of bleeding with warfarin. Concurrent use with ipilimumab may ↑ risk of hepatotoxicity.

Route/Dosage

PO (Adults): 960 mg twice daily. Treatment should continue until unacceptable toxicity or disease progression occurs.

Availability

Tablets: 240 mg.

NURSING IMPLICATIONS

Assessment

- Perform dermatologic evaluation prior to initiation and every 2 mo during therapy. Excise any suspicious lesions, send for dermapathologic evaluation, and treat with standard care. Continue monitoring for 6 mo following discontinuation of therapy.
- Monitor ECG 15 days after initiation of therapy, monthly during first 3 mo, every 3 mo thereafter, and more often if clinically indicated.
- Monitor for hypersensitivity reactions (rash, erythema, hypotension). Permanently discontinue therapy if severe reaction occurs.
- Monitor for signs and symptoms of uveitis periodically during therapy. May require treatment with steroid and mydriatic ophthalmic drops.
- Assess patient for rash (mild to moderate rash usually occurs in the 2nd wk of therapy and resolves within 1–2 wk of continued therapy). If rash is severe (extensive erythematous or maculopapular rash with moist desquamation or angioedema) or accompanied by systemic symptoms (serum sickness-like reaction, Stevens-Johnson syndrome, toxic epidermal necrolysis), therapy must be discontinued immediately.
- **Lab Test Considerations:** Monitor serum potassium, magnesium, and calcium before starting therapy and after dose modification.
- Monitor AST, ALT, alkaline phosphatase, and bilirubin before starting therapy, monthly during therapy, and as clinically indicated. May require dose reduction, treatment interruption or discontinuation.

Potential Nursing Diagnoses

Impaired skin integrity (Indications)

☞ = Canadian drug name. ☞ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Implementation

- **PO:** Administer (four 240 mg tablets) twice daily, without regard to food. Take first dose in the morning with second dose about 12 hrs later. Swallow tablets whole, do not crush or chew.
- Adverse reactions or QTc prolongation may occur requiring dose modification. *If Grade 1 or 2 (tolerable) occur*, maintain dose at 960 mg twice daily. *If Grade 2 (Intolerable) or Grade 3, 1st appearance occurs*, interrupt therapy until Grade 0–1. Resume dosing at 720 mg twice daily. *If 2nd appearance occurs*, interrupt therapy until Grade 0–1. Resume dosing at 480 mg twice daily. *If 3rd appearance occurs*, discontinue permanently. *If Grade 4, 1st appearance occurs*, discontinue permanently or interrupt therapy until Grade 0–1. Resume dosing at 480 mg twice daily. *If 2nd appearance occurs*, discontinue permanently. Doses below 480 mg twice daily are not recommended.

Patient/Family Teaching

- Instruct patient to take venlafaxine as directed. Take missed doses as soon as remembered up to 4 hrs before next dose; do not double dose.
- **⚠** Inform patient that assessment of BRAF mutation is required for selection of patients.
- Instruct patient to stop taking venlafaxine and notify health care professional immediately if signs and symptoms of allergic reaction (rash or redness all over body; feeling faint; difficulty breathing or swallowing; throat tightness or hoarseness; fast heartbeat; swelling of face, lips, or tongue) or severe skin reactions (blisters on skin; blisters or sores in mouth; peeling of skin, fever, redness or swelling of face, hands, or soles of feet) occur.
- Advise patient to wear broad spectrum UVA/UVB sunscreen, lip balm (SPF ≥ 30) and protective clothing, and to avoid sun exposure to prevent photosensitivity reactions. Severe photosensitivity reactions may require dose modifications.
- Advise patient to notify health care professional if signs and symptoms of liver dysfunction (yellow skin or whites of eyes; feeling tired; urine turns dark or brown; nausea or vomiting; loss of appetite; pain on right side of stomach) or eye problems (eye pain, swelling, or redness; blurred vision; vision changes) occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Inform patient that regular assessments of skin and assessments for signs and symptoms of other malignancies must be done during and for up to 6 mo after therapy. Advise patient to notify health care professional immediately if any changes in skin occur.
- Advise women of childbearing potential and men to use appropriate contraceptive measures during and

for at least 2 mo after discontinuation of vemurafenib, and to avoid breast feeding.

Evaluation/Desired Outcomes

- Decreased spread of melanoma.

venlafaxine (ven-la-fax-een) Effexor, Effexor XR

Classification

Therapeutic: antidepressants, antianxiety agents
Pharmacologic: selective serotonin/norepinephrine reuptake inhibitors

Pregnancy Category C

Indications

Major depressive disorder. Generalized anxiety disorder (Effexor XR only). Social anxiety disorder (Effexor XR only). Panic disorder (Effexor XR only). **Unlabeled Use:** Premenstrual dysphoric disorder.

Action

Inhibits serotonin and norepinephrine reuptake in the CNS. **Therapeutic Effects:** Decrease in depressive symptomatology, with fewer relapses/recurrences. Decreased anxiety. Decrease in panic attacks.

Pharmacokinetics

Absorption: 92–100% absorbed after oral administration.

Distribution: Extensive distribution into body tissues.

Metabolism and Excretion: Extensively metabolized on first pass through the liver (primarily through CYP2D6 enzyme pathway). **⚠** A small percentage of the population are poor metabolizers and will have higher blood levels with $\uparrow$ effects. One metabolite, O-desmethylenlafaxine (ODV), has antidepressant activity; 5% of venlafaxine is excreted unchanged in urine; 30% of the active metabolite is excreted in urine.

Half-life: Venlafaxine—3–5 hr; ODV—9–11 hr (both are $\uparrow$ in hepatic/renal impairment).

TIME/ACTION PROFILE (antidepressant action)

ROUTE	ONSET	PEAK	DURATION
PO	within 2 wk	2–4 wk	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of MAO inhibitors or MAO-like drugs (linezolid or methylene blue);.

Use Cautiously in: Cardiovascular disease, including hypertension; Hepatic impairment ($\downarrow$ dose recommended); Impaired renal function ($\downarrow$ dose recommended); History of seizures or neurologic impairment; History of mania; History of $\uparrow$ intraocular

pressure or angle-closure glaucoma; History of drug abuse; **OB:** Use only if clearly required, weighing benefit to mother versus potential harm to fetus (potential for discontinuation syndrome or toxicity in the neonate when venlafaxine is taken during the 3rd trimester); **Lactation:** Potential for serious adverse reactions in infant; discontinue drug or discontinue breast feeding; **Pedi:** ↑ risk of suicidal thinking and behavior (suicidality) in children and adolescents with major depressive disorder and other psychiatric disorders. Observe closely for suicidality and behavior changes.

Adverse Reactions/Side Effects

CNS: **NEUROLEPTIC MALIGNANT SYNDROME**, **SEIZURES**, **SUICIDAL THOUGHTS**, abnormal dreams, anxiety, dizziness, headache, insomnia, nervousness, weakness, abnormal thinking, agitation, confusion, depersonalization, drowsiness, emotional lability, worsening depression. **EENT:** rhinitis, visual disturbances, epistaxis, tinnitus. **CV:** chest pain, hypertension, palpitations, tachycardia. **GI:** abdominal pain, altered taste, anorexia, constipation, diarrhea, dry mouth, dyspepsia, nausea, vomiting, weight loss. **GU:** sexual dysfunction, urinary frequency, urinary retention. **Derm:** eczymoses, itching, photosensitivity, skin rash. **Neuro:** paresthesia, twitching. **Misc:** **SEROTONIN SYNDROME**, chills, bleeding, yawning.

Interactions

Drug-Drug: Concurrent use with **MAO inhibitors** may result in serious, potentially fatal reactions (wait at least 2 wk after stopping MAO inhibitor before initiating venlafaxine; wait at least 1 wk after stopping venlafaxine before starting MAO inhibitors). Concurrent use with **MAO-inhibitor like drugs**, such as **linezolid** or **methylene blue** may ↑ risk of serotonin syndrome; concurrent use contraindicated; do not start therapy in patients receiving **linezolid** or **methylene blue**; if **linezolid** or **methylene blue** need to be started in a patient receiving venlafaxine, immediately discontinue venlafaxine and monitor for signs/symptoms of serotonin syndrome for 2 wk or until 24 hr after last dose of linezolid or methylene blue, whichever comes first (may resume venlafaxine therapy 24 hr after last dose of linezolid or methylene blue). Concurrent use with **alcohol** or other **CNS depressants**, including **sedatives/hypnotics**, **antihistamines**, and **opioid analgesics** in depressed patients is not recommended. Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SNRIs**, **fentanyl**, **buspirone**, **tramadol** and **triptans** ↑ risk of serotonin syndrome. **Lithium** may have ↑ serotonergic effects with venlafaxine; use cautiously in patients receiving venlafaxine. ↑ blood levels and may ↑ effects of **desipramine** and **haloperidol**. **Gimeticidine** may ↑ the effects of venlafaxine (may be

more pronounced in geriatric patients, those with hepatic or renal impairment, or those with pre-existing hypertension). **Ketoconazole** may ↑ the effects of venlafaxine. ↑ risk of bleeding with **NSAIDs**, **aspirin**, **clopidogrel**, or **warfarin**.

Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, **chamomile**, or **hops** can ↑ CNS depression. ↑ risk of serotonergic side effects including serotonin syndrome with **St. John's wort** and **SAMe**.

Route/Dosage

Major Depressive Disorder

PO (Adults): *Tablets* — 75 mg/day in 2–3 divided doses; may ↑ by up to 75 mg/day every 4 days, up to 225 mg/day (not to exceed 375 mg/day in 3 divided doses); *Extended-release (XR) capsules* — 75 mg once daily (some patients may be started at 37.5 mg once daily) for 4–7 days; may ↑ by up to 75 mg/day at intervals of not less than 4 days (not to exceed 225 mg/day).

General Anxiety Disorder

PO (Adults): *Extended-release (XR) capsules* — 75 mg once daily (some patients may be started at 37.5 mg once daily) for 4–7 days; may ↑ by up to 75 mg/day at intervals of not less than 4 days (not to exceed 225 mg/day).

Social Anxiety Disorder

PO (Adults): *Extended-release (XR) capsules* — 75 mg once daily.

Panic Disorder

PO (Adults): *Extended-release (XR) capsules* — 37.5 mg once daily for 7 days; may then ↑ to 75 mg once daily; may then ↑ by 75 mg/day every 7 days (not to exceed 225 mg/day).

Hepatic Impairment

PO (Adults): ↓ daily dose by 50% in patients with mild-to-moderate hepatic impairment.

Renal Impairment

PO (Adults): *CCr 10–70 mL/min* — ↓ daily dose by 25–50%; *Hemodialysis* — ↓ daily dose by 50%.

Availability (generic available)

Tablets: 25 mg, 37.5 mg, 50 mg, 75 mg, 100 mg. **Cost:** *Generic* — 25 mg \$32.24/100, 37.5 mg \$39.41/100, 75 mg \$38.00/100. **Extended-release capsules:** 37.5 mg, 75 mg, 150 mg. **Cost:** *Generic* — 37.5 mg \$32.14/90, 75 mg \$271.37/100, 150 mg \$29.94/100.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

NURSING IMPLICATIONS

Assessment

- Assess mental status and mood changes. Inform health care professional if patient demonstrates significant increase in anxiety, nervousness, or insomnia.
- Assess suicidal tendencies, especially in early therapy. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤ 24 yr.
- Monitor BP before and periodically during therapy. Sustained hypertension may be dose-related; decrease dose or discontinue therapy if this occurs.
- Monitor appetite and nutritional intake. Weigh weekly. Report continued weight loss. Adjust diet as tolerated to support nutritional status.
- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyper-reflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).
- **Lab Test Considerations:** Monitor CBC with differential and platelet count periodically during therapy. May cause anemia, leukocytosis, leukopenia, thrombocytopenia, basophilia, and eosinophilia.
- May cause an $\uparrow$ in serum alkaline phosphatase, bilirubin, AST, ALT, BUN, and creatinine.
- May also cause $\uparrow$ serum cholesterol.
- May cause electrolyte abnormalities (hyperglycemia or hypoglycemia, hyperkalemia or hypokalemia, hyperuricemia, hyperphosphatemia or hypophosphatemia, and hyponatremia).
- May cause false-positive immunoassay screening tests for phenylcyclidine (PCP) and amphetamine.

Potential Nursing Diagnoses

Ineffective coping (Indications)

Risk for injury (Side Effects)

Implementation

- **Do not confuse Effexor with Effexor XR.**
- **PO:** Administer venlafaxine with food.
- Extended-release capsules should be swallowed whole; do not crush, break, or chew.
- Extended-release capsules may be opened and contents sprinkled on a spoonful of applesauce. Take immediately and follow with a glass of water. Do not store mixture for later use.

Patient/Family Teaching

- Instruct patient to take venlafaxine as directed at the same time each day. Take missed doses as soon as possible unless almost time for next dose. Do not double doses or discontinue abruptly. Patients taking venlafaxine for >6 wk should have dose gradually decreased before discontinuation.

- Advise patient, family, and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide; new or worse depression or anxiety; agitation or restlessness; panic attacks; insomnia; new or worse irritability; aggressiveness; acting on dangerous impulses, mania, or other changes in mood or behavior or if symptoms of serotonin syndrome occur.
- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to the drug is known.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications. Caution patient to avoid taking alcohol or other CNS-depressant drugs during therapy.
- Instruct patient to notify health care professional if signs of allergy (rash, hives) occur.
- Instruct female patients to inform health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the importance of follow-up exams to monitor progress. Encourage patient participation in psychotherapy.

Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings. Need for therapy should be periodically reassessed. Therapy is usually continued for several months.
- Decreased anxiety.

verapamil (ver-ap-a-mil)

Calan, Calan SR, Isoptin SR, Verelan, Verelan PM

Classification

Therapeutic: antianginals, antiarrhythmics (class IV), antihypertensives, vascular headache suppressants

Pharmacologic: calcium channel blockers

Pregnancy Category C

Indications

Management of hypertension, angina pectoris, and/or vasospastic (Prinzmetal's) angina. Management of supraventricular arrhythmias and rapid ventricular rates in atrial flutter or fibrillation. **Unlabeled Use:** Prevention of migraine headache.

Action

Inhibits the transport of calcium into myocardial and vascular smooth muscle cells, resulting in inhibition of excitation-contraction coupling and subsequent contraction. Decreases SA and AV conduction and pro-

longs AV node refractory period in conduction tissue.

Therapeutic Effects: Systemic vasodilation resulting in decreased BP. Coronary vasodilation resulting in decreased frequency and severity of attacks of angina. Reduction of ventricular rate during atrial fibrillation or flutter.

Pharmacokinetics

Absorption: 90% absorbed after oral administration, but much is rapidly metabolized, resulting in bioavailability of 20–25%.

Distribution: Small amounts enter breast milk.

Protein Binding: 90%.

Metabolism and Excretion: Mostly metabolized by the liver (primarily by CYP3A4).

Half-life: 4.5–12 hr.

TIME/ACTION PROFILE (cardiovascular effects)

ROUTE	ONSET	PEAK	DURATION
PO	1–2 hr	30–90 min†	3–7 hr
PO-ER	unknown	5–7 hr	24 hr
IV	1–5 min‡	3–5 min	2 hr‡

†Single dose; effects from multiple doses may not be evident for 24–48 hr.

‡Antiarrhythmic effects; hemodynamic effects begin 3–5 min after injection and persist for 10–20 min.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Sick sinus syndrome; 2nd- or 3rd-degree AV block (unless an artificial pacemaker is in place); Systolic BP <90 mm Hg; HF, severe ventricular dysfunction, or cardiogenic shock, unless associated with supraventricular tachyarrhythmias; Concurrent IV beta blocker therapy.

Use Cautiously in: Severe hepatic impairment (dose ↓ recommended); History of serious ventricular arrhythmias or HF; **Geri:** Dose ↓/slower IV infusion rates recommended (↑ risk of hypotension); **OB, Lactation:** Safety not established.

Adverse Reactions/Side Effects

CNS: abnormal dreams, anxiety, confusion, dizziness/lightheadedness, drowsiness, extrapyramidal reactions, headache, jitteriness, nervousness, psychiatric disturbances, weakness. **EENT:** blurred vision, disturbed equilibrium, epistaxis, tinnitus. **Resp:** cough, dyspnea, shortness of breath. **CV:** **ARRHYTHMIAS**, **HF**, bradycardia, chest pain, hypotension, palpitations, peripheral edema, syncope, tachycardia. **GI:** ↑ liver enzymes, anorexia, constipation, diarrhea, dry mouth, dysgeusia, dyspepsia, nausea, vomiting. **GU:** dysuria, nocturia, polyuria, sexual dysfunction, urinary frequency. **Derm:** **STEVENS-JOHNSON SYNDROME**, dermatitis, erythema multiforme, flushing, photosensitivity,

pruritus/urticaria, rash, sweating. **Endo:** gynecomastia, hyperglycemia. **Hemat:** anemia, leukopenia, thrombocytopenia. **Metab:** weight gain. **MS:** joint stiffness, muscle cramps. **Neuro:** paresthesia, tremor. **Misc:** gingival hyperplasia.

Interactions

Drug-Drug: Additive hypotension may occur when used concurrently with **fentanyl**, other **anti-hypertensives**, **nitrates**, acute ingestion of **alcohol**, or **quinidine**. Antihypertensive effects may be ↓ by concurrent use of **NSAIDs**. Serum **digoxin** levels may be ↑. Concurrent use with **beta blockers**, **digoxin**, **disopyramide**, **clonidine**, or **phenytoin** may result in bradycardia, conduction defects, or HF. ↑ risk of hypotension and bradycardia with **erythromycin**, **clarithromycin**, **telithromycin**, or **ritonavir**. May ↓ metabolism of and ↑ risk of toxicity from **cyclosporine**, **prazosin**, **quinidine**, or **carbamazepine**. May ↓ effectiveness of **rifampin**. ↑ the muscle-paralyzing effects of **nondepolarizing neuromuscular-blocking agents**. Effectiveness may be ↓ by coadministration with **vitamin D compounds** and **calcium**. May alter serum **lithium** levels. May ↑ **doxorubicin** and **paclitaxel** levels. May ↑ risk of bleeding with **aspirin**.

Drug-Natural Products: ↑ **caffeine** levels with caffeine-containing herbs (**cola nut**, **guarana**, **mate**, **tea**, **coffee**).

Drug-Food: **Grapefruit juice** ↑ serum levels and effect.

Route/Dosage

PO (Adults): 80–120 mg 3 times daily, ↑ as needed.

Patients with hepatic impairment or geriatric patients—40 mg 3 times daily initially. *Extended-release preparations*—120–240 mg/day as a single dose; may be ↑ as needed (range 240–480 mg/day).

PO (Children up to 15 yr): 4–8 mg/kg/day in divided doses.

IV (Adults): 5–10 mg (75–150 mcg/kg); may repeat with 10 mg (150 mcg/kg) after 15–30 min.

IV (Children 1–15 yr): 2–5 mg (100–300 mcg/kg); may repeat after 30 min (initial dose not to exceed 5 mg; repeat dose not to exceed 10 mg).

IV (Children <1 yr): 0.75–2 mg (100–200 mcg/kg); may repeat after 30 min.

Availability (generic available)

Tablets: 40 mg, 80 mg, 120 mg. **Cost:** *Generic*—40 mg \$21.85/100, 80 mg \$10.83/100. **Extended-release tablets (Isoptin SR):** 120 mg, 180 mg, 240 mg. **Cost:** *Generic*—120 mg \$31.44/100, 180 mg \$35.98/100, 240 mg \$27.80/100. **Extended-release capsules (Verelan PM):** 100 mg, 200 mg, 300 mg. **Cost:** *Generic*—100 mg \$195.84/100, 200 mg

★ = Canadian drug name. † = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

\$252.23/100, 300 mg \$366.98/100. **Extended-release capsules (Verelan):** 120 mg, 180 mg, 240 mg, 360 mg. **Cost:** *Generic*—120 mg \$130.25/100, 180 mg \$135.16/100, 240 mg \$152.54/100, 360 mg \$209.94/100. **Solution for injection:** 2.5 mg/mL. **In combination with:** trandolapril (Tarka); see Appendix B.

NURSING IMPLICATIONS

Assessment

- Monitor BP and pulse before therapy, during dosage titration, and periodically throughout therapy. **Monitor ECG periodically during prolonged therapy.** Verapamil may cause prolonged PR interval.
- Monitor intake and output ratios and daily weight. Assess for signs of HF (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention).
- Patients receiving digoxin concurrently with calcium channel blockers should have routine serum digoxin levels and be monitored for signs and symptoms of digoxin toxicity.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.
- **Angina:** Assess location, duration, intensity, and precipitating factors of patient's anginal pain.
- **Arrhythmias:** Monitor ECG continuously during administration. Notify health care professional promptly if bradycardia or prolonged hypotension occurs. Emergency equipment and medication should be available. Monitor BP and pulse before and frequently during administration.
- **Lab Test Considerations:** Total serum calcium concentrations are not affected by calcium channel blockers.
- Monitor serum potassium periodically. Hypokalemia ↑ risk of arrhythmias and should be corrected.
- Monitor renal and hepatic functions periodically during long-term therapy. May cause ↑ hepatic enzymes after several days of therapy, which return to normal on discontinuation of therapy.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)

Acute pain (Indications)

Implementation

- **PO:** Administer verapamil with meals or milk to minimize gastric irritation.
- Do not open, crush, break, or chew sustained-release capsules or tablets. Empty tablets that appear in stool are not significant.

IV Administration

- **IV:** Patients should remain recumbent for at least 1 hr after IV administration to minimize hypotensive effects.
- **Direct IV:** **Diluent:** Administer undiluted. **Concentration:** 2.5 mg/mL. **Rate:** Administer over 2 min. **Geri:** Administer over 3 min.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, amikacin, aminocaproic acid, amphotericin B lipid complex, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, aztreonam, benzotropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftriaxone, cefuroxime, chlorpromazine, ciprofloxacin, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, enalaprilat, epinephrine, epinephrine, epirubicin, epotein alfa, eptifibatide, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone sodium succinate, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, metaraminol, methotrexate, methyl dopate, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, multivitamins, mycophenolate, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, palcitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine, pentazocine, phentolamine, phenylephrine, phytonadione, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxime, quinuapristin/dalfopristin, ranitidine, rocuronium, sodium acetate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, ticarcillin/clavulanate, tirofiban, tobramycin, tolazoline, vancomycin, vasopressin, vecuronium, vinblastine, vincristine, vinorelbine, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** acyclovir, albumin, aminophylline, amphotericin B cholesteryl, amphotericin B colloidal, amphotericin B liposome, ampicillin, ampicillin/sulbactam, azathioprine,

cefoperazone, ceftazidime, chloramphenicol, dantrolene, diazepam, diazoxide, ertapenem, fluoro-uracil, folic acid, foscarnet, furosemide, ganciclovir, indomethacin, pantoprazole, pentobarbital, phenobarbital, phenytoin, piperacillin/tazobactam, propofol, sodium bicarbonate, thiotepa, tigecycline, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Advise patient to take medication as directed, even if feeling well. Take missed doses as soon as possible unless almost time for next dose; do not double doses. May need to be discontinued gradually.
- Advise patient to avoid large amounts (6–8 glasses of grapefruit juice/day) during therapy.
- Instruct patient on correct technique for monitoring pulse. Instruct patient to contact health care professional if heart rate is <50 bpm.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Instruct patient on importance of maintaining good dental hygiene and seeing dentist frequently for teeth cleaning to prevent tenderness, bleeding, and gingival hyperplasia (gum enlargement).
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially cold preparations.
- Advise patient to notify health care professional if irregular heartbeats, rash, dyspnea, swelling of hands and feet, pronounced dizziness, nausea, constipation, or hypotension occurs or if headache is severe or persistent.
- Caution patient to wear protective clothing and use sunscreen to prevent photosensitivity reactions.
- **Angina:** Instruct patient on concurrent nitrate or beta-blocker therapy to continue taking both medications as directed and use SL nitroglycerin as needed for anginal attacks.
- Advise patient to contact health care professional if chest pain does not improve, worsens after therapy, or occurs with diaphoresis; if shortness of breath occurs; or if severe, persistent headache occurs.
- Caution patient to discuss exercise restrictions with health care professional before exertion.
- **Hypertension:** Encourage patient to comply with other interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol consumption, regular exercise, and stress management). Medication controls but does not cure hypertension.

- Instruct patient and family in proper technique for monitoring BP. Advise patient to take BP weekly and to report significant changes to health care professional.

Evaluation/Desired Outcomes

- Decrease in BP.
- Decrease in frequency and severity of anginal attacks.
- Decrease in need for nitrate therapy.
- Increase in activity tolerance and sense of well-being.
- Suppression and prevention of atrial tachyarrhythmias.

REMS

vigabatrin (vye-gah-bat-rin)
Sabril

Classification

Therapeutic: anticonvulsants

Pregnancy Category C

Indications

Management (adjunctive) of refractory complex partial seizures in patients who have responded inadequately to several alternative treatments (and where potential benefit outweighs risk of vision loss); not a first-line treatment. Management of infantile spasms (IS).

Action

Acts an irreversible inhibitor of γ -aminobutyric acid transaminase (GABA-T), the enzyme responsible for the metabolism of the inhibitory neurotransmitter GABA. This action results in increased levels of GABA in the central nervous system. **Therapeutic Effects:** Decreased incidence and severity of refractory complex partial seizures.

Pharmacokinetics

Absorption: Completely absorbed following oral administration.

Distribution: Enters breast milk, remainder of distribution unknown.

Protein Binding: None.

Metabolism and Excretion: Minimal metabolism, mostly eliminated unchanged in urine.

Half-life: 7.5 hr.

TIME/ACTION PROFILE (anticonvulsant effect)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1 hr†	12 hr‡

†blood level

‡clinical benefit should be seen in 2–4 week for IS or within 3 mo for complex partial seizures

★ = Canadian drug name. ‡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Contraindications/Precautions

Contraindicated in: History or high risk of other types of irreversible vision loss unless benefits of treatment clearly outweigh risks; **OB:** Use only if the potential benefit justifies the potential risk to the fetus (may cause fetal harm); **Lactation:** Enters breast milk; breast feeding should be avoided.

Use Cautiously in: Renal impairment (dose modification recommended for $\text{CCr} < 50 \text{ mL/min}$); History of suicidal ideation; **Geri:** Consider age-related $\downarrow$ in renal function adjust dose accordingly ($\uparrow$ risk of sedation/confusion); **Pedi:** Abnormal MRI signal changes have been seen in infants.

Adverse Reactions/Side Effects

CNS: SUICIDAL THOUGHTS, confusional state, memory impairment, drowsiness, fatigue. **CV:** edema. **Derm:** STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS. **EENT:** blurred vision, nystagmus, vision loss.

Hemat: anemia. **Metab:** weight gain. **MS:** arthralgia. **Neuro:** abnormal coordination, tremor, peripheral neuropathy.

Interactions

Drug-Drug: Should not be used concurrently with other drugs having adverse ocular effects; $\uparrow$ risk of additive toxicity. May $\downarrow$ phenytoin levels and effectiveness.

Route/Dosage

Refractory Complex Partial Seizures

PO (Adults and Children $>16 \text{ yr}$): 500 mg twice daily initially, may be $\uparrow$ in 500 mg increments every 7 days depending on response up to 1500 mg twice daily.

PO (Children $10\text{--}16 \text{ yr}$ and $>60 \text{ kg}$): 500 mg twice daily initially, may be $\uparrow$ in 500 mg increments every 7 days depending on response up to 1500 mg twice daily.

PO (Children $10\text{--}16 \text{ yr}$ and $25\text{--}60 \text{ kg}$): 250 mg twice daily initially, may be $\uparrow$ every 7 days depending on response up to 1000 mg twice daily.

Renal Impairment

PO (Adults and Children $\geq 10 \text{ yr}$ and $\geq 25 \text{ kg}$): $\text{CCr} > 50\text{--}80 \text{ mL/min}$ — $\downarrow$ dose by 25%; $\text{CCr} > 30\text{--}50 \text{ mL/min}$ — $\downarrow$ dose by 50%; $\text{CCr} > 10\text{--}30 \text{ mL/min}$ — $\downarrow$ dose by 75%.

Infantile Spasms

PO (Children $1 \text{ mo--}2 \text{ yr}$): 50 mg/kg/day given in 2 divided doses initially, $\uparrow$ by 25–50 mg/kg/day increments every 3 days up to a maximum of 150 mg/kg/day; dosage adjustments are necessary for renal impairment.

Availability

Tablets: 500 mg. **Powder packets for oral solution:** 500 mg/packet.

NURSING IMPLICATIONS

Assessment

- Assess location, duration, and characteristics of seizure activity. Institute seizure precautions. Assess response to and continued need for vigabatrin periodically during therapy.
- Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- Test vision at baseline (no later than 4 wks after starting), at least every 3 months during, and 3–6 months after discontinuation of therapy.
- Assess for signs and symptoms of peripheral neuropathy (numbness or tingling or toes or feet, reduced lower limb vibration or position sensation, progressive loss of reflexes, starting at ankles).
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.
- **Lab Test Considerations:** Monitor CBC periodically during therapy. May cause anemia.
- May cause $\downarrow$ AST and ALT levels precluding use to detect hepatic injury.
- May $\uparrow$ amino acids in urine causing false positive results of genetic metabolic diseases.

Potential Nursing Diagnoses

Risk for injury (Indications)

Disturbed sensory perception (Adverse Reactions)

Implementation

- Available only through *SHARE* program of restricted distribution. Only prescribers and pharmacies registered in the program and patients enrolled in the program have access. Patients receive vigabatrin from a specialty pharmacy. Contact *SHARE* program at 1-888-45-SHARE.
- **PO:** Administer twice daily without regard to food.
- Mix oral solution for babies by mixing the powder in each packet with 10 mL of water; may be cold or room temperature. Follow manufacturer's instruction for mixing oral solution. Oral solution may be administered at the same time as food, but should only be mixed with water.

Patient/Family Teaching

- Enroll patient in *SHARE* Program. Instruct patient to take vigabatrin around the clock, as directed. Discuss with health care professional what to do if a dose is missed. Medication should be gradually discontinued to prevent seizures. Advise patient to read the *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- Educate patient on risks of vigabatrin. Inform patient of the risk of permanent vision loss, particularly loss of peripheral vision, and that vision loss

may not be detected before it is severe and is irreversible. Emphasize the importance of monitoring vision every 3 months. Advise patient to notify health care professional immediately if changes in vision (not seeing as well as before starting therapy, tripping, bumping into things, more clumsy than usual, surprised by people or things coming in front of you that seem to come out of nowhere) or changes in infant's vision are suspected.

- May cause drowsiness, ataxia, fatigue and confusion. Caution patient to avoid driving or other activities requiring alertness until response to medication is known. Tell patient not to resume driving until physician gives clearance based on control of seizure disorder.
- **Inform patients and families of risk of suicidal thoughts and behavior and advise that behavioral changes, emergency or worsening signs and symptoms of depression, unusual changes in mood, or emergence of suicidal thoughts, behavior, or thoughts of self-harm or rash should be reported to health care professional immediately.**
- Advise patient to notify health care professional if an increase in seizures, weight gain, or edema occurs or if sleepiness, ear infection, or irritability occurs in an infant.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken, to consult health care professional before taking any new medications and to avoid taking alcohol or other CNS depressants concurrently with lacosamide.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding. Encourage pregnant patients to enroll in the North American Antiepileptic Drug (NAAED) Pregnancy Registry by calling 1-888-233-2334; information is available at www.aedpregnancyregistry.org.

Evaluation/Desired Outcomes

- Decreased seizure activity. If no substantial clinical benefit within 3 months of initiation, discontinue vigabatrin.
- Decreased in infantile spasms. If no substantial clinical benefit within 2–4 wk of initiation, discontinue vigabatrin.

vilazodone (vil-az-oh-done)

Viibryd

Classification

Therapeutic: antidepressants

Pharmacologic: selective serotonin reuptake inhibitors (SSRIs), benzofurans

Pregnancy Category C

Indications

Treatment of major depressive disorder.

Action

Increases serotonin activity in the CNS by inhibiting serotonin reuptake. Also binds selectively with high affinity to 5-HT_{1A} receptors and is a 5-HT_{1A} receptor partial agonist. **Therapeutic Effects:** Improvement in symptoms of depression.

Pharmacokinetics

Absorption: 72% absorbed following oral administration with food.

Distribution: Unknown.

Protein Binding: 96–99%.

Metabolism and Excretion: Mostly metabolized by the liver, primarily by the CYP3A4 enzyme system; 1% excreted unchanged in urine.

Half-life: 25 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	4–5 hr	unknown

Contraindications/Precautions

Contraindicated in: Concurrent use of MAO inhibitors or MAO-like drugs (linezolid or methylene blue); Severe hepatic impairment.

Use Cautiously in: History of seizure disorder; History of suicide attempt/suicidal ideation; Bipolar disorder; may ↑ risk of mania/hypomania; **OB:** Use only if maternal benefit outweighs fetal risk; use during third trimester may result in need for prolonged hospitalization, respiratory support and tube feeding; **Lactation:** Breast feed only if maternal benefit outweighs newborn risk; **Pedi:** Safety and effectiveness not established; ↑ risk of suicidal thinking/behavior in children, adolescents and young adults.

Adverse Reactions/Side Effects

CNS: **NEUROLEPTIC MALIGNANT-LIKE SYNDROME, SEIZURES, SUICIDAL THOUGHTS, insomnia, abnormal dreams, dizziness. GI:** diarrhea, nausea, dry mouth, restlessness, vomiting. **Endo:** ↓ libido, sexual dysfunction, syndrome of inappropriate antidiuretic hormone (SIADH). **F and E:** hyponatremia. **Hemat:** bleeding. **Misc:** **SEROTONIN SYNDROME.**

Interactions

Drug-Drug: Concurrent use with, or use within 14 days of starting or stopping **MAOIs** may ↑ risk of neuroleptic malignant syndrome or serotonin syndrome and should be avoided. Concurrent use with **MAO-inhibitor like drugs**, such as **linezolid** or **methylene blue** may ↑ risk of serotonin syndrome; concurrent use contraindicated; do not start therapy in patients re-

✳ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

ceiving **linezolid** or **methylene blue**; if **linezolid** or **methylene blue** need to be started in a patient receiving vilazodone, immediately discontinue vilazodone and monitor for signs/symptoms of serotonin syndrome for 2 wk or until 24 hr after last dose of linezolid or methylene blue, whichever comes first (may resume vilazodone therapy 24 hr after last dose of linezolid or methylene blue). Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SNRIs**, **fentanyl**, **buspirone**, **tramadol** and **triptans** ↑ risk of serotonin syndrome. Concurrent use with **NSAIDs**, **aspirin**, **antiplatelet drugs**, or other **drugs that affect coagulation** may ↑ risk of bleeding. Concurrent use of **strong inhibitors of CYP3A4**, including **ketoconazole** ↑ blood levels and the risk of adverse reactions/toxicity; daily dose should not exceed 20 mg. Concurrent use of **moderate inhibitors of CYP3A4**, including **erythromycin** may require dose ↓ to 20 mg daily if adverse reactions/toxicity occurs. Use cautiously with other **CNS-active drugs**.

Route/Dosage

PO (Adults): 10 mg once daily for one week, then 20 mg once daily for one week, then 40 mg once daily. *Concurrent use of strong inhibitors of CYP3A4*—daily dose should not exceed 20 mg.

Availability

Tablets: 10 mg, 20 mg, 40 mg.

NURSING IMPLICATIONS

Assessment

- Assess mental status and mood changes. Inform health care professional if patient demonstrates significant ↑ in anxiety, nervousness, or insomnia.
- Prior to starting therapy, screen patient for bipolar disorder (detailed psychiatric history, including family history of suicide, bipolar disorder, depression). Use cautiously in patients with a positive history.
- Assess suicidal tendencies, especially in early therapy. Restrict amount of drug available to patient. Risk may be ↑ in children, adolescents, and adults ≤24 yr.
- Assess for signs and symptoms of hyponatremia (headache, difficulty concentrating, memory impairment, confusion, weakness, unsteadiness). May require discontinuation of therapy.
- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyper-reflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).
- Monitor for development of neuroleptic malignant syndrome (fever, muscle rigidity, altered mental

status, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness, loss of bladder control). Discontinue vilazodone and notify health care professional immediately if these symptoms occur.

- **Lab Test Considerations:** Monitor serum sodium concentrations periodically during therapy. May cause hyponatremia potentially as a result of syndrome of inappropriate antidiuretic hormone secretion (SIADH).
- May cause altered anticoagulant effects. Monitor patients receiving warfarin, NSAIDs, or aspirin concurrently.

Potential Nursing Diagnoses

Ineffective coping (Indications)

Risk for injury (Side Effects)

Implementation

- **PO:** Administer vilazodone with food; administration without food can result in inadequate drug concentrations and may ↓ effectiveness.

Patient/Family Teaching

- Instruct patient to take vilazodone as directed at the same time each day. Take missed doses as soon as possible unless almost time for next dose. Do not double doses or discontinue abruptly. Gradually ↓ dose before discontinuation. Advise patient to read *Medication Guide* before starting therapy and with each Rx refill; new information may be available.
- Advise patient, family, and caregivers to look for activation of mania/hypomania and suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide; new or worse depression or anxiety; agitation or restlessness; panic attacks; insomnia; new or worse irritability; aggressiveness; acting on dangerous impulses, mania, or other changes in mood or behavior or if symptoms of serotonin syndrome occur.
- Caution patient of the risk of serotonin syndrome and neuroleptic malignant syndrome, especially when taking triptans, tramadol, tryptophan supplements and other serotonergic or antipsychotic agents.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to the drug is known.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to avoid concurrent use of Rx, OTC, and herbal products, especially NSAIDs, aspirin, and warfarin, without consulting health care professional.
- Caution patient to avoid taking alcohol or other CNS-depressant drugs during therapy.
- Instruct female patients to inform health care professional if pregnancy is planned or suspected or if breast feeding.

- Emphasize the importance of follow-up exams to monitor progress. Encourage patient participation in psychotherapy.

Evaluation/Desired Outcomes

- ↑ sense of well-being.
- Renewed interest in surroundings. Need for therapy should be periodically reassessed. Therapy is usually continued for several months.
- ↓ anxiety.

HIGH ALERT

vinBLASStine (vin-blass-teen)

★ Velbe

Classification

Therapeutic: antineoplastics

Pharmacologic: vinca alkaloids

Pregnancy Category D

Indications

Combination chemotherapy of: Lymphomas, Nonseminomatous testicular carcinoma, Advanced breast cancer, Other tumors.

Action

Binds to proteins of mitotic spindle, causing metaphase arrest. Cell replication is stopped as a result (cell cycle—specific for M phase). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones. Has immunosuppressive properties.

Pharmacokinetics

Absorption: Administered IV only, resulting in complete bioavailability.

Distribution: Does not cross the blood-brain barrier well.

Metabolism and Excretion: Converted by the liver to an active antineoplastic compound; excreted in the feces via biliary excretion, some renal elimination.

Half-life: 24 hr.

TIME/ACTION PROFILE (effects on white blood cell counts)

ROUTE	ONSET	PEAK	DURATION
IV	5–7 days	10 days	7–14 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity, **OB**, **Lactation**: Pregnancy or lactation.

Use Cautiously in: Infection; ↓ bone marrow reserve; Patients with impaired hepatic function (↓ dose by 50% if serum bilirubin > 3 mg/dL); **OB**: Instruct women of childbearing potential to avoid pregnancy during treatment.

Adverse Reactions/Side Effects

CNS: **SEIZURES**, mental depression, neurotoxicity, weakness. **Resp:** **BRONCHOSPASM**. **GI:** nausea, vomiting, anorexia, constipation, diarrhea, stomatitis. **GU:** gonadal suppression. **Derm:** alopecia, dermatitis, vesiculation. **Endo:** syndrome of inappropriate antidiuretic hormone (SIADH). **Hemat:** anemia, leukopenia, thrombocytopenia. **Local:** phlebitis at IV site. **Metab:** hyperuricemia. **Neuro:** neuritis, paresthesia, peripheral neuropathy.

Interactions

Drug-Drug: Additive bone marrow depression with other **antineoplastics** or **radiation therapy**. Bronchospasm may occur in patients who have been previously treated with **mitomycin**. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions. May ↓ **phenytoin** levels.

Route/Dosage

Doses may vary greatly, depending on tumor, schedule, condition of patient, and blood counts.

IV (Adults): *Initial*—3.7 mg/m² (100 mcg/kg), single dose; ↑ weekly as tolerated by 1.8 mg/m² (50 mcg/kg) to maximum of 18.5 mg/m² (usual dose is 5.5–7.4 mg/m²). *Maintenance*—10 mg 1–2 times/mo or one increment less than last dose q 7–14 days.

IV (Children): *Initial*—2.5 mg/m², single dose; ↑ weekly as tolerated by 1.25 mg/m² to maximum of 7.5 mg/m². *Maintenance*—one increment less than last dose q 7 days.

Availability (generic available)

Solution for injection: 1 mg/mL. **Powder for injection:** 10 mg/vial.

V

NURSING IMPLICATIONS

Assessment

- **Monitor BP, pulse, and respiratory rate during therapy.** Notify physician immediately if respiratory distress occurs. Bronchospasm can be life-threatening and may occur at time of infusion or several hours to weeks later.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- May cause nausea and vomiting. Monitor intake and output, appetite, and nutritional intake. Prophylactic antiemetics may be used. Adjust diet as tolerated.
- Assess injection site frequently for redness, irritation, or inflammation. If extravasation occurs, infu-

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

sion must be stopped and restarted elsewhere to avoid damage to subcut tissue. Standard treatment includes infiltration with hyaluronidase and application of heat.

- Monitor for symptoms of gout (increased uric acid, joint pain, edema). Encourage patient to drink at least 2 L of fluid per day. Allopurinol or alkalization of urine may be used to decrease uric acid levels.
- **Lab Test Considerations:** Monitor CBC prior to and routinely throughout therapy. If WBC <2000 , subsequent doses are usually withheld until WBC is ≥ 4000 . The nadir of leukopenia occurs in 5–10 days and recovery usually occurs 7–14 days later. Thrombocytopenia may also occur in patients who have received radiation or other chemotherapy agents.
- Monitor liver function studies (AST, ALT, LDH, bilirubin) and renal function studies (BUN, creatinine) prior to and periodically throughout therapy.
- May cause $\uparrow$ uric acid. Monitor periodically during therapy.

Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)

Imbalanced nutrition: less than body requirements (Adverse Reactions)

Implementation

- **High Alert:** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double check single, daily, and course-of-therapy dose limits; have second practitioner independently double check original order, dose calculations, and infusion pump settings. Do not administer subcut, IM, or intrathecally (IT). IT administration is fatal. Vinblastine must be dispensed in an overwrap stating, "For IV use only." Overwrap should remain in place until immediately before administration.
- **High Alert:** Do not confuse vinblastine with vincristine.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard IV equipment in specially designated containers.
- Do not inject into extremities with impaired circulation; may cause thrombophlebitis.

IV Administration

- **pH:** 3.0–5.0.
- **Direct IV:** **Diluent:** Dilute each 10 mg with 10 mL of 0.9% NaCl for injection with phenol or benzyl alcohol. Solution is clear. Reconstituted medication is stable for 28 days if refrigerated. **Concentration:** 1 mg/mL. **Rate:** Administer each single dose over 1 min through Y-site injection of a free-flowing infusion of 0.9% NaCl or D5W.

- **Intermittent Infusion:** Dilution in large volumes (100–250 mL) or prolonged infusion (≥ 30 min) increases chance of vein irritation and extravasation.
- **Syringe Compatibility:** bleomycin, cisplatin, cyclophosphamide, droperidol, fluorouracil, leucovorin calcium, methotrexate, metoclopramide, mitomycin, vincristine.
- **Syringe Incompatibility:** furosemide.
- **Y-Site Compatibility:** allopurinol, amifostine, amphotericin B cholesteryl sulfate complex, aztreonam, bleomycin, cisplatin, cyclophosphamide, doxorubicin, doxorubicin liposome, droperidol, etoposide phosphate, filgrastim, fludarabine, fluorouracil, gemcitabine, granisetron, heparin, leucovorin calcium, melphalan, methotrexate, metoclopramide, mitomycin, ondansetron, paclitaxel, pemetrexed, piperacillin/tazobactam, sargramostim, teniposide, thiotepa, vincristine, vinorelbine.
- **Y-Site Incompatibility:** cefepime, furosemide, lansoprazole.

Patient/Family Teaching

- Advise patient to notify health care professional if fever; chills; sore throat; signs of infection; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Caution patient not to drink alcoholic beverages or take products containing aspirin or NSAIDs.
- Instruct patient to inspect oral mucosa for redness and ulceration. Advise patient that, if ulceration occurs, to avoid spicy foods, use sponge brush, and rinse mouth with water after eating and drinking. Topical agents may be used if mouth pain interferes with eating. Stomatitis pain may require treatment with opioid analgesics.
- Instruct patient to report symptoms of neurotoxicity (paresthesia, pain, difficulty walking, persistent constipation).
- Advise patient that jaw pain, pain in organs containing tumor tissue, nausea, and vomiting may occur. Avoid constipation and report other adverse reactions.
- Advise patient that this medication may have teratogenic effects. Contraception should be used during and for at least 2 mo after therapy is concluded.
- Discuss with patient the possibility of hair loss. Explore coping strategies.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Emphasize need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Regression of malignancy without the appearance of detrimental side effects.

HIGH ALERT

vinCRiStine (vin-kriss-teen)

Vincasar PFS

Classification

Therapeutic: antineoplastics

Pharmacologic: vinca alkaloids

Pregnancy Category D**Indications**

Used alone and in combination with other treatment modalities (antineoplastics, surgery, or radiation therapy) in treatment of: Hodgkin's disease, Leukemias, Neuroblastoma, Malignant lymphomas, Rhabdomyosarcoma, Wilms' tumor, Other tumors.

Action

Binds to proteins of mitotic spindle, causing metaphase arrest. Cell replication is stopped as a result (cell cycle-specific for M phase). Has little or no effect on bone marrow. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones. Has immunosuppressive properties.

Pharmacokinetics

Absorption: Administered IV only, resulting in complete bioavailability.

Distribution: Rapidly and widely distributed; extensively bound to tissues.

Metabolism and Excretion: Metabolized by the liver and eliminated in the feces via biliary excretion.

Half-life: 10.5–37.5 hr.

TIME/ACTION PROFILE (effects on blood counts*)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	4 days	7 days

†Usually mild

Contraindications/Precautions

Contraindicated in: Hypersensitivity, **OB**, **Lactation:** Pregnancy or lactation.

Use Cautiously in: Infection; ↓ bone marrow reserve; Hepatic impairment (50% dose ↓ recommended if serum bilirubin >3 mg/dL); **OB:** Instruct women of childbearing potential to avoid pregnancy during treatment.

Adverse Reactions/Side Effects

CNS: agitation, insomnia, mental depression, mental status changes. **EENT:** cortical blindness, diplopia.

Resp: bronchospasm. **GI:** nausea, vomiting, abdominal cramps, anorexia, constipation, ileus, stomatitis.

GU: gonadal suppression, nocturia, oliguria, urinary retention. **Derm:** alopecia. **Endo:** syndrome of inap-

propriate antidiuretic hormone (SIADH). **Hemat:** anemia, leukopenia, thrombocytopenia (mild and brief). **Local:** phlebitis at IV site, tissue necrosis (from extravasation). **Metab:** hyperuricemia. **Neuro:** ascending peripheral neuropathy.

Interactions

Drug-Drug: Bronchospasm may occur in patients who have been previously treated with **mitomycin**. **L-asparaginase** may ↓ hepatic metabolism of vincristine (give vincristine 12–24 hr prior to asparaginase). May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions.

Route/Dosage

Many other protocols are used.

IV (Adults): 10–30 mcg/kg (0.4–1.4 mg/m²); may repeat weekly (not to exceed 2 mg/dose).

IV (Children >10 kg): 1.5–2 mg/m² single dose; may repeat weekly.

IV (Children <10 kg): 50 mcg/kg single dose; may repeat weekly.

Availability (generic available)

Solution for injection: 1 mg/mL.

NURSING IMPLICATIONS**Assessment**

- Monitor BP, pulse, and respiratory rate during therapy. Report significant changes.
- Monitor neurologic status. Assess for paresthesia (numbness, tingling, pain), loss of deep tendon reflexes (Achilles reflex is usually first involved), weakness (wrist drop or footdrop, gait disturbances), cranial nerve palsies (jaw pain, hoarseness, ptosis, visual changes), autonomic dysfunction (ileus, difficulty voiding, orthostatic hypotension, impaired sweating), and CNS dysfunction (decreased level of consciousness, agitation, hallucinations). Notify physician if these symptoms develop, as they may persist for months.
- Monitor intake and output ratios and daily weight; report significant discrepancies. Decreased urine output with concurrent hyponatremia may indicate SIADH, which usually responds to fluid restriction.
- Assess infusion site frequently for redness, irritation, or inflammation. If extravasation occurs, infusion must be stopped and restarted elsewhere to avoid damage to subcut tissue. Cellulitis and discomfort may be minimized by infiltration with hyaluronidase and application of moderate heat or by application of cold compresses.
- Assess nutritional status. An antiemetic may be used to minimize nausea and vomiting.
- Monitor for symptoms of gout (increased uric acid, joint pain, edema). Encourage patient to drink at

★ = Canadian drug name. ‡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

least 2 liters of fluid per day. Allopurinol or alkalinization of urine may be used to decrease uric acid levels.

- **Lab Test Considerations:** Monitor CBC prior to and periodically throughout therapy. May cause slight leukopenia 4 days after therapy, which resolves within 7 days. Platelet count may ↑ or ↓.
- Monitor liver function studies (AST, ALT, LDH, bilirubin) and renal function studies (BUN, creatinine) prior to and periodically throughout therapy.
- May cause ↑ uric acid. Monitor periodically during therapy.

Potential Nursing Diagnoses

Risk for injury (Adverse Reactions)

Imbalanced nutrition: less than body requirements (Adverse Reactions)

Implementation

- **High Alert:** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double check single, daily, and course-of-therapy dose limits; have second practitioner independently double check original order, dose calculations, and infusion pump settings. Do not administer subcut, IM, or intrathecally (IT). IT administration is fatal. Vincristine must be dispensed in an overwrap stating "For IV use only." Overwrap should remain in place until immediately before administration. Do not confuse vincristine with vinblastine.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard IV equipment in specially designated containers (see Appendix I).

IV Administration

- **Direct IV: Diluent:** Does not need to be reconstituted. **Concentration:** Administer undiluted at 1 mg/mL. **Rate:** Administer each dose direct IV push over 1 min through Y-site injection of a free-flowing infusion of 0.9% NaCl or D5W.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, al-fentanil, allopurinol, amifostine, amikacin, aminophylline, amiodarone, amphotericin B cholesteryl sulfate complex, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefoperazone, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, cladribine, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, daunorubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron,

dopamine, doxorubicin, doxorubicin liposome, doxycycline, droperidol, enalapril, ephedrine, epinephrine, epirubicin, ertapenem, erythromycin, es-molol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, ganciclovir, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, insulin, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, levopranolol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meprenem, mesna, methohexital, methotrexate, methoprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, pancuronium, pemetrexed, pentamidine, pentazocine, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propanolol, quinupristin/dalfopristin, ranitidine, remifentanyl, rituximab, rocuronium, sargramostim, sodium acetate, sodium phosphates, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vinorelbine, voriconazole, zidovudine, zolendronic acid.

- **Y-Site Incompatibility:** amphotericin B colloidal, cefepime, diazepam, idarubicin, nafcillin, pantoprazole, phenytoin.

Patient/Family Teaching

- Instruct patient to notify health care professional immediately if redness, swelling, or pain at injection site occurs.
- Instruct patient to report symptoms of neurotoxicity (paresthesia, pain, difficulty walking, persistent constipation). Inform patient that increased fluid intake, dietary fiber, and exercise may minimize constipation. Stool softeners or laxatives may be used. Patient should inform health care professional if severe constipation or abdominal discomfort occurs, as this may be a sign of neuropathy.
- Advise patient to notify health care professional if fever; chills; sore throat; signs of infection; bleeding gums; bruising; petechiae; blood in urine, stool, or emesis; or mouth sores occur. Caution patient to avoid crowds and persons with known infections.
- Discuss with patient the possibility of hair loss. Explore coping strategies.

- Instruct patient not to receive any vaccinations without advice of health care professional.
- Advise patient that this medication may have teratogenic effects. Contraception should be used during and for at least 2 mo after therapy is concluded.
- Emphasize need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Regression of malignancy without the appearance of detrimental side effects.

HIGH ALERT

vinorelbine (vine-oh-rel-been)

Navelbine

Classification

Therapeutic: antineoplastics

Pharmacologic: vinca alkaloids

Pregnancy Category D

Indications

Inoperable non–small-cell cancer of the lung in ambulatory patients (alone or with cisplatin).

Action

Binds to a protein (tubulin) of cellular microtubules, where it interferes with microtubule assembly. Cell replication is stopped as a result (cell cycle–specific for M phase). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Highly bound to platelets and lymphocytes.

Metabolism and Excretion: Mostly metabolized by the liver. At least one metabolite is active. Large amounts eliminated in feces; 11% excreted unchanged by the kidneys.

Half-life: 28–44 hr.

TIME/ACTION PROFILE (effect on WBCs)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	7–10 days	7–15 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Active infections; ↓ bone marrow reserve; **OB, Lactation:** Pregnancy or lactation.

Use Cautiously in: Impaired hepatic function (dose ↓ recommended if total bilirubin >2 mg/dL); Dehydrated patients (↑ risk of hyponatremia); Granulocytopenic patients (temporarily discontinue or re-

duce dose); **Pedi:** Safety not established; **OB:** Instruct women of childbearing potential to avoid pregnancy during treatment.

Adverse Reactions/Side Effects

CNS: fatigue. **Resp:** shortness of breath. **CV:** chest pain. **GI:** constipation, nausea, abdominal pain, anorexia, diarrhea, transient ↑ in liver enzymes, vomiting. **Derm:** alopecia, rashes. **F and E:** hyponatremia. **Hemat:** anemia, neutropenia, thrombocytopenia. **Local:** irritation at IV site, skin reactions, phlebitis. **MS:** arthralgia, back pain, jaw pain, myalgia. **Neuro:** neurotoxicity. **Misc:** pain in tumor-containing tissue.

Interactions

Drug-Drug: ↑ bone marrow depression with other antineoplastics or radiation therapy. Concurrent use with cisplatin ↑ risk and severity of bone marrow depression. Concurrent use with mitomycin or chest radiation ↑ risk of pulmonary reactions.

Route/Dosage

IV (Adults): 30 mg/m² once weekly.

Hepatic Impairment

IV (Adults): Total bilirubin 2.1–3 mg/dL—15 mg/m² once weekly; total bilirubin ≥3 mg/dL—7.5 mg/m² once weekly.

Availability (generic available)

Solution for injection: 10 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor BP, pulse, and respiratory rate during therapy. Note significant changes. Acute shortness of breath and severe bronchospasm may occur infrequently shortly after administration. Treatment with corticosteroids, bronchodilators, and supplemental oxygen may be required, especially in patients with a history of pulmonary disease.
- Assess frequently for signs of infection (sore throat, temperature, cough, mental status changes), especially when nadir of granulocytopenia is expected.
- Monitor neurologic status. Assess for paresthesia (numbness, tingling, pain), loss of deep tendon reflexes (Achilles reflex is usually first involved), weakness (wrist drop or footdrop, gait disturbances), cranial nerve palsies (jaw pain, hoarseness, ptosis, visual changes), autonomic dysfunction (constipation, ileus, difficulty voiding, orthostatic hypotension, impaired sweating), and CNS dysfunction (decreased level of consciousness, agitation, hallucinations). These symptoms may persist for months. The incidence of neurotoxicity associated with vinorelbine is less than that of other vinca alkaloids.

V

✳ = Canadian drug name. ⚡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Monitor intake and output and daily weight for significant discrepancies.
- Assess nutritional status. Mild to moderate nausea is common. An antiemetic may be used to minimize nausea and vomiting.
- Monitor for symptoms of gout (increased uric acid, joint pain, edema). Encourage patient to drink at least 2 L of fluid/day. Allopurinol and alkalization of urine may decrease uric acid levels.
- **Lab Test Considerations:** Monitor CBC prior to each dose and routinely during therapy. The nadir of granulocytopenia usually occurs 7–10 days after vinorelbine administration and recovery usually follows within 7–15 days. If granulocyte count is $<1500/\text{mm}^3$, dose reduction or temporary interruption of vinorelbine may be warranted. If repeated episodes of fever and/or sepsis occur during granulocytopenia, future dose of vinorelbine should be modified. May also cause mild to moderate anemia. Thrombocytopenia rarely occurs.
- Monitor liver function studies (AST, ALT, LDH, bilirubin) and renal function studies (BUN, creatinine) prior to and periodically during therapy. May cause ↑ uric acid; monitor periodically during therapy.

Potential Nursing Diagnoses

Risk for injury (Adverse Reactions)

Risk for infection (Adverse Reactions)

Implementation

- **High Alert:** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double check single, daily, and course-of-therapy dose limits; have second practitioner independently double check original order, dose calculations, and infusion pump settings.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard IV equipment in specially designed containers.
- Assess infusion site frequently for redness, irritation, or inflammation. Vinorelbine is a vesicant. If extravasation occurs, infusion must be stopped and restarted elsewhere to avoid damage to subcut tissue. Treatment of extravasation includes application of warm compresses applied over the area immediately for 30–60 min, then alternating on/off every 15 min for 1 day to increase systemic absorption of the drug. Hyaluronidase 150 units diluted in 1–2 mL of 0.9% NaCl, 1 mL for each mL extravasated, should be injected through existing IV cannula or subcut if the needle has been removed to enhance absorption and dispersion of the extravasated drug.

IV Administration

- **pH:** 3.5.
- **Direct IV:** **Diluent:** Dilute vinorelbine with 0.9% NaCl or D5W. **Concentration:** 1.5–3 mg/mL.

Rate: Infuse over 6–10 min into Y-site closest to bag of a free-flowing IV or into a central line.

- Flush vein with at least 75–125 mL of 0.9% NaCl or D5W administered over 10 min or more following administration of vinorelbine.
- **Intermittent Infusion:** **Diluent:** Dilute vinorelbine with 0.9% NaCl, D5W, 0.45% NaCl, D5/0.45% NaCl, Ringer's or lactated Ringer's injection. Solution should be colorless to pale yellow. Do not administer solutions that are discolored or contain particulate matter. Diluted solution is stable for 24 hr at room temperature. **Concentration:** 0.5–2 mg/mL. **Rate:** Infuse over 6–10 min (up to 30 min) into Y-site closest to bag of a free-flowing IV or into a central line.
- Flush vein with at least 75–125 mL of 0.9% NaCl or D5W administered over 10 min or more following administration of vinorelbine.
- **Y-Site Compatibility:** amikacin, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, cefazolin, cefazidime, carboplatin, carmustine, cefotaxime, ceftazidime, chlorpromazine, cimetidine, cisplatin, clindamycin, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, daunorubicin, dexamethasone sodium phosphate, diphenhydramine, doxorubicin, doxorubicin liposome, doxycycline, droperidol, enalaprilat, etoposide, famotidine, filgrastim, flouxuridine, fluconazole, fludarabine, gemcitabine, gentamicin, granisetron, haloperidol, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, lorazepam, mannitol, mechloroethamine, melphalan, meperidine, mesna, methotrexate, metoclopramide, metronidazole, mitoxantrone, morphine, nalbuphine, ondansetron, oxaliplatin, potassium chloride, prochlorperazine, promethazine, ranitidine, streptozocin, teniposide, ticarcillin/clavulanate, tobramycin, vancomycin, vinblastine, vincristine, zidovudine.
- **Y-Site Incompatibility:** acyclovir, allopurinol, aminophylline, amphotericin B, amphotericin B cholesteryl sulfate, ampicillin, cefazolin, ceftriaxone, cefuroxime, fluorouracil, furosemide, ganciclovir, lansoprazole, methylprednisolone, mitomycin, sodium bicarbonate, thiopeta, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Instruct patient to report symptoms of neurotoxicity (paresthesia, pain, difficulty walking, persistent constipation).
- Inform patient that increased fluid intake, dietary fiber, and exercise may minimize constipation. Stool softeners or laxatives may be necessary. Patient should be advised to report severe constipation or abdominal discomfort, as this may be a sign of ileus, which may occur as a consequence of neuropathy.

- Advise patient to notify health care professional if fever; chills; sore throat; signs of infection; bleeding gums; bruising; petechiae; blood in urine, stool, or emesis; or mouth sores occur.
- Caution patient to avoid crowds and persons with known infections.
- Advise patient that this medication may have teratogenic effects. Contraception should be used during and for at least 2 mo after therapy is concluded.
- Discuss with patient the possibility of hair loss and explore coping strategies.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in the size or spread of malignancy without detrimental side effects.

VITAMIN B₁₂ PREPARATIONS

cyanocobalamin

(sy-e-an-oh-koe-bal-a-min)

Nascobal, Rubramin PC

hydroxocobalamin

(hye-drox-oh-koe-bal-a-min)

Cyanokit

Classification

Therapeutic: antianemics, vitamins

Pharmacologic: water soluble vitamins

Pregnancy Category C

Indications

Vitamin B₁₂ deficiency (parenteral product or nasal spray should be used when deficiency is due to malabsorption). Pernicious anemia (only parenteral products should be used for initial therapy; nasal or oral products are not indicated until patients have achieved hematologic remission following parenteral therapy and have no signs of CNS involvement). Part of the Schilling test (vitamin B₁₂ absorption test) (diagnostic). Cyanide poisoning (Cyanokit only).

Action

Necessary coenzyme for metabolic processes, including fat and carbohydrate metabolism and protein synthesis. Required for cell production and hematopoiesis. **Therapeutic effect:** Corrects manifestations of pernicious anemia (megaloblastic indices, GI lesions, and neurologic damage). Corrects vitamin B₁₂ deficiency. Reverses symptoms of cyanide toxicity (Cyanokit only).

Pharmacokinetics

Absorption: Oral absorption in GI tract requires intrinsic factor and calcium; well absorbed after IM, subcut and nasal administration.

Distribution: Stored in the liver and bone marrow; crosses placenta, enters breast milk.

Metabolism and Excretion: Primarily excreted unchanged in urine.

Half-life: *Cyanocobalamin*—6 days (400 days in liver); *Hydroxocobalamin*—26–31 hr.

TIME/ACTION PROFILE (reticulocytosis)

ROUTE	ONSET	PEAK	DURATION
Cyanocobalamin IM, subcut, nasal	unknown	3–10 days	unknown
Hydroxocobalamin IM	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **Pedi:** Avoid using preparations containing benzyl alcohol in premature infants (associated with fatal “gasping syndrome”).

Use Cautiously in: Hereditary optic nerve atrophy (accelerates nerve damage); Uremia, folic acid deficiency, concurrent infection, iron deficiency (response to B₁₂ will be impaired); Renal dysfunction (when using aluminum-containing products); **Pedi:** *Cyanokit*—Safety and effectiveness not established; **OB:** *Cyanokit*—Use only if potential benefit justifies potential risk to fetus.

Adverse Reactions/Side Effects

CNS: headache; *Cyanokit*, dizziness, memory impairment, restlessness. **CV:** heart failure; *Cyanokit*, hypertension, chest pain, tachycardia. **EENT:** *Cyanokit*—dry throat, eye redness, eye swelling. **GI:** diarrhea; *Cyanokit*, abdominal discomfort, dyspepsia, dysphagia, hemochezia, nausea, vomiting. **Derm:** itching; *Cyanokit*, erythema, rash. **F and E:** hypokalemia. **GU:** *Cyanokit*—red urine. **Hemat:** thrombocytosis. **Resp:** pulmonary edema; *Cyanokit*, dyspnea. **Local:** pain at IM site. **Misc:** hypersensitivity reactions including **ANAPHYLAXIS**.

Interactions

Drug-Drug: Chloramphenicol and antineoplastic may ↓ hematologic response to vitamin B₁₂. **Colchicine, aminosalicilic acid, cimetidine**, and excess intake of **alcohol**, or **vitamin C** may ↓ oral absorption/effectiveness of vitamin B₁₂.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Route/Dosage

Cyanocobalamin (oral products are usually not recommended due to poor absorption and should be used only if patient refuses the IM, deep subcutaneous, or intranasal route of administration)

PO (Adults and Children): *Vitamin B₁₂ deficiency*—amount depends on deficiency (up to 1000 mcg/day have been used).

PO (Adults): *Pernicious anemia (for hematologic remission only)*—1000–2000 mcg/day.

IM, Subcut (Adults): *Vitamin B₁₂ deficiency*—30 mcg/day for 5–10 days, then 100–200 mcg/month. *Pernicious anemia*—100 mcg/day for 6–7 days; if improvement, give same dose every other day for 7 doses, then every 3–4 days for 2–3 wk; once hematologic values return to normal (remission), can give maintenance dose of 100 mcg/month (doses up to 1000 mcg have been used for maintenance) (could alternatively use oral or intranasal formulations below for maintenance at specified doses). *Schilling test*—Flushing dose is 1000 mcg.

IM, Subcut (Children): *Vitamin B₁₂ deficiency*—0.2 mcg/kg for 2 days, then 1000 mcg/day for 2–7 days, then 100 mcg/week for 1 mo. *Pernicious anemia*—30–50 mcg/day for 2 or more weeks (to a total dose of 1000–5000 mcg), then give maintenance dose of 100 mcg/month (doses up to 1000 mcg have been used for maintenance).

Intranasal (Adults): *Vitamin B₁₂ deficiency*—500 mcg (one spray) in one nostril once weekly. *Pernicious anemia (for hematologic remission only)*—500 mcg (one spray) in one nostril once weekly.

Hydroxocobalamin

IM (Adults): *Vitamin B₁₂ deficiency*—30 mcg/day for 5–10 days, then 100–200 mcg/month. *Pernicious anemia*—100 mcg/day for 6–7 days; if improvement, give same dose every other day for 7 doses, then every 3–4 days for 2–3 wk; once hematologic values return to normal (remission), give maintenance dose of 100 mcg/month. *Schilling test*—Flushing dose is 1000 mcg.

IM (Children): *Vitamin B₁₂ deficiency*—100 mcg/day for 2 or more weeks (to achieve total dose of 1000–5000 mcg), then 30–50 mcg/month. *Pernicious anemia*—30–50 mcg/day for 2 or more weeks (to achieve total dose of 1000–5000 mcg), then 100 mcg/month.

IV (Adults): *Cyanide poisoning (Cyanokit only)*—5 g over 15 min; another 5 g dose may be infused over 15–120 min depending upon severity of poisoning (maximum cumulative dose = 10 g).

Availability

Cyanocobalamin (generic available)

Tablets: 50 mcg^{OTC}, 100 mcg^{OTC}, 250 mcg^{OTC}, 500 mcg^{OTC}, 1000 mcg^{OTC}, 5000 mcg^{OTC}. **Extended-release tablets:** 1000 mcg^{OTC}, 1500 mcg^{OTC}. **Sublingual tablets:** 2500 mcg^{OTC}. **Lozenges:** 100 mcg^{OTC}, 250 mcg^{OTC}, 500 mcg^{OTC}. **Nasal spray:** 500 mcg/0.1 mL actuation (8 sprays/bottle). **Injection:** 1000 mcg/mL.

Hydroxocobalamin (generic available)

Injection: 1000 mcg/mL. **Powder for injection (Cyanokit):** 5 g/vial.

NURSING IMPLICATIONS

Assessment

- Assess patient for signs of vitamin B₁₂ deficiency (pallor; neuropathy; psychosis; red, inflamed tongue) before and periodically during therapy.
- Lab Test Considerations:** Monitor plasma folic acid, vitamin B₁₂, and iron levels, hemoglobin, hematocrit, and reticulocyte count before treatment, 1 mo after the start of therapy, and then every 3–6 mo. Evaluate serum potassium level in patients receiving vitamin B₁₂ for pernicious anemia for hypokalemia during the first 48 hr of treatment. Serum potassium and platelet counts should be monitored routinely during the course of therapy.
- Cyanokit:** Management of cyanide poisoning should also include establishment of airway, ensuring adequate oxygenation and hydration, cardiovascular support, and seizure management. Monitor BP and heart rate continuously during and after infusion and immediately report significant changes. The maximal ↑ in BP usually occurs toward the end of the infusion. BP usually returns to baseline within 4 hr of drug administration.

Potential Nursing Diagnoses

Imbalanced nutrition: less than body requirements (Indications)

Activity intolerance (Indications)

Implementation

- Usually administered in combination with other vitamins; solitary vitamin B₁₂ deficiencies are rare.
- Administration of vitamin B₁₂ by the oral route is useful only for nutritional deficiencies. Patients with small-bowel disease, malabsorption syndrome, or gastric or ileal resections require parenteral administration.
- PO:** Administer with meals to increase absorption.
- May be mixed with fruit juices. Administer immediately after mixing; ascorbic acid alters stability.
- Intranasal:** Dose should not be administered within 1 hr of hot food or liquids (these substances may result in the formation of nasal secretions which may result in ↓ effectiveness of nasal spray).

- **IM, Subcut:** Vials should be protected from light.
- If subcutaneous route used, deep subcutaneous administration is preferred.

IV Administration

- **pH:** 3.5–6.0.
- **IV:** IV route should only be used with Cyanokit.
- **Intermittent Infusion:** **Diluent:** Dilute each Cyanokit vial with 200 mL of 0.9% NaCl, D5W, or LR. Gently invert the vial for at least 60 sec prior to infusion. Reconstituted vial can be hung for infusion and is stable for 6 hr at room temperature. Discard any unused solution after 6 hr. **Rate:** Administer initial 5-g dose over 15 min. Administer additional 5-g dose over 15–120 min.
- **Y-Site Incompatibility:** ascorbic acid, blood products, diazepam, dobutamine, dopamine, fentanyl, nitroglycerin, pentobarbital, propofol, sodium thiosulfate, thiopental.

Patient/Family Teaching

- Encourage patient to comply with diet recommendations of health care professional. Explain that the best source of vitamins is a well-balanced diet with foods from the four basic food groups.
- Foods high in vitamin B₁₂ include meats, seafood, egg yolk, and fermented cheeses; few vitamins are lost with ordinary cooking.
- Patients self-medicating with vitamin supplements should be cautioned not to exceed RDA. Effectiveness of megadoses for treatment of various medical conditions is unproved and may cause side effects.
- Inform patients with pernicious anemia of the lifelong need for vitamin B₁₂ replacement.
- Emphasize the importance of follow-up exams to evaluate progress.
- **Intranasal:** Instruct patient in proper administration technique. Review *Patient Information Sheet* and demonstrate use of actuator. Unit must be primed with 3 strokes upon using for the first time. Unit must be primed with 1 stroke before each of the remaining doses. Advise patient to clear nose, then place tip approximately 1 inch into nostril and press pump once, firmly and quickly. After dose, remove unit from nose and massage dosed nostril gently for a few seconds. Vial delivers 8 doses. Unit should be stored at room temperature and protected from light.
- **Intermittent Infusion:** Advise patient that skin redness may last up to 2 wk and that their urine may remain red for up to 5 wk after drug administration. Instruct patient to avoid sun exposure while their skin is red. Advise patient to contact health care professional if skin or urine redness persist after these time periods. Advise patient that a rash may develop from 7–28 days after drug administration.

It will usually resolve without treatment within a few weeks. Advise patient to contact health care professional if rash persists after this time period.

Evaluation/Desired Outcomes

- Resolution of the symptoms of vitamin B₁₂ deficiency.
- Increase in reticulocyte count.
- Improvement in manifestations of pernicious anemia.
- Resolution of symptoms of cyanide poisoning.

VITAMIN D COMPOUNDS

calcitriol (kal-si-trye-ole)
1,25-dihydroxycholecalciferol, Calcijex, Rocaltrol, vitamin D₃ (active)

cholecalciferol
(kol-e-kal-sif-e-role)
Delta-D, vitamin D₃ (inactive)

doxercalciferol
(dox-er-kal-sif-e-role)
Hectorol, vitamin D₂

ergocalciferol
(er-goe-kal-sif-e-role)
Drisdol,  Ostoforte, vitamin D₂

paricalcitol (par-i-kal-si-tole)
Zemlar

Classification

Therapeutic: vitamins

Pharmacologic: fat-soluble vitamins

Pregnancy Category B (doxercalciferol), **C** (calcitriol, cholecalciferol, ergocalciferol, paricalcitol)

Indications

Calcitriol: Management of hypocalcemia in chronic renal dialysis (IV and PO). Treatment of hypocalcemia in patients with hypoparathyroidism or pseudohypoparathyroidism (PO only). Management of secondary hyperparathyroidism and resulting metabolic bone disease in predialysis patients with moderate to severe renal insufficiency (CCr 15–55 mL/min) (PO only).

Cholecalciferol: Treatment or prevention of vitamin D deficiency. **Doxercalciferol:** Treatment of secondary hyperparathyroidism in patients undergoing chronic renal dialysis (IV and PO). Treatment of secondary hyperparathyroidism in patients with Stage 3 or 4 chronic kidney disease (PO only). **Ergocalciferol:** Treatment of familial hypophosphatemia. Treatment of

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

hypoparathyroidism. Treatment of vitamin D-resistant rickets. **Paricalcitol:** Prevention and treatment of secondary hyperparathyroidism in patients with Stage 3 or 4 (PO) or Stage 5 (PO and IV) chronic kidney disease.

Action

Cholecalciferol requires activation in the liver and kidneys to create the active form of vitamin D₃ (calcitriol). Doxercalciferol and ergocalciferol require activation in the liver to create the active form of vitamin D₂. Paricalcitol is a synthetic analogue of calcitriol. Vitamin D: Promotes the absorption of calcium and ↓ parathyroid hormone concentration. **Therapeutic Effects:** Treatment and prevention of deficiency states, particularly bone manifestations. Improved calcium and phosphorous homeostasis in patients with chronic kidney disease.

Pharmacokinetics

Absorption: *Calcitriol, doxercalciferol, ergocalciferol, paricalcitol*—Well absorbed following oral administration. *Calcitriol, doxercalciferol, paricalcitol*—IV administration results in complete bioavailability.

Distribution: Calcitriol and paricalcitol cross the placenta; calcitriol also enters breast milk.

Protein Binding: *Calcitriol and paricalcitol*—99.9%.

Metabolism and Excretion: *Calcitriol*—Undergoes enterohepatic recycling and is excreted mostly in bile. *Cholecalciferol*—Converted by the liver and kidneys to calcitriol (active form of vitamin D₃). *Ergocalciferol*—Converted to active form of vitamin D₂ by sunlight, the liver, and the kidneys. *Doxercalciferol*—Converted by the liver to the active form of vitamin D₂. *Paricalcitol*—mostly metabolized by the liver and excreted via hepatobiliary elimination.

Half-life: *Calcitriol*—5–8 hr. *Cholecalciferol*—14 hr. *Doxercalciferol*—32–37 hr (up to 96 hr). *Paricalcitol*—14–20 hr.

TIME/ACTION PROFILE (effects on serum calcium)

ROUTE	ONSET	PEAK	DURATION
Calcitriol-PO	2–6 hr	2–6 hr	3–5 days
Calcitriol-IV	unknown	unknown	unknown
Cholecalciferol-PO	unknown	unknown	unknown
Doxercalciferol-PO	unknown	8 wk	1 wk
Doxercalciferol-IV	unknown	8 wk	1 wk
Ergocalciferol-PO	12–24 hr	unknown	up to 6 mo
Paricalcitol-PO	unknown	2–4 wk	unknown
Paricalcitol-IV	unknown	up to 2 wk	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypercalcemia; Vitamin D toxicity; **Lactation:** Potential for serious adverse reactions in infant; Concurrent use of magnesium-containing antacids or other vitamin D supplements; **Ergocalciferol:** Known intolerance to tartrazine; **Cholecalciferol and ergocalciferol:** Malabsorption problems.

Use Cautiously in: Calcitriol, doxercalciferol, paricalcitol: Patients receiving digoxin; **OB:** Safety not established.

Adverse Reactions/Side Effects

Seen primarily as manifestations of toxicity (hypercalcemia).

CNS: headache, somnolence, weakness; *doxercalciferol, dizziness, malaise*. **EENT:** conjunctivitis, photophobia, rhinorrhea. **Resp:** *doxercalciferol and ergocalciferol*—dyspnea. **CV:** arrhythmias, edema, hypertension; *doxercalciferol, bradycardia; paricalcitol, palpitations*. **GI:** **PANCREATITIS**, abdominal pain, anorexia, constipation, dry mouth, ↑ liver enzymes, metallic taste, nausea, polydipsia, vomiting, weight loss. **GU:** albuminuria, azotemia, ↓ libido, nocturia, polyuria. **Derm:** pruritus. **F and E:** hypercalcemia. **Metab:** hyperthermia. **MS:** bone pain, muscle pain; *doxercalciferol, arthralgia; paricalcitol, metastatic calcification*. **Local:** pain at injection site. **Misc:** *calcitriol*—allergic reactions, chills, fever.

Interactions

Drug-Drug: Cholestyramine, colestipol, or mineral oil ↓ absorption of vitamin D analogues. Use with thiazide diuretics may result in hypercalcemia. **Corticosteroids** ↓ effectiveness of vitamin D analogues. Using calcitriol, doxercalciferol, or paricalcitol with digoxin may ↑ risk of arrhythmias. Vitamin D requirements ↓ by phenytoin and other hydantoin anticonvulsants, succralfate, barbiturates, and primidone. Concurrent use with magnesium-containing drugs may lead to hypermagnesemia. Concurrent use of calcium-containing drugs may ↑ risk of hypercalcemia. Concurrent use of other vitamin D supplements may ↑ risk of hypercalcemia. **Agents that induce liver enzymes** (phenobarbital, rifampin) and **agents that inhibit liver enzymes** (atazanavir, clarithromycin, erythromycin, indinavir, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, saquinavir, verapamil, voriconazole) may alter requirements for doxercalciferol and paricalcitol (monitoring of calcium and phosphorus recommended).

Drug-Food: Ingestion of foods high in calcium content (see Appendix M) may lead to hypercalcemia.

Route/Dosage

Calcitriol

PO (Adults): *Hypocalcemia during dialysis*—0.25 mcg/day or every other day; if needed, may ↑ by 0.25 mcg/day at 4–8 wk intervals (typical dosage = 0.5–1 mcg/day). *Hypoparathyroidism*—0.25 mcg/day initially; if needed, may ↑ dose by 0.25 mcg/day at 2–4 wk intervals (typical dosage = 0.5–2 mcg/day). *Pre-dialysis patients*—0.25 mcg/day (up to 0.5 mcg/day).

PO (Children): *Hypocalcemia during dialysis*—0.25–2 mcg/day. *Hypoparathyroidism (children ≥6 yr)*—0.25 mcg/day initially; if needed, may ↑ dose by 0.25 mcg/day at 2–4 wk intervals (typical dosage = 0.5–2 mcg/day). *Hypoparathyroidism (children 1–5 yr)*—0.25–0.75 mcg/day. *Hypoparathyroidism (children <1 yr)*—0.04–0.08 mcg/kg/day. *Pre-dialysis patients (children ≥3 yr)*—0.25 mcg/day (up to 0.5 mcg/day). *Predialysis patients (children <3 yr)*—10–15 ng/kg/day.

IV (Adults): *Hypocalcemia during dialysis*—0.5 mcg (0.01 mcg/kg) 3 times weekly. May be increased by 0.25–0.5 mcg/dose at 2–4 wk intervals (typical maintenance dose = 0.5–3.0 mcg 3 times weekly [0.01–0.05 mcg/kg 3 times weekly]).

IV (Children): *Hypocalcemia during dialysis*—0.01–0.05 mcg/kg 3 times weekly.

Cholecalciferol

PO (Adults): 400–1000 units daily.

PO (Infants): *Exclusively or partially breast fed*—400 IU daily.

Doxercalciferol

PO (Adults): *Dialysis patients*—10 mcg 3 times weekly (at dialysis); dose may be adjusted by 2.5 mcg at 8-wk intervals based on intact PTH concentrations (maximum dose = 20 mcg 3 times weekly). *Non-dialysis patients*—1 mcg/day; dose may be adjusted by 0.5 mcg at 2 wk intervals based on intact PTH concentrations (maximum dose = 3.5 mcg/day).

IV (Adults): 4 mcg 3 times weekly at the end of dialysis; dose may be adjusted by 1–2 mcg at 8-wk intervals based on intact PTH concentrations (maximum dose = 6 mcg 3 times weekly).

Ergocalciferol

PO (Adults): *Vitamin D-resistant rickets*—12,000–500,000 units/day (to be used with phosphate supplement). *Familial hypophosphatemia*—10,000–80,000 units/day (with phosphorus 1–2 g/day). *Hypoparathyroidism*—50,000–200,000 units/day (to be used with calcium supplement).

PO (Children): *Vitamin D-resistant rickets*—40,000–80,000 units/day (to be used with phosphate

supplement). *Familial hypophosphatemia*—10,000–80,000 units/day (with phosphorus 1–2 g/day). *Hypoparathyroidism*—50,000–200,000 units/day (to be used with calcium supplement).

PO (Infants): *Exclusively or partially breast fed*—400 IU daily.

Paricalcitol

Stage 3 or 4 Chronic Kidney Disease

PO (Adults): *Baseline intact PTH concentration ≤500 pg/mL*—Initiate with 1 mcg/day or 2 mcg 3 times weekly; dose can be adjusted at 2–4 wk intervals based on intact PTH, calcium, and phosphate concentrations. *Baseline intact PTH concentration >500 pg/mL*—Initiate with 2 mcg/day or 4 mcg 3 times weekly; dose can be adjusted at 2–4 wk intervals based on intact PTH, calcium, and phosphate concentrations.

Stage 5 Chronic Kidney Disease

PO (Adults): Initial dose (in mcg) is based on following equation: baseline intact PTH concentration (pg/mL)/80; dose should be given 3 times weekly; dose can be adjusted at 2–4 wk intervals based on intact PTH, calcium, and phosphate concentrations.

IV (Adults and Children ≥5 yr): 0.04–0.1 mcg/kg 3 times weekly during dialysis; dose can be adjusted by 2–4 mcg at 2–4 wk intervals based on intact PTH, calcium, and phosphate concentrations (doses up to 0.24 mcg/kg have been used).

Availability

Calcitriol (generic available)

Capsules: 0.25 mcg, 0.5 mcg. **Oral solution:** 1 mcg/mL. **Solution for injection:** 1 mcg/mL.

Cholecalciferol

Tablets: 400 units^{OTC}, 1000 units^{OTC}. **Oral solution:** 400 IU/drop^{OTC}. **In combination with:** alendronate (Fosamax Plus D), see Appendix B.

Doxercalciferol

Capsules: 0.5 mcg, 1 mcg, 2.5 mcg. **Solution for injection:** 2 mcg/mL.

Ergocalciferol (generic available)

Liquid: 8000 units/mL^{Rx, OTC}. **Capsules:** 50,000 units. **Tablets:** 400 IU.

Paricalcitol (generic available)

Capsules: 1 mcg, 2 mcg, 4 mcg. **Solution for injection:** 2 mcg/mL, 5 mcg/mL.

NURSING IMPLICATIONS

Assessment

- Assess for symptoms of vitamin deficiency prior to and periodically during therapy.

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Assess patient for bone pain and weakness prior to and during therapy.
- Observe patient carefully for evidence of hypocalcemia (paresthesia, muscle twitching, laryngospasm, colic, cardiac arrhythmias, and Chvostek's or Trousseau's sign). Protect symptomatic patient by raising and padding side rails; keep bed in low position.
- **Pedi:** Monitor height and weight; growth arrest may occur in prolonged high-dose therapy.
- **Rickets/Osteomalacia:** Assess patient for bone pain and weakness prior to and during therapy.
- **Lab Test Considerations:** During *calcitriol* therapy, serum calcium and phosphate concentrations should be drawn twice weekly initially. Serum calcium, magnesium, alkaline phosphatase, and intact PTH should then be monitored at least monthly. During *cholecalciferol* therapy, serum calcium, phosphate, and alkaline phosphatase concentrations should be monitored periodically. During *doxercalciferol* therapy, serum ionized calcium, phosphate, and intact PTH concentrations should be monitored prior to initiation of therapy, and then weekly during the first 12 wk of therapy, then periodically. Alkaline phosphatase should be monitored periodically. During *ergocalciferol* therapy, serum calcium and phosphate concentrations should be monitored every 2 wk. During oral *paricalcitol* therapy, serum calcium, phosphate, and intact PTH concentrations should be monitored at least every 2 wk for the first 3 mo of therapy or after any dosage adjustment, then monthly for 3 mo, then every 3 mo. During IV *paricalcitol* therapy, serum calcium and phosphate concentrations should be monitored twice weekly initially until dosage stabilized, and then at least monthly. Serum intact PTH concentrations should be monitored every 3 mo.
- The serum calcium $\times$ phosphate product ($\text{Ca} \times \text{P}$) should not exceed $70 \text{ mg}^2/\text{dL}^2$ ($55 \text{ mg}^2/\text{dL}^2$ for *doxercalciferol*) (patients may be at $\uparrow$ risk of calcification).
- Calcitriol may cause false $\uparrow$ cholesterol levels.
- **Toxicity and Overdose:** Toxicity is manifested as hypercalcemia, hypercalciuria, and hyperphosphatemia. Assess patient for appearance of nausea, vomiting, anorexia, weakness, constipation, headache, bone pain, and metallic taste. Later symptoms include polyuria, polydipsia, photophobia, rhinorrhea, pruritus, and cardiac arrhythmias. Notify health care professional immediately if these signs of hypervitaminosis D occur. Treatment usually consists of discontinuation of calcitriol, a low-calcium diet, use of low-calcium dialysate in peritoneal dialysis patients, and administration of a laxative. IV hydration and loop diuretics may be ordered to increase urinary excretion of calcium. Hemodialysis may also be used.

Potential Nursing Diagnoses

Imbalanced nutrition: less than body requirements (Indications)

Implementation

- **PO:** May be administered without regard to meals. Measure solution accurately with calibrated dropper provided by manufacturer. May be mixed with juice, cereal, or food, or dropped directly into mouth. Calcitriol capsules or solution should be protected from light.

IV Administration

- **pH:** No Data.
- **Direct IV:** Administer *calcitriol*, *doxercalciferol*, and *paracalcitol* undiluted by rapid injection through the catheter at the end of a hemodialysis period.

Patient/Family Teaching

- Advise patient to take medication as directed. Take missed doses as soon as remembered that day, unless almost time for next dose; do not double up on doses.
- Review diet modifications with patient. See Appendix M for foods high in calcium and vitamin D. Renal patients must still consider renal failure diet in food selection. Health care professional may order concurrent calcium supplement.
- Encourage patient to comply with dietary recommendations of health care professional. Explain that the best source of vitamins is a well-balanced diet with foods from the 4 basic food groups and the importance of sunlight exposure. See Appendix M for foods high in vitamin D.
- Patients self-medicating with vitamin supplements should be cautioned not to exceed RDA. The effectiveness of megadoses for treatment of various medical conditions is unproved and may cause side effects.
- Advise patient to avoid concurrent use of antacids containing magnesium.
- Review symptoms of overdosage and instruct patient to report these promptly to health care professional.
- Emphasize the importance of follow-up exams to evaluate progress.

Evaluation/Desired Outcomes

- Normalization of serum calcium and parathyroid hormone levels.
- Resolution or prevention of vitamin D deficiency.
- Improvement in symptoms of vitamin D—resistant rickets.

voriconazole (vor-i-kon-a-zole) VFEND

Classification

Therapeutic: antifungals

Pregnancy Category D

Indications

Serious systemic fungal infections including candidemia, esophageal candidiasis, candidal deep tissue and skin infections, abdominal, kidney, bladder wall and wound infections, and aspergillosis.

Action

Inhibits fungal ergosterol synthesis leading to production of abnormal fungal plasma membrane. **Therapeutic Effects:** Antifungal activity.

Pharmacokinetics

Absorption: Well absorbed following oral administration (96%); IV administration results in complete bioavailability.

Distribution: Extensive tissue distribution.

Protein Binding: 58%.

Metabolism and Excretion: Highly metabolized by the hepatic P450 enzymes (CYP2C19, CYP2C9, CYP3A4); <2% excreted unchanged in urine. Much individual variation in metabolism; metabolites are inactive.  The CYP2C19 enzyme system exhibits genetic polymorphism; 15–20% of Asian patients and 3–5% of Caucasian and Black patients may be poor metabolizers and may have significantly ↑ voriconazole concentrations and an ↑ risk of adverse effects.

Half-life: Dose-dependent (adults 6–9 hrs); ↑ in hepatic impairment.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1–2 hr	12 hr
IV	rapid	end of infusion	12 hr

Contraindications/Precautions

Contraindicated in: Concurrent use of ritonavir, rifampin, rifabutin, St. John's wort, carbamazepine, and phenobarbital (↓ antifungal activity); Concurrent use of sirolimus, pimozone, quinidine, ergotamine, and dihydroergotamine (↑ risk of toxicity of these agents); Tablets contain lactose and should be avoided in patients with galactose intolerance, Lapp lactase deficiency, or glucose-galactose malabsorption.

Use Cautiously in: Mild to moderate liver disease (Child-Pugh Class A and B); maintenance dose reduc-

tion recommended; Renal impairment (CCr <50 mL/min); use only if justified by risk/benefit assessment (IV form should be avoided, use oral form only); **OB, Lactation:** Use only if benefits justify risk; **Pedi:** Children <12 yr (limited dosing information); suspension contains benzyl alcohol which may cause potentially fatal "gasping syndrome" in neonates.

Adverse Reactions/Side Effects

CNS: dizziness, hallucinations, headache. **EENT:** visual disturbances, eye hemorrhage. **CV:** changes in BP, peripheral edema, tachycardia, QT interval prolongation. **GI:** **HEPATOTOXICITY**, abdominal pain, diarrhea, nausea, pancreatitis, vomiting. **Derm:** **MELANOMA**, **SQUAMOUS CELL CARCINOMA**, **STEVENS-JOHNSON SYNDROME**, photosensitivity, rash. **F and E:** hypokalemia, hypomagnesemia, hyperglycemia. **MS:** fluorosis, periostitis. **Misc:** chills, fever, infusion reactions.

Interactions

Drug-Drug: Voriconazole is a substrate and inhibitor of the **CYP3A4**, **CYP2C9**, and **CYP2C19** enzyme systems. **Carbamazepine**, **ritonavir**, **phenobarbital**, **St. John's wort**, **rifabutin**, and **rifampin** ↑ metabolism and ↓ antifungal activity of voriconazole; concurrent use is contraindicated. **Efavirenz** ↑ metabolism and ↓ antifungal activity of voriconazole; voriconazole also ↓ metabolism and ↑ risk of toxicity of **efavirenz**; if used together, ↑ dose of voriconazole to 400 mg q 12 hr and ↓ dose of efavirenz to 300 mg daily. ↓ metabolism and ↑ risk of toxicity from **dihydroergotamine**, **ergotamine**, **pimozone**, **rifabutin**, **quinidine**, and **sirolimus**; concurrent use is contraindicated. **Fluconazole** ↑ levels and toxicity of voriconazole; avoid concurrent use. ↓ metabolism and ↑ risk of toxicity from **cyclosporine**, **HMG-CoA reductase inhibitors**, some **benzodiazepines** (**alprazolam**, **midazolam**, **triazolam**), **fentanyl**, **hydrocodone**, **NSAIDs** (**ibuprofen**, **diclofenac**), some **calcium channel blockers**, **sulfonyleureas** (**glipizide**, **glyburide**, **tolbutamide**), **alfentanil**, **tacrolimus**, **warfarin**, and **vinca alkaloids** (**vincristine**, **vinblastine**); careful monitoring required during concurrent use. May ↑ **methadone** levels; may ↑ risk of QT interval prolongation. **Oral contraceptives** containing **ethinyl estradiol** and **norethindone** may ↓ voriconazole levels. **Phenytoin** ↑ metabolism and ↓ antifungal activity of voriconazole; voriconazole ↑ **phenytoin** levels and may cause toxicity; careful monitoring required during concurrent use. ↑ blood levels of **omeprazole**; ↓ omeprazole dose by 50% during concurrent use. Similar effects may occur with other **proton-pump inhibitors**. May ↓ metabolism and ↑ blood levels and effects of **protease-inhibitor antiretrovirals** and **non-nucleoside reverse transcriptase inhibitor antiretro-**

★ = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

virals; frequent monitoring recommended.
Non-nucleoside reverse transcriptase inhibitor antiretrovirals; may induce or inhibit the metabolism of voriconazole; frequent monitoring recommended.

Route/Dosage

IV (Adults and children >12 yr): *Loading dose*—6 mg/kg every 12 hour for 2 doses, followed by *maintenance dosing*—3–4 mg/kg every 12 hours. IV then switched to oral dosing when possible. If intolerance occurs, dose may be ↓ to 3 mg/kg every 12 hr. If phenytoin is coadministered, ↑ maintenance dose to 5 mg/kg every 12 hr.

IV (Children 2–11 yrs): *Loading dose*—6–8 mg/kg (maximum: 400 mg/dose) every 12 hour for 2 doses, followed by *Maintenance dosing*—7 mg/kg (maximum: 200 mg/dose) every 12 hours. *Invasive aspergillosis*—5–7 mg/kg every 12 hr.

PO (Adults and children >12 yr and >40 kg): *Most infections*—(following IV loading dose) 200 mg every 12 hr; may be increased to 300 mg every 12 hr if response is inadequate. If phenytoin is coadministered, ↑ maintenance dose to 400 mg every 12 hr; *Esophageal candidiasis*—200 mg every 12 hr for 14 days or 7 days following symptom resolution.

PO (Adults and children >12 yr and <40 kg): *Most infections*—(following IV loading dose) 100 mg every 12 hr; may be increased to 150 mg every 12 hr if response is inadequate. If phenytoin is coadministered, ↑ maintenance dose to 200 mg every 12 hr; *Esophageal candidiasis*—100 mg every 12 hr for 14 days or 7 days following symptom resolution.

PO (Children <12 yrs or <25 kg): *Invasive aspergillosis*—8 mg/kg/dose (maximum: 400 mg/dose) q 12 hr x 2 doses then *Maintenance dosing*—7 mg/kg (maximum: 200 mg/dose) every 12 hrs.

Hepatic Impairment

IV (Adults and Children >12 yr): *Child-Pugh Class A and B*—Use standard loading dose, ↓ maintenance dose by 50%; *Child-Pugh Class C*—Not recommended.

Availability (generic available)

Tablets: 50 mg, 200 mg. **Oral suspension (orange):** 40 mg/mL. **Powder for injection (requires reconstitution):** 200 mg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor for signs and symptoms of fungal infections prior to and during therapy.
- Obtain specimens for culture and histopathology prior to therapy to isolate and identify organism. Therapy may be started before results are received.
- Monitor visual function including visual acuity, visual field, and color perception in patients receiving more than 28 days of therapy. Vision usually re-

turns to normal within 14 days after discontinuation of therapy.

- **Monitor for allergic reactions during infusion of voriconazole** (flushing, fever, sweating, tachycardia, chest tightness, dyspnea, faintness, nausea, pruritus, rash). Symptoms occur immediately upon start of infusion. May require discontinuation.
- Monitor patients with risk factors for acute pancreatitis (recent chemotherapy, hematopoietic stem cell transplantation [HSCT]) for the signs of pancreatitis (abdominal pain, ↑ serum amylase and lipase).
- **Assess for rash periodically during therapy.** May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.
- **Lab Test Considerations:** Monitor liver function tests prior to and during therapy. If abnormal liver function tests occur, monitor for development of severe hepatic injury. Discontinue therapy if clinical signs and symptoms of liver disease develop.
- Monitor renal function (serum creatinine) during therapy.

Potential Nursing Diagnoses

Risk for infection (Indications)

Implementation

- Once patient can tolerate oral medication, PO voriconazole may be used.
- Correct electrolyte disturbances (hypokalemia, hypomagnesemia, hypocalcemia) prior to initiation therapy.
- **PO:** Administer 1 hr before or 1 hr after a meal.
- Shake suspension well (approximately 10 seconds) before measuring suspension. Do not mix suspension with other medicine, flavored liquid, or syrup.

IV Administration

- **pH:** 6.0–7.0.
- **Intermittent Infusion:** Reconstitute each 200-mg vial with 19 mL of sterile water for injection to achieve concentration of 10 mg/mL. Calculate volume of 10 mg/mL solution required for patient dose. **Diluent:** Withdraw and discard equal volume of diluent from infusion bag or bottle to be used. Withdraw required volume of voriconazole solution from vial(s) and add to appropriate volume of 0.9% NaCl, LR, D5/LR, D5/0.45% NaCl, D5W, 0.45% NaCl, or D5/0.9% NaCl. Reconstituted solution stable for 24 hr if refrigerated. Discard partially used vials. **Concentration:** Final concentration of infusion should be 0.5–5 mg/mL. **Rate:** Infuse over 1–2 hr at a rate not to exceed 3 mg/kg/hr.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, amino-

phylline, amiodarone, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, azithromycin, aztreonam, bivalirudin, bleomycin, buprenorphine, butorphanol, bumetanide, buprenorphine, butorphanol, calcium acetate, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftriaxone, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin, dexamethasone, dexmedetomidine, dextrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doripenem, doxacurium, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydralazine, hydrocortisone, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, mephalan, meperidine, meropenem, mesna, metaraminol, methohexital, methotrexate, methyl dopate, methylprednisolone, metioclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, morphine, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, pamidronate, pancuronium, pentamidine, pentazocine, pentobarbital, phenobarbital, phentolamine, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, promethazine, propranolol, quinupristin/dalfopristin, remifen-

tanil, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiopeta, ticarcillin/clavulanate, tirofiban, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** amphotericin B colloidal, amphotericin B lipid complex, busulfan, cefepime, cyclosporine, dantrolene, diazepam, doxorubicin, idarubicin, mitoxantrone, moxifloxacin, nitroprusside, pantoprazole, phenytoin, thiopental.

Patient/Family Teaching

- Advise patient to take voriconazole as directed, on an empty stomach.
- May cause blurred vision, photophobia, and dizziness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known. Also advise patient to avoid driving at night during voriconazole therapy.
- Advise patient to avoid direct sunlight, sunlamps and tanning beds during voriconazole therapy. Use sunscreen and protective clothing to prevent severe sunburn.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise patient to notify health care professional if rash or signs and symptoms of allergic reaction occur.
- Advise women of childbearing age to use contraception and notify health care professional if pregnancy is planned or suspected or if breast feeding. If pregnancy is detected, discontinue medication as soon as possible.

Evaluation/Desired Outcomes

- Resolution of fungal infections.

V

HIGH ALERT

 **warfarin** (war-fa-rin)
Coumadin, Jantoven

Classification

Therapeutic: anticoagulants
Pharmacologic: coumarins

Pregnancy Category X

Indications

Prophylaxis and treatment of: Venous thrombosis, Pulmonary embolism, Atrial fibrillation with embolization. Management of myocardial infarction: Decreases risk of death, Decreases risk of subsequent MI, Decreases risk of future thromboembolic events. Prevention of thrombus formation and embolization after prosthetic valve placement.

Action

Interferes with hepatic synthesis of vitamin K-dependent clotting factors (II, VII, IX, and X). **Therapeutic Effects:** Prevention of thromboembolic events.

Pharmacokinetics

Absorption: Well absorbed from the GI tract after oral administration.

Distribution: Crosses the placenta but does not enter breast milk.

Protein Binding: 99%.

Metabolism and Excretion: Metabolized by the liver.

Half-life: 42 hr.

TIME/ACTION PROFILE (effects on coagulation tests)

ROUTE	ONSET	PEAK	DURATION
PO, IV	36–72 hr	5–7 days†	2–5 days‡

† At a constant dose

‡ After discontinuation

Contraindications/Precautions

Contraindicated in: Uncontrolled bleeding; Open wounds; Active ulcer disease; Recent brain, eye, or spinal cord injury or surgery; Severe liver or kidney disease; Uncontrolled hypertension; **OB:** Crosses placenta and may cause fatal hemorrhage in the fetus. May also cause congenital malformation.

Use Cautiously in: Malignancy; Patients with history of ulcer or liver disease; History of poor compliance; Women with childbearing potential;  Asian patients or those who carry the CYP2C9*2 allele and/or the CYP2C9*3 allele, or with the VKORC1 AA genotype (↑ risk of bleeding with standard dosing; lower initial doses should be considered); **Pedi:** Has been used

safely but may require more frequent PT/INR assessments; **Geri:** Due to greater than expected anticoagulant response, initiate and maintain at lower doses.

Adverse Reactions/Side Effects

GI: cramps, nausea. **Derm:** dermal necrosis. **Hemat:** **BLEEDING**. **Misc:** fever.

Interactions

Drug-Drug: Abciximab, androgens, capecitabine, cefotetan, chloramphenicol, clopidogrel, disulfiram, fluconazole, fluoroquinolones, itraconazole, metronidazole (including vaginal use), thrombolytics, eptifibatide, tirofiban, ticlopidine, sulfonamides, quinidine, quinine, NSAIDs, valproates, and aspirin may ↑ the response to warfarin and ↑ the risk of bleeding. Chronic use of acetaminophen may ↑ the risk of bleeding. Chronic alcohol ingestion may ↓ action of warfarin; if chronic alcohol abuse results in significant liver damage, action of warfarin may be ↑ due to ↓ production of clotting factor. Acute alcohol ingestion may ↑ action of warfarin. Barbiturates, carbamazepine, rifampin, and hormonal contraceptives containing estrogen may ↓ the anticoagulant response to warfarin. Many other drugs may affect the activity of warfarin.

Drug-Natural Products: St. John's wort ↓ effect. ↑ bleeding risk with anise, arnica, chamomile, clove, dong quai, fenugreek, feverfew, garlic, ginger, ginkgo, Panax ginseng, licorice, and others.

Drug-Food: Ingestion of large quantities of foods high in vitamin K content (see list in Appendix M) may antagonize the anticoagulant effect of warfarin.

Route/Dosage

 **PO, IV (Adults):** 2–5 mg/day for 2–4 days; then adjust daily dose by results of INR. Initiate therapy with lower doses in geriatric or debilitated patients or in Asian patients or those with CYP2C9*2 and/or CYP2C9*3 alleles or VKORC1 AA genotype.

PO, IV (Children >1 mo): Initial loading dose—0.2 mg/kg (maximum dose: 10 mg) for 2–4 days then adjust daily dose by results of INR, use 0.1 mg/kg if liver dysfunction is present. Maintenance dose range—0.05–0.34 mg/kg/day.

Availability (generic available)

Tablets: 1 mg, 2 mg, 2.5 mg, 3 mg, 4 mg, 5 mg, 6 mg, 7.5 mg, 10 mg. **Cost:** Generic—1 mg \$10.83/100, 2 mg \$10.83/100, 2.5 mg \$10.83/100, 3 mg \$10.83/100, 4 mg \$10.83/100, 5 mg \$8.52/100, 6 mg \$10.64/100, 7.5 mg \$10.83/100, 10 mg \$10.83/100. **Powder for injection:** 5 mg/vial.

 = Canadian drug name.  = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

W

NURSING IMPLICATIONS

Assessment

- **Assess** for signs of bleeding and hemorrhage (bleeding gums; nosebleed; unusual bruising; tarry, black stools; hematuria; fall in hematocrit or BP; guaiac-positive stools, urine, or nasogastric aspirate).
- Assess for evidence of additional or increased thrombosis. Symptoms depend on area of involvement.
- **Geri:** Patients over 60 yr exhibit greater than expected PT/INR response. Monitor for side effects at lower therapeutic ranges.
- **Pedi:** Achieving and maintaining therapeutic PT/INR ranges may be more difficult in pediatric patients. Assess PT/INR levels more frequently.
- **Lab Test Considerations:** Monitor PT, INR and other clotting factors frequently during therapy. Therapeutic PT ranges 1.3–1.5 times greater than control; however, the INR, a standardized system that provides a common basis for communicating and interpreting PT results, is usually referenced. Normal INR (not on anticoagulants) is 0.8–1.2. An INR of 2.5–3.5 is recommended for patients at very high risk of embolization (for example, patients with mitral valve replacement and ventricular hypertrophy). Lower levels are acceptable when risk is lower. Heparin may affect the PT/INR; draw blood for PT/INR in patients receiving both heparin and warfarin at least 5 hr after the IV bolus dose, 4 hr after cessation of IV infusion, or 24 hr after subcut heparin injection. ☞ Asian patients and those who carry the CYP2C9*2 allele and/or the CYP2C9*3 allele, or those with VKORC1 AA genotype may require more frequent monitoring and lower doses.
- Monitor hepatic function and CBC before and periodically throughout therapy.
- **Monitor stool and urine for occult blood before and periodically during therapy.**
- **Toxicity and Overdose:** Withholding 1 or more doses of warfarin is usually sufficient if INR is excessively elevated or if minor bleeding occurs. If overdose occurs or anticoagulation needs to be immediately reversed, the antidote is vitamin K (phytonadione, AquaMEPHYTON). Administration of whole blood or plasma also may be required in severe bleeding because of the delayed onset of vitamin K.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)

Risk for injury (Side Effects)

Implementation

- **High Alert:** Medication errors involving anticoagulants have resulted in serious harm or death from internal or intracranial bleeding. Before adminis-

tering, evaluate recent INR or PT results and have second practitioner independently check original order.

- Do not confuse Coumadin (warfarin) with Avandia (rosiglitazone) or Cardura (doxazosin). Do not confuse Jantoven (warfarin) with Janumet (sitagliptin/metformin) or Januvia (sitagliptin).
- Because of the large number of medications capable of significantly altering warfarin's effects, careful monitoring is recommended when new agents are started or other agents are discontinued. Interactive potential should be evaluated for all new medications (Rx, OTC, and natural products).
- **PO:** Administer medication at same time each day. Medication requires 3–5 days to reach effective levels; usually begun while patient is still on heparin.
- Do not interchange brands; potencies may not be equivalent.

IV Administration

- **Direct IV:** Reconstitute each 5-mg vial with 2.7 mL of sterile water for injection. Reconstituted solution is stable for 4 hr at room temperature. **Diluent:** No further dilution needed before administration. **Concentration:** 2 mg/mL. **Rate:** Administer over 1–2 min.
- **Y-Site Compatibility:** amikacin, ascorbic acid, bivalirudin, cefazolin, ceftriaxone, dopamine, epinephrine, heparin, lidocaine, morphine, nitroglycerin, oxytocin, potassium chloride, ranitidine.
- **Y-Site Incompatibility:** aminophylline, ceftazidime, ciprofloxacin, dobutamine, esmolol, gentamicin, labetalol, promazine.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as remembered that day; do not double doses. Inform health care professional of missed doses at time of checkup or lab tests. Inform patients that anticoagulant effect may persist for 2–5 days following discontinuation. Advise patient to read *Medication Guide* before starting therapy and with each Rx refill.
- Review foods high in vitamin K (see Appendix M). Patient should have consistent limited intake of these foods, as vitamin K is the antidote for warfarin, and alternating intake of these foods will cause PT levels to fluctuate. Advise patient to avoid cranberry juice or products during therapy.
- Caution patient to avoid IM injections and activities leading to injury. Instruct patient to use a soft toothbrush, not to floss, and to shave with an electric razor during warfarin therapy. Advise patient that venipunctures and injection sites require application of pressure to prevent bleeding or hematoma formation.

- Advise patient to report any symptoms of unusual bleeding or bruising (bleeding gums; nosebleed; black, tarry stools; hematuria; excessive menstrual flow) and pain, color, or temperature change to any area of your body to health care professional immediately.  Patients with a deficiency in protein C and/or S mediated anticoagulant response may be at greater risk for tissue necrosis.
- Instruct patient not to drink alcohol or take other Rx, OTC, or herbal products, especially those containing aspirin or NSAIDs, or to start or stop any new medications during warfarin therapy without advice of health care professional.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Instruct patient to carry identification describing medication regimen at all times and to inform all health care personnel caring for patient on anticoagulant therapy before lab tests, treatment, or surgery.
- **Emphasize the importance of frequent lab tests to monitor coagulation factors.**

Evaluation/Desired Outcomes

- Prolonged PT (1.3–2.0 times the control; may vary with indication) or INR of 2–4.5 without signs of hemorrhage.

W

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

zaleplon (za-lep-lon)

Sonata

Classification

Therapeutic: sedative/hypnotics

Schedule IV**Pregnancy Category C****Indications**

Short-term management of insomnia in patients unable to get at least 4 hr of sleep; especially useful in sleep initiation disorders.

Action

Produces CNS depression by binding to GABA receptors in the CNS. Has no analgesic properties. **Therapeutic Effects:** Induction of sleep.

Pharmacokinetics

Absorption: Rapidly absorbed following oral administration.

Distribution: Enters breast milk.

Metabolism and Excretion: Extensively metabolized in the liver (mostly by aldehyde oxidase and some by CYP 450 3A4 enzymes).

Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	within min	unknown	3–4 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Severe hepatic impairment; **OB, Lactation:** Pregnancy or lactation.

Use Cautiously in: Mild to moderate hepatic impairment, weight ≤ 50 kg, or concurrent cimetidine therapy (initiate therapy at lowest dose); Impaired respiratory function; History of suicide attempt; **Pedi:** Safety not established; **Geri:** $\uparrow$ risk of cognitive impairment. If used, start at lowest dose.

Adverse Reactions/Side Effects

CNS: abnormal thinking, amnesia, anxiety, behavior changes, depersonalization, dizziness, drowsiness, hallucinations, headache, impaired memory (briefly following dose), impaired psychomotor function (briefly following dose), malaise, nightmares, sleep-driving, vertigo, weakness. **EENT:** abnormal vision, ear pain, epistaxis, hearing sensitivity, ocular pain, altered sense of smell. **CV:** peripheral edema. **GI:** abdominal pain, anorexia, colitis, dyspepsia, nausea.

GU: dysmenorrhea. **Derm:** photosensitivity. **Neuro:** hyperesthesia, paresthesia, tremor. **Misc:** fever.

Interactions

Drug-Drug: **Cimetidine** $\downarrow$ metabolism and $\uparrow$ effects (initiate therapy at a lower dose). Additive CNS depression with other CNS depressants including alcohol, antihistamines, opioid analgesics, other sedative/hypnotics, phenothiazines, and tricyclic antidepressants. Effects may be $\downarrow$ by drugs that induce the CYP 450 3A4 enzyme system including rifampin, phenytoin, carbamazepine, and phenobarbital.

Drug-Natural Products: Concomitant use of kava-kava, valerian, chamomile, or hops can $\uparrow$ CNS depression.

Drug-Food: Concurrent ingestion of a high-fat meal slows the rate of absorption.

Route/Dosage

PO (Adults <65 yr): 10 mg (range 5–20 mg) at bedtime.

PO (Geriatric Patients or Patients <50 kg): Initiate therapy at 5 mg at bedtime (not to exceed 10 mg at bedtime).

Hepatic Impairment

PO (Adults): Initiate therapy at 5 mg at bedtime (not to exceed 10 mg at bedtime).

Availability (generic available)

Capsules: 5 mg, 10 mg.

NURSING IMPLICATIONS**Assessment**

- Assess mental status, sleep patterns, and potential for abuse prior to administering this medication. Zaleplon is used to treat short-term difficulty in falling asleep; decreases time to sleep onset. May not increase total sleep time or decrease number of awakenings after falling asleep. Prolonged use of >7 –10 days may lead to physical and psychological dependence. Limit amount of drug available to the patient.
- Assess alertness at time of peak effect. Notify health care professional if desired sedation does not occur.
- Assess patient for pain. Medicate as needed. Untreated pain decreases sedative effects.

Potential Nursing Diagnoses

Insomnia (Indications)

Risk for injury (Side Effects)

Implementation

- Do not confuse Sonata with Soriatane.
- Before administering, reduce external stimuli and provide comfort measures to increase effectiveness of medication.

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Protect patient from injury. Supervise ambulation and transfer of patients after administration. Remove cigarettes. Side rails should be raised and call bell within reach at all times.
- **PO:** Tablets should be swallowed whole with full glass of water immediately before bedtime or after going to bed and experiencing difficulty falling asleep. Do not administer with or immediately after a high-fat or heavy meal.

Patient/Family Teaching

- Instruct patient to take zaleplon as directed. Do not take more than the amount prescribed because of the habit-forming potential. Not recommended for use longer than 7–10 days. Rebound insomnia (1–2 nights) may occur when stopped. If used for 2 wk or longer, abrupt withdrawal may result in dysphoria, insomnia, abdominal or muscle cramps, vomiting, sweating, tremors, and seizures.
- Because of rapid onset, advise patient to go to bed immediately after taking zaleplon.
- May cause daytime drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to this medication is known.
- Inform patient that amnesia may occur, but can be avoided if zaleplon is only taken when patient is able to get >4 hr sleep.
- Caution patient that complex sleep-related behaviors (sleep-driving, making phone calls, preparing and eating food, having sex, sleep walking) may occur while asleep. Inform patient to notify health care professional if sleep-related behaviors, (may include sleep-driving—driving while not fully awake after ingestion of a sedative-hypnotic product, with no memory of the event) occur.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Improved ability to fall asleep; decreased time to sleep onset.

zanamivir (za-na-mi-veer) Relenza

Classification

Therapeutic: antivirals

Pharmacologic: neuraminidase inhibitors

Pregnancy Category C

Indications

Treatment of uncomplicated acute illness caused by influenza virus in patients ≥ 7 yr who have been symp-

tomatic ≤ 2 days. Prevention of influenza in patients ≥ 5 yr.

Action

Inhibits the enzyme neuramidase, which may alter virus particle aggregation and release. **Therapeutic Effects:** Reduced duration or prevention of flu-related symptoms.

Pharmacokinetics

Absorption: 4–17% of inhaled dose is systemically absorbed.

Distribution: Unknown.

Protein Binding: <10%.

Metabolism and Excretion: Mainly excreted by kidneys as unchanged drug; unabsorbed drug is excreted in feces.

Half-life: 2.5–5.1 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
Inhalation	rapid	1–2 hr	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to zanamivir or lactose.

Use Cautiously in: Chronic obstructive pulmonary disease or asthma ($\uparrow$ risk of decreased lung function and/or bronchospasm); **OB, Lactation:** Safety not established; **Pedi:** Children <7 yr (for treatment) or <5 yr (for prophylaxis) (safety not established; may be at $\uparrow$ risk for neuropsychiatric events).

Adverse Reactions/Side Effects

CNS: **SEIZURES,** abnormal behavior, agitation, delirium, hallucinations, nightmares. **Resp:** bronchospasm. **Misc:** allergic reactions.

Interactions

Drug-Drug: None noted.

Route/Dosage

Treatment

Inhaln (Adults and children ≥ 7 yr): 10 mg (given as 2 inhalations of 5 mg each) twice daily for 5 days.

Prophylaxis

Inhaln (Adults and children ≥ 5 yr): 10 mg (given as 2 inhalations of 5 mg each) daily for 10 days (for household setting) (28 days for community outbreaks).

Availability

Powder for inhalation: 5 mg/blister.

NURSING IMPLICATIONS

Assessment

- Assess patient for signs and symptoms of influenza (fever, headache, myalgia, cough, sore throat) be-

fore administration. Determine duration of symptoms. Indicated for patients who have been symptomatic for up to 2 days.

- Determine if patient is lactose intolerant; may cause allergic reaction.

Potential Nursing Diagnoses

Risk for infection (Indications)

Implementation

- Consider available information on influenza drug susceptibility patterns and treatment effects before using zanamivir for prophylaxis.
- **Inhaln:** Administer 2 doses on the first day of treatment whenever possible; must have at least 2 hours between doses. Doses should be administered 12 hr apart on subsequent days. Zanamivir is only for oral inhalation via DISKHALER; do not attempt via nebulization or mechanical ventilation.

Patient/Family Teaching

- Instruct patient to use zanamivir exactly as directed and to finish entire course, even if feeling better.
- Instruct patient in the use of the DISKHALER. Patient should read the accompanying *Patient Instructions for Use*.
- Advise patients that zanamivir is not a substitute for a flu shot. Patients should receive annual flu shot according to immunization guidelines.
- Patients with a history of asthma should be advised to have a fast-acting inhaled bronchodilator available in case of bronchospasm following zanamivir administration. If using bronchodilator and zanamivir concurrently, administer bronchodilator first.
- Advise patients to report behavioral changes (hallucinations, delirium, and abnormal behavior) to health care professional immediately.
- Inform patient that zanamivir does not replace flu shot. Flu shot should be taken according to instructions of health care professional.
- Advise female patient to avoid zanamivir if pregnant or breast feeding.

Evaluation/Desired Outcomes

- Reduced duration or prevention of flu-related symptoms.

zidovudine (zye-doe-vue-deen)
AZT, Retrovir

Classification

Therapeutic: antiretrovirals

Pharmacologic: nucleoside reverse transcriptase inhibitors

Pregnancy Category C

Indications

HIV infection (with other antiretrovirals). Reduction of maternal/fetal transmission of HIV. **Unlabeled Use:** Chemoprophylaxis after occupational exposure to HIV.

Action

Following intracellular conversion to its active form, inhibits viral RNA synthesis by inhibiting the enzyme DNA polymerase (reverse transcriptase). Prevents viral replication. **Therapeutic Effects:** Virustatic action against selected retroviruses. Slowed progression and decreased sequelae of HIV infection. Decreased viral load and improved CD4 cell counts. Decreased transmission of HIV to infants born to HIV-infected mothers.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Widely distributed; enters the CNS. Crosses the placenta.

Metabolism and Excretion: Mostly (75%) metabolized by the liver; 15–20% excreted unchanged by the kidneys.

Half-life: 1 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	0.5–1.5 hr	4 hr
IV	rapid	end of infusion	4 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **Lactation:**

Breast feeding not recommended in HIV-infected patients.

Use Cautiously in: ↓ bone marrow reserve (dose ↓ required for anemia or granulocytopenia); Severe hepatic or renal disease (dose modification may be required); **Geri:** Select dose carefully due to potential for age-related ↓ in hepatic, renal, or cardiac function.

Adverse Reactions/Side Effects

CNS: **SEIZURES**, headache, weakness, anxiety, confusion, ↓ mental acuity, dizziness, insomnia, mental depression, restlessness, syncope. **GI:** **HEPATOMEGALY** (with steatosis), **PANCREATITIS**, abdominal pain, diarrhea, nausea, anorexia, drug-induced hepatitis, dyspepsia, oral mucosa pigmentation, vomiting. **F and E:** **LACTIC ACIDOSIS**. **Derm:** nail pigmentation. **Endo:** fat redistribution, gynecomastia. **Hemat:** anemia, granulocytopenia, pure red-cell aplasia, thrombocytosis.

MS: back pain, myopathy. **Neuro:** tremor. **Misc:** immune reconstitution syndrome.

☼ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Interactions

Drug-Drug: ↑ bone marrow depression with other agents having bone marrow–depressing properties, antineoplastics, radiation therapy, or ganciclovir. ↑ neurotoxicity may occur with acyclovir. Toxicity may be ↑ by concurrent administration of probenecid or fluconazole. Levels are ↓ by clarithromycin.

Route/Dosage

Management of HIV Infection

PO (Adults): 100 mg q 4 hr while awake or 200 mg 3 times daily or 300 mg twice daily (depends on combination and clinical situation).

PO (Children 4 wk–<18 yr): 4–8.9 kg–12 mg/kg twice daily or 8 mg/kg 3 times daily; 9–29.9 kg–9 mg/kg twice daily or 6 mg/kg 3 times daily; ≥30 kg–300 mg twice daily or 200 mg 3 times daily.

IV (Adults and Children >12 yr): 1 mg/kg infused over 1 hr q 4 hr. Change to oral therapy as soon as possible.

IV (Children): 120 mg/m² q 6 hr (not to exceed 160 mg/dose) or 20 mg/m²/hr as a continuous infusion.

Prevention of Maternal/Fetal Transmission of HIV Infection

PO (Adults >14 wk Pregnant): 100 mg 5 times daily until onset of labor.

IV (Adults during Labor and Delivery): 2 mg/kg over 1 hr, then continuous infusion of 1 mg/kg/hr until umbilical cord is clamped.

IV (Infants): 1.5 mg/kg q 6 hr until able to take PO.

PO (Infants): 2 mg/kg q 6 hr, started within 12 hr of birth and continued for 6 wk.

PO (Neonates premature <30 wk gestational age at birth): 2 mg/kg q 12 hr then ↑ to q 8 hr at 4 wk of age.

PO (Neonates premature ≥30 wk gestational age at birth): 2 mg/kg q 12 hr then ↑ to q 8 hr at 2 wk of age.

IV (Neonates premature <30 wk gestational age at birth): 1.5 mg/kg q 12 hr then ↑ to q 8 hr at 4 wk of age.

IV (Neonates premature ≥30 wk gestational age at birth): 1.5 mg/kg q 12 hr then ↑ to q 8 hr at 2 wk of age.

Availability (generic available)

Capsules: 100 mg. **Tablets:** 300 mg. **Oral syrup:** 50 mg/5 mL. **Solution for injection:** 10 mg/mL. **In combination with:** lamivudine (Combivir); abacavir and lamivudine (Trizivir); see Appendix B.

NURSING IMPLICATIONS

Assessment

- Assess patient for change in severity of symptoms of HIV and for symptoms of opportunistic infections during therapy.

- Lab Test Considerations:** Monitor viral load and CD4 counts prior to and periodically during therapy.
- Monitor CBC every 2 wk during the first 8 wk of therapy in patients with advanced HIV disease, and decrease to every 4 wk after the first 2 mo if zidovudine is well tolerated or monthly during the first 3 mo and every 3 mo thereafter unless indicated in patients who are asymptomatic or have early symptoms. Commonly causes granulocytopenia and anemia. Anemia may occur 2–4 wk after initiation of therapy. Anemia may respond to epoetin administration (see epoetin monograph). Granulocytopenia usually occurs after 6–8 wk of therapy. Consider dose reduction, discontinuation of therapy, or blood transfusions if hemoglobin is <7.5 g/dL or reduction of >25% from baseline and/or granulocyte count is <750/mm³ or reduction of >50% from baseline. Therapy may be gradually resumed when bone marrow recovery is evident.
- May cause ↑ serum AST, ALT, and alkaline phosphatase levels. Lactic acidosis may occur with hepatic toxicity, causing hepatic steatosis; may be fatal, especially in women.
- Monitor serum amylase, lipase, and triglycerides periodically during therapy. Elevated serum levels may indicate pancreatitis and require discontinuation.

Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)

Implementation

- Do not confuse Retrovir (zidovudine) with ritonavir.**
- PO:** Administer doses around the clock.
- IV:** Patient should receive the IV infusion only until oral therapy can be administered.

IV Administration

- pH:** 5.5.
- Intermittent Infusion:** **Diluent:** Remove calculated dose from the vial and dilute with D5W or 0.9% NaCl. Do not use solutions that are discolored. Stable for 8 hr at room temperature or 24 hr if refrigerated. **Concentration:** Not to exceed 4 mg/mL. **Rate:** Infuse at a constant rate over 1 hr or over 30 min in neonates. Avoid rapid infusion or bolus injection.
- Continuous Infusion:** Has also been administered via continuous infusion.
- Y-Site Compatibility:** acyclovir, alemtuzumab, allopurinol, amifostine, amikacin, amphotericin B cholesteryl, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, azithromycin, aztreonam, bivalirudin, bleomycin, carboplatin, carmustine, caspofungin, cefepime, ceftazidime, ceftriaxone, cisatracurium, cisplatin, clindamycin, cyclophos-

- phamide, cytarabine, dactinomycin, daptomycin, dexamethasone sodium phosphate, dexmedetomidine, diltiazem, dobutamine, docetaxel, dolasetron, dopamine, doripenem, doxacurium, doxorubicin hydrochloride, doxorubicin liposome, epirubicin, epifibatide, ertapenem, erythromycin lactobionate, etoposide, etoposide phosphate, fenoldopam, filgrastim, fluconazole, fludarabine, fluorouracil, fos-carnet, gemcitabine, gentamicin, granisetron, heparin, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, irinotecan, leucovorin, levofloxacin, linezolid, lorazepam, mechlorethamine, melphalan, meperidine, methotrexate, metoclopramide, metronidazole, milrinone, mitoxantrone, morphine, mycophenolate, nafcillin, nesiritide, nicardipine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, pentamidine, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, quina-pristin/dalfopristin, ranitidine, remifentanyl, rituximab, rocuronium, sargramostim, sodium acetate, tacrolimus, teniposide, thiotepa, tigecycline, tirofiban, tobramycin, trastuzumab, trimethoprim/sulfamethoxazole, trastuzumab, vancomycin, vasopressin, vecuronium, vinblastine, vincristine, vinorelbine, voriconazole, zoledronic acid.
- **Additive Incompatibility:** blood products or protein solutions, dexrazoxane.

Patient/Family Teaching

- Instruct patient to take zidovudine as directed, around the clock, even if sleep is interrupted. Emphasize the importance of compliance with therapy, not taking more than prescribed amount, and not discontinuing without consulting health care professional. Take missed doses as soon as remembered unless almost time for next dose; do not double doses. Inform patient that long-term effects of zidovudine are unknown at this time.
- Instruct patient that zidovudine should not be shared with others.
- Zidovudine may cause dizziness or fainting. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Inform patient that zidovudine does not cure HIV and does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom during sexual contact and avoid sharing needles or donating blood to prevent spreading the AIDS virus to others.
- Instruct patient to notify health care professional promptly if fever, sore throat, signs of infection, muscle weakness, or shortness of breath occurs. Caution patient to avoid crowds and persons with

known infections. Instruct patient to use soft toothbrush, to use caution when using toothpicks or dental floss, and to have dental work done prior to therapy or deferred until blood counts return to normal. **Patient should also notify health care professional immediately if shortness of breath, muscle weakness, muscle aches, symptoms of hepatitis or pancreatitis, or other unexpected reactions occur.**

- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Inform patient that redistribution and accumulation of body fat may occur, causing central obesity, dorsocervical fat enlargement (buffalo hump), peripheral wasting, breast enlargement, and cushingoid appearance. The cause and long-term effects are not known.
- Advise patients not to breast feed during therapy.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in viral load and increase in CD4 counts in patients with HIV.
- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Reduction of maternal/fetal transmission of HIV.

zinc sulfate (zink sul-fate)

Orazinc,  PMS Egozinc, Verazinc, Zinc 220, Zincate, Zinkaps

Classification

Therapeutic: mineral and electrolyte replacements/supplements
Pharmacologic: trace metals

Pregnancy Category C (parenteral)

Z

Indications

Replacement and supplementation therapy in patients who are at risk for zinc deficiency, including patients on long-term parenteral nutrition. **Unlabeled Use:** Management of impaired wound healing due to zinc deficiency.

Action

Serves as a cofactor for many enzymatic reactions. Required for normal growth and tissue repair, wound healing, and senses of taste and smell. **Therapeutic Effects:** Replacement in deficiency states.

Pharmacokinetics

Absorption: Poorly absorbed from the GI tract (20–30%).

 = Canadian drug name.  = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Distribution: Widely distributed. Concentrates in muscle, bone, skin, kidney, liver, pancreas, retina, prostate, RBCs, and WBCs.

Metabolism and Excretion: 90% excreted in feces, remainder lost in urine and sweat.

Half-life: Unknown.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2 hr	unknown
IV	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity or allergy to any components in formulation; Pregnancy or lactation (supplemental amounts >RDA for pregnant or lactating patients); Preparations containing benzyl alcohol should not be used in neonates.

Use Cautiously in: Renal failure.

Adverse Reactions/Side Effects

GI: gastric irritation (oral use only), nausea, vomiting.

Interactions

Drug-Drug: Oral zinc may ↓ absorption of tetracyclines or fluoroquinolones.

Drug-Food: Caffeine, dairy products, and bran may ↓ absorption of orally administered zinc.

Route/Dosage

RDA = 15 mg. Doses expressed in mg of elemental zinc unless otherwise noted. Zinc sulfate contains 23% zinc.

Deficiency

PO (Adults): *Prevention of deficiency*—15–19 mg/day; *treatment of deficiency*—must be individualized; based on degree of deficiency.

IV Nutritional Supplementation—Metabolically Stable Patients

IV (Adults): 2.5–4 mg/day; up to 12 mg/day in patients with excessive losses.

IV (Infants and Children ≤5 yr): 100 mcg/kg/day.

IV (Infants up to 3 kg): 300 mcg/kg/day.

Availability (generic available)

Tablets: 66 mg^{OTC}, 110 mg^{OTC}. **Capsules:** 220 mg^{OTC}.

Injection: 1 mg/mL in 10- and 30-mL vials, 5 mg/mL in 5- and 10-mL vials.

NURSING IMPLICATIONS

Assessment

- Monitor progression of zinc deficiency symptoms (impaired wound healing, growth retardation, decreased sense of taste, decreased sense of smell) during therapy.
- **Lab Test Considerations:** Serum zinc levels may not accurately reflect zinc deficiency.

- Long-term high-dose zinc therapy may cause ↓ serum copper concentrations.
- Monitor serum alkaline phosphatase concentrations monthly; may ↑ with zinc therapy.
- Monitor HDL concentrations monthly in patients on long-term high-dose zinc therapy. Serum concentrations may be ↓.

Potential Nursing Diagnoses

Imbalanced nutrition: less than body requirements (Indications)

Implementation

- **PO:** Administer oral doses with food to decrease gastric irritation. Administration with caffeine, dairy products, or bran may impair absorption.
- **IV:** Zinc is often included as a trace mineral in total parenteral nutrition solution prepared by pharmacist.

Patient/Family Teaching

- Encourage patient to comply with diet recommendations of health care professional. Explain that the best source of vitamins is a well-balanced diet with foods from the four basic food groups. Foods high in zinc include seafood, organ meats, and wheat germ.
- Patients self-medicating with vitamin supplements should be cautioned not to exceed RDA. The effectiveness of megadoses for treatment of various medical conditions is unproved and may cause side effects.
- Instruct patients receiving oral zinc to notify health care professional if severe nausea or vomiting, abdominal pain, or tarry stools occur.
- Emphasize the importance of follow-up exams to evaluate progress.

Evaluation/Desired Outcomes

- Improved wound healing.
- Improved senses of taste or smell. 6–8 wk of therapy may be required before full effect is seen.

ziprasidone (zi-pra-si-done)

Geodon,  Zeldox

Classification

Therapeutic: antipsychotics, mood stabilizers

Pharmacologic: piperazine derivatives

Pregnancy Category C

Indications

Schizophrenia; IM form is reserved for control of acutely agitated patients. Treatment of acute manic or mixed episodes associated with Bipolar I Disorder (oral only). Maintenance treatment of Bipolar I Disorder (as adjunct to lithium or valproate) (oral only).

Action

Effects probably mediated by antagonism of dopamine type 2 (D₂) and serotonin type 2 (5-HT₂). Also antagonizes α_2 adrenergic receptors. **Therapeutic Effects:** Diminished schizophrenic behavior.

Pharmacokinetics

Absorption: 60% absorbed following oral administration; 100% absorbed from IM sites.

Distribution: Unknown.

Protein Binding: 99%; potential for drug interactions due to drug displacement is minimal.

Metabolism and Excretion: 99% metabolized by the liver; <1% excreted unchanged in urine.

Half-life: PO—7 hr; IM—2–5 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	within hours	1–3 days†	unknown
IM	rapid	60 min	unknown

†Steady state achieved following continuous use

Contraindications/Precautions

Contraindicated in: Hypersensitivity; History of QT prolongation (persistent QTc measurements >500 msec), arrhythmias, recent MI or uncompensated heart failure; Concurrent use of other drugs known to prolong the QT interval including quinidine, dofetilide, sotalol, other class Ia and III antiarrhythmics, pimozide, sotalol, thioridazine, chlorpromazine, pentamidine, arsenic trioxide, mefloquine, dolasetron, tacrolimus, droperidol, and moxifloxacin; Hypokalemia or hypomagnesemia; **Lactation:** Discontinue drug or bottle feed.

Use Cautiously in: Concurrent diuretic therapy or diarrhea (may ↑ the risk of hypotension, hypokalemia, or hypomagnesemia); Significant hepatic impairment; History of cardiovascular or cerebrovascular disease; Hypotension, concurrent antihypertensive therapy, dehydration, or hypovolemia (may ↑ risk of orthostatic hypotension); **OB:** Neonates at ↑ risk for extrapyramidal symptoms and withdrawal after delivery when exposed during the 3rd trimester; use only if maternal benefit outweighs risk to fetus; **Pedi:** Safety not established; **Geri:** Alzheimer's dementia or age >65 yr (may ↑ risk of seizures). Geriatric patients (may require ↓ doses; ↑ risk of mortality in elderly patients treated for dementia-related psychosis); Patients at risk for aspiration pneumonia; History of suicide attempt.

Adverse Reactions/Side Effects

CNS: NEUROLEPTIC MALIGNANT SYNDROME, seizures, dizziness, drowsiness, restlessness, extrapyramidal reactions, syncope, tardive dyskinesia. **Resp:** cough/runny nose. **CV:** PROLONGED QT INTERVAL, orthostatic

hypotension. **GI:** constipation, diarrhea, nausea, dysphagia. **GU:** amenorrhea, impotence. **Hemat:** AGRANULOCYTOSIS, leukopenia, neutropenia. **Endo:** galactorrhea, hyperglycemia, hyperlipidemia, weight gain. **Derm:** rash, urticaria.

Interactions

Drug-Drug: Concurrent use of quinidine, dofetilide, other class Ia and III antiarrhythmics, pimozide, sotalol, thioridazine, chlorpromazine, pentamidine, arsenic trioxide, mefloquine, dolasetron, tacrolimus, droperidol, moxifloxacin, or other agents that prolong the QT interval may result in potentially life-threatening adverse drug reactions (concurrent use contraindicated). Additive CNS depression may occur with alcohol, antidepressants, antihistamines, opioid analgesics, or sedative/hypnotics. Blood levels and effectiveness may be ↓ by carbamazepine. Blood levels and effects may be ↑ by ketoconazole.

Route/Dosage

Schizophrenia

PO (Adults): 20 mg twice daily initially; dose increments may be made at 2-day intervals up to 80 mg twice daily.

IM (Adults): 10–20 mg as needed up to 40 mg/day; may be given as 10 mg every 2 hr or 20 mg every 4 hr.

Acute Manic or Mixed Episodes Associated with Bipolar I Disorder

PO (Adults): 40 mg twice on first day, then 60 or 80 mg twice daily on second day, then 40–80 mg twice daily.

Maintenance Treatment of Bipolar I Disorder (as adjunct to lithium or valproate)

PO (Adults): Continue same dose on which patient was initially stabilized (range: 40–80 mg twice daily).

Availability (generic available)

Capsules: 20 mg, 40 mg, 60 mg, 80 mg. **Cost:** *Generic*—20 mg \$380.02/180, 40 mg \$544.16/180, 60 mg \$451.99/180, 80 mg \$451.99/180. **Lyophilized powder for injection (requires reconstitution):** 20 mg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor patient's mental status (orientation, mood, behavior) prior to and periodically during therapy.
- Assess weight and BMI initially and periodically during therapy.
- Monitor BP (sitting, standing, lying) and pulse rate prior to and frequently during initial dose titration. **Patients found to have persistent QTc measure-**

★ = Canadian drug name. ‡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

ments of >500 msec should have ziprasidone discontinued. Patients who experience dizziness, palpitations, or syncope may require further evaluation (i.e., Holter monitoring).

- Assess for rash during therapy. May be treated with antihistamines or corticosteroids. Usually resolves upon discontinuation of ziprasidone. Medication should be discontinued if no alternative etiology for rash is found.
- Observe carefully when administering medication to ensure medication is actually taken and not hoarded or cheeked.
- Monitor for onset of akathisia (restlessness or desire to keep moving) and extrapyramidal side effects (*parkinsonian*—difficulty speaking or swallowing, loss of balance control, pill rolling of hands, mask-like face, shuffling gait, rigidity, tremors and dystonic muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs) every 2 mo during therapy and 8–12 wk after therapy has been discontinued. Notify health care professional if these symptoms occur, as reduction in dose or discontinuation of medication may be necessary. Trihexyphenidyl or benztropine may be used to control these symptoms.
- Although not yet reported for ziprasidone, monitor for possible tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities, lip smacking or puckering, puffing of cheeks, uncontrolled chewing, rapid or worm-like movements of tongue). Report these symptoms immediately; may be irreversible.
- Monitor frequency and consistency of bowel movements. Increasing bulk and fluids in the diet may help to minimize constipation.
- Ziprasidone lowers the seizure threshold. Institute seizure precautions for patients with history of seizure disorder.
- **Monitor for development of neuroleptic malignant syndrome** (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness). **Notify health care professional immediately if these symptoms occur.**
- Monitor for symptoms related to hyperprolactinemia (menstrual abnormalities, galactorrhea, sexual dysfunction).
- **Lab Test Considerations:** Monitor serum potassium and magnesium prior to and periodically during therapy. Patients with low potassium or magnesium should have levels treated and checked prior to resuming therapy. Obtain fasting blood glucose and cholesterol levels initially and periodically during therapy.
- Monitor CBC frequently during initial months of therapy in patients with pre-existing or history of low WBC. May cause leukopenia, neutropenia, or agranulocytosis. Discontinue therapy if this occurs.

- Monitor serum prolactin prior to and periodically during therapy. May cause $\uparrow$ serum prolactin levels.

Potential Nursing Diagnoses

Risk for other-directed violence (Indications)

Disturbed thought process (Indications)

Imbalanced nutrition: risk for more than body requirements (Side Effects)

Implementation

- Dose adjustments should be made at intervals of no less than 2 days. Usually patients should be observed for several weeks before dose titration.
- Patients on parenteral therapy should be converted to oral doses as soon as possible.
- **PO:** Administer capsules with food or milk to decrease gastric irritation. Swallow capsules whole; do not open.
- **IM:** Add 1.2 mL of Sterile Water for Injection to the vial; shake vigorously until all drug is dissolved for a concentration of 20 mg/mL. Discard unused portion. Do not mix with other products or solutions. Do not administer solutions that are discolored or contain particulate matter.

Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day. Do not discontinue medication without discussing with health care professional, even if feeling well. Patients on long-term therapy may need to discontinue gradually.
- Inform patient of possibility of extrapyramidal symptoms. Instruct patient to report these symptoms immediately.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- May cause seizures and drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications. Caution patient to avoid concurrent use of alcohol and other CNS depressants.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Instruct patient to notify health care professional promptly if dizziness, loss of consciousness, palpitations, menstrual abnormalities, galactorrhea or sexual dysfunction occur.
- Advise female patients to notify health care professional if pregnancy is planned or suspected, or if breast feeding or planning to breast feed.
- Advise patient of need for continued medical follow-up for psychotherapy, eye exams, and laboratory tests.

Evaluation/Desired Outcomes

- Decrease in acute excited, manic behavior.
- Decrease in positive (delusions, hallucinations) and negative symptoms (social withdrawal, flat, blunted affect) of schizophrenia.
- Management of signs and symptoms of Bipolar I Disorder.

ziv-aflibercept

(ziv a-flib-er-sept)

Zaltrap

Classification

Therapeutic: antineoplastics

Pharmacologic: fusion proteins

Pregnancy Category C

Indications

Used in combination with 5-fluorouracil, leucovorin and irinotecan (FOLFIRI), for metastatic colorectal cancer (mCRC) that is resistant to/progressed after an oxaliplatin-containing regimen.

Action

Binds to human Vascular Endothelial Growth Factor (VEGF-A), resulting in decreased neovascularization and decreased vascular permeability. Also inhibits proliferation of endothelial cells, decreasing growth of new blood vessels. **Therapeutic Effects:** Decreased spread of mCRC.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: 6 days (range 4–7 days).

TIME/ACTION PROFILE (improved survival)

ROUTE	ONSET	PEAK	DURATION
IV	4–6	unknown	unknown

Contraindications/Precautions

Contraindicated in: **OB:** Pregnancy (may cause fetal harm); **Lactation:** Should not be used in nursing mothers.

Use Cautiously in: Elective surgery; **Geri:** ↑ risk of adverse effects especially diarrhea/dehydration; Females/males with reproductive potential; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: REVERSIBLE POSTERIOR LEUKOENCEPHALOPATHY SYNDROME, fatigue, headache. **EENT:** dysphonia. **CV:** ARTERIAL THROMBOTIC EVENTS, hypertension. **GI:** GI

PERFORATION, abdominal pain, anorexia, diarrhea, fistula formation, ↑ liver enzymes, stomatitis. **GU:** NEPHROTIC SYNDROME, ↑ serum creatinine, proteinuria.

Derm: impaired wound healing, Palmar-Plantar Erythrodysesthesia Syndrome, skin hyperpigmentation. **F and E:** dehydration. **Hemat:** BLEEDING, NEUTROPENIA, THROMBOTIC MICROANGIOPATHY, leukopenia, thrombocytopenia. **Metab:** weight loss.

Interactions

Drug-Drug: ↑ risk of bone marrow depression with other antineoplastics or radiation therapy.

Route/Dosage

IV (Adults): 4 mg/kg every 2 wk continued until disease progression or unacceptable toxicity.

Availability

Solution for intravenous administration (requires dilution): 25 mg/mL.

NURSING IMPLICATIONS

Assessment

- **Monitor for signs and symptoms of bleeding.** Do not initiate ziv-aflibercept in patients with severe hemorrhage. Discontinue in patients who develop severe hemorrhage.
- **Monitor for signs and symptoms of GI perforation.** Discontinue therapy in patients with GI perforation or who develop a fistula.
- **Monitor BP every 2 wk or more frequently as needed during therapy.** Treat with antihypertensive agents. Temporarily suspend ziv-aflibercept in patients with uncontrolled hypertension until controlled, and permanently reduce dose to 2 mg/kg for subsequent cycles. Discontinue in hypertensive crisis or with hypertensive encephalopathy.
- **Monitor for arterial thrombotic events (TIA, CVA, angina).** Discontinue therapy in patients with an arterial thrombotic event.
- **Assess for diarrhea during therapy.** **Geri:** Incidence is greater with elderly patients.
- **Lab Test Considerations:** Monitor proteinuria by urine dipstick and urinary protein creatinine ratio (UPCR) for development or worsening proteinuria. Obtain 24–hr urine collection in patients with $\geq 2+$ for protein or UPCR > 1 . Suspend therapy for proteinuria ≥ 2 g/24 hr and resume when proteinuria is < 2 g/24 hr. If recurrent, suspend until proteinuria < 2 g/24 hr and then permanently reduce ziv-aflibercept dose to 2 mg/kg. Discontinue therapy in patients who develop nephrotic syndrome.
- **Monitor CBC with differential at baseline and before each cycle.** Delay therapy until neutrophil count is $\geq 1.5 \times 10^9/L$.
- **May cause ↑ serum AST and ALT.**

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Potential Nursing Diagnoses

Diarrhea (Adverse Reactions)

Risk for impaired skin integrity (Adverse Reactions)

Implementation

- Administer ziv-aflibercept prior to other components of the FOLFIRI regimen on the day of treatment.
- **High Alert:** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double check single, daily, and course-of-therapy dose limits; have second practitioner independently double check original order, dose calculations and infusion pump settings.

IV Administration

- **Intermittent Infusion:** Solution should be clear and colorless to pale yellow; do not administer solutions that are discolored or contain particulate matter. Do not re-enter vial after initial puncture; discard unused portion. **Diluent:** Withdraw prescribed dose and dilute with 0.9% NaCl or D5W. **Concentration:** 0.6–8 mg/mL. Use polyvinyl chloride (PVC) infusion bags containing bis (2-ethylhexyl) phthalate (DEHP) or polyolefin infusion bags. Store infusion bags for up to 4 hr; discard unused portion. **Rate:** Infuse over 1 hr through a 0.2 micron polyethersulfone filter. Do not use filters made of polyvinylidene fluoride (PVDF) or nylon every 2 wk. Do not administer as IV push or bolus. Use infusion set made of PVC containing DEHP, DEHP free PVC containing trioctyl-trimellitate (TOTM), polypropylene, polypropylene lined PVC, or polyurethane.
- **Y-Site Incompatibility:** Do not combine with other drugs in same infusion bag or IV line.

Patient/Family Teaching

- Explain purpose of therapy and potential adverse effects to patient.
- Advise patient to notify health care professional immediately if signs of bleeding (lightheadedness), hypertension (severe headache, lightheadedness, neurologic symptoms), severe diarrhea, vomiting, severe abdominal pain, fever or other signs of infection, or symptoms of arterial thromboembolic events occur.
- Advise patient to maintain adequate hydration to minimize risk and to notify health care professional promptly if signs and symptoms of reversible posterior leukoencephalopathy syndrome (RPLS) (headache, seizures, weakness, confusion, high BP, blindness or change in vision, problems thinking) occur. Symptoms usually resolve within days.
- Advise patient to notify health care provider of therapy prior to surgery or if had recent surgery. Ziv-aflibercept should be suspended for at least 4 wk prior to major surgery and until surgical wounds fully healed. For minor surgery, such as central ve-

nous access port placement, biopsy, and tooth extraction ziv-aflibercept may be initiated/resumed once wound is fully healed. Discontinuation is needed in patients with compromised wound healing.

- Inform female patient that ziv-aflibercept can cause fetal harm. Advise women with reproductive potential and men of the need for effective contraception during and for at least 3 mo after completion of therapy. Notify health care provider immediately if pregnancy is planned or suspected or if breast feeding.
- Emphasize importance of monitoring lab values to monitor for adverse reactions.

Evaluation/Desired Outcomes

- Decrease in spread of metastatic colorectal cancer.

zoledronic acid

(zoe-led-dron-ic as-id)

★ Aclasta, Reclast, Zometa

Classification

Therapeutic: bone resorption inhibitors, electrolyte modifiers, hypocalcemics
Pharmacologic: biphosphonates

Pregnancy Category C

Indications

Hypercalcemia of malignancy (Zometa only). Multiple myeloma and metastatic bone lesions from solid tumors (Zometa only). Paget's disease (Reclast only). Treatment of osteoporosis in men (Reclast only). Treatment and prevention of osteoporosis in postmenopausal women (Reclast only). Treatment and prevention of glucocorticoid-induced osteoporosis in patients expected to be on glucocorticoids for at least 12 mo (Reclast only).

Action

Inhibits bone resorption. Inhibits increased osteoclast activity and skeletal calcium release induced by tumors. **Therapeutic Effects:** Decreased serum calcium. Decreased serum alkaline phosphatase. Decreased fractures, radiation/surgery to bone, or spinal cord compression in patients with multiple myeloma or metastatic bone lesions. Decreased hip, vertebral, or non-vertebral osteoporosis-related fractures in postmenopausal women. Increased bone mass in men, postmenopausal women, and patients on prolonged corticosteroid therapy.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Mostly excreted unchanged by the kidneys.

Half-life: 167 hr.

TIME/ACTION PROFILE (effect on serum calcium)

ROUTE	ONSET	PEAK	DURATION
IV	within 4 days	4–7 days	30 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity to zoledronic acid or other bisphosphonates; Severe renal impairment ($\text{CCr} < 35 \text{ mL/min}$) or acute renal failure.

Use Cautiously in: History of aspirin-induced asthma; Chronic renal impairment; Chronic renal impairment, concurrent use of diuretics or nephrotoxic drugs, or dehydration ($\uparrow$ risk of renal impairment; correct deficits prior to use); Concurrent use of nephrotoxic drugs; Invasive dental procedures, cancer, receiving chemotherapy or corticosteroids, poor oral hygiene, periodontal disease, dental disease, anemia, coagulopathy, infection, or poorly-fitting dentures (may $\uparrow$ risk of jaw osteonecrosis); **Geri:** $\uparrow$ risk of renal impairment; **OB, Lactation, Pedi:** Safety not established.

Adverse Reactions/Side Effects

CNS: agitation, anxiety, confusion, insomnia. **EENT:** conjunctivitis. **CV:** hypotension, chest pain, leg edema. **GI:** abdominal pain, constipation, diarrhea, nausea, vomiting, dysphagia. **GU:** renal impairment/failure. **Derm:** pruritus, rash. **F and E:** hypophosphatemia, hypocalcemia, hypokalemia, hypomagnesemia. **Hemat:** anemia. **MS:** musculoskeletal pain, femur fractures, osteonecrosis (primarily of jaw).

Resp: asthma exacerbation. **Misc:** fever, flu-like syndrome.

Interactions

Drug-Drug: Concurrent use of **loop diuretics** or **aminoglycosides** $\uparrow$ risk of hypocalcemia. Concurrent use of **NSAIDs** may $\uparrow$ risk of nephrotoxicity.

Route/Dosage

Reclast

IV (Adults): *Paget's disease*—5 mg as a single dose (information regarding retreatment unknown); *Treatment of osteoporosis in men or postmenopausal women, treatment/prevention of glucocorticoid-induced osteoporosis*—5 mg once early; *Prevention of osteoporosis in postmenopausal women*—5 mg every 2 yr.

Zometa

IV (Adults): *Hypercalcemia of malignancy*—4 mg; may be repeated after 7 days; *Multiple myeloma and bone metastases from solid tumors*—4 mg q 3–4 wk (has been used for up to 15 mo).

Availability (generic available)

Solution for IV infusion (Zometa): 4 mg/5–mL vial. **Solution for IV infusion (premixed) (Reclast):** 5 mg/100 mL.

NURSING IMPLICATIONS

Assessment

- Monitor intake and output ratios. Initiate a vigorous saline hydration promptly and maintain a urine output of 2 L/day during therapy. Patients should be adequately hydrated, but avoid overhydration. Do not use diuretics prior to treatment of hypovolemia.
- Assess for acute-phase reaction (fever, myalgia, flu-like symptoms, headache, arthralgia). Usually occur within 3 days of dose and resolve within 3 days of onset, but may take 7–14 days to resolve; incidence decreases with repeat dosing.
- **Hypercalcemia:** Monitor symptoms of hypercalcemia (nausea, vomiting, anorexia, weakness, constipation, thirst, cardiac arrhythmias).
- Observe for evidence of hypocalcemia (paresthesia, muscle twitching, laryngospasm, Chvostek's or Trousseau's sign).
- **Paget's Disease:** Assess for symptoms of Paget's disease (bone pain, headache, decreased visual and auditory acuity, increased skull size) periodically during therapy.
- **Osteoporosis:** Assess patients via bone density study for low bone mass before and periodically during therapy.
- **Lab Test Considerations:** Monitor serum creatinine, calculated based on actual body weight using the Cockcroft-Gault formula, prior to each treatment. Patients with a normal serum creatinine prior to treatment, who develop an increase of 0.5 mg/dL within 2 wk of next dose should have next dose withheld until serum creatinine is within 10% of baseline value. Patients with an abnormal serum creatinine prior to treatment who have an increase of 1.0 mg/dL within 2 wk of next dose should have next dose withheld until serum creatinine is within 10% of baseline value.
- Assess serum calcium, phosphate, and magnesium before and periodically during therapy. If hypocalcemia, hypophosphatemia, or hypomagnesemia occur, temporary supplementation may be required. Hypocalcemia and vitamin D deficiency should be treated before initiating zoledronic acid therapy.
- Monitor CBC with differential and hemoglobin and hematocrit closely during therapy.
- **Paget's Disease:** Monitor serum alkaline phosphatase prior to and periodically during therapy to monitor effectiveness.

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Potential Nursing Diagnoses

Risk for injury (Indications)

Implementation

- Vigorous saline hydration alone may be sufficient to treat mild, asymptomatic hypercalcemia. Adequate rehydration is required prior to administration.
- Patients on long-term therapy should have 1200 mg of oral calcium and 800–1000 units of Vitamin D each day.
- Patients treated for *Paget's disease* should receive 1500 mg elemental calcium and 800 IU of vitamin D daily, particularly during the 2 wk after dosing. Patients with osteoporosis should take 1200 mg of calcium and 800–1000 IU of Vitamin D daily.
- Administration of acetaminophen or ibuprofen following administration may reduce the incidence of acute-phase reaction symptoms.

IV Administration

- **Intermittent Infusion:** **Diluent:** Reconstitute *Zometa* by adding 5 mL of sterile water for injection to each vial for a solution containing 4 mg of zoledronic acid. Medication must be completely dissolved prior to withdrawal of solution. Dilute 4-mg dose further with 100 mL of 0.9% NaCl or D5W. If not used immediately, may be refrigerated for up to 24 hr. *Reclast* comes ready to use 5 mg in 100-mL solution. If refrigerated, allow solution to reach room temperature prior to administration. Do not administer solution that is discolored or contains particulate matter. **Rate:** Administer as a single infusion over at least 15 min. Rapid infusions increase risk of renal deterioration and renal failure.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amiodarone, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, carboplatin, carmustine, caspofungin, ceftazidime, cefepime, cefotaxime, cefotetan, cefoxitin, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, epifibotide, eripapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine,

gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melfalan, meperidine, meropenem, mesna, metaraminol, methotrexate, methyldopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, pancuronium, pantoprazole, pemetrexed, pentamidine, pentazocine, pentobarbital, phenobarbital, phenolamine, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, ranitidine, remifentanyl, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiopental, thiopeta, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine.

- **Y-Site Incompatibility:** alemtuzumab, calcium-containing solutions, dantrolene, diazepam, phenytoin. Manufacturer recommends administration as a single infusion in a line separate from all other drugs.
- **Additive Incompatibility:** Do not mix with solutions containing calcium, such as Lactated Ringer's solution.

Patient/Family Teaching

- Explain the purpose of zoledronic acid to patient. Advise patient to read *Medication Guide* prior to administration.
- Advise patients of the importance of adequate hydration. Patient should be instructed to drink at least two glasses of water prior to receiving dose.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient to eat a balanced diet and consult health care professional about the need for supplemental calcium and vitamin D.
- Inform patient that severe musculoskeletal pain may occur within days, months, or yr after starting zoledronic acid. Symptoms may resolve completely after discontinuation or slow or incomplete resolution may occur. Notify health care professional if severe pain occurs.

- Encourage patient to participate in regular exercise and to modify behaviors that increase the risk of osteoporosis (stop smoking, reduce alcohol consumption).
- Advise patient to inform health care professional of zoledronic acid therapy prior to dental surgery.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the importance of lab tests to monitor progress.

Evaluation/Desired Outcomes

- Decrease in serum calcium.
- Decrease in serum alkaline phosphatase and the progression of Paget's disease.
- Reversal of the progression of osteoporosis with decreased fractures and other sequelae. Discontinuation after 3–5 years should be considered for postmenopausal women with low risk for fractures.

ZOLmitriptan (zole-mi-trip-tan)

Zomig, Zomig-ZMT

Classification

Therapeutic: vascular headache suppressants

Pharmacologic: 5-HT₁ agonists

Pregnancy Category C

Indications

Acute treatment of migraine headache.

Action

Acts as an agonist at specific 5-HT₁ receptor sites in intracranial blood vessels and sensory trigeminal nerves.

Therapeutic Effects: Cranial vessel vasoconstriction with resultant decrease in migraine headache.

Pharmacokinetics

Absorption: Well absorbed (40%) following oral and intranasal administration.

Distribution: Unknown.

Metabolism and Excretion: Mostly metabolized by the liver; some conversion to metabolites that are more active than zolmitriptan. 8% excreted unchanged in urine.

Half-life: 3 hr (for zolmitriptan and active metabolite).

TIME/ACTION PROFILE (relief of headache)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1.5 hr*	unknown
Intranasal	unknown	3 hr	unknown

*3 hr for orally disintegrating tablets

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Significant underlying heart disease (including ischemic heart disease, history of MI, coronary artery vasospasm, uncontrolled hypertension); Stroke or transient ischemic attack; Peripheral vascular disease (including, but not limited to ischemic bowel disease); Concurrent (or within 24 hr) use of other 5-HT agonists, ergotamine, or ergot-type medications; Concurrent (or within 2 wk) use of MAO inhibitors; Hemiplegic or basilar migraine; Symptomatic Wolff-Parkinson-White syndrome or other arrhythmias; Moderate-severe hepatic impairment (nasal spray only).

Use Cautiously in: Cardiovascular risk factors (hypertension, hypercholesterolemia, cigarette smoking, obesity, diabetes, strong family history, menopausal females or males >40 yr [use only if cardiovascular status has been evaluated and determined to be safe and 1st dose is administered under supervision]); Hepatic impairment (use lower doses of oral); **OB, Lactation, Pedi:** Safety not established.

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, vertigo, weakness.

EENT: throat pain/tightness/pressure. **CV:** MI, angina, chest pain/pressure/tightness/heaviness, hypertension, palpitations. **GI:** dry mouth, dyspepsia, dysphagia, nausea. **Derm:** sweating, warm/cold sensation. **MS:** myalgia, myasthenia. **Neuro:** hypesthesia, paresthesia. **Misc:** feeling of heaviness, pain.

Interactions

Drug-Drug: Because of ↑ risk of cerebral vasospasm, avoid concurrent use of other 5-HT agonists (naratriptan, sumatriptan, rizatriptan) and/or ergot-type preparations (dihydroergotamine). Concurrent use of MAO inhibitors ↑ blood levels and risk of toxicity (avoid use within 2 wk of MAO inhibitors). Blood levels may be ↑ by hormonal contraceptives. Cimetidine ↑ half-life of zolmitriptan and its active metabolite. ↑ risk of serotonin syndrome when used with SSRI or SNRI antidepressants. **Drug-Natural Products:** ↑ risk of serotonergic side effects including serotonin syndrome with St. John's wort and SAME.

Route/Dosage

PO (Adults): 1.25–2.5 mg initially; if headache returns, dose may be repeated after 2 hr (not to exceed 10 mg/24 hr); Concurrent cimetidine therapy—Single dose not to exceed 2.5 mg (not to exceed 5 mg/24 hr).

Hepatic Impairment

PO (Adults): Moderate-severe hepatic impairment (oral tablets only)—1.25 mg initially; if headache

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

returns, dose may be repeated after 2 hr (not to exceed 5 mg/24 hr).

Intranasal (Adults): single 2.5-mg dose (maximum single dose = 5 mg); may be repeated after 2 hr (not to exceed 10 mg/24 hr); *Concurrent cimetidine therapy*—Single dose not to exceed 2.5 mg (not to exceed 5 mg/24 hr).

Availability (generic available)

Tablets: 2.5 mg, 5 mg. **Orally disintegrating tablets:** 2.5 mg, 5 mg. **Nasal spray:** 2.5 mg/100 mL unit-dose spray device (package of 6), 5 mg/100 mL unit-dose spray device (package of 6).

NURSING IMPLICATIONS

Assessment

- Assess pain location, intensity, duration, and associated symptoms (photophobia, phonophobia, nausea, vomiting) during migraine attack.
- Monitor for serotonin syndrome in patients taking SSRIs or SNRIs concurrently with zolmitriptan.**

Potential Nursing Diagnoses

Acute pain (Indications)

Implementation

- Do not confuse zolmitriptan with sumatriptan.**
- PO:** Initial dose is 2.5 mg. Lower doses can be achieved by breaking 2.5-mg tablet.
- Orally disintegrating tablets should be left in the package until use. Remove from the blister pouch. Do not push tablet through the blister; peel open the blister pack with dry hands and place tablet on tongue. Do not break orally disintegrating tablet. Tablet will dissolve rapidly and be swallowed with saliva. No liquid is needed to take the orally disintegrating tablet.
- Intranasal:** Remove cap from nasal spray. Hold upright and block one nostril. Tilt head slightly back, insert device into opposite nostril, and depress plunger. May repeat in 2 hr.

Patient/Family Teaching

- Inform patient that zolmitriptan should be used only during a migraine attack. It is meant to be used to relieve migraine attack but not to prevent or reduce the number of attacks.
- Instruct patient to administer zolmitriptan as soon as symptoms appear, but it may be administered any time during an attack. If migraine symptoms return, a 2nd dose may be used. Allow at least 2 hr between doses, and do not use more than 10 mg in any 24-hr period.
- If dose does not relieve headache, additional zolmitriptan doses are not likely to be effective; notify health care professional.
- Advise patient that lying down in a darkened room following zolmitriptan administration may further help relieve headache.

- May cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional prior to next dose of zolmitriptan if pain or tightness in the chest occurs during use. If pain is severe or does not subside, notify health care professional immediately. If wheezing; heart throbbing; swelling of eyelids, face, or lips; skin rash; skin lumps; or hives occur, notify health care professional immediately and do not take more zolmitriptan without approval of health care professional. If feelings of tingling, heat, flushing, heaviness, pressure, drowsiness, dizziness, tiredness, or sickness develop, discuss with health care professional at next visit.
- Advise patient to avoid alcohol, which aggravates headaches, during zolmitriptan use.
- Advise patient that overuse (use more than 10 days/month) may lead to exacerbation of headache (migraine-like daily headaches, or as a marked increase in frequency of migraine attacks). May require gradual withdrawal of zolmitriptan and treatment of symptoms (transient worsening of headache).
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications. **Patients concurrently taking SSRI or SNRI antidepressants should notify health care professional promptly if signs of serotonin syndrome (mental status changes: agitation, hallucinations, coma; autonomic instability: tachycardia, labile BP, hyperthermia; neuromuscular aberrations: hyperreflexia, incoordination; and/or gastrointestinal symptoms: nausea, vomiting, diarrhea) occur.**
- Caution patient not to use zolmitriptan if pregnancy is planned or suspected or if breast feeding. Adequate contraception should be used during therapy.

Evaluation/Desired Outcomes

- Relief of migraine attack.

zolpidem (zole-pi-dem)

Ambien, Ambien CR, Edluar, Intermezzo,  Sublinox, Zolpimist

Classification

Therapeutic: sedative/hypnotics

Schedule IV

Pregnancy Category C

Indications

Insomnia with difficulties in sleep initiation (Intermezzo is indicated for insomnia when a middle-of-the-

night awakening is followed by difficulty returning to sleep).

Action

Produces CNS depression by binding to GABA receptors. Has no analgesic properties. **Therapeutic Effects:** Sedation and induction of sleep.

Pharmacokinetics

Absorption: Rapidly absorbed following oral administration. Controlled-release formulation releases 10 mg immediately, then another 2.5 mg later.

Distribution: Minimal amounts enter breast milk; remainder of distribution not known.

Metabolism and Excretion: Converted to inactive metabolites, which are excreted by the kidneys; clearance of Intermezzo lower in women than in men.

Half-life: 2.5–3 hr (↑ in geriatric patients and patients with hepatic impairment).

TIME/ACTION PROFILE (sedation)

ROUTE	ONSET	PEAK*	DURATION
PO	rapid	30 min–2 hr	6–8 hr
PO-ER	rapid	2–4 hr	6–8 hr
PO-Spray	rapid	unknown	unknown
SL	rapid	unknown	unknown

*Food delays peak levels and effects

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Sleep apnea.

Use Cautiously in: History of previous psychiatric illness, suicide attempt, drug or alcohol abuse; Hepatic impairment (initial dose ↓ recommended); Pulmonary disease; Sleep apnea; Myasthenia gravis; **Geri:** Initial dose ↓ recommended; **OB, Lactation, Pedi:** Safety not established.

Adverse Reactions/Side Effects

CNS: daytime drowsiness, dizziness, abnormal thinking, agitation, amnesia, behavior changes, “drugged” feeling, hallucinations, sleep-driving. **GI:** diarrhea, nausea, vomiting. **Misc:** **ANAPHYLAXIS**, hypersensitivity reactions, physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: CNS depression may ↑ with **sedatives/hypnotics, alcohol, phenothiazines, tricyclic antidepressants, opioid analgesics, or antihistamines.**

Drug-Natural Products: Concomitant use of **kava-kava, valerian, or chamomile** can ↑ CNS depression.

Drug-Food: **Food** ↓ and delays absorption.

Route/Dosage

PO, SL (Adults): *Tablets, spray, or SL tablets (Edluar)* — 5 mg (for women) and 5–10 mg (for men)

at bedtime; may ↑ to 10 mg at bedtime if 5–mg dose not effective; *SL tablets (Intermezzo)* — 1.75 mg (for women) or 3.5 mg (for men) once upon awakening in the middle-of-the-night; *Extended-release tablets* — 6.25 mg (for women) and 6.25–12.5 mg (for men) at bedtime; may ↑ to 12.5 mg at bedtime if 6.25–mg dose not effective.

PO, SL (Geriatric Patients, Debilitated Patients, or Patients with Hepatic Impairment): *Tablets, spray or SL tablets (Edluar)* — Do not exceed dose of 5 mg at bedtime; *Extended-release tablets* — Do not exceed dose of 6.25 mg at bedtime.

SL (Geriatric Patients, Patients taking concomitant CNS depressants, or Patients with Hepatic Impairment): *SL tablets (Intermezzo)* — Do not exceed dose of 1.75 mg at bedtime (in either men or women).

Availability (generic available)

Tablets: 5 mg, 10 mg. **Cost:** *Generic* — 5 mg \$7.81/30. *Extended-release tablets:* 6.25 mg, 12.5 mg. **Cost:** *Generic* — 6.25 mg \$42.14/30, 12.5 mg \$37.39/30. **Sublingual tablets (Edluar):** 5 mg, 10 mg. **Cost:** All strengths \$235.19/30. **Sublingual tablets (Intermezzo):** 1.75 mg, 3.5 mg. **Cost:** All strengths \$248.46/30. **Oral spray (Zolpimist):** 5 mg/spray (60 sprays/container). **Cost:** \$79.20/7.7 mL.

NURSING IMPLICATIONS

Assessment

- Assess mental status, sleep patterns, and potential for abuse prior to administration. Prolonged use of >7–10 days may lead to physical and psychological dependence. Limit amount of drug available to the patient.
- Assess alertness at time of peak effect. Notify health care professional if desired sedation does not occur.
- Assess patient for pain. Medicate as needed. Untreated pain decreases sedative effects.

Potential Nursing Diagnoses

Insomnia (Indications)

Risk for injury (Side Effects)

Implementation

- Before administering, reduce external stimuli and provide comfort measures to increase effectiveness of medication.
- Protect patient from injury. Raise bed side rails. Assist with ambulation. Remove patient's cigarettes.
- Use lowest effective dose.
- **PO:** Tablets should be swallowed whole with full glass of water. For faster onset of sleep, do not administer with or immediately after a meal.

✳ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Swallow extended-release tablets whole; do not crush, break, or chew.
- **SL:** To open the blister pack, separate the individual blisters at the perforations. Peel off top layer of paper and push tablet through foil. Place the tablet under the tongue, allow to disintegrate; do not swallow or take with water.
- **Intermezzo:** Only take if at least 4 hr left prior to time to awakening.
- **Oral Spray:** Do not take with or immediately after a meal. Spray is a clear, colorless, and cherry-flavor solution.

Patient/Family Teaching

- Instruct patient to take zolpidem as directed. Advise patient not to take zolpidem unless able to stay in bed a full night (7–8 hours) before being active again. Do not take more than the amount prescribed because of the habit-forming potential. Not recommended for use longer than 7–10 days. If used for 2 wk or longer, abrupt withdrawal may result in fatigue, nausea, flushing, light-headedness, uncontrolled crying, vomiting, GI upset, panic attack, or nervousness. Instruct patient to read *Patient Information* for correct product before taking and with each Rx refill, changes may occur.
- Because of rapid onset, advise patient to go to bed immediately after taking zolpidem.
- May cause daytime drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to this medication is known.
- Caution patient that complex sleep-related behaviors (sleep-driving) may occur while asleep.
- **Advise patient to notify health care professional immediately if signs of anaphylaxis (swelling of the tongue or throat, trouble breathing, and nausea and vomiting) occur.**
- Caution patient to avoid concurrent use of alcohol or other CNS depressants.
- **Oral Spray:** To prime, patients should be told to point the black spray opening away from their face and other people and spray 5 times. For administration, hold container upright with the black spray opening pointed directly into the mouth. Press down fully on pump to make sure a full dose (5 mg) is sprayed directly into mouth over tongue. For 10-mg dose, a second spray should be administered. If not used for 14 days, re-prime with 1 spray.

Evaluation/Desired Outcomes

- Relief of insomnia.
- Re-evaluate insomnia after 7–10 days of *Intermezzo*.

zonisamide (zoe-niss-a-mide)

Zonegran

Classification

Therapeutic: anticonvulsants

Pharmacologic: sulfonamides

Pregnancy Category C

Indications

Partial seizures in adults.

Action

Raises the threshold for seizures and reduces duration of seizures probably by action on sodium and calcium channels. **Therapeutic Effects:** Decreased frequency of partial seizures.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Binds extensively to red blood cells.

Protein Binding: 40%.

Metabolism and Excretion: Mostly metabolized by the liver; 35% excreted unchanged in urine. Some metabolism occurs via CYP3A4 enzyme system.

Half-life: 63 hr (plasma).

TIME/ACTION PROFILE (blood levels†)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–6 hr	24 hr

†Requires 2 weeks of dosing to achieve steady-state blood levels

Contraindications/Precautions

Contraindicated in: Hypersensitivity to zonisamide or sulfonamides.

Use Cautiously in: All patients (may ↑ risk of suicidal thoughts/behaviors); Hepatic or renal disease (may require slower titration/more frequent monitoring; ↑ risk of metabolic acidosis with renal impairment); Patients with respiratory disorders, diarrhea, or undergoing surgery (↑ risk of metabolic acidosis); **OB, Lactation:** Use only if potential benefit justifies risk to fetus/infant; **Pedi:** Children ≤16 yr (safety not established; ↑ risk of oligohydrosis, hyperthermia, and/or metabolic acidosis).

Adverse Reactions/Side Effects

CNS: **SUICIDAL THOUGHTS,** drowsiness, fatigue, agitation/irritability, depression, dizziness, psychomotor slowing, psychosis, weakness. **EENT:** amblyopia, tinnitus. **Resp:** cough, pharyngitis. **GI:** anorexia, nausea, vomiting. **F and E:** metabolic acidosis. **GU:** kidney stones. **Derm:** **STEVENS-JOHNSON SYNDROME,** oligohydrosis (↑ in children), rash. **Metab:** hyperthermia (↑ in children). **Neuro:** abnormal gait, hyperaesthesia, incoordination, tremor.

Interactions

Drug-Drug: Drugs that induce or inhibit

CYP3A4 may alter blood levels and effects of zonisamide. Blood levels and effects may be ↓ by **phenytoin**, **carbamazepine**, **phenobarbital**, or **valproate**. May enhance the adverse/toxic effect of **carbonic anhydrase inhibitors**, avoid combination.

Route/Dosage

PO (Adults and Children >16 yr): 100 mg once daily initially for 2 wk, then ↑ to 200 mg daily for 2 wk; with subsequent increments of 100 mg made at 2-wk intervals as required (range 100–600 mg/day). Can be given as a single daily dose or in 2 divided doses.

PO (Infants and Children): Initial: 1–2 mg/kg/day given in two divided doses/day; increase dose in increments of 0.5–1 mg/kg/day every 2 weeks (maximum dose: 12 mg/kg/day).

Availability (generic available)

Capsules: 25 mg, 50 mg, 100 mg. **Cost:** *Generic*—25 mg \$54.80/100, 50 mg \$109.60/100, 100 mg \$219.20/100.

NURSING IMPLICATIONS

Assessment

- Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- Monitor frequency, duration, and characteristics of seizures.
- Monitor patient frequently for development of skin rash. Unexplained rash may require discontinuation of therapy.
- Assess patient for allergy to sulfa drugs.
- **Lab Test Considerations:** Monitor renal function periodically during therapy. May cause ↑ creatinine and BUN.
- Measure serum bicarbonate before starting and periodically during therapy. Metabolic acidosis may be more frequent and severe in younger patients.
- May cause ↑ in serum alkaline phosphatase.

Potential Nursing Diagnoses

Risk for injury (Adverse Reactions)

Implementation

- **PO:** May be administered with or without meals. Capsules should be swallowed whole.

Patient/Family Teaching

- Instruct patient to take zonisamide as directed, even if feeling well. Consult health care professional if a dose is missed. Do not discontinue abruptly without consulting health care professional; may cause seizures. Instruct patient to read the *Medication Guide* before starting and with each Rx refill, changes may occur.
- Instruct patient to contact health care professional immediately if skin rash occurs or seizures worsen. Patient should also contact health care professional if a child taking zonisamide is not sweating as usual, with or without a fever, or if they develop fever, sore throat, oral ulcers, easy bruising, depression, unusual thoughts, speech or language problems.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until cleared by health care professional and effects of medication is known.
- Advise patient to increase fluid intake to at least 6–8 glasses of water/day to minimize risk of kidney stones. Instruct patient to contact health care professional if symptoms of kidney stones (sudden back pain, abdominal pain, blood in urine) occur.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking, other unusual changes in behavior or mood occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- May have teratogenic effects. Advise women of childbearing age to use effective contraception throughout therapy. Instruct patient to notify health care professional if pregnancy is planned or suspected or if planning to breast feed.

Evaluation/Desired Outcomes

- Decrease in frequency and duration of partial seizures.

✶ = Canadian drug name. ✶ = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Drugs Approved in Canada

These monographs describe medications approved for use in Canada by the Therapeutic Products Directorate, a division of Health Canada's Health Products and Food Branch. The medications are not approved by the United States Food and Drug Administration; however, similar formulations carrying different generic or brand names might be available in the U.S.

alfacalcidol (al-fa kal-si-dol)

★One-Alpha

Classification

Therapeutic: vitamins

Pharmacologic: vitamin D analogues

Indications

Management of hypocalcemia, secondary hyperparathyroidism, and osteodystrophy associated with chronic renal failure.

Action

Stimulates intestinal absorption of calcium and phosphorus, reabsorption of calcium from bone, and renal reabsorption of calcium. Does not require renal activation.

Therapeutic Effects: Improved calcium and phosphorus homeostasis in patients with chronic kidney disease.

Pharmacokinetics

Absorption: Completely absorbed following oral administration.

Distribution: Unknown.

Protein Binding: Extensively protein bound.

Metabolism and Excretion: Following absorption, 50% is rapidly converted by liver to active metabolite (1.25-(OH)₂D; 13% renally excreted.

Half-life: 3 hr.

TIME/ACTION PROFILE (levels of active metabolite)

ROUTE	ONSET†	PEAK	DURATION‡
PO	6 hr	12 hr	few days—1 wk
IV	unknown	4 hr	few days—1 wk

†Effect on intestinal calcium absorption, bone pain and muscle weakness improve within 2 wk—3 mo.

‡Effect on serum calcium levels following discontinuation.

Contraindications/Precautions

Contraindicated in: **Lactation:** Breast feeding should be avoided; Concurrent use of other Vitamin D analogues or magnesium-containing antacids.

Use Cautiously in: **OB:** Potential benefits should be weighed against hazards to fetus and mother; **Pedi:** Safe and effective use in children has not been established.

Adverse Reactions/Side Effects

CNS: headache, drowsiness, weakness. **CV:** **ARRHYTHMIAS,** hypertension. **EENT:** conjunctivitis, photophobia.

GI: constipation, nausea, anorexia, dry mouth, metallic taste, pancreatitis, polydipsia, vomiting. **Derm:** **pruritus.**

F and E: **HYPERCALCEMIA,** hyperphosphatemia, hyperthermia, ↑ thirst. **GU:** albuminuria, hypercalcuria, ↓ libido, nocturia, polyuria. **Metab:** ectopic calcification, hypercholesterolemia, hyperthermia. **MS:** bone pain, muscle pain.

Interactions

Drug-Drug: Hypercalcemia ↑ risk of toxicity from **digitalis glycosides**, including **digoxin**. ↑ risk of toxicity and adverse reactions with concurrent use of other **vitamin D analogues**. Concurrent use of **bile acid sequestrants** including **cholestyramine** or **mineral oil** ↓ absorption and effectiveness. Concurrent use of **barbiturates** and other **anticonvulsants** may ↓ effectiveness, larger doses of alfacalcidol may be required.

Route/Dosage

PO (Adults): *Pre-dialysis patients*—0.25 mcg/day for 2 mo initially, if necessary dose increments of 0.25 mcg/day may be made at 2 mo intervals (usual range 0.5–1.0 mcg/day); *dialysis patients*—1 mcg/day, if necessary dose increments of 0.5 mcg/day may be made at 2–4 wk intervals (usual range 1–2 mcg/day, up to 3 mcg/day). When normalization occurs, dose should be ↓ to minimum amount required to maintain normal serum calcium levels.

IV (Adults): *Dialysis patients*—1 mcg during each dialysis (2–3 times weekly), if necessary dose may be increased weekly by 1 mcg per dialysis up to 12 mcg/week (range 1.5–12 mcg/week). When normalization occurs, dose should be ↓ to minimum amount required to maintain normal serum calcium levels.

Availability

Soft gel capsules: 0.25 mcg, 1 mcg; Oral drops: 2 mcg/mL; Solution for intravenous injection (contains ethanol and propylene glycol): 2 mcg/mL.

NURSING IMPLICATIONS

Assessment

- Assess for signs of vitamin D deficiency prior to and during treatment.
- Assess patient for bone pain and weakness during therapy; usually decreases within 2 wk to 3 mo.
- **Lab Test Considerations:** *For pre-dialysis patients:* Monitor serum calcium and phosphate levels monthly and electrolytes periodically during treatment. *For dialysis patients:* Monitor serum calcium at least twice weekly during dose titration. If hypercalcemia occurs decrease dose of alfacalcidol by 50% and stop all calcium supplements until calcium levels return to normal. May cause ↑ plasma phosphorus levels.

Maintain serum phosphate levels <2.0 mmol/L. Monitor inorganic phosphorus, magnesium, alkaline phosphatase, creatinine, BUN, 24-hour urinary calcium and protein as needed.

- **Toxicity and Overdose:** Toxicity is manifested as hypercalcemia, hypercalciuria, and hyperphosphatemia. Assess patient for appearance of nausea, vomiting, anorexia, weakness, constipation, headache, bone pain, and metallic taste. Later symptoms include polyuria, polydipsia, photophobia, rhinorrhea, pruritus, and cardiac arrhythmias. Notify health care professional immediately if these signs of hypervitaminosis D occur. Treatment usually consists of discontinuation of alfacalcidol, a low-calcium diet, stopping calcium supplements. Persistent or markedly elevated serum calcium levels in hemodialysis patients may be corrected by dialysis against a calcium-free dialysate.

Potential Nursing Diagnoses

Imbalanced nutrition: less than body requirements

Implementation

- **PO:** Administer with food. Use calibrated dropper with oral for accurate dose. Oral solution may be mixed with water or milk.
- **IV:** Administer IV during hemodialysis. Shake well before use. Keep refrigerated. Single use vials; discard unused portion.

Patient/Family Teaching

- Advise patient to take medication as directed. Do not stop taking without consulting with health care professional.
- Advise patient and family to notify health care professional if signs and symptoms of hypercalcemia occur.
- Review diet modifications with patient. See Appendix M for foods high in calcium and vitamin D. Renal patients must still consider renal failure diet in food selection. Health care professional may order concurrent calcium supplement.
- Encourage patient to comply with dietary recommendations. Explain that best source of vitamins is a well-balanced diet with foods from all 4 basic food groups, and sunlight exposure for vitamin D.
- Advise patient to avoid concurrent use of antacids containing magnesium during therapy.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any other Rx, OTC, or herbal products.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the importance of follow-up exams to evaluate progress.

Evaluation

- Improved levels of calcium and phosphorous in patients with kidney disease.

bezafibrate (bezz-uh-fibe-rate)

★Bezalip SR

Classification

Therapeutic: lipid-lowering agents

Pharmacologic: fibric acid derivatives

Indications

Use in conjunction with diet and other modalities in the treatment of hypercholesterolemia (Type IIa and IIb mixed hyperlipidemia, to decrease serum TG, LDL cholesterol and apolipoprotein B and increase HDL cholesterol and apolipoprotein A). Treatment of adults with hypertriglyceridemia (Type IV and V hyperlipidemias) at risk pancreatitis and other sequelae.

Action

Inhibits triglyceride synthesis. **Therapeutic Effects:** Lowered cholesterol and triglycerides, increased HDL, with decreased risk of pancreatitis and other sequelae.

Pharmacokinetics

Absorption: Well absorbed (100%) following oral administration.

Distribution: Unknown.

Metabolism and Excretion: 50% metabolized, 50% excreted unchanged in urine, remainder as metabolites. 3% excreted in feces.

Half-life: 1–2 hr.

TIME/ACTION PROFILE (blood levels))

ROUTE	ONSET	PEAK	DURATION
PO	unknown	3–4 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity/photosensitivity to bezafibrate or other fibric acid or fibrate derivatives; Severe liver or kidney impairment (CCr < 60 mL/min), primary biliary cirrhosis, gallstone or gallbladder disease or hypoalbuminemia; **OB:** Avoid use during pregnancy (discontinue several months prior to conception); **Lactation:** Discontinue breast feeding.

Use Cautiously in: History of liver disease; Doses >400 mg/day in conjunction with HMG CoA reductase inhibitors (statins) with any risk factors (renal impairment, infection, trauma, surgery, hormonal or electrolyte imbalance) ↑ risk for rhabdomyolysis; **Ger:** Consider age-related decrease in renal function, avoid in patients >70 yr; **Pedi:** Limited experience in children at a dose of 10–20 mg/kg/day, use cautiously.

Adverse Reactions/Side Effects

CNS: dizziness, headache. **GI:** dyspepsia, flatulence, gastritis, abdominal distension, abdominal pain, ↓ appetite, cholestasis, constipation, diarrhea, nausea. **GU:** erectile dysfunction, renal failure. **Derm:** alopecia, pruritus, urticaria, photosensitivity reaction, alopecia, rash. **MS:** muscle cramps, muscular weakness, myalgia, **RHABDOMYOLYSIS.** **Misc:** hypersensitivity reactions including **ANAPHYLAXIS.**

Interactions

Drug-Drug: ↑ risk of bleeding with oral anticoagulants; dose of anticoagulant should be ↓ by 50% with frequent monitoring. **Cyclosporine** ↑ risk of severe myositis/rhabdomyolysis, risk of combined therapy should be undertaken with caution. Concurrent use of immunosuppressants may ↑ risk of reversible renal impairment. ↑ risk of myopathy **HMG CoA reductase inhibitors (statins)**, combination therapy should be undertaken with extreme caution and must be discontinued at the first signs of myopathy and should not be un-

dertaken in the presence of predisposing factors including impaired renal function, severe infection, trauma, surgery, hormonal/electrolyte imbalance or ↑ alcohol intake. ↑ risk of serious hypoglycemia with **insulin** or **sulphonylureas**. Concurrent use with **MAO inhibitors** may ↑ risk of hepatotoxicity. **Cholestyramine** and other **bile-acid sequestrants** may ↓ absorption, separate administration by ≥2 hr. Effectiveness may be ↓ by concurrent **estrogen**.

Route/Dosage

PO (Adults): 400 mg once daily.

Availability

Sustained-release tablet: 400 mg.

NURSING IMPLICATIONS

Assessment

- Obtain a diet history with regard to fat consumption. Before starting bezafibrate, every attempt should be made to obtain a normal triglyceride level with diet, exercise, and weight loss.
- Assess patient for cholelithiasis. If gallbladder studies are indicated, and gallstones are found, discontinue therapy.
- **Lab Test Considerations:** Monitor serum lipids prior to and periodically during therapy.
- **Lab Test Considerations:** Monitor AST and ALT serums periodically during therapy to assess for increased levels. Discontinue therapy if levels rise >3 times normal value.
- **Lab Test Considerations:** If patient develops muscle tenderness during therapy, monitor CPK levels. If CPK levels are markedly ↑ or myopathy occurs, discontinue therapy.

Potential Nursing Diagnoses

Noncompliance

Implementation

- **PO:** Administer without regards to meals. Swallow sustained-release tablets whole; do not crush, break, or chew.

Patient/Family Teaching

- Instruct the patient to take the medication as directed, and to not share medication. Missed doses should be taken as soon as remembered. Do not double dose. Medication helps control but does not cure elevated serum triglyceride levels.
- Advise patient that medication should be taken in conjunction with diet restrictions of fat, cholesterol, carbohydrates, and alcohol, as well as an exercise regimen, and cessation of smoking.
- Instruct patient to notify health care professional of unexplained muscle pain or weakness, tiredness, fever, nausea, vomiting, abdominal pain.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any other Rx, OTC, or herbal products.
- Instruct female patients to immediately notify health care professional if pregnancy is planned or suspected.

- Emphasize importance of follow-up appointments and lab tests to evaluate effectiveness.

Evaluation

- A decrease in serum triglyceride and LDL cholesterol levels.
- An increase in HDL levels.

buserelin (bue-se-rel-in)

★Suprefact

Classification

Therapeutic: antineoplastics, hormones
Pharmacologic: luteinizing hormone-releasing hormone (LHRH) analogues

Indications

Subcutaneous injection—Initial and maintenance palliative treatment of advanced hormone-dependent prostate cancer (usually given with an antiandrogen). **Nasal solution**—Maintenance palliative treatment of advanced hormone-dependent prostate cancer (usually given with an antiandrogen). **Nasal solution**—Nonsurgical treatment of endometriosis (course of treatment 6–9 mo).

Action

Acts as a synthetic analog of endogenous gonadotropin-releasing hormone (GnRH/LHRH). Chronic use results in inhibited secretion of gonadotropin release and gonadal steroid production. The overall effect is due to down-regulation of pituitary LHRH receptors. In males, testosterone synthesis and release is decreased. In females, secretion of estrogen is decreased. **Therapeutic Effects:** Decreased spread of advanced prostate cancer. Decreased sequelae of endometriosis (pain, dysmenorrhea).

Pharmacokinetics

Absorption: *Subcut*—70%; *intranasal*—1–3%; *implant*—drug is slowly absorbed over 2–3 mo.

Distribution: Accumulates in liver, kidneys, and anterior pituitary lobe; enters breast milk in small amounts.

Metabolism and Excretion: Metabolized in liver, kidneys and by enzymes on membranes in the pituitary gland.

Half-life: *Subcut*—80 min; *intranasal*—1–2 hr; *implant*—20–30 days.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
prostate cancer †	7 days	4 mo	until discontinuation
endometriosis ‡ (intranasal)	unknown	unknown	duration of treatment

†Decrease in testosterone levels.

‡Symptom improvement.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Nonhormonal-dependent prostate cancer or previous orchiectomy; Females with undiagnosed vaginal bleeding; **OB:** Pregnancy

★ = Canadian drug name. † = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

(avoid use); **Lactation:** Breast feeding is contraindicated (small amounts enter breast milk; injection contains benzyl alcohol).

Use Cautiously in: Prostate cancer with urinary tract obstruction or spinal lesions; **Pedi:** Safe and effective use in children had not been established (injection contains benzyl alcohol).

Adverse Reactions/Side Effects

CNS: depression, dizziness. **CV:** hypertension. **Endo:** glucose intolerance. **Hemat:** anemia. **Local:** injection site reactions. **MS:** osteoporosis (long-term use). **Misc:** transient exacerbation of metastatic prostate cancer or endometriosis.

Prostate cancer

CNS: headache (nasal solution). **EENT:** nasal irritation (nasal spray). **GU:** ↓ libido, impotence. **Derm:** hot flushes. **Endo:** gynecomastia, testosterone flair. **MS:** bone pain.

Endometriosis

CNS: headache, weakness, insomnia. **CV:** edema. **GI:** constipation, gastrointestinal disorders, nausea. **GU:** ↓ libido, vaginal dryness, menorrhagia. **Derm:** hot flushes, acne. **Endo:** suppression of ovulation. **MS:** back pain.

Interactions

Drug-Drug: Risk of serious arrhythmias may be ↑ by concurrent **amiodarone**, **disopyramide**, **dofetilide**, **flecainide ibutilide**, **propafenone quinidine**, **sotalol**, **antipsychotics** (including **chlorpromazine**) **antidepressants** (including **amitriptyline** and **nortriptyline**), **opioids** (including **methadone**), **macrolide anti-infectives** (including **azithromycin**, **erythromycin**, and **clarithromycin**), **quinolone anti-infectives** (including **moxifloxacin**), **azole anti-fungals**, **5-HT₃ antagonists** (including **ondansetron**), **beta-2 receptor agonists** (including **salbutamol**), **pentamidine** and **quinine**.

Route/Dosage

Prostate cancer

Subcut (Adults): *Initial treatment*—500 mcg every 8 hr for 7 days; *maintenance treatment*—200 mcg daily.

Intranasal (Adults): *Maintenance treatment*—400 mcg (200 mcg in each nostril) three times daily.

Implant (Adults): 6.3 mg every 2 mo or 9.45 mg every 3 mo.

Endometriosis

Intranasal (Adults): 400 mcg (200 mcg in each nostril) three times daily. Treatment is usually continued for 6 mo, not to exceed 9 mo.

Availability

Solution for subcutaneous injection (contains benzyl alcohol): 1000 mcg/mL; **Intranasal Solution:** 1 mg/mL (delivers 100 mcg per actuation); **Implant (depot):** 6.3 mg (2 mo implant), 9.45 mg (3 mo implant).

NURSING IMPLICATIONS

Assessment

- **Cancer:** Monitor patients with vertebral metastases for increased back pain and decreased sensory/motor function.

- Monitor intake and output ratios and assess for bladder distention in patients with urinary tract obstruction during initiation of therapy.
- **Endometriosis:** Assess patient for signs and symptoms of endometriosis before and periodically during therapy. Amenorrhea usually occurs within 8 wk of initial administration and menses usually resume 8 wk after completion.
- **Lab Test Considerations:** During treatment male patients should have blood tests every 3 mo to measure testosterone levels. When treatment begins, testosterone levels can temporarily markedly increase and patients may need another medication to decrease levels.
- Monitor blood glucose in patients with diabetes frequently; may affect blood glucose levels.
- Women should have a negative pregnancy test result prior to starting treatment.

Potential Nursing Diagnoses

Sexual dysfunction

Potential Nursing Diagnoses

Disturbed body image

Implementation

Prostate Cancer

- **Subcut:** Only use syringes that come with kit for accurate dose. Inject into fatty tissue of abdomen, arm, or leg 3 times a day for 7 days; then daily during maintenance.
- **Intranasal:** When used as maintenance, begin nasal spray in each nostril 3 times daily. If patient also receives decongestant nasal spray, wait 30 minutes to give buserelin spray before or after the decongestant.
- **Implant:** Implant is inserted in subcut tissue of upper abdominal wall every 28 days. Local anesthesia may be used before injection.
- If the implant needs to be removed for any reason, it can be located by ultrasound.

Endometriosis

- **Intranasal:** One spray in each nostril 3 times daily for 6 to 9 mo.

Patient/Family Teaching

- Men may experience breast swelling and tenderness, decreased libido, hot flashes and sweats, impotence, and weight gain. Notify health care professional if these symptoms occur.
- Women may experience decreased libido, constipation, painful sexual intercourse, menopausal symptoms, changes in hair growth. Notify health care professional if these symptoms occur.
- Caution both male and female patients to use contraception while taking this drug. Advise female patient to inform health care professional if pregnancy is suspected. Buserelin can be harmful to a fetus.
- **Subcut:** Instruct patient in proper technique for self-injection, care and disposal of equipment. Use only syringes included in kit. Instruct patients that syringes may only be used once, and then discarded.
- **Intranasal:** Instruct patient on proper nasal spray technique. Prime pump before use.
- Advise patients that the nasal spray can cause nose bleeds, and may change smell and taste senses.

Evaluation

- Decrease in the spread of prostate cancer.
- Decrease in lesions and pain in endometriosis.

cannabidiol (ka-na-bi-dye-ole)

delta-9 – tetrahydrocannabinol (THC)

(del-ta nine tet-re-hye-dro-ka-na-bi-nole)

✳Sativex

Classification

Therapeutic: analgesic adjuncts, therapeutic, antispasticity agents

Pharmacologic: cannabinoids

Indications

Adjunct treatment of spasticity in adults with multiple sclerosis (MS) who have not responded to other therapies. Analgesic adjunct in the management of neuropathic pain in patients with MS or advanced cancer who have not responded to opioids or other analgesics for severe pain.

Action

Acts on cannabinoid receptors located in pain pathways in the brain, spinal cord, and peripheral nerve terminals. Has analgesic and muscle relaxant properties. **Therapeutic Effects:** Decreased pain and spasticity.

Pharmacokinetics

Absorption: Buccal absorption is slower than inhalation.

Distribution: Highly lipid soluble, distributes and accumulates in fatty tissues. Cannabinoids enter breast milk in considerable amounts.

Metabolism and Excretion: Some first-pass hepatic metabolism occurs; highly metabolized by the CYP450 enzyme system. Metabolites can be stored in fatty tissues and rereleased over time (up to weeks); one metabolite of THC is pharmacologically active (11 – hydroxy-THC). Further metabolism occurs in renal and biliary systems.

Half-life: Biexponential half-lives with short initial phases of *Cannabidiol* — 1.4 – 1.8 hr; *THC* — 1.3 – 1.7 hr; *11 – hydroxy-THC* — 1.9 – 2.1 hr; terminal elimination half-life of *cannabinoids* — 24 – 26 hr or more.

TIME/ACTION PROFILE (analgesic and antispasticity effects)

ROUTE	ONSET	PEAK†	DURATION
cannabidiol	unknown	1.6–2.8 hr	up to 12 hr
THC	unknown	1.6–2.4 hr	up to 12 hr

†Blood levels peak more quickly when administered under the tongue.

Contraindications/Precautions

Contraindicated in: Allergy/hypersensitivity to cannabinoids, propylene glycol, or peppermint oil; Serious cardiovascular disease, including ischemic heart disease, arrhythmias, poorly controlled hypertension or severe

heart failure; History of schizophrenia/psychoses; Patients with child-bearing potential who are not using reliable contraception; Sore/inflamed mucosa (may alter absorption); **OB:** Pregnancy (avoid use); **Lactation:** Avoid breast-feeding (Cannabinoids enter breast milk in considerable amounts); **Pedi:** Safe and effective use in children <18 yr has not been established; avoid use.

Use Cautiously in: History of epilepsy/recurrent seizures; History of substance abuse; Perioperative state (consider possible changes in cardiovascular status); History of depression/suicide attempt or ideation; Significant hepatic/renal impairment; Patients with child-bearing potential (reliable contraception must be ensured); Cancer patients with urinary tract pathology (↑ risk of urinary tract adverse reactions); **Geri:** Should be used cautiously in this population.

Adverse Reactions/Side Effects

CNS: dizziness, fatigue, confusion, depression, disorientation, drowsiness, euphoria, hallucinations, psychotic reactions, suicidal ideation, weakness. **CV:** hypertension, palpitations, tachycardia, postural hypotension. **GI:** appetite change, constipation, dry mouth, dysgeusia, mucosal/teeth discoloration, nausea (↑ in cancer patients), stomatitis. **GU:** urinary retention (↑ in cancer patients).

Local: application site irritation. **Misc:** physical dependence, psychological dependence.

Interactions

Drug-Drug: ↑ risk of CNS depression with other CNS depressants including alcohol, some antidepressants, some antihistamines, benzodiazepines, GABA inhibitors, sedative/hypnotics, opioids and psychotropics/antipsychotics. Cannabidiol inhibits the CYP450 enzyme system; may ↑ effects of amitriptyline, alfentanil, fentanyl and sufentanil.

Drug-Natural Products: ↑ risk of intoxication with other forms of cannabis.

Route/Dosage

Buccal (Adults): *Day 1* — One spray in the morning and one in the evening; *subsequent days* — Increase by one spray/day. Wait at least 15 min between sprays. Spread out sprays used per day. If unacceptable effects occur temporarily discontinue and reinstitute at a lower amount sprays/day or longer intervals between sprays. Titrate to optimal maintenance dose (usual range 4–8 sprays/day, usually not more than 12 sprays/day; higher doses have been used/tolerated). Adjust dose to changes in patient condition.

Availability

Buccal spray (contains ethanol (50% v/v), propylene glycol and peppermint oil: Each ml contains *Cannabidiol* — 25 mg and *THC* — 27 mg/ml. Delivers 100 microliter/spray, each spray provides cannabidiol 2.5 mg and THC 2.7 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient's pain level before and after cannabidiol.

✳ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Potential Nursing Diagnoses

Acute pain
Chronic pain

Implementation

- Administer one spray 2 times a day, in morning and in evening, on first day. Administer under tongue or in buccal area. Rotate sites in mouth to avoid irritation. Effects should be noticed in about 30 minutes. Do not spray the back of throat or into nose. After first day, increase dose by 1 spray every 24 hours, spacing doses evenly. No more than 12 doses should be used over a 24-hour period. Space each spray by at least 15 min.
- Prime pump before first use. Shake vial gently and remove protective cap. Hold vial in an upright position and press firmly and quickly on the actuator 2 or 3 times, until a fine spray appears. Point spray into a tissue, away from patient.

Patient/Family Teaching

- Caution patient to use medication as directed.
- Instruct patient on correct spray technique. Instruct patient to rotate sites in the mouth between under the tongue and buccal locations.
- Instruct patient to store unopened bottles in refrigerator. Do not freeze. Keep away from sources of heat such as direct sunlight or flames (product is flammable). Opened bottles may be stored at room temperature. Keep out of reach of children.
- Inform patient that any unused contents should be discarded after 28 days. Do not dispose of medications in wastewater (e.g., down the sink or in the toilet) or in household garbage. Consult pharmacist how to dispose of expired or unneeded medication.
- Caution patient to avoid alcohol while taking cannabidiol.

Evaluation

- Decrease in pain.
- Decrease in muscle spasticity.

cilazapril (syé-lay-za-pril)

✶Inhibace

Classification

Therapeutic: antihypertensives
Pharmacologic: ACE inhibitors

Indications

Alone or with other agents in the management of hypertension. Management of HF.

Action

ACE inhibitors block the conversion of angiotensin I to the vasoconstrictor angiotensin II. ACE inhibitors also prevent the degradation of bradykinin and other vasodilatory prostaglandins. ACE inhibitors also ↑ plasma renin levels and ↓ aldosterone levels. Net result is systemic vasodilation. **Therapeutic Effects:** Lowering of BP in hypertensive patients. Improved symptoms in patients with HF.

Pharmacokinetics

Absorption: Well absorbed following oral administration, rapidly converted to active metabolite, cilazaprilat (57% bioavailability for cilazaprilat).

Distribution: Enters breast milk.

Metabolism and Excretion: Cilazaprilat is eliminated unchanged by the kidneys (91%).

Half-life: *Early elimination phase*—0.9 hr; *terminal elimination phase (enzyme-bound cilazaprilat)* 36–49 hr.

TIME/ACTION PROFILE (effects on hemodynamics)

ROUTE	ONSET	PEAK	DURATION
PO (hypertension)	within 1 hr	3–7 hr	12–24 hr
PO (heart failure)	1–2 hr	2–4 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; History of angioedema with previous use of ACE inhibitors; Concurrent use with aliskiren in patients with diabetes or moderate-to-severe renal impairment (CCr <60 mL/min); **OB:** Can cause injury or death of fetus—if pregnancy occurs, discontinue immediately; **Lactation:** Discontinue drug or use formula.

Use Cautiously in: Renal impairment, hepatic impairment, hypovolemia, hyponatremia, concurrent diuretic therapy; **H:** Black patients with hypertension (monotherapy less effective, may require additional therapy; ↑ risk of angioedema); Women of childbearing potential; Surgery/anesthesia (hypotension may be exaggerated); **Geri:** Initial dose ↓ recommended for most agents due to age-related ↓ in renal function; **Pedi:** Safe use in children has not been established.

Exercise Extreme Caution in: Family history of angioedema.

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, fatigue, headache, insomnia, vertigo, weakness. **Resp:** cough, dyspnea. **CV:** hypotension, chest pain, edema, tachycardia. **Endo:** hyperuricemia. **GI:** taste disturbances, abdominal pain, anorexia, constipation, diarrhea, nausea, vomiting. **GU:** erectile dysfunction, proteinuria, renal dysfunction, renal failure.

Derm: flushing, pruritis, rashes. **F and E:** hyperkalemia.

Hemat: AGRANULOCYTOSIS. **MS:** back pain, muscle cramps, myalgia. **Misc:** ANGIOEDEMA, fever.

Interactions

Drug-Drug: Excessive hypotension may occur with concurrent use of **diuretics** or other **anti-hypertensives** or **alcohol**. ↑ risk of hyperkalemia with concurrent use of **potassium supplements**, **potassium-sparing diuretics**, or **potassium-containing salt substitutes**. ↑ risk of hyperkalemia, renal dysfunction, hypotension, and syncope with concurrent use of **angiotensin II receptor antagonists** or **aliskiren**; avoid concurrent use with aliskiren in patients with diabetes or CCr <60 mL/min. **NSAIDs** and selective **COX-2 inhibitors** may blunt the antihypertensive effect and ↑ the risk of renal dysfunction. ↑ levels and may ↑ risk of **lithium** toxicity.

Route/Dosage

Hypertension

PO (Adults ≤65 yr): Hypertension (monotherapy)—2.5 mg once daily initially, may be increased every two weeks by 2.5 mg/day; usual dose 2.5–5 mg once daily, not to exceed 10 mg/day. Twice daily administration may be necessary in some patients; *hypertension (concurrent diuretics)*—0.5 mg once daily initially, titrate carefully.

PO (Adults >65 yr): Hypertension (monotherapy)—1.25 mg once daily initially, titrate carefully.

Renal Impairment

PO (Adults): CCr >40 mL/min—1 mg once daily initially, titrate carefully, not to exceed 5 mg once daily; **CCr 10–40 mL/min**—0.5 mg once daily initially, titrate carefully, not to exceed 2.5 mg once daily; **CCr <10 mL/min**—0.25–0.5 mg once or twice weekly depending on blood pressure response.

Hepatic Impairment

PO (Adults): 0.5 mg once daily or less.

Heart Failure

PO (Adults): After considering concurrent diuretic therapy/salt/volume depletion, *Initial dose*—0.5 mg/day with careful monitoring; after 5 days dose may be ↑ to 1 mg/day; dose may then be carefully titrated as needed/tolerated up to 2.5 mg/day; rarely patients may require 5 mg/day.

Renal Impairment

PO (Adults): CCr 10–40 mL/min—0.25–0.5 mg once daily **CCr <10 mL/min**—0.25–0.5 mg once or twice weekly depending on response.

Availability

Tablets: 1 mg, 2.5 mg, 5 mg. **In combination with:** hydrochlorothiazide 12.5 mg (Inhibace Plus).

NURSING IMPLICATIONS

Assessment

- Assess patient for signs of angioedema; dyspnea and facial swelling.
- **Hypertension:** Monitor BP and pulse frequently during initial dose adjustment and periodically during therapy. Notify health care professional of significant changes.
- **Heart Failure:** Monitor daily weight and assess frequently for fluid overload (dyspnea, rales/crackles, weight gain, jugular venous distention).
- **Lab Test Considerations:** Monitor BUN, creatinine, and serum electrolyte levels periodically during therapy.
- Monitor CBC periodically. May cause agranulocytosis.
- May cause ↑ AST, ALT, alkaline phosphatase, serum bilirubin, uric acid, and glucose.

Potential Nursing Diagnoses

Decreased cardiac output
Noncompliance

Implementation

- Tablets may be taken before or after meals.

Patient/Family Teaching

- Instruct patient to take cilazapril as directed. Take missed dose as soon as remembered. If not until the following day, skip missed dose. Do not double doses.
- Caution patient to change positions slowly to minimize hypotension. Use of alcohol, standing for long periods, exercising, and hot weather may ↑ orthostatic hypotension.
- May cause dizziness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Instruct patient on proper technique for monitoring blood pressure. Advise patient to check BP and weight weekly and record and report results to health care professional.
- Provide patient with additional interventions for hypertension control (weight reduction, low sodium diet, cessation of smoking, exercise regiment, stress management, and moderation of alcohol consumption). Medication controls but does not cure hypertension.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially cough, cold, or allergy remedies.
- Advise women of child-bearing age to use contraception and to notify health care professional if planning or suspecting pregnancy. Discontinue medication immediately if pregnancy is confirmed.

Evaluation

- Decrease in blood pressure.
- Decrease in signs and symptoms of heart failure.

cloxacillin (klox-a-sill-in)

★ Apo Cloxi, ★ Novo-Cloxin, ★ Nu-Cloxi

Classification

Therapeutic: anti-infectives

Pharmacologic: penicillinase resistant penicillins

Indications

Treatment of the following infections due to penicillinase-producing staphylococci: respiratory tract infections, sinusitis, septicemia, endocarditis, osteomyelitis, skin and skin structure infections.

Action

Bind to bacterial cell wall, leading to cell death. Not inactivated by penicillinase enzymes. **Therapeutic Effects:** Bactericidal action. **Spectrum:** Active against most gram-positive aerobic cocci. Spectrum is notable for activity against: Penicillinase-producing strains of *Staphylococcus aureus*, *Staphylococcus epidermidis*. Not active against methicillin-resistant bacteria (MRSA).

★ = Canadian drug name. ⚡ = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability. Moderately absorbed (50%) following oral administration.

Distribution: Widely distributed; penetration into CSF is minimal but sufficient in the presence of inflamed meninges; crosses the placenta and enters breast milk.

Metabolism and Excretion: Some metabolism by the liver (9–22%) and some renal excretion of unchanged drug (20%).

Half-life: 0.5–1.1 hr (increased in severe hepatic, renal dysfunction, and in neonates).

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	30 min	30–120 min	6 hr
IM	unknown	unknown	6 hr
IV	rapid	end of injection/infusion	6 hr

Contraindications/Precautions

Contraindicated in: Previous hypersensitivity to penicillins (cross-sensitivity exists with cephalosporins and other beta-lactam antibiotics).

Use Cautiously in: Severe renal or hepatic impairment; **OB:** Safe use in pregnancy has not been established; **Pedi:** Safe use in premature and newborn infants has not been established.

Adverse Reactions/Side Effects

CNS: SEIZURES. **GI:** PSEUDOMEMBRANOUS COLITIS, diarrhea, epigastric distress, nausea, vomiting. **GU:** interstitial nephritis. **Derm:** rash, urticaria. **Hemat:** eosinophilia, leukopenia. **Misc:** allergic reactions including ANAPHYLAXIS and SERUM SICKNESS, superinfection.

Interactions

Drug-Drug: Cloxacillin may ↓ effectiveness of oral contraceptive agents. Probenecid ↓ renal excretion and ↑ blood levels of cloxacillin (therapy may be combined for this purpose). Neomycin may ↓ absorption of cloxacillin. Concurrent use with methotrexate ↓ methotrexate elimination and ↑ risk of serious toxicity.

Drug-Food: Food ↓ oral absorption by 50%.

Route/Dosage

PO (Adults): 250–500 mg q 6 hr.

PO (Children >1 mo): 50–100 mg/kg/day divided q 6 hr up to a maximum of 4 g/day.

IM, IV (Adults): 250–500 mg every 6 hr, maximum dose 6 g/day.

IM, IV (Children up to 20 kg): 25–50 mg/kg/day in 4 equally divided doses every 6 hr.

Availability

Capsules: ★ 250 mg, ★ 500 mg; Oral solution: ★ 125 mg/5 mL; Powder for injection (requires reconstitution/dilution): ★ 250 mg, ★ 500 mg, ★ 2 g vials.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.

- Obtain a history before initiating therapy to determine previous use of and reactions to cephalosporins or other beta-lactam antibiotics. Persons with no history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity prior to initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing, abdominal pain). Discontinue drug and notify health care professional immediately if these occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in event of an anaphylactic reaction.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of pseudomembranous colitis. May begin up to several weeks following cessation of therapy.
- Lab Test Considerations:** May cause leukopenia and neutropenia, especially with prolonged therapy or hepatic impairment.
- May cause positive direct Coombs' test result.
- May cause ↑ AST, ALT, LDH, and serum alkaline phosphatase concentrations.

Potential Nursing Diagnoses

Risk for infection (Indications) (Side Effects)

Noncompliance (Patient/Family Teaching)

Implementation

- PO:** Administer around the clock on an empty stomach at least 1 hr before or 2 hr after meals. Take with a full glass of water; acidic juices may decrease absorption of penicillins. Swallow capsules whole; do not crush, chew or open capsules.
- Use calibrated measuring device for liquid preparations. Shake well. Solution is stable for 14 days if refrigerated.
- IM:** Reconstitute by adding 1.9 mL and 1.7 mL Sterile Water to 250 mg and 500 mg respectively, for concentrations of 125 mg/mL and 250 mg/mL. Shake well to dissolve. Stable for 24 hr at room temperature or 48 hr if refrigerated.
- IV:** For IV use, reconstitute 250 mg vial with 4.9 mL, 500 mg vial with 4.8 mL, and 1000 mg vial with 9.6 mL Sterile Water for concentrations of 50 mg/mL, 100 mg/mL, and 100 mg/mL respectively. Shake well. Use reconstituted solution immediately. Infuse over 2–4 min.
- IV:** Reconstitute for infusion with Sterile Water for injection using 3.4 mL for 1000 mg, 6.8 mL for 2000 mg, and 34 mL for 10,000 mg, resulting in 250 mg/mL. Add to an appropriate infusion fluid in amount calculated to give desired dose. Shake well to dissolve. Use solution immediately. Infuse over 30–40 min.
- Y-Site Compatibility:** epinephrine, ketamine.
- Y-Site Incompatibility:** pantoprazole, rocuronium.

Patient/Family Teaching

- Instruct patient to take medication around the clock and to finish the drug completely as directed, even if feeling better. Missed doses should be taken as soon as remembered. Advise patient that sharing of this medication may be dangerous.

- Advise patient to report signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools) and allergy.
- **Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.**
- Instruct patient to notify health care professional if symptoms do not improve.

Evaluation

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

cypoterone (sy-proe-te-rone)

★ Androcur

Classification

Therapeutic: antineoplastics, hormones

Pharmacologic: antiandrogens

Indications

Palliative treatment of advanced prostate cancer.

Action

Has antiandrogenic and progestogenic/antigonadotropic properties, resulting in blocked binding of the active metabolite of testosterone on the surface of prostatic cancer cells and decreased production of testicular testosterone.

Therapeutic Effects: Decreased spread of prostate cancer.

Pharmacokinetics

Absorption: Completely absorbed following oral administration. Absorption after IM depot injection is delayed and prolonged.

Distribution: Unknown.

Metabolism and Excretion: Metabolized by the CYP3A enzyme system; excreted in feces (60%) and urine (33%), as unchanged drug and metabolites.

Half-life: PO—38 hr; IM—4 days.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	3–4 hr	8–12 hr
IM (depot)	unknown	3.4 days	1–2 wk

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Liver disease/hepatic dysfunction/liver tumors (not due to prostate cancer); Dubin Johnson syndrome; Rotor syndrome; History of meningioma; Wasting diseases (not related to prostate cancer); Severe depression; Thromboembolism; **OB:** Not indicated for use in women; **Pedi:** Not recommended for use in children <18 yr.

Use Cautiously in: History of cardiovascular disease; Renal impairment.

Adverse Reactions/Side Effects

CNS: MENINGIOMAS, fatigue, weakness, depression.

Resp: cough, dyspnea, pulmonary microembolism. **CV:**

THROMBOEMBOLISM, edema, heart failure, myocardial infarction, hypotension, syncope, tachycardia, vasovagal reactions. **GI:** HEPATOTOXICITY, LIVER TUMORS, anorexia, constipation, diarrhea, nausea, vomiting. **Derm:** dry skin, hot flashes, ↑ sweating, patchy hair loss. **Endo:** adrenal suppression, antiandrogen withdrawal syndrome, gynecomastia. **F and E:** hypercalcemia. **GU:** infertility, impotence. **Hemat:** anemia, thrombocytopenia. **Metab:** glucose intolerance, hyperlipidemia. **MS:** osteoporosis (long-term use). **Misc:** allergic reactions.

Interactions

Drug-Drug: Antiandrogenic effect may be ↓ by alcohol. Effectiveness/long-term survival may be ↓ by concurrent GnRH agonist treatment. ↑ risk of myopathy with HMG CoA reductase inhibitors (statins). Blood levels and effects may be ↑ by strong inhibitors of CYP3A4 including clotrimazole, itraconazole, ketoconazole, and ritonavir. Blood levels and effectiveness may be ↓ by inducers of CYP3A4 including phenytoin and rifampicin. Use cautiously with other drugs that are substrates of the P450 enzymes.

Drug-Natural Products: Blood levels and effectiveness may be ↓ by St. John's wort.

Route/Dosage

PO (Adults): 200–300 mg/day in 2–3 divided doses, not to exceed 300 mg/day; *after orchiectomy*—100–200 mg/day.

IM (Adults): 300 mg once weekly; *after orchiectomy*—300 mg every 2 wk.

Availability

Tablets: 50 mg; **Depot injection:** 100 mg/mL in 3–mL ampules. **In combination with:** Ethinyl estradiol (Diane-35, Cyestra-35).

NURSING IMPLICATIONS

Assessment

- Assess patient for signs and symptoms of thromboembolism (chest pain, dyspnea, vital signs, level of consciousness). Discontinue therapy if symptoms occur.
- Monitor mood changes, especially during first 6–8 wk. Note degree to which these thoughts and behaviors interfere with daily functioning. Inform health care professional if patient demonstrates significant increase in anxiety, nervousness, or insomnia.
- **Lab Test Considerations:** Monitor PSA during therapy. May cause increase in PSA. If PSA increase occurs discontinue therapy and monitor for 6–8 wk for withdrawal response prior to any decision to proceed with other prostate cancer therapy.
- **Lab Test Considerations:** May impair carbohydrate metabolism. Monitor fasting blood glucose and glucose tolerance tests periodically during therapy, especially in patients with diabetes. May require dose changes in insulin or oral antidiabetic agents.
- **Lab Test Considerations:** Monitor CBC and platelet count periodically during therapy.
- **Lab Test Considerations:** Monitor liver function tests prior to and periodically during therapy and if

★ = Canadian drug name. † = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

symptoms of hepatotoxicity occur. May develop several weeks to months after therapy starts. Discontinue therapy if hepatotoxicity occurs.

- **Lab Test Considerations:** Monitor adrenocortical function tests by serum cortisol assay periodically during therapy.

Potential Nursing Diagnoses

Disturbed body image

Implementation

- **PO:** Take by mouth two or three times a day with or just after meals as directed. Dose is usually lower after orchiectomy.

Patient/Family Teaching

- Instruct patient to take cyproterone as directed. Take missed doses as soon as remembered, unless almost time for next dose, then skip missed dose and resume usual dosing schedule. Do not double dose.
- Inform patient that benign breast lumps may occur; they generally subside 1 to 3 mo after discontinuation of therapy and/or after dose reduction. Dose reduction should be weighed against the risk of inadequate tumor control.
- Advise patient to avoid alcohol during therapy.
- May cause fatigue and lassitude during first few weeks of therapy; then diminishes. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Inform patient that sperm count and volume of ejaculate decrease with therapy. Infertility is common but is reversible when therapy is discontinued.
- Discuss with patient potential for patchy hair loss. Explore methods of coping.
- Emphasize the importance of follow-up appointments and blood tests to monitor progression of treatment.

Evaluation

- Decreased spread of prostate cancer.

danaparoid (da-nap-a-roid)

• Orgaran

Classification

Therapeutic: anticoagulants

Pharmacologic: heparins (low molecular weight)

Indications

Prevention of thromboembolic phenomena including deep vein thrombosis and pulmonary emboli after surgical procedures known to increase the risk of such complications (knee/hip replacement, abdominal surgery). Management of nonhemorrhagic stroke. Treatment/prevention of thromboembolic phenomena in patients with a history of heparin-induced thrombocytopenia (HIT). Maintenance of catheter patency.

Action

Potentiates the inhibitory effect of antithrombin on factor Xa and thrombin. Danaparoid is a heparinoid. **Therapeutic Effects:** Prevention of thrombus formation.

Pharmacokinetics

Absorption: 100% absorbed after subcut administration; IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Excreted mostly by the kidneys.

Half-life: 24 hr.

TIME/ACTION PROFILE (anticoagulant effect)

ROUTE	ONSET	PEAK	DURATION
Subcut	unknown	2–5 hr	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to danaparoid, pork products, or sulfites; Uncontrolled bleeding; Immigrant/threatened abortion; **Lactation:** Breast feeding should be avoided.

Use Cautiously in: Severe liver or kidney disease (dosage ↓ may be necessary in severe renal impairment); Retinopathy (hypertensive or diabetic); Untreated hypertension; Recent history of ulcer disease; Spinal/epidural anesthesia; History of congenital or acquired bleeding disorder; Geriatric patients; Malignancy; History of thrombocytopenia related to heparin (HIT), has been used successfully; **OB:** Safe use in pregnancy has not been established; **Pedi:** Use with caution.

Exercise Extreme Caution in: Severe uncontrolled hypertension; Bacterial endocarditis, bleeding disorders; GI bleeding/ulceration/pathology; Hemorrhagic stroke; Recent CNS or ophthalmologic surgery; Active GI bleeding/ulceration.

Adverse Reactions/Side Effects

CNS: dizziness, headache, insomnia. **CV:** edema. **GI:** constipation, nausea, reversible increase in liver enzymes, vomiting. **GU:** urinary retention. **Derm:** ecchymoses, pruritus, rash, urticaria. **Hemat:** **BLEEDING**, anemia, thrombocytopenia. **Local:** erythema at injection site, hematoma, irritation, pain. **Misc:** fever.

Interactions

Drug-Drug: Risk of bleeding may be ↑ by concurrent use of other **anticoagulants** including **warfarin** or **drugs that affect platelet function**, including **aspirin**, **NSAIDs**, **dipyridamole**, some **penicillins**, **clopidogrel**, **ticlopidine**, and **dextran**.

Route/Dosage

Prophylaxis of DVT (non-HIT patients)

Subcut (Adults): 750 anti-factor Xa IU q 12 hr starting 1–4 hr preop and at least 2 hr postop for 7–10 days or until ambulatory (up to 14 days). **Prophylaxis of DVT following Orthopedic, Major Abdominal Surgery and Thoracic Surgery** — 750 anti-factor Xa units, twice daily up to 14 days, initiate 1–4 hr preop.

IV, Subcut (Adults): Prophylaxis of Deep Vein Thrombosis in Nonhemorrhagic Stroke Patients — up to 1000 anti-Xa units IV, followed by 750 anti-Xa units subcutaneously, twice daily for 7–14 days.

IV (Children): Acute Thrombosis (arterial and/or venous) — 30 anti-Xa units/kg iv bolus injection, then 1.2–4.0 anti-Xa units/kg/hr.

Subcut (Children): Prophylaxis — 10 anti-Xa units/kg twice daily.

Renal Impairment

IV (Children <10 yr): Renal Dialysis — (for the first two dialyses) — 30 anti-Xa units/kg + 1000 anti-Xa units

(if predialysis plasma anti-Xa level > 500 U/L, then no danaparoid is required for next dialysis; if level is 300–500 U/L then decrease total dose by 250 anti-Xa units, < 300 anti-Xa units/L then give previous dialysis dose).

IV (Children 10–17 yr): Renal Dialysis—30 anti-Xa units/kg + 1500U (3rd and subsequent dialyses) (if predialysis plasma anti-Xa level > 500 U/L, then no danaparoid is required for next dialysis; if level is 300–500 U/L then decrease total dose by 250 anti-Xa units, < 300 DVT prophylaxis/L then give previous dialysis dose).

IV (Adults and Children): Catheter patency—750 anti-Xa units diluted in 50 mL saline; 5–10 mL of this solution is used to flush each line/port.

HIT patients

IV, Subcut (Adults): DVT prophylaxis, current HIT, ≤90 kg—750 anti-Xa units SC two or three times daily for 7–10 days (initial bolus of 1250 anti-Xa units IV may be used); **DVT prophylaxis, current HIT, >90 kg**—1250 anti-Xa units SC two or three times daily for 7–10 days (initial bolus of 1250 anti-Xa units IV may be used); **DVT prophylaxis, past (> 3 mo) HIT, ≤90 kg**—750 anti-Xa units SC two or three times daily for 7–10 days; **DVT prophylaxis, past (> 3 mo) HIT, >90 kg**—750 anti-Xa units SC three times daily or 1250 anti-Xa units SC twice daily for 7–10 days; **Established pulmonary embolism or DVT, thrombus < 5 days, >90 kg**—3750 anti-Xa units IV bolus, then 400 anti-Xa units/hr for 4 hr, then 300 anti-Xa units/hr for 4 hr, then 150–200 anti-Xa units/hr for 5–7 days or 1750 anti-Xa units SC twice daily for 4–7 days; **Established pulmonary embolism or DVT, thrombus < 5 days, 55–90 kg**—2250–2500 anti-Xa units IV bolus, then 400 anti-Xa units/hr for 4 hr, then 300 anti-Xa units/hr for 4 hr, then 150–200 anti-Xa units/hr for 5–7 days or 2000 anti-Xa units SC twice daily for 4–7 days; **Established pulmonary embolism or DVT, thrombus < 5 days, < 55 kg**—1250–1500 anti-Xa units IV bolus, then 400 anti-Xa units/hr for 4 hr, then 300 anti-Xa units/hr for 4 hr, then 150–200 anti-Xa units/hr for 5–7 days or 1500 anti-Xa units SC twice daily for 4–7 days; **Established pulmonary embolism or DVT, thrombus ≥ 5 days, >90 kg**—1250 anti-Xa units IV bolus, then 750 anti-Xa units SC three times daily or 1250 anti-Xa units twice daily; **Established pulmonary embolism or DVT, thrombus ≥ 5 days, ≤90 kg**—1250 anti-Xa units IV bolus, then 750 anti-Xa units SC two to three times daily; **Surgical prophylaxis, nonvascular surgery, > 90 kg**—750 anti-Xa units SC, repeat ≥6 hr after procedure, then 1250 anti-Xa units SC twice daily for 7–10 days; **Surgical prophylaxis, nonvascular surgery, ≤ 90 kg**—750 anti-Xa units SC, repeat ≥6 hr after procedure, then 750 anti-Xa units SC twice daily for 7–10 days; **Surgical prophylaxis, embolectomy, >90 kg**—2250–2500 anti-Xa units IV bolus before procedure, then 150–200 anti-Xa units/hr IV starting ≥6 hr after procedure for 5–7 days or 750 anti-Xa units two to three times daily or change to oral anticoagulants after several days; **Surgical prophylaxis, embolectomy, 55–90 kg**—2250–2500 anti-Xa units IV bolus before procedure, then 1250 anti-Xa units SC twice daily starting

≥6 hr after procedure, then 750 anti-Xa units two to three times daily or change to oral anticoagulants after several days; **Cardiac catheterization > 90 kg**—3750 anti-Xa units IV bolus prior to procedure; **Cardiac catheterization < 90 kg**—2500 anti-Xa units IV bolus prior to procedure; **Percutaneous transluminal angioplasty**—2500 anti-Xa units IV prior to procedure, then 150–200 anti-Xa units/hr IV for 1–2 days after procedure, may be followed by 750 anti-Xa units SC for several several days; **Intra-aortic balloon pump catheterization, > 90 kg**—3750 anti-Xa units IV bolus before procedure, then 150–200 anti-Xa units/hr IV or a second bolus of 1250 anti-Xa units IV or 750 anti-Xa units SC two or three times daily or 1250 anti-Xa units SC twice daily; **Intra-aortic balloon pump catheterization, < 90 kg**—2500 anti-Xa units IV bolus before procedure, then 150–200 anti-Xa units/hr IV or a second bolus of 1250 anti-Xa units IV or 750 anti-Xa units SC two or three times daily or 1250 anti-Xa units SC twice daily; **Periphereal vascular bypass**—2250–2500 anti-Xa units IV bolus before procedure, then 150–200 anti-Xa units/hr IV started ≥6 hr after procedure for 5–7 days or 750 anti-Xa units SC two or three times daily or change to oral anticoagulants.

Availability

Solution for injection (contains sulfites): 750 anti-factor Xa units/0.6 mL ampule.

NURSING IMPLICATIONS

Assessment

- **Assess patient for signs of bleeding and hemorrhage** (bleeding gums; nosebleed; unusual bruising; black, tarry stools; hematuria; fall in hematocrit or BP; guaiac-positive stools); bleeding from surgical site. **Notify health care professional if these occur.**
- Assess patient for evidence of additional or increased thrombosis. Symptoms will depend on area of involvement. Monitor neurological status frequently for signs of neurological impairment. May require urgent treatment.
- Monitor patient for hypersensitivity reactions (chills, fever, urticaria).
- Monitor patients with epidural catheters frequently for signs and symptoms of neurologic impairment.
- **Subcut:** Observe injection sites for hematomas, ecchymosis, or inflammation.
- **Lab Test Considerations:** Monitor CBC, and stools for occult blood periodically throughout therapy. Monitor platelet count every other day for first wk, twice weekly for next 2 wks, and weekly thereafter. If thrombocytopenia occurs, monitor closely. If hematocrit decreases unexpectedly, assess patient for potential bleeding sites.
- Special monitoring of clotting times (aPTT) is not necessary.
- May cause increases in AST, ALT, and alkaline phosphatase levels.
- **Toxicity and Overdose:** Danaparoid is not reversed with protamine sulfate. If overdose occurs, discontinue danaparoid. Transfusion with fresh frozen plasma and plasmapheresis has been used if bleeding is uncontrollable.

★ = Canadian drug name. ⚡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)

Risk for injury (Side Effects)

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- Cannot be used interchangeably (unit for unit) with unfractionated heparin or other low-molecular-weight heparins.
- Conversion to oral antiticoagulant therapy (unless it is contraindicated) should not be started until adequate antithrombotic control with parenteral danaparoid has been achieved; conversion may take up to 5 days.
- **Subcut:** Administer deep into subcut tissue. Alternate injection sites daily between the left and right anterolateral and left and right posterolateral abdominal wall. Inject entire length of needle at a 45° or 90° angle into a skin fold held between thumb and forefinger; hold skin fold throughout injection. Do not aspirate or massage. Rotate sites frequently. Do not administer IM because of danger of hematoma formation. Solution should be clear; do not inject solution containing particulate matter.
- If excessive bruising occurs, ice cube massage of site before injection may lessen bruising.

IV Administration

- **Catheter Patency:** May be used intermittently to maintain patency of IV lines/catheters, and/or access ports, if saline flushes do not work adequately. 1 ampule, 750 U (0.6 mL) can be diluted in 50 mL 0.9% NaCl. Use 5–10 mL to flush each line/port as required.
- **Direct IV:** Subcut is preferred route. **Diluent:** If administered IV, give as a bolus. May dilute with 0.9% NaCl, D5/0.9% NaCl, Ringer's, LR, and mannitol. Stable for up to 48 hr at room temperature.
- **Y-Site Incompatibility:** Administer separately; do not mix with other drugs.

Patient/Family Teaching

- Instruct patient in correct technique for self-injection, care and disposal of equipment.
- Advise patient to report any symptoms of unusual bleeding or bruising, dizziness, itching, rash, fever, swelling, or difficulty breathing to health care professional immediately.
- Instruct patient not to take aspirin, naproxen, or ibuprofen without consulting health care professional while on danaparoid therapy.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation

- Prevention of deep vein thrombosis and pulmonary emboli.
- Maintenance of catheter patency.

domperidone (dom-per-i-done)

✶Motilium

Classification

Therapeutic: gastric stimulant

Pharmacologic: butyrophenones, dopamine antagonists

Indications

Management of symptoms associated with GI motility disorders including subacute/chronic gastritis and diabetic gastroparesis. Treatment of nausea/vomiting associated with dopamine agonist antiparkinson therapy. **Unlabeled Use:** To stimulate lactation.

Action

Acts as a peripheral dopamine receptor blocker. Increases GI motility, peristalsis, and lower esophageal sphincter pressure. Facilitates gastric emptying and decreases small bowel transit time. Also increases prolactin levels. **Therapeutic Effects:** Improved GI motility. Decreased nausea/vomiting associated with dopamine agonist antiparkinson therapy.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Does not cross the blood-brain barrier; enters breast milk in low concentrations.

Metabolism and Excretion: Undergoes extensive first-pass hepatic metabolism; much via the CYP3A4 enzyme system. 31% excreted in urine, 66% in feces.

Half-life: 7 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unk	30 min (blood levels)	6–8 hr

Contraindications/Precautions

Contraindicated in: Known hypersensitivity/intolerance; Concurrent use of ketoconazole; Prolactinoma; Conditions where GI stimulation is dangerous including GI hemorrhage/mechanical obstruction/perforation; **Lactation:** Breast feeding is not recommended unless potential benefits outweigh potential risks.

Use Cautiously in: History of breast cancer; Hepatic impairment; Severe renal impairment (dose adjustment may be necessary during chronic therapy); **OB:** Use only if expected benefit outweighs potential hazard; **Pedi:** Safe and effective use in children has not been established.

Adverse Reactions/Side Effects

CNS: headache, insomnia. **GI:** dry mouth. **GU:** amenorrhea, impotence. **Derm:** hot flushes, rash. **Endo:** galactorrhea, gynecomastia, hyperprolactinemia.

Interactions

Drug-Drug: Ketoconazole↑ blood levels and the risk of cardiovascular toxicity and is contraindicated; other azole antifungals, macrolide anti-infectives and protease inhibitors may have similar effects. Risk of adverse cardiovascular reactions may be ↑ by concurrent use of drugs known to ↑ QT interval including other antiarrhythmics, some fluoroquinolones, antipsychotics, beta-2 adrenergic agonists, antimalarials, SSRIs, tri/tetracyclic antidepressants, and nefazodone and should be undertaken cautiously, especially if other risk factors for torsade de pointes exists. Effectiveness may be ↓ by concurrent use of anticholinergics. Due to effects on gastric motility, absorption of drugs from the small intestine may be accelerated, while absorption of drugs from the stomach may be slowed, espe-

cially **sustained-release** or **enteric-coated** formulations. Concurrent use with **MAOIs** should be undertaken with caution.

Drug-Food: Grapefruit juice may ↑ blood levels.

Route/Dosage

PO (Adults): *Upper GI motility disorders*—10 mg three to four times daily; may be increased to 20 mg three to four times daily; *nausea/vomiting due to dopamine agonist antiparkinson agents*—20 mg three to four times daily; higher doses maybe required during dose titration.

Renal Impairment

PO (Adults): Depending on degree of impairment, dosing during chronic therapy should be reduced to once or twice daily.

Availability

Tablets: 10 mg.

NURSING IMPLICATIONS

Assessment

- Assess for nausea, vomiting, abdominal distention, and bowel sounds before and after administration.
- Monitor BP (sitting, standing, lying down) and pulse before and periodically during therapy. May cause prolonged QT interval, tachycardia, and orthostatic hypotension, especially in patients older than 60 yr or taking >30 mg/day.
- Monitor for symptoms related to hyperprolactinemia (menstrual abnormalities, galactorrhea, sexual dysfunction).
- **Lab Test Considerations:** May cause ↑ serum ALT, AST, and cholesterol.
- Monitor serum prolactin prior to and periodically during therapy. May cause ↑ serum prolactin levels.

Potential Nursing Diagnoses

Imbalanced nutrition: less than body requirements

Risk for injury (side effects)

Implementation

- Use lowest effective dose.
- Administer 3–4 times daily, 15–30 min before meals and at bedtime.

Patient/Family Teaching

- Instruct patient to take as directed. Advise patient to avoid grapefruit juice during therapy.
- Advise patient to notify health care professional if galactorrhea (excessive or spontaneous flow of breast milk), gynecomastia (excessive development of male mammary gland), menstrual irregularities (spotting or delayed periods), palpitations, irregular heart beat (arrhythmia), dizziness, or fainting occur.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation

- Prevention or relief of nausea and vomiting.
- Decreased symptoms of gastric stasis.

flupentixol (floo-pen-tiks-ol)

★Fluanxol

Classification

Therapeutic: antipsychotics

Pharmacologic: thioxanthenes

Indications

Maintenance treatment of schizophrenia in patients whose symptomatology does not include excitement, agitation of hyperactivity. Not indicated for the treatment of dementia in the elderly.

Action

Alters the effects of dopamine in the CNS. Has some anticholinergic and alpha-adrenergic blocking activity.

Therapeutic Effects: Diminished signs and symptoms of schizophrenia.

Pharmacokinetics

Absorption: *Flupentixol dihydrochloride*—40% absorbed following oral administration; *Flupentixol decanoate*—slowly released from IM injection sites.

Distribution: Distributes to lungs, liver, and spleen, enters CNS; extensive tissue distribution.

Protein Binding: 99%.

Metabolism and Excretion: Mostly metabolized, metabolites do not have antipsychotic activity. Most metabolites are excreted in feces, some renal elimination.

Half-life: *Flupentixol dihydrochloride*—35 hr; *Flupentixol decanoate*—3 wk.

TIME/ACTION PROFILE (antipsychotic effect)

ROUTE	ONSET	PEAK	DURATION
PO	within 2–3 days	3–8 hr (blood level)	8 hr
IM (depot)	24–72 hr	4–7 days (blood level)	2–4 wk

Contraindications/Precautions

Contraindicated in: Hypersensitivity to flupentixol or other thioxanthenes (cross-sensitivity with phenothiazines may occur); CNS depression due to any cause, including comatose states, cortical brain damage (known or suspected), or circulatory collapse; Opiate, alcohol, or barbiturate intoxication; Liver impairment, cerebrovascular insufficiency, or severe cardiovascular pathology; Concurrent use of other drugs known to prolong QT interval; **Pedi:** Safe and effective use in children <18 yr has not been established, not recommended.

Use Cautiously in: Brain tumors or intestinal obstruction (may mask symptoms); Patients exposed to extreme heat or organophosphorous insecticides; Risk factors for/history of stroke; Any risk factors for QT prolongation including hypokalemia, hypomagnesemia, genetic predisposition, cardiovascular disease history (including bradycardia), recent MI, HF, or arrhythmias; Known/suspected glaucoma; History of seizures (may ↓ seizure

★ = Canadian drug name. ⚠ = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

threshold); Parkinson's disease (may worsen symptoms); **Geri**: Use cautiously in patients >65 yr, consider age-related decreases in renal, cardiac and hepatic function; **OB**: Safe use in pregnancy has not been established, use only if expected benefit outweighs potential risks to infant; **Lactation**: Safe use not established, low levels in breast milk are not expected to affect infant if therapeutic doses are used.

Adverse Reactions/Side Effects

CNS: **NEUROLEPTIC MALIGNANT SYNDROME**, dizziness.

EENT: blurred vision. **CV**: **QT PROLONGATION**, **THROMBO-EMBOLISM**, extrapyramidal symptoms, tachycardia, hypotension, sedation, tardive dyskinesia. **GI**: constipation, dry mouth, excess salivation, hepatotoxicity. **GU**: ↓ libido, urinary retention. **Derm**: photosensitivity reactions, rash, sweating. **Endo**: glucose intolerance, hyperprolactinemia, menstrual irregularity. **Hemat**: agranulocytosis, granulocytopenia, neutropenia. **Metab**: weight change. **MS**: osteoporosis (long-term use).

Interactions

Drug-Drug: ↑ CNS depression with other **CNS depressants** including **alcohol**, some **antidepressants**, some **antihistamines**, **anxiolytics**, **benzodiazepines**, and **sedative/hypnotics**. ↑ risk of QT prolongation and serious arrhythmias with **Class Ia and III antiarrhythmics** (including **quinidine**, **amiodarone**, and **sotalol**), some **antipsychotics** (including **thioridazine**), some **macrolide anti-infectives** (including **erythromycin**), and some **quinolone anti-infectives** (including **moxifloxacin**); concurrent use should be avoided. Concurrent use of **diuretics** and other **drugs affecting electrolytes** may ↑ risk of QT prolongation and serious arrhythmias. ↑ risk of anticholinergic adverse reactions, including paralytic ileus when used concurrently with other **anticholinergics** or **drugs with anticholinergic side effects**. May ↓ metabolism and ↑ effects of **tricyclic antidepressants**. ↑ risk of extrapyramidal symptoms with **metoclopramide**. May ↓ effectiveness of **levodopa** and **dopamine agonists**. May ↓ antihypertensive effectiveness of **guanethidine** and similar drugs; concurrent use should be avoided.

Route/Dosage

PO (Adults): 1 mg three times daily initially, increase by 1 mg every 2–3 days until desired response; usual effective dose is 3–6 mg/day in divided doses (up to 12 mg/day has been used); if insomnia occurs, evening dose may be decreased.

IM (Adults): Initiate with a 5–20 mg test dose (use 5 mg dose in elderly/frail/cachectic patients) as the 2% injection. Patients previously treated with long-acting neuroleptic injections may tolerate initial doses of 20 mg. A second 20 mg dose may be given 4–10 days later and then 20–40 mg every two to three weeks depending on response. Oral flupentixol should be continued, but gradually decreased in the first week following depot injection. Guidelines for conversion from PO to depot IM injection: daily oral dose (mg) × 4 = dose of depot injection (mg) given every 2 wk or daily oral dose (mg) × 8 = depot injection (mg) given every 4 wk.

Availability

Tablets (flupentixol dihydrochloride): 0.5 mg, 3 mg, 5 mg; **Depot injection (flupentixol decanoate)**—con-

tains medium-chain triglycerides [coconut oil]: 20 mg/mL (2%) in 10 mL vials, 100 mg/mL (10%) in 2 mL vials.

NURSING IMPLICATIONS

Assessment

- Assess mental status (orientation, mood, behavior) before and periodically during therapy.
- Monitor BP (sitting, standing, lying), ECG, pulse, and respiratory rate before and frequently during the period of dose adjustment. May cause Q-T prolongation.
- Observe carefully when administering oral medication to ensure that medication is actually taken and not hoarded.
- Assess weight and BMI initially and throughout therapy.
- Assess fluid intake and bowel function. Increased bulk and fluids in the diet help minimize constipation.
- Monitor for onset of akathisia (restlessness or desire to keep moving) and extrapyramidal side effects (*parkinsonian*—difficulty speaking or swallowing, loss of balance control, pill rolling, mask-like face, shuffling gait, rigidity, tremors; *dystonic*—muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs) every 2 mo during therapy and 8–12 wk after therapy has been discontinued. Reduction in dose or discontinuation of medication may be necessary. Benztropine or diphenhydramine may be used to control these symptoms.
- Monitor for tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or worm-like movements of tongue). Report immediately; may be irreversible.
- Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, arrhythmias, hypertension or hypotension, pallor, tiredness, severe muscle stiffness, loss of bladder control). Report immediately.
- Monitor for symptoms related to hyperprolactinemia (menstrual abnormalities, galactorrhea, sexual dysfunction).
- **Lab Test Considerations**: Monitor CBC and liver function tests periodically during treatment. May cause ↑ AST, ALT, and alkaline phosphatase.
- Monitor blood glucose prior to and periodically during therapy. May cause hyperglycemia.
- Monitor serum prolactin prior to and periodically during therapy. May cause ↑ serum prolactin levels.
- May cause false-positive pregnancy tests.

Potential Nursing Diagnoses

Disturbed thought process

Risk for injury

Implementation

- **PO**: Initially, take tablets 3 times daily, without regard to food. Dose will increase for first few days until desired results. Maintenance dose is usually taken in morning.
- When converting to IM doses, PO dose is usually continued in decreasing doses for first wk.
- **IM**: Inject deep IM preferably into gluteus maximus. Solution is a yellow viscous oil; aspirate prior to injection to ensure dose is not injected IV. Do not adminis-

ter solutions that are discolored, hazy, or contain particulate matter.

- For large doses or pain with large volume, flupentizol decanoate BP 10% (100 mg/mL) may be used instead of flupentizol decanoate BP 2% (20 mg/mL).

Patient/Family Teaching

- Instruct patient to take as directed. If a dose is missed, omit and take next dose as scheduled. Discontinuation should be gradual; abrupt discontinuation may cause withdrawal symptoms (nausea, vomiting, anorexia, diarrhea, rhinorrhea, sweating, myalgias, paraesthesias, insomnia, restlessness, anxiety, agitation, vertigo, feelings of warmth and coldness, tremor). Symptoms begin within 1 to 4 days of withdrawal and abate within 7 to 14 days. Advise patient to read *Patient Information* leaflet prior to starting therapy and with each Rx refill in case of changes.
- Inform patient of possibility of extrapyramidal symptoms and tardive dyskinesia. Caution patient to report these symptoms immediately to health care professional.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Medication may cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Caution patient to avoid concurrent use of alcohol and other CNS depressants.
- Instruct patient to notify health care professional promptly if sore throat, fever, unusual bleeding or bruising, rash, weakness, tremors, visual disturbances, dark-colored urine, or clay-colored stools occur.
- Instruct patient to avoid sun exposure and to wear protective clothing and sunscreen when outdoors.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding or planning to breast feed.

Evaluation

- Decreased symptoms of schizophrenia (delusions, hallucinations, social withdrawal, flat, blunt affect).

framycetin (fray-mye-see-tin)

★Soframycin

Classification

Therapeutic: anti-infectives

Pharmacologic: aminoglycosides

Indications

Local treatment of ocular infections due to susceptible organisms including blepharitis, conjunctivitis, corneal

injuries, corneal ulcers, meibomianitis, ocular infections, following foreign body removal (prevention of infection).

Action

Inhibits protein synthesis in susceptible bacteria by binding to ribosomal subunits; not active against fungi, viruses, and most anaerobic bacteria. Active against *Staphylococcus aureus*, the proteus group of bacteria, coliforms, and *Pseudomonas aeruginosa*. **Therapeutic Effects:** Erradication/prevention of infection.

Pharmacokinetics

Absorption: Poorly absorbed following oral administration. Minimal systemic absorption following ophthalmic use.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
ophth	rapid	unknown	1–6 hr (longer for ophth ointment)

Contraindications/Precautions

Contraindicated in: Hypersensitivity (cross-sensitivity with other aminoglycosides may occur).

Use Cautiously in: **OB:** Has been used safely; **Lactation:** Has been used safely; **Pedi:** Safe and effective use not established.

Adverse Reactions/Side Effects

Local: allergic cutaneous reactions. **Misc:** overgrowth of nonsusceptible organisms (prolonged use).

Interactions

Drug-Drug: None noted.

Route/Dosage

Ophth (Adults): *Ophthalmic solution* — 1–2 drops every 1–2 hr acutely for 2–3 days, then 1–2 drops 3–4 times daily; *ophthalmic ointment* — apply 2–3 times daily or use at bedtime if solution has been used during the day.

Availability

Ophthalmic solution: 5 mg/mL in 8–mL bottles; **Ophthalmic ointment:** 5 mg/g in 5–g tubes. **In combination with:** phenylephrine (Soframycin Nasal Spray), gramicidin (Soframycin Skin Ointment).

NURSING IMPLICATIONS

Assessment

- Assess the degree of pain and visual impairment.

Potential Nursing Diagnoses

Acute pain (Indications)

Implementation

- When administering avoid touching any part of eye. Wash hands and wear gloves to administer ophthalmic medication. See Appendix D for administration instructions.

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

1310 DRUGS APPROVED IN CANADA

- **Ophth: Drops:** Apply 1 or 2 drops to affected eye every 1–2 hrs for first 2–3 days. Dose may then decrease to 1 or 2 drops to affected eye 3 or 4 times daily.
- **Ophth: Ointment:** Apply ointment to affected eye 2 or 3 times per day, or at bedtime if solution has been used during day.

Patient/Family Teaching

- Instruct patient on proper technique for applying drops or ointment.

Evaluation

- Resolution of signs and symptoms of eye infection.

fusidic acid (fyoo-sid-ik as-id)

★Fucidin, ★Fucithalmic

Classification

Therapeutic: anti-infectives

Indications

Topical —Local treatment of primary and secondary bacterial skin infections including impetigo contagiosa, erythrasma and secondary skin infections such as infected wounds/burns. **Ophthalmic** —Treatment of superficial eye infections.

Action

Inhibits bacterial protein synthesis. **Therapeutic Effects:** Resolution of localized bacterial infections. Not active against Gram-negative organisms; active against Staphylococci, Streptococci, and Corynebacterium.

Pharmacokinetics

Absorption: Unknown.

Distribution: Systemically absorbed drug crosses the placenta and enters breast milk.

Metabolism and Excretion: Absorbed drug is extensively metabolized.

Half-life: 5–6 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
Top	unknown	unknown	6–8 hr
ophth	unknown	unknown	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to fusidic acid or other components of the formulation (topical ointment contains lanolin).

Use Cautiously in: **OB:** Safe use during pregnancy has not been established; potential benefits should be weighed against the possible hazards to the fetus (crosses the placenta); **Lactation:** Safe use during breast feeding has not been established (enters breast milk).

Adverse Reactions/Side Effects

Derm: mild local irritation.

Interactions

Drug-Drug: None noted for topical use.

Route/Dosage

Topical (Adults and Children): Apply to affected area 3–4 times daily.

Ophth (Adults and Children): One drop into conjunctival sac of both eyes every 12 hr for 7 days.

Availability

Topical cream: 2% (20 mg/g); Topical ointment (contains lanolin): 2% (20 mg/g); Ophthalmic viscous drops (microcrystalline suspension): 1%. **In combination with:** hydrocortisone (Fucidin H).

NURSING IMPLICATIONS

Assessment

- Inspect involved areas of skin and mucous membranes before and frequently during therapy. Increased skin irritation may indicate need to discontinue medication.

Potential Nursing Diagnoses

Risk for infection (Indications)

Acute pain (Indications)

Implementation

- **Do not confuse topical product with ophthalmic product.**
- **Topical:** Consult health care professional for proper cleansing technique before applying medication. Apply small amount to cover affected area completely. Avoid the use of occlusive wrappings or dressings unless directed by health care professional.
- **Ophth:** Administer 1 drop into conjunctival sac of both eyes every 12 hours for 7 days. See Appendix D for instructions.

Patient/Family Teaching

- Instruct patient to apply medication as directed for full course of therapy, even if feeling better. Emphasize the importance of avoiding the eyes.
- Advise patient to report increased skin irritation or lack of response to therapy to health care professional.

Evaluation

- Resolution of skin or eye infection.

gliclazide (glik-la-zide)

★Diamicon MR

Classification

Therapeutic: antidiabetics

Pharmacologic: sulfonylureas

Indications

Control of blood sugar in type 2 diabetes mellitus when control of diet and exercise fails or when insulin is not an option. Requires some pancreatic function.

Action

Lowers blood glucose by stimulating the release of insulin from the pancreas and increasing sensitivity to insulin at receptor sites. **Therapeutic Effects:** Lowering of blood glucose in diabetic patients.

Pharmacokinetics

Absorption: Well absorbed following oral administration (97%).

Distribution: Unknown.

Protein Binding: 95%.

Metabolism and Excretion: Extensively metabolized; metabolites are mostly eliminated (60–70%) in urine, 10–20% in feces; <1% excreted unchanged in urine.

Half-life: *Tablets*—10.4 hr; *modified-release tablets*—16 hr.

TIME/ACTION PROFILE (effect on blood sugar)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	4–6 hr (blood levels)	12–24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; cross-sensitivity with other sulfonylureas may occur; Unstable diabetes, type 1 diabetes mellitus, diabetic ketoacidosis, diabetic coma or precoma; Severe hepatic or renal disease; Concurrent use of oral/oromucosal miconazole, alcohol or alcohol-containing medications, or systemic phenylbutazone; **OB:** Should not be used during pregnancy, insulin is preferred; **Lactation:** Should not be used during lactation, insulin is preferred.

Use Cautiously in: Glucose 6-phosphate dehydrogenase deficiency (↑ risk of hemolytic anemia); Infection, stress, or changes in diet may alter requirements for control of blood sugar or require use of insulin; Impaired thyroid, pituitary, or adrenal function; Malnutrition, high fever, prolonged nausea, or vomiting; **Pedi:** Safe and effective use in children <18 yr has not been established.

Adverse Reactions/Side Effects

Endo: hypoglycemia. **GI:** abdominal pain, diarrhea, dyspepsia, ↑ liver enzymes, nausea, vomiting. **Derm:** photosensitivity, rashes.

Interactions

Drug-Drug: Concurrent use of **chlorpromazine**, **corticosteroids**, **ritodrine**, **salbutamol**, **terbutaline**, or **anticoagulants** should be undertaken with caution due alteration of effects. Concurrent use of **alcohol**, **angiotensin converting-enzyme inhibitors**, **antibacterials**, **azole antifungals**, **beta-blockers**, **clarithromycin**, **clofibrate**, **dispyramide**, **H₂–receptor antagonists**, **MAO inhibitors**, **NSAIDs**, **phenylbutazone**, **salicylates**, long-acting **sulfonamides**, **warfarin** may ↑ risk of hypoglycemia. ↑ risk of hypoglycemia with other **antidiabetic agents** including **alpha glucosidase inhibitors**, **biguanides**, and **insulin**. Concurrent use of **chlorpromazine**, **corticosteroids**, **danazol diuretics** (including **thiazides** and **furosemide**), **hormonal contraceptives** (**estrogen and progestogen**), **nicotinic acid** (pharmacologic doses), **ritodrine**, **salbutamol**, **terbutaline**, or **tetracosactrin** may ↑ risk of hyperglycemia and lead to loss of diabetic control. May ↑ risk of bleeding with **warfarin**. Concurrent use with **alcohol** may result in a disulfiram-like reaction and should be avoided. **Beta-blockers** may ↓ some symptoms of hyperglycemia.

Route/Dosage

PO (Adults): *Tablets*—80–320 mg/day, doses >160 mg/day should be divided and given twice daily; *modified-release tablets*—30 mg daily, may be increased in 30 mg increments every 2 wk until blood sugar is controlled up to 120 mg/day.

Availability

Tablets (contain lactose): 80 mg; Modified-release tablets: 30 mg, 60 mg.

NURSING IMPLICATIONS

Assessment

- Observe for signs and symptoms of hypoglycemia (hunger, weakness, sweating, dizziness, tachycardia, anxiety).
- Assess patient for allergy to sulfonylureas.
- **Lab Test Considerations:** Monitor serum glucose and glycosylated hemoglobin periodically during therapy to evaluate effectiveness of treatment.
- Monitor liver function periodically in patients with mild to moderate liver dysfunction. May cause ↑ AST, ALT, alkaline phosphatase, and LDH.
- Monitor renal function periodically in patients with mild to moderate renal dysfunction. May cause ↑ creatinine and hyponatremia.
- **Toxicity and Overdose:** Overdose is manifested by symptoms of hypoglycemia. Mild hypoglycemia may be treated with administration of oral glucose. Treat severe hypoglycemia with IV D50W followed by continuous IV infusion of more dilute dextrose solution at a rate sufficient to keep serum glucose at approximately 100 mg/dL.

Potential Nursing Diagnoses

Imbalanced nutrition: more than body requirements (indications)

Noncompliance

Implementation

- Patients on a diabetic regimen exposed to stress, fever, infection, trauma, or surgery may require administration of insulin.
- **PO:** Administer with meals at the same time every day.

Patient/Family Teaching

- Instruct patient to take glizalazides directed at the same time every day.
- Explain to patient that this medication does not cure diabetes and must be used in conjunction with a prescribed diet, exercise regimen, to prevent hypoglycemic and hyperglycemic events.
- Instruct patient on proper technique for home glucose monitoring. Monitor closely during periods of stress or illness and notify health care professional if significant changes occur.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to drink a glass of orange juice or ingest 2–3 tsp of sugar, honey, or corn syrup dissolved in water or an appropriate number of glucose tablets and notify health care professional.

★ = Canadian drug name. ☒ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

1312 DRUGS APPROVED IN CANADA

- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hypoglycemic or hyperglycemic episodes.
- Concurrent use of alcohol may cause a disulfiram-like reaction (abdominal cramps, nausea, flushing, headaches, and hypoglycemia).
- Instruct patient to avoid sun exposure and to wear protective clothing and sunscreen when outdoors.
- Caution patient to avoid other medications, especially aspirin and alcohol, while on this therapy without consulting health care professional.
- Advise patient to notify health care professional promptly if unusual weight gain, swelling of ankles, drowsiness, shortness of breath, muscle cramps, weakness, sore throat, rash, or unusual bleeding or bruising occurs.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Advise patient to carry sugar packets or candy, and identification describing diabetes diagnosis and medication regimen.
- Insulin is the recommended method of controlling blood sugar during pregnancy. Counsel female patients to use a form of contraception other than oral contraceptives and to notify health care professional promptly if pregnancy is planned or suspected.
- Emphasize the importance of routine follow-up exams.

Evaluation

- Control of blood glucose levels to avoid episodes of hypoglycemia and hyperglycemia.

methotrimeprazine (meth-oh-try-mep-ra-zeen)

✳ Meprazine, ✳ Methoprazine, ✳ No-zinan

Classification

Therapeutic: antipsychotics, nonopioid analgesics

Pharmacologic: phenothiazines

Indications

Management of psychotic disturbances. Management of conditions associated with anxiety/tension. As an analgesic and adjunct in pain due to cancer, zona, trigeminal neuralgia, intercostal neuralgia, phantom limb pain, and muscular discomforts. Used as a preoperative sedative. As an antiemetic. As a sedative in the treatment of insomnia.

Action

Sedation. **Therapeutic Effects:** Reduction in severity of pain.

Pharmacokinetics

Absorption: Well absorbed after PO/IM administration. IV administration results in complete bioavailability.

Distribution: Enters CSF and crosses the placenta. Minimal amounts enter breast milk.

Metabolism and Excretion: Mostly metabolized by the liver. Some metabolites are active; 1% excreted unchanged by the kidneys.

Half-life: PO—10.3–10.8 hr; IM—15–30 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO (blood levels)	unknown	2.7–2.9 hr	8–12 hr
IM (analgesia)	unknown	20–40 min	8 hr (up to 24 hr in children)

Contraindications/Precautions

Contraindicated in: Blood dyscrasias; Hepatic impairment; Hypersensitivity to methotrimeprazine, phenothiazines, or sulfites; Comatose patients or those who have overdosed on CNS depressants including alcohol, analgesics, opioids, or sedative/hypnotics; **OB:** Third-trimester use may result in agitation, hypotonia, tremor, somnolence, respiratory distress, and feeding disturbances in newborn and should be avoided.

Use Cautiously in: History of seizures; History of glaucoma or prostatic hypertrophy (↑ risk of anticholinergic adverse reactions); Bradycardia, electrolyte abnormalities, congenital/acquired prolonged QT interval or concurrent use of drugs that may prolong QT interval (↑ risk of serious arrhythmias); Underlying cardiovascular disease including stroke, arteriosclerosis, or thromboembolism (↑ risk of adverse cardiovascular effects); **Geri:** Geriatric or debilitated patients (initial dosage ↓ recommended, ↑ risk of death in elderly patients with dementia); **Lactation:** Safety not established; **Pedi:** Safe use in children not established.

Adverse Reactions/Side Effects

CNS: NEUROLEPTIC MALIGNANT SYNDROME, SEIZURES, amnesia, drowsiness, excess sedation, disorientation, euphoria, extrapyramidal reactions, headache, slurred speech, tardive dyskinesia, weakness. **EENT:** nasal congestion. **CV:** orthostatic hypotension, bradycardia, palpitations, tachycardia. **GI:** constipation, abdominal discomfort, dry mouth, nausea, vomiting. **GU:** difficulty in urination. **Endo:** hyperglycemia, hyperprolactinemia. **Hemat:** blood dyscrasias. **Local:** pain at injection site. **Misc:** chills.

Interactions

Drug-Drug: ↑ CNS depression with other CNS depressants, including alcohol, antihistamines, antidepressants, opioids, or sedative/hypnotics; decrease dose of these agents by 50% initially. ↑ anticholinergic effects with antihistamines, antidepressants, phenothiazines, quinidine, disopyramide, atropine, or scopolamine (reduce doses of concurrent atropine or scopolamine). Reverses vasopressor effects of epinephrine (avoid concurrent use—if vasopressor required, use phenylephrine, methoxamine, or norepinephrine). ↑ risk of hypotension with acute ingestion of alcohol, nitrates, MAO inhibitors, or antihypertensives. Concurrent use with succinylcholine may result in tachycardia, hypotension, CNS stimulation, delirium, and ↑ extrapyramidal symptoms.

Drug-Natural Products: Concomitant use of kava, valerian, skullcap, chamomile, or hops ↑ risk of CNS depression.

Route/Dosage

PO (Adults): *Minor conditions*—6–25 mg/day in three divided doses (if sedation occurs, use smaller day-time doses and a larger dose at bedtime); *Nighttime sedative*—10–25 mg as a single bedtime dose; *Psychoses/intense pain*—50–75 mg/day in two to three divided doses, dose may be titrated upward to desired effect (doses of 1 g/day have been used; if daily doses exceed 100–200 mg, administer in divided doses and keep patient at bedrest).

PO (Children): 0.25 mg/kg/day in two to three divided doses (not to exceed 40 mg/day in children <12 yr).

IM (Adults): *Postoperative analgesic adjunct*—10–25 mg q 8 hr, if given with opioids/decrease opioid dose by 50%.

IM (Children): *Analgesia*—62.5–125 mcg (0.0625–0.125 mg) kg/day single dose or divided doses; change to oral medication as soon as possible.

IV (Children): *Palliative care setting*—62.5 mg (0.0625 mg) kg/day in 250 mL of 5% dextrose solution as a slow infusion (20–40 drops/min).

Availability

Tablets: 2 mg, 5 mg, 25 mg, 50 mg; **Solution for injection** (requires further dilution for IV use): 25 mg/mL in 1 mL ampules.

NURSING IMPLICATIONS**Assessment**

- Assess type, location, and intensity of pain before and 30 min after administration.
- Monitor BP frequently after injection. Orthostatic hypotension, fainting, syncope, and weakness frequently occur from 10 min to 12 hr after administration. Patient should remain supine for 6–12 hr after injection.
- Assess weight and BMI initially and throughout therapy.
- Observe patient carefully for extrapyramidal side effects (*parkinsonian*—difficulty speaking or swallowing, loss of balance control, pill rolling, mask-like face, shuffling gait, rigidity, tremors; *dystonic*—muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs). Usually occur only after prolonged or high-dose therapy. Usually resolve with dose decrease or administration of antiparkinsonian agent.
- Monitor for tardive dyskinesia (involuntary rhythmic movement of mouth, face, and extremities). Report immediately and discontinue therapy; may be irreversible.
- Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness). Discontinue methotrimeprazine and notify health care professional immediately if these symptoms occur.
- Methotrimeprazine potentiates the action of other CNS depressants but can be given in conjunction with modified doses of opioid analgesics for management

of severe pain. This medication does not significantly depress respiratory status and can be useful where pulmonary reserve is low.

- Monitor for symptoms related to hyperprolactinemia (menstrual abnormalities, galactorrhea, sexual dysfunction).
- **Lab Test Considerations:** Monitor CBC prior to and periodically during therapy and liver function tests should be evaluated periodically throughout long-term (>30 days) therapy.
- Monitor blood glucose prior to and periodically during therapy. May cause hyperglycemia.
- Monitor serum prolactin prior to and periodically during therapy. May cause ↑ serum prolactin levels.

Potential Nursing Diagnoses

Acute pain (Indications)

Risk for injury (Side Effects)

Implementation

- **PO:** May be administered during day or only at night depending on indication.
- **IM:** Do not inject subcut. Inject slowly into deep, well-developed muscle. Rotate injection sites.
- **Intermittent Infusion:** For patients in palliative care, may be infused as 0.0625 mg/kg/day in 250 mL of D5W. **Rate:** Infuse slowly 20–40 drops per minute.
- **Y-Site Compatibility:** fentanyl, hydromorphone, methadone, morphine, sufentanil.
- **Y-Site Incompatibility:** heparin.

Patient/Family Teaching

- Instruct patient on how and when to ask for pain medication.
- Instruct patient to take medication as directed. Take missed doses as soon as remembered unless almost time for next dose; do not double dose. Advise patient to read *Patient Information* leaflet prior to starting therapy and with each Rx refill in case of changes.
- Advise patient to make position changes slowly and to remain recumbent for 6–12 hr after administration to minimize orthostatic hypotension.
- May cause drowsiness. Caution patient to request assistance with ambulation and transfer and to avoid driving or other activities requiring alertness until response to the medication is known.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially cold medications.
- Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Advise patient to use sunscreen and protective clothing when exposed to the sun. Extremes of temperature should also be avoided because this drug impairs body temperature regulation.
- Instruct patient to use frequent mouth rinses, good oral hygiene, and sugarless gum or candy to minimize dry mouth.
- Instruct patient to notify health care professional promptly if sore throat, fever, unusual bleeding or

★ = Canadian drug name. ⚡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

bruising, rash, weakness, tremors, dark-colored urine, or clay-colored stools or signs of blood clots (swelling, pain and redness in an arm or leg that can be warm to touch, sudden chest pain, difficulty breathing, heart palpitations) occur.

Evaluation

- Decrease in severity of pain.
- Sedation.

moclobemide

(moe-kloe-be-mide)

✳️Manerix

Classification

Therapeutic: antidepressants

Pharmacologic: monoamine oxidase (MAO) inhibitors, benzamides

Indications

Treatment of depression.

Action

Short-acting, Reversible Inhibitor of Monoamine oxidase type A (RIMA). Increases concentrations of serotonin, norepinephrine, and dopamine. **Therapeutic Effects:** Decreased symptoms of depression, with improved mood and quality of life.

Pharmacokinetics

Absorption: 98% absorbed following oral administration, but undergoes first-pass hepatic metabolism resulting in 90% bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Extensively metabolized (partially by CYP2C19 and CYP2D6), very small amounts are pharmacologically active, less than 1% excreted unchanged in urine.

Half-life: 1.5 hr (increases with dose).

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	days—several weeks (anti- depressant effect)	0.5–3.5 hr (blood lev- els)	24 hr (MAO-A inhibition)

Contraindications/Precautions

Contraindicated in: Known hypersensitivity; Acute confusional states; **Pedi:** Safe use in children <18 yr has not been established, use is not recommended; Concurrent use of tricyclic antidepressants; Concurrent use of SSRIs or other MAO inhibitors; Concurrent use of dextromethorphan, meperidine, selegiline, or thioridazine.

Use Cautiously in: History of suicide attempt or ideation; History of thyrotoxicosis or pheochromocytoma (possible risk of hypertensive reaction); Severe hepatic impairment (↓ dose required); Renal impairment; **OB:** Safe use in pregnancy has not been established, should not be used unless anticipated benefits justify potential harm to fetus; **Lactation:** Not recommended unless anticipated benefits justify potential harm to infant.

Adverse Reactions/Side Effects

CNS: **SUICIDAL IDEATION**, agitation, insomnia, restlessness, tremor. **CV:** hypotension.

Interactions

Drug-Drug: ↑ levels and risk of QT prolongation with **thioridazine**, avoid concurrent use. Concurrent use with **selegiline** greatly ↑ sensitivity to tyramine and is contraindicated. Concurrent use with **tricyclic antidepressants** may result in severe adverse reactions and is contraindicated. Should not be used with **SSRIs** or other **MAO inhibitors**; when making a switch allow 4–5 half-lives of previous drug; for **fluoxetine** wait at least 5 wk. Excessive **alcohol** should be avoided. **Cimetidine** ↓ metabolism and ↑ blood levels, ↓ moclobemide dose by 50%. Because of the potential for interactions with **anesthetics**, especially local anesthetics containing **epinephrine**, moclobemide should be discontinued at least 2 days prior to procedures. Concurrent use with **opioids** should be avoided; dosage adjustments may be necessary. Concurrent use of **sympathomimetics** including **ephedrine** and **amphetamines** may ↑ blood pressure and should be avoided. Concurrent use with **dextromethorphan** may result in vertigo, tremor, nausea and vomiting, and should be avoided. Concurrent use with **antihypertensives** should be carefully monitored. **Drug-Food:** Ingestion of large amounts of **tyramine-containing foods** including some cheeses and **Marmite yeast extract** may result in hypertension and arrhythmias and should be undertaken with caution.

Route/Dosage

PO (Adults): 150 mg twice daily initially, increased gradually after 1 wk as needed/tolerated up to 600 mg/day.

Hepatic Impairment

PO (Adults): *Severe hepatic impairment or concurrent enzyme inhibitor (cimetidine)* — Decrease daily dose to 1/3 to 1/2 of standard dose.

Availability

Tablets: 100 mg, 150 mg, 300 mg.

NURSING IMPLICATIONS

Assessment

- Assess mental status for orientation, mood, behavior, and anxiety. Assess for suicidal tendencies. Restrict amount of drug available to patient.
- Monitor BP and pulse before and frequently during therapy. Report significant changes promptly.
- **Monitor mood changes.** Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- Monitor intake and output ratios and daily weight. Assess patient for peripheral edema and urinary retention.
- **Lab Test Considerations:** Monitor liver and kidney function periodically during treatment.
- Monitor serum glucose closely in diabetic patients; hypoglycemia may occur.
- **Toxicity and Overdose:** Concurrent ingestion of tyramine-rich foods and many medications may result in a life-threatening hypertensive crisis. Signs and symptoms of hypertensive crisis include chest pain,

tachycardia, severe headache, nausea and vomiting, photosensitivity, and enlarged pupils. Treatment includes IV phenolamine.

- Symptoms of overdose include anxiety, irritability, tachycardia, hypertension or hypotension, respiratory distress, dizziness, drowsiness, hallucinations, confusion, seizures, fever, and diaphoresis. Treatment includes induction of vomiting or gastric lavage and supportive therapy as symptoms arise.

Potential Nursing Diagnoses

Ineffective coping

Noncompliance (Patient/Family Teaching)

Implementation

- Administer after meals. Swallow tablet whole; do not crush, break, or chew. Dose may be adjusted gradually during the first weeks of therapy.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses if remembered unless almost time for next dose; do not double dose. Do not discontinue abruptly; withdrawal symptoms (nausea, vomiting, malaise, nightmares, agitation, psychosis, seizures) may occur. Advise patient to read *Patient Information* leaflet prior to starting and with each Rx refill in case of changes.
- Caution patient to avoid alcohol, CNS depressants, OTC drugs, and foods or beverages containing tyramine (see Appendix M) during and for at least 2 wk after therapy has been discontinued; they may precipitate a hypertensive crisis. Contact health care professional immediately if symptoms of hypertensive crisis develop.
- Caution patient to notify health care professional if neck stiffness, changes in vision, diarrhea, constipation, rapid/pounding heartbeat, sudden and severe headache, stiff neck, confusion, disorientation, slurred speech, behavioral changes, seizures.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking; other unusual changes in behavior or mood occur.
- Instruct patient to carry identification describing medication regimen.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding or planning to breast feed.
- Encourage patient to participate in psychotherapy in conjunction with taking medication.

Evaluation

- Improved mood in depressed patients.
- Decreased anxiety.

pinaverium (pin-ah-veer-ee-um)

★Dicetel

Classification

Therapeutic: anti-irritable bowel syndrome agents

Pharmacologic: calcium channel blockers

Indications

Management of symptoms of Irritable Bowel Syndrome (IBS) including abdominal pain, and bowel disturbances and discomfort. Treatment of symptoms related to biliary tract disorders.

Action

Acts as a calcium channel blocker with specific selectivity for intestinal smooth muscle. Relaxes gastrointestinal (mainly colon) and biliary tracts, inhibits colonic motor response to food/pharmacologic stimulation. **Therapeutic Effects:** Decreased symptoms of IBS.

Pharmacokinetics

Absorption: Poorly absorbed (1–10%).

Distribution: Distributes selectively to digestive tract.

Protein Binding: 97%.

Metabolism and Excretion: Minimal enterohepatic cycling, eliminated almost entirely in feces. Some metabolism.

Half-life: 1.5 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1 hr	unknown

Contraindications/Precautions

Contraindicated in: Known hypersensitivity; Galactose intolerance/Lapp lactase deficiency/glucose-galactose malabsorption (tablets contain lactose); **Lactation:** May enter breast milk, avoid use if breast feeding; **Pedi:** Safe and effective use in children has not been established, use is not recommended.

Use Cautiously in: Pre-existing esophageal lesions/hial hernia (glass of water and snack should be taken with each dose); **OB:** Safe use in pregnancy has not been established, should be used only if essential to welfare of patient.

Adverse Reactions/Side Effects

All less than 1%. **CNS:** drowsiness, headache, vertigo. **GI:** constipation, diarrhea, distention, dry mouth, epigastric pain/fullness, esophageal irritation, nausea. **Derm:** rash.

Interactions

Drug-Drug: Concurrent use of **anticholinergics** may ↑ spasmolytic effects.

Route/Dosage

PO (Adults): 50 mg three times daily, may be increased as needed/tolerated up to 100 mg three times daily.

Availability

Tablets (contain lactose): 50 mg, 100 mg.

★ = Canadian drug name. ☒ = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

NURSING IMPLICATIONS

Assessment

- Assess patient for symptoms of IBS (abdominal pain or discomfort, bloating, constipation).
- Assess patient for lactose intolerance; product contains lactose.

Potential Nursing Diagnoses

Acute pain
Diarrhea

Implementation

- PO:** Administer tablet with a glass of water and food. Swallow tablet whole; do not crush, chew, or suck. If >3 tablets/day prescribed, take additional tablets with glass of water and a snack. May be irritating to esophagus. Do not take the tablet while lying down or just before bedtime.

Patient/Family Teaching

- Instruct patient to take pinaverium as directed. Take missed doses as soon as remembered unless almost time for next dose; do not double dose.
- Caution patient to inform health care professional if the following side effects persist or worsen; stomach pain or fullness, nausea, constipation or diarrhea, heartburn, headache, dry mouth, dizziness, skin rash.
- Instruct patient to avoid alcohol intake while taking this medication.
- Advise female patient to inform health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation

- A decrease in symptoms of irritable bowel syndrome. The length of treatment depends on the condition being treated.

prucalopride (proo-kal-o-pride)

✶Resotran

Classification

Therapeutic: prokinetic agents

Pharmacologic: dihydrobenzofurancarboxamides

Indications

Treatment of chronic idiopathic constipation in adult females who do not respond to laxatives.

Action

Acts as a serotonin (5-HT₄) receptor agonist with prokinetic properties. Enhances peristalsis and gastrointestinal propulsion. **Therapeutic Effects:** Laxative effect.

Pharmacokinetics

Absorption: Rapidly absorbed (90%) following oral administration.

Distribution: Rapidly and extensively distributed, enters breast milk.

Metabolism and Excretion: 60% excreted unchanged in urine, 3–8% unchanged in feces, minor amounts are extensively metabolized.

Half-life: 24 hr.

TIME/ACTION PROFILE (normalization of bowel movements)

ROUTE	ONSET	PEAK	DURATION
PO	3–4 days	1–4 wk	unk

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Renal impairment requiring dialysis; Intestinal obstruction/perforation (structural or functional), obstructive ileus, severe gastrointestinal inflammatory disease, including Crohn's disease, ulcerative colitis, toxic megacolon/megarectum; Galactose intolerance, Lapp lactase deficiency, or glucose/galactose malabsorption (tablets contain lactose); **OB:** Not recommended for use during pregnancy (effective contraception should be used); **Lactation:** Not recommended for use while breast feeding (enters breast milk); **Pedi:** Not recommended for use in children <18 yr.

Use Cautiously in: Severe/clinically stable concurrent chronic diseases including liver, cardiovascular or lung disease, neurological or psychiatric disorders, cancer, AIDS or other disorders, or insulin-dependent diabetes mellitus; History of arrhythmias or cardiovascular disease, ischemic heart disease, pre-excitation syndromes (including Wolff-Parkinson-White syndrome, Lown-Ganong-Levine syndrome, or AV nodal disorders (↑ risk of arrhythmias); Severe renal impairment (↓ dose recommended); **Geri:** Due to age-related ↓ in renal function, ↓ dose is recommended.

Adverse Reactions/Side Effects

CNS: headache, dizziness, fatigue. **CV:** palpitations, ↓ PR interval, tachycardia. **GI:** abdominal pain, diarrhea, nausea, vomiting.

Interactions

Drug-Drug: Severe diarrhea may ↓ effectiveness of oral hormonal contraceptives (additional method of contraception recommended). Blood levels and effects are ↑ by concurrent CYP3A4 and P-gp inhibitors including ketoconazole, verapamil, cyclosporine, and quinidine. Beneficial effects may be ↓ by concurrent use of anticholinergics.

Route/Dosage

PO (Adults): 2 mg once daily. If no bowel movement occurs in 3–4 days, add-on laxatives should be considered. If benefit is not obtained after 4 wk, prucalopride should be discontinued.

PO (Adults > 65 yr): 1 mg once daily.

Renal Impairment

PO (Adults): $GFR < 30 \text{ mL/min/1.73m}^2$ — 1 mg once daily.

Availability

Tablets (contain lactose): 1 mg, 2 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for symptoms of chronic constipation (abdominal pain or discomfort, bloating, constipation).

Potential Nursing Diagnoses

Constipation

Implementation

- **PO:** Medication should be taken with food or on an empty stomach at the same time each day.

Patient/Family Teaching

- Instruct patient to take prucalopride as directed.
- Caution the patient to discontinue the medication and notify health care professional with occurrence of severe diarrhea, signs of heart attack, black tarry stools, vomiting of blood or material that looks like coffee grounds.
- Advise patient on a nutritional regimen and hydration, and exercise to decrease constipation.
- Inform patient that if no bowel movement within 3 days of treatment, a "rescue" laxative may be added occasionally while taking prucalopride.
- Advise women of childbearing age who are taking prucalopride to use an effective method of birth control during treatment. If pregnancy occurs while taking this medication, contact health care professional immediately.

Evaluation

- A soft, formed bowel movement.

trimebutine (try-meh-booh-teen)

✳️Modulon

Classification

Therapeutic: lower gastrointestinal tract motility regulators, spasmolytics

Indications

Symptomatic treatment of irritable bowel syndrome (IBS). Treatment of postoperative paralytic ileus.

Action

Acts as a spasmolytic. **Therapeutic Effects:** ↓ symptoms of IBS. Resumption of intestinal transit following abdominal surgical procedures.

Pharmacokinetics

Absorption: Rapidly absorbed following oral administration.

Distribution: Unknown.

Metabolism and Excretion: Extensively metabolized, < 2.4% excreted unchanged in urine.

Half-life: 2.7–3.1 hr.

TIME/ACTION PROFILE (symptom relief)

ROUTE	ONSET	PEAK	DURATION
PO	within 3 days– 2 wk	1 hr (blood level)	>1 wk (follow- ing discontinuation)

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: **OB:** Safety and effective use in pregnancy has not been established, not recommended for use during pregnancy; **Pedi:** Safe and effective use in

children has not been established, not recommended for use in children <12 yr.

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, fatigue, headache. **GI:** diarrhea, dry mouth, dysgeusia, dyspepsia, epigastric pain, nausea. **Derm:** hot/cold sensation, rash.

Interactions

Drug-Drug: May ↑ duration of **d-tubocurarine**-induced curarization.

Route/Dosage

PO (Adults): 200 mg three times daily.

Availability

Tablets: 100 mg, 200 mg.

NURSING IMPLICATIONS

Assessment

- Assess for symptoms of irritable bowel syndrome (cramping, constipation and diarrhea, mucus in stools).
- Assess for abdominal distention and assess bowel sounds.
- Monitor intake and output and record.

Potential Nursing Diagnoses

Acute pain

Diarrhea

Implementation

- **PO:** Administer three times daily before meals.

Patient/Family Teaching

- Instruct patient to take trimebutine as directed.
- Advise female patient to inform health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation

- Decrease signs and symptoms of irritable bowel disease.

zopiclone (zoe-pi-clone)

✳️Imovane

Classification

Therapeutic: sedative/hypnotics

Pharmacologic: cyclopyrrolones

Indications

Short-term treatment of insomnia characterized by difficulty falling asleep and frequent/early awakenings.

Action

Interacts with GABA-receptor complexes; not a benzodiazepine. **Therapeutic Effects:** Improved sleep with decrease latency and increased maintenance of sleep.

Pharmacokinetics

Absorption: Rapidly absorbed (75%) following oral administration.

✳️ = Canadian drug name. ⚠️ = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Distribution: Rapidly distributed from extravascular compartment. Enters breast milk in concentrations that are 50% of plasma levels.

Metabolism and Excretion: Extensively metabolized (mostly by the CYP3A4 enzyme system), metabolites have minimal sedative/hypnotic activity; 4–5% excreted unchanged in urine.

Half-life: 5 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	rapid	2 hr	6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Myasthenia gravis; Severe hepatic impairment; Severe respiratory impairment (including sleep apnea); **OB:** May cause fetal harm, neonatal CNS depression or withdrawal; **Lactation:** Breast feeding is not recommended; Galactose intolerance (5 mg tablet contains lactose).

Use Cautiously in: Renal, hepatic or pulmonary impairment (dosage reduction may be recommended); Past history of paradoxical reactions to sedative/hypnotics or alcohol or violent behavior; History of depression or suicidal ideation; **Geri:** Increased sensitivity may increase the risk of falls, confusion, or anterograde amnesia (use lowest effective dose); **Pedi:** Safe and effective use in children <18 yr has not been established.

Exercise Extreme Caution in: History of substance/alcohol abuse.

Adverse Reactions/Side Effects

CV: abnormal thinking, behavioral changes, sleep-driving. **GI:** bitter taste, anorexia, constipation, dry mouth, dyspepsia. **Misc:** allergic reactions including **ANAPHYLAXIS, ANAPHYLACTOID REACTIONS** and **ANGIOEDEMA**.

Interactions

Drug-Drug: ↑ risk of CNS depression with other **CNS depressants** including **antihistamines, antidepressants, opioids, sedative/hypnotics, and antipsychotics**. ↑ levels and risk of CNS depression with **drugs that inhibit the CYP3A4 enzyme system**, including **erythromycin ketoconazole, itraconazole, clarithromycin, nefazodone, ritonavir, and nelfinavir**; ↓ dose may be necessary. Levels and effectiveness may be ↓ by **drugs that induce the CYP3A4 enzyme system**, including **carbamazepine, phenobarbital, phenytoin, rifampicin, and rifampin**; dose increase may be necessary.

Route/Dosage

PO (Adults): 5–7.5 mg taken immediately before bedtime; not to exceed 7.5 mg or 7–10 days' use. **Geri:** 3.75 mg initially taken immediately before bedtime; may be increased up to 7.5 mg if needed.

Hepatic Impairment

Renal Impairment

PO (Adults): 3.75 mg initially taken immediately before bedtime; may be increased up to 7.5 mg if needed.

Availability

Tablets: 5 mg, 7.5 mg.

NURSING IMPLICATIONS

Assessment

- Assess mental status, sleep patterns, and previous use of sedative/hypnotics. Prolonged use of > 7–10 days may lead to physical and psychological dependence.
- Assess alertness at time of peak of drug. Notify health care professional if desired sedation does not occur.
- Assess patient for pain. Medicate as needed. Untreated pain decreases sedative effects.

Potential Nursing Diagnoses

Insomnia

Risk for injury

Implementation

- Before administering, reduce external stimuli and provide comfort measures to increase effectiveness of medication.
- Protect patient from injury. Raise bedside rails. Assist with ambulation. Remove patient's cigarettes.
- Use lowest effective dose.
- **PO:** Tablets should be swallowed with full glass of water. For faster onset of sleep, do not administer with or immediately after a meal.

Patient/Family Teaching

- Instruct patient to take zopiclone as directed. Advise patient not to take zopiclone unless able to stay in bed a full night (7–8 hours) before being active again. Do not take more than the amount prescribed because of the habit-forming potential. Not recommended for use longer than 7–10 days. If used for 2 wk or longer, abrupt withdrawal may result in fatigue, nausea, flushing, light-headedness, uncontrolled crying, vomiting, GI upset, panic attack, or nervousness. Instruct patient to read *Patient Information* for correct product before taking and with each Rx refill, in case of changes.
- Because of rapid onset, advise patient to go to bed immediately after taking zopiclone.
- May cause daytime drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to this medication is known.
- Caution patient that complex sleep-related behaviors (sleep-driving) may occur while asleep.
- Advise patient to notify health care professional immediately if signs of anaphylaxis (swelling of the tongue or throat, trouble breathing, and nausea and vomiting) occur.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants.

Evaluation

- Relief of insomnia by improved falling asleep and decreased frequency of nocturnal and early morning awakenings.

zuclopenthixol

(zoo-kloe-pen-thix-ole)

★ Cloxipol, ★ Cloxipol-Acuphase, ★

Cloxipol Depot

Classification

Therapeutic: antipsychotics

Pharmacologic: thioxanthenes

Indications

Management of schizophrenia; *oral*—initial and maintenance management; *IM (acuphase)*—initial treatment of acute psychotic episodes or exacerbation of psychosis due to schizophrenia; *IM (depot)*—maintenance management of schizophrenia.

Action

Has high affinity for dopamine D₁ and D₂ receptors, α₁—adrenergic and 5—HT₂ receptors. Dopaminergic blockade produces neuroleptic activity. **Therapeutic Effects:** Decreases psychoses due to schizophrenia.

Pharmacokinetics

Absorption: *PO*—well absorbed following oral administration; *IM (depot and acuphase)*—slowly absorbed from IM sites.

Distribution: Enters breast milk.

Metabolism and Excretion: Mostly metabolized (partially by the CYP2D6 enzyme system); metabolites do not have antipsychotic activity; minimal amounts excreted unchanged in urine.

Half-life: *PO*—20 hr.

TIME/ACTION PROFILE (antipsychotic effect)

ROUTE	ONSET	PEAK	DURATION
PO	within hrs	4 hr (blood level)	8–24 hr
IM (acetate [Acuphase])	2–4 hr	8 hr (sedation)	2–3 days
IM (decanoate [Depot])	within 3 days	3–7 days (blood level)	2–4 wk

Contraindications/Precautions

Contraindicated in: Treatment of dementia; Narrow angle glaucoma; **Pedi:** Safe and effective use in children <18 yr has not been established and is not recommended.

Use Cautiously in: Impaired hepatic or renal function; Electrolyte abnormalities, including hypokalemia, hyponatremia, concurrent diuretic therapy, or drugs affecting QT interval or cardiovascular disease/history (↑ risk of serious arrhythmias); Intestinal pathology or brain lesions (antiemetic effect may mask symptoms); History of seizures (may ↓ threshold); Parkinson's disease (may cause deterioration); Risk factors/history of stroke; Abrupt discontinuation (should be tapered); **Geri:** Consider age-related decrease in renal, hepatic, and cardiovascular function, concurrent disease states and drug therapies in patients >65 yr; **OB:** Infants exposed in the third trimester may exhibit extrapyramidal and withdrawal reactions including agitation, hypertonia, hypotonia, tremor, somnolence, respiratory distress, and feeding disorders; do not use in pregnancy unless expected benefit to the mother outweighs potential fetal risks; **Lactation:** Enters breast milk, safe use has not been established.

Adverse Reactions/Side Effects

CNS: **NEUROLEPTIC MALIGNANT SYNDROME**, dizziness, extrapyramidal symptoms, fatigue, sedation, tardive dyskinesia, weakness, syncope. **EENT:** abnormal vision accommodation. **CV:** **THROMBOEMBOLISM**, arrhythmias, hypotension, tachycardia. **GI:** constipation, dry mouth, diarrhea, thirst, vomiting. **Derm:** photosensitivity reactions, ↑ sweating. **Endo:** hyperprolactinemia, hyperglycemia. **GU:** ↓ libido, abnormal urination. **Hemat:** anemia, granulocytopenia. **Metab:** weight change. **MS:** myalgia.

Interactions

Drug-Drug: ↑ risk of CNS depression with other CNS depressants including alcohol, some antihistamines, some antidepressants, anxiolytics, barbiturates, benzodiazepines, and sedative/hypnotics. ↑ blood levels and risk of toxicity with drugs that inhibit the CYP2D6 enzyme system. Concurrent use of diuretics, lithium Class Ia and III antiarrhythmics including amiodarone, sotalol, and quinidine; some antipsychotics including thioridazine; some macrolide anti-infectives including erythromycin; and some quinolone anti-infectives including moxifloxacin ↑ risk of QT prolongation and serious arrhythmias; concurrent use should be avoided. ↑ risk of anticholinergic adverse reactions with other anticholinergic drugs. ↑ risk of hypotension with antihypertensives and diuretics. May ↓ antihypertensive effects of guanethidine and similar drugs. Concurrent use with tricyclic antidepressants may result in altered metabolism and effects of both. ↑ risk of extrapyramidal symptoms with metoclopramide. May ↓ beneficial effects of levodopa and dopamine agonists.

Route/Dosage

PO (Adults): *Acute psychoses*—10–50 mg/day in 2–3 divided doses initially, may be increased by 10–20 mg/day every 2–3 days, titrate according to response. Usual dose range is 20–60 mg/day; doses >100 mg/day are not recommended. Dose should be reduced to lowest dose needed to control symptoms (usual range 20–40 mg/day). Once maintenance dose is established, may be given as a single daily dose.

IM (Adults): *Zuclopentixol acetate [Acuphase]*—50–150 mg, may be repeated every 2–3 days if necessary, some patients may need an additional dose 1–2 days after first injection only; care must be taken to avoid overmedicating due to delay in absorption and antipsychotic effects. Maximum cumulative dose should not exceed 400 mg or four injections. *Zuclopentixol acetate (Acuphase)* dose form is not meant for long-term use; duration should not exceed 2 wk. If injection volume exceeds 2 mL, dose should be divided and given in two sites. If oral maintenance is to be used, treatment with tablets should be initiated 2–3 days following the last dose of the *Zuclopentixol acetate (Acuphase)* dose form; if *Zuclopentixol decanoate (Depot)* dose form is to be used for maintenance, may be given concurrently with the last injection of *Zuclopentixol acetate (Acuphase)* dose form. *Suggested transfer regimen to oral*

★ = Canadian drug name. ‡ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

dosing—If *Zuclopentixol acetate (Acuphase)* dose was 50 mg, then daily oral dose could be 20 mg; if *Zuclopentixol acetate (Acuphase)* dose was 100 mg, then daily oral dose could be 40 mg; if *Zuclopentixol acetate (Acuphase)* dose was 150 mg, then daily oral dose could be 60 mg. *Suggested transfer regimen to Zuclopentixol decanoate (Depot) dosing*—If *Zuclopentixol acetate (Acuphase)* dose was 50 mg, then IM dose of *Zuclopentixol decanoate (Depot)* could be 100 mg every 2 wk; if *Zuclopentixol acetate (Acuphase)* dose was 100 mg, then IM dose of *Zuclopentixol decanoate (Depot)* could be 200 mg every 2 wk; if *Zuclopentixol acetate (Acuphase)* dose was 150 mg, then IM dose of *Zuclopentixol decanoate (Depot)* could be 300 mg every 2 wk.

IM (Adults): *Zuclopentixol decanoate [depot]*—Usual maintenance dose is 150–300 mg every 2–4 wk, regimens should be individualized according to response, care must be taken not to over-medicate due to delayed/prolonged absorption and effects. If injection volume exceeds 2 mL, dose should be divided and given in two sites.

Availability

Zuclopentixol hydrochloride tablets—contain **castor oil**: 10 mg, 25 mg; zuclopentixol acetate injection (*Acuphase*)—contains medium-chain triglycerides: 50 mg/mL in 1 and 2 mL ampules; zuclopentixol decanoate injection (*Depot*)—contains medium-chain triglycerides: 200 mg/mL in 1 mL ampules and 10 mL vials.

NURSING IMPLICATIONS

Assessment

- Assess mental status (orientation, mood, behavior) before and periodically during therapy.
- Observe carefully when administering oral medication to ensure that medication is actually taken and not hoarded.
- Assess weight and BMI initially and throughout therapy.
- Assess fluid intake and bowel function. Increased bulk and fluids in the diet help minimize constipation.
- Monitor for onset of akathisia (restlessness or desire to keep moving) and extrapyramidal side effects (*parkinsonian*—difficulty speaking or swallowing, loss of balance control, pill rolling, mask-like face, shuffling gait, rigidity, tremors; *dystonic*—muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs) every 2 mo during therapy and 8–12 wk after therapy has been discontinued. Reduction in dose or discontinuation of medication may be necessary. Benztropine or diphenhydramine may be used to control these symptoms.
- Monitor for tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled

chewing; rapid or worm-like movements of tongue). Report immediately; may be irreversible.

- **Monitor for development of neuroleptic malignant syndrome** (fever, respiratory distress, tachycardia, seizures, diaphoresis, arrhythmias, hypertension or hypotension, pallor, tiredness, severe muscle stiffness, loss of bladder control). Report immediately.
- Monitor for symptoms related to hyperprolactinemia (menstrual abnormalities, galactorrhea, sexual dysfunction).
- **Lab Test Considerations:** Monitor CBC and liver function tests every 6 mo and periodically as needed during treatment. May cause ↑ AST, ALT, and alkaline phosphatase.
- Monitor blood glucose prior to and periodically during therapy. May cause hyperglycemia.
- Monitor serum prolactin prior to and periodically during therapy. May cause ↑ serum prolactin levels.

Potential Nursing Diagnoses

Risk for injury
Disturbed thought process

Implementation

- **PO:** Administer tablets before or after meals.
- **IM:** Administer deep in large muscle. A test dose may be ordered for first administration.

Patient/Family Teaching

- Instruct patient to take as directed. If a dose is missed, omit and take next dose as scheduled. Discontinuation should be gradual.
- Inform patient of possibility of extrapyramidal symptoms and tardive dyskinesia. Caution patient to report these symptoms immediately to health care professional.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Medication may cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- **Instruct patient to notify health care professional promptly if sore throat, fever, unusual bleeding or bruising, rash, weakness, tremors, visual disturbances, dark-colored urine, or clay-colored stools occur.**
- Instruct patient to avoid sun exposure and to wear protective clothing and sunscreen when outdoors.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding or planning to breast feed.

Evaluation

- Decreased symptoms of schizophrenia (delusions, hallucinations, social withdrawal, flat, blunt affect).

Natural/Herbal Products

The following monographs introduce some commonly used natural products. Because the amounts of active ingredients in these agents are not standardized or currently subject to FDA guidelines for medicines, *Davis's Drug Guide for Nurses*, although respectful of patients' right to choose from a variety of therapeutic options, does not endorse their routine use unless supervised by a knowledgeable health care professional. Users should take into account the possibility of adverse reactions and interactions and consider the relative lack of data supporting widespread use of these products. Doses are poorly standardized, and individuals are advised to read package labels carefully to ensure safe and efficacious use.

aloe (al-oh)

Other Name(s):

Aloe vera, Cape aloe, Aloe latex, Burn plant, Curacao aloe

Classification

Therapeutic: laxatives, wound/ulcer/decubiti healing agent

Common Uses

PO: Cathartic laxative. **Topical:** Use on burns/sunburns, wounds, irritated skin, psoriasis; topical anti-infective.

Action

PO: Exerts a laxative effect by increasing colonic motility, reducing water absorption from the bowel and stimulating bowel, chloride secretion, and water content. **Topical:** May help accelerate wound healing through inhibition of thromboxane A₂ and increased microcirculation, although the evidence is inconsistent. May have some activity against gram-positive, gram-negative bacteria and yeast. **Therapeutic Effects:** Relief of constipation. Improved wound healing.

Pharmacokinetics

Absorption: Unknown.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO, Topical	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Intestinal obstruction; Inflammatory intestinal diseases (including Crohn's disease); Appendicitis and abdominal pain of unknown origin; **OB:** Safety not established; **Pedi:** Oral aloe not appropriate for children <12 yr.

Use Cautiously in: Renal disease; Fluid or electrolyte abnormalities; Diabetes; Alcohol containing products should be used cautiously in patients with known intolerance or liver disease; **Pedi:** Cautious use in children >12 yr.

Adverse Reactions/Side Effects

Derm: Contact dermatitis, skin irritation. **Endo:** hypoglycemia. **F and E:** **HYPOKALEMIA**, dehydration. **GI:**

Cramping, diarrhea, laxative dependence (chronic use). **GU:** hematuria.

Interactions

Natural Product-Drug: Combining oral aloe with potassium-wasting drugs (e.g., **diuretics**, other **laxatives**, **corticosteroids**, **cisplatin**, **amphotericin B**) may worsen hypokalemia. Hypokalemia may ↑ risk of toxicity from **digoxin** and some **antiarrhythmics**. May have additive effects with **antidiabetic** agents. May ↑ bleeding risk with **warfarin**. **Alcohol**-containing preparations may interact with **disulfiram** and **metronidazole**.

Natural-Natural: ↑ hypokalemia risk with **licorice** and **horsetail**. Additive effects with stimulant laxative herbs and herbs with hypoglycemic potential.

Route/Commonly Used Doses

PO (Adults): *Constipation*—100–200 mg aloe or 50 mg of aloe extract taken in the evening. Do not use for >1–2 wk without medical advice; *Juice*—1 teaspoonful tid after meals.

Topical (Adults): Aloe gel can be applied liberally to affected areas 3–5 times daily.

Availability

Alone or in combination with other herbal medicinals^{OTC}; Capsules^{OTC}; Juice^{OTC}; Tincture (1:10 in 50% alcohol)^{OTC}; Topical or gel or applied directly from cut plant.

NURSING IMPLICATIONS

Assessment

- **Constipation:** Assess for abdominal distention, presence of bowel sounds, and usual pattern of elimination.
- Assess color, consistency, and amount of stool produced.
- **Topical:** Perform baseline skin assessment prior to applying aloe to minor wounds, burns, and abrasions. Observe the size, character, and location of the affected area prior to the application of aloe.
- Note topical response assessing for increased inflammation, drainage, pain, warmth, and/or pruritus.
- **Lab Test Considerations:** Monitor serum potassium in patients with chronic use and CBC in patients who self-medicate and experience bloody diarrhea or have ulcerative colitis or Crohn's disease.

Potential Nursing Diagnoses

Constipation (Indications)

Risk for impaired skin integrity

Deficient knowledge, related to medication regimen

Implementation

- **PO:** Administer laxative at bedtime to induce a bowel movement in the morning.
- **Topical:** Wash hands and then apply liberally to affected area of skin. Cover broken areas of skin with a light nonadhering dressing (e.g., band-aid dressing with *Telfa* lining) to facilitate keeping area clean. Do not apply an occlusive dressing over site of application.

Patient/Family Teaching

- **Constipation:** Instruct patients with pre-existing intestinal disorders (e.g., ulcerative colitis, Crohn's disease, irritable bowel syndrome) not to take aloe juice without the advice of a health care professional.
- Counsel patients that the oral juice should not be taken if they are experiencing abdominal pain, nausea, vomiting, or fever.
- Inform patients that occasional constipation may not be an issue but persistent constipation may represent a more serious health problem and to consult their health care professional.
- Advise patients to expect laxative response to the oral juice in 8–12 hr.
- Caution patients that the cathartic effects may be dramatic and that accompanying dehydration and electrolyte imbalances may occur. If severe diarrhea occurs or persists, seek out treatment from their health care professional.
- Advise patients other than those with spinal cord injury that laxatives should only be used for short-term therapy. Although this is considered by some to be a natural way of correcting constipation it still carries the risk of electrolyte imbalance and dependency with chronic use.
- Encourage patients to use other forms of bowel regulation: increasing bulk in the diet, increasing fluid intake, and increasing mobility, as appropriate. Normal bowel habits are individualized and may vary from 3 times/day to 3 times/wk.
- Advise patients to consume 1500–2000 mL/day of fluids during therapy to prevent dehydration.
- Direct patients with a known cardiac history not to take this herbal supplement without the advice of their health care professional because of the risk of hypokalemia worsening arrhythmias.
- Caution patients with cardiac history to avoid straining during bowel movements (Valsalva maneuver).
- **Topical:** Advise patients that topical applications should only be used for minor burns, abrasions, or wounds. Wounds of larger size or more serious burns should be treated by a health care professional.
- Instruct patients using topical application on a non-intact skin surface about signs and symptoms of infection (milky or discolored drainage, redness, warmth, swelling, pain) and to promptly seek out treatment of a health care professional if this occurs.

- Counsel patients that if improvement in the wound is not occurring or it worsens, stop treatment with aloe vera and seek the advice of a health care professional.
- Warn patients with risk factors for delayed wound healing (e.g., diabetic patients, vascular disease) not to self-medicate with aloe vera without the approval of their health care professional.

Evaluation

- A soft, formed bowel movement.
- Evacuation of the colon.
- Relief of sunburn pain.
- Wound healing in small localized burns or abrasions.

arnica (ar-ni-cuh)

Other Name(s):

Arnica montana, leopard's bane, mountain tobacco, mountain snuff, wolf's bane

Classification

Therapeutic: immune stimulant, anti-inflammatory

Common Uses

Topical treatment of insect bites, bruises, acne, boils, sprains, muscle, and joint pain.

Action

Polysaccharides in arnica may produce a slight anti-inflammatory and analgesic effect. Some antibacterial effects are seen, in addition to a counterirritant effect, which may aid in wound healing. **Therapeutic Effects:** Decreased inflammation. Pain relief.

Pharmacokinetics

Absorption: Systemic absorption may occur following topical application to broken skin.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
Topical	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Not for oral use (except in highly diluted homeopathic preparations); Arnica allergy; Avoid use on broken skin; Infectious or inflammatory GI conditions; **OB:** Pregnancy and lactation.

Use Cautiously in: Infectious or inflammatory GI conditions; Surgery (discontinue use 2 wk prior to procedure due to antiplatelet effects).

Adverse Reactions/Side Effects

GI: abdominal pain, vomiting, diarrhea (if taken orally).

Derm: edematous dermatitis with pustules (chronic treatment of damaged skin), eczema (prolonged use).

Misc: local allergic reactions.

Interactions

Natural Product-Drug: Alcohol-containing preparations may interact with **disulfuram** and **metronidazole**. Potential for reduced effectiveness of **anti-hypertensives** has been noted. May potentiate the effects of **anticoagulants** and **antiplatelet agents**, increasing the risk of bleeding.

Natural-Natural: May increase risk of bleeding with **clove**, **garlic**, **ginger**, **ginkgo**, and **ginseng**.

Route/Commonly Used Doses

Topical (Adults): *Topical*—rub or massage arnica tincture, cream, or gel onto injured area. Do not apply to broken skin; *Compress*—dilute 1 tablespoon of arnica tincture in 1/2 L water. Wet a gauze pad with solution and apply to affected area for 15 minutes. For use in poultices, dilute tincture 3 to 10 times with water.

Availability

Cream, tincture, salve, ointment, gel, and oil^{OTC};

Topical (preparations should contain not more than 20–25% arnica tincture or 15% arnica oil)^{OTC}; **Homeopathic preparations**^{OTC}.

NURSING IMPLICATIONS

Assessment

- Inspect skin for breaks prior to application to ensure arnica is applied only to an intact surface. Note the size, character, and location of affected area prior to application of arnica.
- After application, assess the affected area for signs of allergic response.
- Toxicity and Overdose:** Systemic absorption may result in nausea, vomiting, organ damage, hypertension, cardiotoxicity, arrhythmias, muscular weakness, collapse, vertigo, renal dysfunction, coma, and death. If ingested orally, induce emesis and gastric lavage to remove undigested contents. Supportive care may be necessary. Do not take orally or apply to nonintact skin to avoid systemic absorption.

Potential Nursing Diagnoses

Acute pain (Indications)

Implementation

- Clean skin with a nonalcohol containing cleanser prior to applying arnica. Apply topically to affected area, or site of injury, ensuring skin is intact.
- Do not take orally or apply to an open wound because of potential for systemic absorption with toxicity.**

Patient/Family Teaching

- Teach patients to inspect the affected area for breaks in the skin and not to apply arnica to any areas where the skin is broken.
- Warn patients that use on nonintact skin and oral ingestion may cause life-threatening toxicity.
- Advise patients that arnica should only be used for short period of time in the treatment of minor aches and pains associated with local muscle, joint, or skin pain. Prolonged use may cause allergic/hypersensitivity reactions to develop.
- Instruct patients taking antihypertensive agents to avoid concurrent use of arnica.

- Advise female patients to notify health care professional if pregnancy is planned or suspected. Arnica should be avoided during pregnancy.

Evaluation

- Relief of, or improvement in, minor aches and pains associated with muscle or joint overuse, or sprains and/or local skin irritation from insect bites, bruises, boils, or acne.

bilberry (bill-beh-ree)

Other Name(s):

Vaccinium myrtillus

Classification

Therapeutic: ocular agents

Common Uses

Visual acuity improvement, atherosclerosis, venous insufficiency, varicose veins, diabetes mellitus, diarrhea, hemorrhoids, peptic ulcer disease, osteoarthritis, and chronic fatigue syndrome.

Action

Anthocyanidins in bilberry have a variety of effects including increased glycosaminoglycans synthesis, decreasing vascular permeability, reducing membrane thickness, redistribution of microvascular blood flow, and formation of interstitial fluid. **Therapeutic Effects:** Decreased inflammation. Decreased edema. Decreased blood glucose. Improved circulation.

Pharmacokinetics

Absorption: Unknown.

Distribution: Unknown.

Metabolism and Excretion: Eliminated by the kidneys.

Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	Unknown	Unknown	Unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity or allergy to bilberry; Leaves are potentially toxic with chronic use of 1.5 g/kg/day.

Use Cautiously in: Diabetic patients; Patients at risk for bleeding; **OB:** Avoid use in pregnancy due to lack of safety data.

Adverse Reactions/Side Effects

Endo: low blood sugar. **GI:** diarrhea, upset stomach.

Hemat: bleeding, bruising.

Interactions

Natural Product-Drug: May ↑ effects of **anticoagulants** and **antiplatelet drugs** and ↓ platelet activity.

May ↑ effects of **antidiabetic agents** and cause hypoglycemia.

Natural-Natural: Avoid use with chromium-containing herbs and supplements (bilberry contains chro-

mium). Avoid use with herbs with hypoglycemic properties.

Route/Commonly Used Doses

PO (Adults): 80–480 mg of bilberry extract daily in 2–3 divided doses.

Availability

Liquid extract; Tablets; Softgel capsules.

NURSING IMPLICATIONS

Assessment

- Monitor BP periodically during therapy, coagulation panel, blood glucose.
- **Lab Test Considerations:** Monitor coagulation studies in patients on anticoagulants and antiplatelet agents.
- Monitor blood glucose periodically during therapy. May cause hypoglycemia.

Potential Nursing Diagnoses

Activity intolerance (Indications)
Diarrhea (Indications)

Implementation

- Administer without regard to food.

Patient/Family Teaching

- Instruct patient to take bilberry as directed.

Evaluation

- Improvement in vascular insufficiency.
- Decrease in diarrhea.

black cohosh (blak coe-hosh)

Remifemin

Other Name(s):

baneberry, black snakeroot, bugbane, phytoestrogen, rattle root, rattleweed, rattle top, squawroot

Classification

Therapeutic: none assigned

Do not confuse black cohosh with blue or white cohosh

Common Uses

Management of menopausal symptoms. Premenstrual discomfort. Dysmenorrhea. Mild sedative. Rheumatism.

Action

Therapeutic effects are produced by glycosides isolated from the fresh or dried rhizome with attached roots. Mechanism of action is unclear. **Therapeutic Effects:** May decrease symptoms of menopause, including hot flashes, sweating, sleep disturbance, and anxiety. Has no effect on vaginal epithelium.

Pharmacokinetics

Absorption: Unknown.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: **OB:** Pregnancy and lactation.

Use Cautiously in: Breast cancer (may increase risk of metastasis); Hormone-sensitive cancers; Protein S deficiency (increased risk for thrombosis); Liver disease.

Adverse Reactions/Side Effects

Neuro: **SEIZURES** (in combination with evening primrose and chasteberry), headache, dizziness. **GI:** GI upset, hepatotoxicity. **Derm:** rash. **Misc:** weight gain, cramping, breast tenderness, vaginal spotting/bleeding.

Interactions

Natural Product-Drug: Unknown effects when combined with hormone replacement therapy and **antiestrogens** (e.g., **tamoxifen**). Concurrent use with **hepatotoxic drugs** may ↑ risk of liver damage.

Alcohol-containing preparations may interact with **disulfiram** and **metronidazole**. May ↓ cytotoxic effects of **cisplatin**. May precipitate hypotension when used in combination with **antihypertensives**.

Natural-Natural: May ↑ risk of hepatotoxicity when used with **chaparral**, **comfrey**, **kava-kava**, and **niacin**.

Route/Commonly Used Doses

PO (Adults): *Tablets (Remifemin®)* — 20 mg bid. *Liquid extract* — 0.3–2 mL bid-tid. *Tincture* — 2–4 mL bid–tid. *Dried rhizome* — 0.3–2 g tid. Do not use for more than 6 mo.

Availability

Alone or in combination with other herbal **medicinals**^{OTC}; *Tablets (Remifemin® 20 mg [best studied black cohosh product])*^{OTC}; *Liquid extract (1:1 in 90% alcohol)*^{OTC}; *Tincture (1:10 in 60% alcohol)*^{OTC}; *Dried rhizome*.

NURSING IMPLICATIONS

Assessment

- Assess frequency and severity of menopausal symptoms.
- Monitor BP for patients on antihypertensive drugs; may increase effects and cause hypotension.
- Assess for history of seizures or liver disease.

Potential Nursing Diagnoses

Sleep deprivation (Indications)

Implementation

- Administration with food may help to minimize nausea.

Patient/Family Teaching

- Advise patient to notify health care professional if pregnancy is planned or suspected. Avoid use during pregnancy; may induce a miscarriage.
- Patients with seizures, liver dysfunction, excessive alcohol intake, cancer, or other medical problems should be advised to consult their health care professional prior to initiating self-therapy with this herb.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Advise patient to consult health care professional before taking with other estrogen replacements.
- Emphasize the importance of continued medical supervision for Pap smears, mammograms, pelvic examinations, and BP monitoring at the intervals indicated by health care professional.

Evaluation

- Resolution of menopausal vasomotor symptoms.

chondroitin (konn-droy-tinn)

Other Name(s):

chondroitin polysulfate, CPS, CDS

Classification

Therapeutic: nonopioid analgesics

Common Uses

Osteoarthritis. Ischemic heart disease. Hyperlipidemia. Osteoporosis. **Ophthalm:** In combination with sodium hyaluronate, for use as a surgical aid in cataract extraction or lens implantation, and as a lubricant.

Action

May serve as a building block of articular cartilage. May protect cartilage against degradation. May have antiatherogenic properties. **Therapeutic Effects:** Improvement in osteoarthritis symptoms.

Pharmacokinetics

Absorption: 8–18% is absorbed orally.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: **OB:** Pregnancy and lactation.

Use Cautiously in: Asthma (may exacerbate symptoms); Clotting disorders (may ↑ risk of bleeding); Prostate cancer (may ↑ risk of metastasis or recurrence).

Adverse Reactions/Side Effects

GI: heartburn, nausea, diarrhea. **Hemat:** bleeding (antiplatelet effect). **Misc:** allergic reactions, edema, hair loss.

Interactions

Natural Product-Drug: Use of chondroitin with anticoagulant and antiplatelet drugs, thrombolytics, NSAIDs, some cephalosporins, and valproates may ↑ risk of bleeding.

Natural-Natural: Herbs with anticoagulant or antiplatelet properties may ↑ bleeding risk when combined with chondroitin, including: anise, arnica, chamomile, clove, dong quai, fenugreek, feverfew, ginger, ginkgo, Panax ginseng, licorice, and others.

Route/Commonly Used Doses

PO (Adults): Osteoarthritis—200–400 mg 2–3 times daily or 1000–1200 mg once daily. *Prevention of*

recurrent myocardial infarction—10 grams daily in 3 divided doses for 3 mo followed by 1.5 grams daily in 3 divided doses as maintenance therapy.

IM (Adults): Osteoarthritis—50 mg twice weekly for 8 wk every 4 mo.

Availability

Tablets^{OTC}, Capsules^{OTC}, Injection (not available in US): Ophthalmic Drops Rx in combination with sodium hyaluronate (Viscoat).

NURSING IMPLICATIONS

Assessment

- Evaluate drug profile before starting therapy with this herbal supplement. If the patient is taking anticoagulants or antiplatelet drugs, avoid use of this herb.
- Monitor pain (type, location, and intensity) and range of motion on an ongoing basis as an indicator of drug efficacy.
- Evaluate gastric discomfort and instruct patient to seek out the advice of a health care professional if persistent gastric discomfort occurs.
- Assess for signs of bleeding and discontinue herbal supplement promptly and seek out health care professional for follow-up.

Potential Nursing Diagnoses

Chronic pain (Indications)

Impaired physical mobility (Indications)

Implementation

- Administer with food.

Patient/Family Teaching

- Advise patients that this herbal supplement is usually taken with glucosamine.
- Caution patients who take aspirin or NSAIDs or other non-prescription medications not to take this herbal supplement without conferring with their health care professional.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding; avoid use.
- Instruct patients that this medication works by building up cartilage and that this requires that the medication be taken consistently over a period of time. It is not recommended as a supplemental pain medication.

Evaluation

- Improvement in pain and range of motion.
- Reduced need for supplemental or breakthrough pain medication.

Crataegus Species, see hawthorne.

dong quai (don kwi)

Other Name(s):

Angelica sinensis, Chinese Angelica, Dang Gui, Danggwi, Don Quai, Ligustilides, Phytoestrogen, *Radix angeli-*

*CAPITALS indicates life-threatening; underlines indicate most frequent.

cae gigantis, Tang Kuei, Tan Kue Bai Zhi

Classification

Therapeutic: none assigned

Common Uses

Premenstrual syndrome. Various uses as a blood purifier. Typically in combination with other ingredients for premature ejaculation.

Action

May have vasodilating and antispasmodic properties. Binds to estrogen receptors. **Therapeutic Effects:** Improved ejaculatory latency.

Pharmacokinetics

Absorption: Unknown.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Allergy to carrot, celery, mugwort, or other members of the Apiaceae family; **OB:** Pregnancy and lactation.

Use Cautiously in: Hormone sensitive cancers and conditions (may exacerbate effects or stimulate growth of cancer cells); Protein S deficiency (↑ risk for thrombosis); Surgery (discontinue 2 wk prior to procedure).

Adverse Reactions/Side Effects

Derm: photosensitivity. **GI:** diarrhea. **Misc:** Some constituents are carcinogenic and mutagenic.

Interactions

Natural Product-Drug: Alcohol-containing preparations may interact with **disulfiram** and **metronidazole**. Use of dong quai with **anticoagulant** and **antiplatelet** drugs, **thrombolytics**, **NSAIDs**, some **cephalosporins**, and **valproates** may increase risk of bleeding.

Natural-Natural: Herbs with antiplatelet or anticoagulant properties may increase bleeding risk when combined with dong quai including: **angelica**, **clove**, **danshen**, **garlic**, **ginger**, **ginkgo**, **Panax ginseng**, and **willow**.

Route/Commonly Used Doses

PO (Adults): *Bulk herb*—3–4.5 g per day in divided doses with meals; *Extract*—1 ml (20–40 drops) three times daily.

Availability

Bulk herb^{OTC}; **Extract**^{OTC}.

NURSING IMPLICATIONS

Assessment

- Assess pain and menstrual patterns prior to and following menstrual cycle to determine effectiveness of this herbal supplement.

- Assess for pregnancy prior to recommending use of the herbal supplement and warn women not to take this herb if pregnancy is planned or suspected.
- Assess for history of hormone sensitive cancers or conditions and warn against use.
- Assess medication profile including prescription and over-the-counter use of products such as aspirin- and ibuprofen-based products to treat menstrual pain.

Potential Nursing Diagnoses

Acute pain (Indications)

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- Take with meals.

Patient/Family Teaching

- Warn patients not to take this medication if pregnant or breast feeding.
- Inform patients to avoid use of aspirin or other NSAIDs concurrently because of the risk of bleeding.
- Notify patients that there are no studies supporting the use of this herbal supplement for treatment of menopausal symptoms.
- Tell patients to consult their health care professional if taking prescription medications before taking dong quai.
- Discontinue the herbal supplement if diarrhea or excessive bleeding occurs and contact a health care provider if symptoms do not resolve.
- Instruct patients that photosensitivity may occur and to wear sunscreen and protective clothing if sun exposure is anticipated.

Evaluation

- Reduction in menstrual pain and cramping and regular periods with normal flow.

echinacea (*Echinacea purpurea*) (ek-i-nay-sha)

Other Name(s):

American coneflower, black sampson, black susan, *brauneria angustifolia*, kansas snakeroot, purple coneflower, red sunflower, *rudbeckia*, sampson root, scurvy root

Classification

Therapeutic: immune stimulants

Common Uses

Bacterial and viral infections. Prevention and treatment of colds, coughs, flu, and bronchitis. Fevers. Wounds and burns. Inflammation of the mouth and pharynx. Urinary tract infections. Vaginal candidiasis.

Action

Medicinal parts derived from the roots, leaves, or whole plant of perennial herb (*Echinacea*). *Echinacea purpurea herba* has been reported to promote wound healing, which may be due to an increase in white blood cells,

spleen cells, and increased activity of granulocytes, as well as an increase in helper T cells and cytokines. *E. purpurea radix* has been shown to have antibacterial, antiviral, anti-inflammatory, and immune-modulating effects. **Therapeutic Effects:** Resolution of respiratory and urinary tract infections. Decreased duration and intensity of common cold. Improved wound healing. Stimulates phagocytosis; inhibits action of hyaluronidase (secreted by bacteria), which helps bacteria gain access to healthy cells. Externally, has antifungal and bacteriostatic properties.

Pharmacokinetics

Absorption: Unknown.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Multiple sclerosis, leukosis, collagenoses, AIDS, tuberculosis, autoimmune diseases; Hypersensitivity and cross-sensitivity in patients allergic to plants in *Asteraceae/Compositae* plant family (daisies, chrysanthemums, marigolds, etc.); **OB:** Pregnancy and lactation.

Use Cautiously in: Diabetes; **Pedi:** May increase risk of rash in children; Tinctures should be used cautiously in alcoholics or patients with liver disease; Do not take longer than 8 wk—may suppress immune function.

Adverse Reactions/Side Effects

CNS: dizziness, fatigue, headache, somnolence. **EENT:** tingling sensation on tongue, sore throat. **GI:** nausea, vomiting, heartburn, constipation, abdominal pain, diarrhea. **Derm:** allergic reaction, rash (more common in children). **Misc:** fever.

Interactions

Natural Product-Drug: May possibly interfere with immunosuppressants because of its immunostimulant activity. May ↑ risk for hepatotoxicity from **anabolic steroids, methotrexate, or ketoconazole** when taken with echinacea. May ↑ **midazolam** availability.

Natural-Natural: May ↑ risk for hepatotoxicity when taken with **kava**.

Route/Commonly Used Doses

PO (Adults): *Tablets*—6.78 mg tablets, take 2 tabs 3 times daily. *Capsules*—500–1000 mg 3 times a day for 5–7 days. *Fluid extract*—1–2 mL tid; solid form (6.5:1)—150–300 mg tid. Should not be used for more than 8 wk at a time. *Tea*—1/2 tsp comminuted drug, steeped and strained after 10 min, 1 cup 5–6 times daily on the first day, titrating down to 1 cup daily over the next 5 days. *Echinacea purpurea herb juice*—6–9 mL/day. *Liquid*—20 drops every 2 hr for the first day of symptoms, then 3 times daily for up to 10 days.

Topical (Adults): *Ointment, lotion, tincture used externally*—1.5–7.5 mL tincture, 2–5 g dried root.

Availability

Capsules^{OTC}; Tablets; Dried Root^{OTC}; **The dried root can be steeped and strained in boiling water and taken as a tea; Liquid extract^{OTC}; 1:1 in 45% alcohol; Tincture^{OTC}; 1:5 in 45% alcohol; Blended teas^{OTC}; Echinacea purpurea herb juice^{OTC}.**

NURSING IMPLICATIONS

Assessment

- Assess wound for size, appearance, and drainage prior to the start of and periodically during therapy.
- Assess frequency of common mild illnesses (such as a cold) in response to use.

Potential Nursing Diagnoses

Risk for impaired skin integrity (Indications)

Implementation

- Tinctures may contain significant concentrations of alcohol and may not be suitable for children, alcoholics, patients with liver disease, or those taking disulfiram, metronidazole, some cephalosporins, or sulfonylurea oral antidiabetic agents.
- Prolonged use of this agent may cause overstimulation of the immune system, and use beyond 8 wk is not recommended. Therapy of 10–14 days is usually considered sufficient.
- May be taken without regard to food.

Patient/Family Teaching

- Herb is more effective for treatment than prevention of colds. Take at first sign of symptoms.
- Advise patient to seek immediate treatment for an illness that does not improve after taking this herb.
- Instruct patient that the usual course of therapy is 10–14 days and 8 wk is the maximum.
- Inform patient that use of this herb is not recommended in severe illnesses (e.g., AIDS, tuberculosis) or autoimmune diseases (e.g., multiple sclerosis, collagen diseases, etc.).
- Caution patient that prolonged use of this herb may result in overstimulation of the immune system, possibly with subsequent immunosuppression.
- Warn pregnant or breast feeding women not to use this herb.
- Instruct patient to consult health care professional before taking any prescription or OTC medications concurrently with echinacea.
- Keep tincture in a dark bottle away from sunlight. Should be taken several times a day.
- Store herb in airtight container away from sunlight.

Evaluation

- Improved wound healing.
- Infrequent common illnesses.
- Illnesses of shorter duration and less severity.

feverfew (fee-vurr-fyoo)

Other Name(s):

Altamisa, Bachelor's Button, *Chrysanthemum parthenium*, Featerfoiul,

Featherfew, Featherfoil, Flirtwort Midsummer Daisy, *Pyrethrum parthenium*, Santa Maria, *Tanacetum parthenii*, Wild chamomile, Wild quinine

Classification

Therapeutic: vascular headache suppressants

Common Uses

PO: Migraine headache prophylaxis. **Topical:** Toothaches and as an antiseptic.

Action

The sesquiterpene lactone, parthenolide, may provide feverfew's migraine prophylaxis effects. Feverfew also have antiplatelet and vasodilatory effects and block prostaglandin synthesis. **Therapeutic Effects:** May reduce the symptoms and frequency of migraine headaches.

Pharmacokinetics

Absorption: Unknown.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	2–4 mo	unknown	unknown

Contraindications/Precautions

Contraindicated in: **OB:** Pregnancy and lactation; Feverfew hypersensitivity or allergy to *Asteraceae/Compositae* family plants, including ragweed, chrysanthemums, daisies, and marigolds.

Use Cautiously in: Use >4 mo (safety and efficacy not established).

Adverse Reactions/Side Effects

CNS: "Post-Feverfew Syndrome" (anxiety, headache, insomnia, muscle and joint aches). **CV:** with long-term use—tachycardia. **GI:** nausea, vomiting, diarrhea, heartburn, mouth ulceration and soreness (from chewing fresh leaves). **Derm:** contact dermatitis (when used topically).

Interactions

Natural Product-Drug: Use of feverfew with anticoagulant and antiplatelet drugs, thrombolytics, NSAIDs, some cephalosporins, and valproates may increase risk of bleeding. Concomitant use with NSAIDs may also reduce feverfew effectiveness.

Natural-Natural: Use with anise, arnica, chamomile, clove, dong quai, fenugreek, garlic, ginger, ginkgo, licorice, and *Panax ginseng* may increase anticoagulant potential of feverfew.

Route/Commonly Used Doses

PO (Adults): 50–100 mg feverfew extract daily (standardized to 0.2–0.35% parthenolide) or 50–125 mg freeze-dried leaf daily with or after food.

Availability

Feverfew extract: standardized to 0.2–0.35% parthenolide^{OTC}; **Freash leaf**^{OTC}; **Freeze-dried leaf**^{OTC}.

NURSING IMPLICATIONS

Assessment

- Monitor frequency, intensity, and duration of migraine headaches prior to and during ongoing therapy.
- Assess for mouth ulcers or skin ulcerations during therapy.

Potential Nursing Diagnoses

Acute pain (Indications)

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- Take with food or on a full stomach.

Patient/Family Teaching

- Instruct patients to take this medication on a consistent basis to prevent migraine headaches. This herbal supplement is not for treatment of migraines.
- Warn patients about mouth ulcers and sores and that if this occurs to seek the advice of a health care professional. Encourage proper oral hygiene.
- Advise patients not to abruptly stop this product because of the possibility of post-feverfew syndrome. Tell patients that anxiety, headache, insomnia, and muscle aches may indicate withdrawal. Feverfew should be gradually tapered.
- Review dietary and medication profile of patient to identify potential interactions. Instruct patient about other herbs that may interact with feverfew.
- Counsel patients on anticoagulants not to take feverfew except as directed by their health care provider.
- Advise patients to avoid using NSAIDs as this may reduce the effectiveness of feverfew.
- Instruct patients to look for signs of bleeding such as unusual bruising or inability to clot after a cut and to seek the advice of a health care professional if this occurs.
- Inform patients that feverfew should reduce the number of migraines and severity of symptoms but that duration of the migraine may not be affected.

Evaluation

- Reduction in the frequency and severity of migraine headaches.

garlic (gar-lik)

Other Name(s):

Alli sativa bulbous, *Allium sativum*

Classification

Therapeutic: lipid-lowering agents

Common Uses

PO: Hypertension, hyperlipidemia, cardiovascular disease prevention, colorectal and gastric cancer prevention. **Topical:** Dermal fungal infections including tinea corporis, cruris, and pedis.

Action

May have HMG-CoA inhibitor properties in lowering cholesterol, but less effectively than statin drugs; vasodilatory

and antiplatelet properties. **Therapeutic Effects:** Decreased cholesterol levels. Decreased platelet aggregation.

Pharmacokinetics

Absorption: Garlic oil is well absorbed.

Distribution: Unknown.

Metabolism and Excretion: Kidney and lungs.

Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	4–25 wk	unknown	unknown

Contraindications/Precautions

Contraindicated in: Bleeding disorders. Discontinue use 1–2 weeks prior to surgery.

Use Cautiously in: Diabetes, gastrointestinal infection or inflammation.

Adverse Reactions/Side Effects

CNS: dizziness. **GI:** Irritation of the mouth, esophagus, and stomach, nausea, bad breath, vomiting, flatulence, diarrhea. **Derm:** Contact dermatitis and other allergic reactions (asthma, rash, anaphylaxis [rare]), Diaphoresis. **Hemat:** Chronic use or excessive dose may lead to ↓ hemoglobin production and lysis of RBCs, platelet dysfunction, prolonged bleeding time. **Misc:** body odor.

Interactions

Natural Product-Drug: Use of garlic with **anticoagulants, antiplatelet agents, and thrombolytics** may ↑ risk of bleeding. May ↓ the effectiveness of **contraceptive drugs** and **cyclosporine**. May ↓ plasma concentrations of **saquinavir, nevirapine, delavirdine, and efavirenz**. May ↓ **isoniazid** levels by 65%.

Natural-Natural: Herbs with anticoagulant or antiplatelet properties may increase bleeding risk when combined with garlic, including: **angelica, anise, asafoetida, bogbean, boldo, capsicum, celery, chamomile, clove, danshen, dong quai, fenugreek, feverfew, ginger, ginkgo, Panax ginseng, horse chestnut, horseradish, licorice, meadowsweet, prickly ash, onion, papain, passionflower, poplar, quassia, red clover, turmeric, wild carrot, wild lettuce, willow, and others.**

Route/Commonly Used Doses

PO (Adults): 200–400 mg tid of standardized garlic powder extract with 1.3% allin. *Fresh garlic*—1–7 cloves per day. One clove contains approximately 4 grams of garlic.

Topical (Adults): *Tinea infections*—0.4% cream, 0.6% gel, or 1% gel applied bid x 7 days.

Availability

Capsules^{OTC}; Tablets^{OTC}; Topical cream; Topical gel; Fresh garlic^{OTC}.

NURSING IMPLICATIONS

Assessment

- Elicit from patients their usual dietary intake especially in regard to fat consumption.

- Assess patient's reason for using this herbal remedy and knowledge about hyperlipidemia.
- Ascertain the amount of garlic the patient consumes on a regular basis.

Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Noncompliance (Patient/Family Teaching)

Implementation

- Take orally as fresh clove, capsule, or tablet.
- Do not exceed recommended dose.

Patient/Family Teaching

- Instruct patients about the need to follow a healthy diet (low in fat and high in vegetables and fruits) in conjunction with garlic. Other lipid-reducing strategies, such as exercise and smoking cessation, should also be employed.
- Inform patients that there are other more effective agents for lipid reduction available.
- Emphasize the need for follow-up exams with a healthcare professional to assess effectiveness of the regimen.
- Warn patients about the potential for bleeding and not to take this herbal remedy without notifying their health care provider if they are on other medications. Instruct patients undergoing elective surgery to stop using garlic 2 wk prior to surgery and to notify the surgeon that they are taking garlic in the event of emergent surgery.
- Notify patients that allergies may occur and to discontinue use if symptoms develop.

Evaluation

- Normalization of lipid profile.
- Prevention of cardiac disease.

ginger (*Zingiber officinale*) (jin-jer)

Other Name(s):

Calicut, cochin, gengibre, ginger root, imber, ingwerwurzel, ingwer, Jamaica ginger, jenjibre, kankyo, jiang, zingiber

Classification

Therapeutic: antianemics

Common Uses

Prevention and treatment of nausea and vomiting associated with motion sickness, loss of appetite, pregnancy, surgery, and chemotherapy. Prevention of postoperative nausea and vomiting. May be used for dyspepsia, flatulence, relief of joint pain in rheumatoid arthritis, cramping, and diarrhea. Migraine headache. Tonic (toning/strengthening agent) in gout, gas, respiratory infections, anti-inflammatory, stimulant (tones the gut, increases saliva and gastric juices, acts as anticoagulant, decreases blood cholesterol).

Action

Antiemetic effect due to increasing GI motility and transport; may act on serotonin receptors. Shown to be hypoglycemic, hypotensive, or hypertensive, and positive inotropic agent. Inhibits prostaglandins and platelets, lowers cholesterol, and improves appetite and digestion. **Therapeutic Effects:** ↓ nausea and vomiting due to motion sickness, surgery, and chemotherapy. ↓ joint pain and improvement of joint motion in rheumatoid arthritis. Antioxidant.

Pharmacokinetics

Absorption: Unknown.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Lactation (if using large amounts); Gallstones.

Use Cautiously in: Pregnancy (preliminary evidence that ginger might affect fetal sex hormones); Patients with ↑ risk of bleeding; Diabetes; Anticoagulant therapy; Cardiovascular disease.

Adverse Reactions/Side Effects

GI: minor heartburn. **Derm:** dermatitis (when used topically).

Interactions

Natural Product-Drug: May ↑ risk of bleeding when used with **anticoagulants**, **antiplatelet agents**, and **thrombolytics**. May have additive effects with **antidiabetic agents** (causing hypoglycemia) and **calcium channel blockers** (causing hypotension).

Natural-Natural: May theoretically ↑ risk of bleeding when used with other **herbs** that have anticoagulant or antiplatelet activities.

Route/Commonly Used Doses

PO (Adults): *Motion sickness*—1000 mg dried ginger root taken 30 min–4 hr before travel or 250 mg qid.

Postoperative nausea prevention—1000 mg ginger taken 1 hr before induction or anesthesia. *Chemotherapy–induced nausea*—2–4 g/day. Up to 2 g freshly powdered drug has been used as an antiemetic (not to exceed 4 g/day). *Migraine headache*—500 mg at onset then 500 mg every 4 hrs up to 1.5–2 g/day for 3–4 days. *Osteoarthritis*—170 mg tid or 255 mg bid of ginger extract. *Whole root rhizome*—0.25–1 g for other illnesses. *Tea*—pour 150 mL boiling water over 0.5–1 g of ginger and strain after 5 min. *Tincture*—0.25–3 mL.

Availability

Alone or in combination with other herbal **medicinals**^{OTC}; **Dried powdered root**^{OTC}; **Syrup**^{OTC}; **Tincture**^{OTC}; **Tablets**^{OTC}; **Capsules** (≥550 mg)^{OTC}; **Spice**^{OTC}; **Tea**^{OTC}.

NURSING IMPLICATIONS

Assessment

- Assess patient for nausea, vomiting, abdominal distention, and pain prior to and after administration of the herb when used as an antiemetic agent.
- Assess pain location, duration, intensity, and associated symptoms (photophobia, phonophobia, nausea, vomiting) during migraine attack.
- Assess pain, swelling, and range of motion in affected joints prior to and after administration when used in the treatment of arthritis.
- Assess patient for epigastric pain prior to and after administration when used as a gastroprotective agent.
- Monitor BP and heart rate in patients with cardiovascular disease including hypertension.
- **Lab Test Considerations:** Monitor blood glucose and coagulation panels periodically during therapy.

Potential Nursing Diagnoses

Acute pain (Indications)

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- Administer ginger prior to situations where nausea or vomiting is anticipated (e.g., motion sickness).
- Dosage form and strengths vary with each disease state. Ensure that proper formulation and dose are administered for the indicated use.

Patient/Family Teaching

- Instruct patients receiving anticoagulants not to take this herb without the advice of health care professional (increased risk of bleeding).
- Tell patient to stop the herb immediately if palpitations occur and notify health care professional.
- Advise patient to observe for easy bruising or other signs of bleeding. If they occur, stop the herb immediately and notify health care professional.
- Warn patients with a history of gallbladder disease to use this herb only under the supervision of health care professional.
- Instruct patient to consult health care professional before taking any Rx, OTC, or other herbal products concurrently with ginger.
- Herb is meant to be used as a tonic, not for long-term use.

Evaluation

- Prevention of nausea and vomiting.
- Relief of epigastric pain.
- Improved joint mobility and relief of pain.
- Relief of migraine headache.

ginkgo (ging-ko)

Other Name(s):

Bai guo ye, fossil tree, ginkgo folium, Japanese silver apricot, kew tree, maidenhair-tree, *salisburia adiantifolia*, yinhsing

Classification

Therapeutic: antiplatelet agents, central nervous system stimulants

Common Uses

Symptomatic relief of organic brain dysfunction (dementia syndromes, short-term memory deficits, inability to concentrate, depression). Intermittent claudication. Vertigo and tinnitus of vascular origin. Improvement of peripheral circulation. Premenstrual syndrome.

Action

Improves tolerance to hypoxemia, especially in cerebral tissue. Inhibits development of cerebral edema and accelerates its regression. Improves memory, blood flow (microcirculation), compensation of disequilibrium, and rheological properties of blood. Inactivates toxic oxygen radicals. Antagonizes platelet-activating factor. Interferes with bronchoconstriction and phagocyte chemotaxis.

Therapeutic Effects: Symptomatic relief of dementia syndromes. Inhibits arterial spasm, decreases capillary fragility and blood viscosity. Improves venous tone, relaxes vascular smooth muscle.

Pharmacokinetics

Absorption: 70–100% absorption.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Pregnancy and lactation.

Use Cautiously in: Bleeding disorders; Children (fresh seeds have caused seizures and death); Diabetes; Epilepsy; Surgery (discontinue use 2 wk prior).

Adverse Reactions/Side Effects

CNS: CEREBRAL BLEEDING, dizziness, headache, vertigo, seizure. **CV:** palpitations. **GI:** flatulence, stomach upset.

Derm: allergic skin reaction. **Hemat:** bleeding. **Misc:** hypersensitivity reactions.

Interactions

Natural Product-Drug: Theoretically may potentiate effects of anticoagulants, thrombolytics, antiplatelet agents, and MAO inhibitors. May also ↑ risk of bleeding with some cephalosporins, valproic acid, and NSAIDs. May ↓ effectiveness of anticonvulsants. May alter insulin metabolism requiring dose adjustments of antidiabetic drugs.

Natural-Natural: May ↑ risk of bleeding when used with other herbs with antiplatelet effects (including angelica, arnica, chamomile, feverfew, garlic, ginger, and licorice).

Route/Commonly Used Doses**Organic Brain Syndromes**

PO (Adults): 120–240 mg ginkgo leaf extract daily in 2 or 3 doses.

Intermittent Claudication

PO (Adults): 120–240 mg ginkgo leaf extract daily in 2 or 3 doses.

Vertigo and Tinnitus

PO (Adults): 120–160 mg ginkgo leaf extract daily in 2 or 3 doses.

Cognitive Function Improvement

PO (Adults): 120–600 mg per day.

Premenstrual Syndrome

PO (Adults): 80 mg BID starting on the 16th day of the menstrual cycle until the 5th day of the next cycle.

Availability

Ginkgo leaf extract (acetone/water): 22–27% flavonoid glycosides, 5–7% terpene lactones, 2.6–3.2% bilobalide, <5 ppm of ginkgolic acids.

NURSING IMPLICATIONS**Assessment**

- Exclude other treatable causes of dementia prior to instituting treatment with ginkgo.
- Assess cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) periodically throughout therapy.
- Assess frequency, duration, and severity of muscle cramps (claudication) experienced by the patient prior to and periodically throughout therapy.
- Assess for headache and neurosystem changes (thromboembolism).

Potential Nursing Diagnoses

Disturbed thought process (Indications)

Acute pain (Indications)

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- Start dose at 120 mg per day and increase as needed to minimize side effects.
- Administration for a minimum of 6–8 wk of 80 mg (tid) (not <6 wk) is required to determine response.
- May be administered without regard to food.
- Use of dried leaf preparations in the form of a tea is not recommended because of insufficient quantity of active ingredients.
- Advise patients to avoid crude ginkgo plant parts which can cause severe allergic reactions.
- Take this herb at the same time daily.
- Keep this herb out of the reach of children as seizures may occur with increased doses of ginkgo seeds.

Patient/Family Teaching

- Advise patient to observe for easy bruising and other signs of bleeding and report to health care professional if they occur.
- Caution patient to keep this herb out of the reach of children because ingestion has been associated with seizures.
- Warn patient to avoid handling the pulp or seed coats because of the risk of contact dermatitis. Wash skin

under free-flowing water promptly if contact does occur.

- Instruct patient not to exceed recommended doses because large doses may result in toxicity (restlessness, diarrhea, nausea and vomiting, headache).
- Notify patients receiving anticoagulant or antiplatelet therapy not to take this medication without approval of health care professional and frequent monitoring.
- Instruct patient to consult health care professional before taking any prescription or OTC medications concurrently with ginkgo.

Evaluation

- Improvement in walking distances pain-free.
- Improvement in tinnitus and vertigo.
- Improvement in short-term memory, attention span, and ability to perform simple tasks.
- Improvement in sexual function.
- Decreased symptoms of premenstrual syndrome.

ginseng (*Panax ginseng*) (jin-seng)

Other Name(s):

Asian ginseng, Chinese ginseng, hong shen, Japanese ginseng, Korean ginseng, red ginseng, renshe, white ginseng

Classification

Therapeutic: none assigned

Common Uses

Improving physical and mental stamina. General tonic to energize during times of fatigue and inability to concentrate. Sedative, sleep aid, antidepressant. Diabetes. Enhanced sexual performance/aphrodisiac. Increased longevity. Adjunctive treatment of cancer. Increased immune response. Increased appetite.

Action

Main active ingredient is ginsenoside from the dried root. Serves as CNS stimulant and depressant. Enhances immune function. Interferes with platelet aggregation and coagulation. Has analgesic, anti-inflammatory, and estrogen-like effects. **Therapeutic Effects:** Improves mental and physical ability. May improve appetite, memory, sleep pattern. May reduce fasting blood glucose level in diabetic patients.

Pharmacokinetics

Absorption: Unknown.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Pregnancy (androgenization of fetus); Lactation; Children; Manic-depressive disorders and psychosis; Hypertension; Asthma; Infection; Organ transplant recipients (can interfere with immunosuppressive therapy); Hormone-sensitive cancers.

Use Cautiously in: Autoimmune diseases; Cardiovascular disease; Diabetics (may have hypoglycemic effects); Patients receiving anticoagulants; Bleeding disorders; Schizophrenia (may cause agitation).

Adverse Reactions/Side Effects

CNS: agitation, depression, dizziness, euphoria, headaches, insomnia, nervousness. **CV:** hypertension, tachycardia. **GI:** diarrhea. **GU:** amenorrhea, vaginal bleeding.

Derm: skin eruptions. **Endo:** estrogen-like effects.

Misc: fever, mastalgia, **STEVENS-JOHNSON SYNDROME**.

Interactions

Natural Product-Drug: May ↓ anticoagulant activity of warfarin. May interfere with MAO inhibitors treatment and cause headache, tremulousness, and manic episodes. May enhance blood glucose lowering effects of oral hypoglycemics and insulin. May interfere with immunosuppressant therapy. Use with caution when taking estrogens.

Natural-Natural: May ↑ risk of bleeding when used with herbs that have antiplatelet or anticoagulant activities. May prolong the QT interval when used with bitter orange, country mallow, and ephedra and ↑ risk of life-threatening arrhythmias. May ↑ risk of hypoglycemia when used with herbs with hypoglycemic potential.

Natural-Food: May potentiate effects of caffeine in coffee or tea and CNS stimulant effects of mate.

Route/Commonly Used Doses

PO (Adults): Capsule—200–600 mg/day; extract—100–300 mg 3 times daily; crude root—1–2g/day; infusion—tea—1–2g root daily (1/2 tsp/cup water) up to 3 times daily (*P. ginseng* tea bag usually contains 1500 mg of ginseng root). Do not use for longer than 3 mo. **Cold/flu prevention**—100 mg daily 4 wk prior to influenza vaccination and continued for 8 wk; **Chronic bronchitis**—100 mg BID for 9 days combined with antibiotic therapy; **Erectile dysfunction**—900 mg TID; **Type 2 diabetes**—200 mg daily.

Availability (generic available)

Root powder^{OTC}; Extract in alcohol^{OTC}; Capsules^{OTC}; Tea bags^{OTC}.

NURSING IMPLICATIONS

Assessment

- Assess level of energy, attention span, and fatigue person is experiencing prior to initiating and periodically during therapy.
- Assess appetite; sleep duration; and perceived quality, emotional lability, and work efficiency prior to and during therapy.
- Patients with chronic medical problems should not use this herb without the advice of health care professional.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

- Assess for ginseng toxicity (nervousness, insomnia, palpitations, and diarrhea).
- Monitor patients with diabetes more frequently for hypoglycemia until response to the agent is ascertained.
- Assess for the development of ginseng abuse syndrome (occurs when large doses of the herb are taken concomitantly with other psychomotor stimulants such as coffee and tea. May present as diarrhea, hypertension, restlessness, insomnia, skin eruptions, depression, appetite suppression, euphoria, and edema).

Potential Nursing Diagnoses

Energy field disturbance (Indications)

Insomnia (Indications)

Implementation

- May be taken without regard to food.
- Take at the same time daily and do not increase dose above the recommended amount because of potential toxic effects.

Patient/Family Teaching

- Warn patients with cardiovascular disease, hypertension or hypotension, or on steroid therapy to avoid the use of this herb.
- Caution pregnant or breast-feeding women not to use this herb.
- Instruct patient in the symptoms of ginseng toxicity and to reduce dose or stop use of the herb if they occur.
- Inform patient to limit the amount of caffeine consumed.
- Advise patients with diabetes to monitor blood sugar levels until response to this agent is known.
- Inform patient that the recommended course of therapy is 3 wk. A repeated course is feasible. Do not use for longer than 3 mo.
- Teach patient about the signs and symptoms of hepatitis (yellow skin or whites of eyes, dark urine, light-colored stools, lack of appetite for several days or longer, nausea, abdominal pain) and to stop use of the herb and promptly contact health care professional if they occur. (This herb is hepatoprotectant at low doses, but hepatodestructive at high doses.)
- Caution patient not to exceed recommended doses because of potential side effects and toxicity.
- If diarrhea develops, stop herb.
- Instruct patient to consult health care professional before taking any Rx or OTC medications concurrently with ginseng.

Evaluation

- Improved energy level and sense of well-being.
- Improved quality of sleep.
- Improved concentration and work efficiency.
- Improved appetite.
- May need to take for several weeks before seeing results.

glucosamine (glew-kos-ah-meen)

Other Name(s):

2-amino-2-deoxyglucose sulfate, chitosamine

Classification

Therapeutic: antirheumatics

Common Uses

Osteoarthritis. Temporomandibular joint (TMJ) arthritis. Glaucoma.

Action

May stop or slow osteoarthritis progression by stimulating cartilage and synovial tissue metabolism. **Therapeutic Effects:** Decreased pain and improved joint function.

Pharmacokinetics

Absorption: 0.9% absorbed.

Distribution: Unknown.

Metabolism and Excretion: 74% eliminated via first-pass metabolism.

Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Shellfish allergy (glucosamine is often derived from marine exoskeletons); Pregnancy and lactation.

Use Cautiously in: Diabetes (may worsen glycemic control); Asthma (may exacerbate symptoms).

Adverse Reactions/Side Effects

GI: nausea, heartburn, diarrhea, constipation. **CNS:** headache, drowsiness. **Derm:** skin reactions.

Interactions

Natural Product-Drug: May antagonize the effects of antidiabetics. May induce resistance to some chemotherapy drugs such as **etoposide**, **teniposide**, and **doxorubicin**.

Natural-Natural: None known.

Route/Commonly Used Doses

PO (Adults): 500 mg three times daily.

Topical (Adults): Use cream as needed for up to 8 wk.

Availability

Tablets^{OTC}; Capsules^{OTC}; Topical cream: 30 mg/g in combination with other ingredients^{OTC}.

NURSING IMPLICATIONS

Assessment

- Evaluate for shellfish allergy prior to initiating therapy.
- Monitor pain (type, location, and intensity) and range of motion on an ongoing basis as an indicator of drug efficacy.

1334 NATURAL/HERBAL PRODUCTS

- Assess glucose levels via home-monitoring device for patients with diabetes until response is ascertained.
- Evaluate gastric discomfort and instruct patient to seek out the advice of a health care provider if persistent gastric discomfort occurs.
- Assess bowel function and symptomatically treat constipation with improved fluid intake and bulk in diet and bulk laxatives if necessary.

Potential Nursing Diagnoses

Acute pain (Indications)

Impaired physical mobility (Indications)

Implementation

- Take prior to meals.

Patient/Family Teaching

- Warn patients with a shellfish allergy that this herbal supplement should not be used.
- Instruct patients that the effects of this drug come from stimulating cartilage and synovial tissue metabolism and that the supplement must be taken on a regular basis to achieve benefit. It should not be used as an intermittent pain medication.
- Contact a health care provider if gastric discomfort develops and persists.
- Caution diabetics to monitor glucose values to ascertain impact on glycemic control.

Evaluation

- Improvement in pain and range of motion.

grape seed extract (gray seed ex-trakt)

Other Name(s):

Vitis vinifera, *Vitis coignetiae*, Oligomeric Proanthocyanidins (OPCs)

Classification

Therapeutic: cardioprotective agents

Common Uses

Chronic venous insufficiency, edema, diabetic retinopathy, varicose veins, cancer prevention, atherosclerosis, cirrhosis, prevention of collagen breakdown, vision problems, constipation, antioxidant, wound healing.

Action

Grape flavonoids have a wide range of effects including antioxidant, vasodilatory, antiplatelet, decreased superoxide production, free-radical removal, and inhibition of collagenase. **Therapeutic Effects:** Reduced risk of coronary disease. Decreased skin and vasculature breakdown.

Pharmacokinetics

Absorption: unknown.

Distribution: unknown.

Metabolism and Excretion: unknown.

Half-life: unknown.

TIME/ACTION PROFILE

	ONSET	PEAK	DURATION
PO	Unknown	Unknown	Unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity or allergy to grape seed extract; Patients with bleeding disorders or receiving anticoagulant therapy.

Use Cautiously in: **OB:** Avoid use in pregnancy due to lack of safety data.

Adverse Reactions/Side Effects

CV: hypertension. **CNS:** dizziness, headache. **Derm:** dry skin. **EENT:** sore throat, cough. **GI:** nausea, diarrhea. **Hemat:** ↑ risk of bleeding.

Interactions

Natural Product-Drug: May ↑ anticoagulant effects of warfarin. May ↓ plasma levels of CYP1A2 substrates.

Natural-Natural: May inhibit the growth of *Lactobacillus acidophilus*. May ↑ BP in hypertensive patients also taking vitamin C.

Route/Commonly Used Doses

PO (Adults): 75–300 mg daily.

Availability

Tablets; Capsules.

NURSING IMPLICATIONS

Assessment

- Monitor BP periodically during therapy.
- **Lab Test Considerations:** Monitor serum cholesterol levels periodically during therapy.

Potential Nursing Diagnoses

Activity intolerance (Indications)

Implementation

- Administer as directed. Doses may vary.

Patient/Family Teaching

- Advise patient not to take grape seed extract with vitamin C; may cause increase in BP.
- Advise female patients to notify health care professional if pregnancy is planned or suspected.

Evaluation

- Decrease in cholesterol.
- Decrease in BP.

green tea (green tee)

Other Name(s):

Camellia sinensis

Classification

Therapeutic: central nervous system stimulants

Common Uses

Bladder, esophageal, ovarian, and pancreatic cancer risk reduction, mental alertness, hypotension, cervical dysplasia associated with human papillomavirus infection, hy-

perlipidemia, weight loss, protection of the skin from sun damage, genital warts, dental caries, Parkinson's disease.

Action

Caffeine in green tea stimulates the CNS and cardiovascular system through adenosine receptor blockade and phosphodiesterase inhibition. **Therapeutic Effects:** Improved cognitive performance and mental alertness.

Pharmacokinetics

Absorption: Unknown.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	Unknown	Unknown	Unknown

Contraindications/Precautions

Contraindicated in: Allergy/hypersensitivity; Pregnancy and lactation (doses >200 mg/day due to caffeine content).

Use Cautiously in: Patients with caffeine sensitivity. Long-term use of doses >250 mg/day may produce tolerance, psychological dependence, tachyarrhythmias, and sleep disturbances; Iron deficiency anemia (may worsen); Diabetes (may impair glucose control); Cardiac conditions (may induce arrhythmias in sensitive individuals); Bleeding disorders.

Adverse Reactions/Side Effects

CV: arrhythmia, tachycardia. **CNS:** agitation, dizziness, excitement, insomnia, tremors. **GI:** nausea, vomiting, diarrhea, hepatotoxicity, abdominal pain. **F and E:** hypokalemia. **Endo:** hyperglycemia. **Hemat:** prolonged bleeding time.

Interactions

Natural Product-Drug: Green tea may ↓ effects of adenosine. ↑ risk of bleeding with anticoagulants or antiplatelet agents. ↑ effects of CNS stimulants. May impair glucose control from antidiabetic agents. Abrupt withdrawal can ↑ lithium levels. May ↓ dipyridamol—induced vasodilation. Verapamil can ↑ caffeine concentrations by 25%. Additive effects with methylxanthines.

Natural-Natural: ↑ risk of adverse cardiovascular effects with bitter orange. ↑ risk of hepatotoxicity with hepatotoxic herbs or supplements. ↑ risk of seizures, hypertension, or stroke with ephedra and creatine.

Route/Commonly Used Doses

PO (Adults): Range: 1–10 cups/day. One cup provides approximately 60 mg of caffeine.

Availability

Tea leaves.

NURSING IMPLICATIONS

Assessment

- Monitor BP and heart rate periodically during therapy.
- **Lab Test Considerations:** Monitor serum glucose, homocysteine, and uric acid levels periodically during therapy.

- Monitor liver and kidney function periodically during therapy.

Potential Nursing Diagnoses

Impaired memory (Indications)

Implementation

- May be taken as tea or as an extract in capsules.

Patient/Family Teaching

- Advise women who may be pregnant or who are breast feeding to limit green tea due to the caffeine content.

Evaluation

- Improvement in memory.

hawthorne (*Crataegus* Species) (haw-thorn)

Other Name(s):

aubepine, cum flore, hagedorn, may-bush, whitehorn

Classification

Therapeutic: antihypertensives, inotropics

Common Uses

Hypertension. Mild to moderate HF. Angina. Spasmodic. Sedative.

Action

Active compounds in hawthorne include flavonoids and procyanidins. Increase coronary blood flow. Positive inotropic and chronotropic effects because of increased permeability to calcium and inhibition of phosphodiesterase. **Therapeutic Effects:** Increased cardiac output. Decreased BP, myocardial workload, and oxygen consumption.

Pharmacokinetics

Absorption: Unknown.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	6–8 wk	unknown

Contraindications/Precautions

Contraindicated in: Pregnancy (potential uterine activity); Lactation.

Use Cautiously in: Concurrent use with ACE inhibitors and digoxin; Do not discontinue use abruptly.

Adverse Reactions/Side Effects

CNS: agitation, dizziness, fatigue, vertigo, headache, sedation (high dose), sleeplessness, sweating. **CV:** hypotension (high dose), palpitations. **Derm:** rash. **GI:** nausea.

Interactions

Natural Product-Drug: May potentiate effects of digoxin, calcium channel blockers, and beta block-

ers. Concurrent use with **phosphodiesterase-5 inhibitors** (sildenafil, tadalafil, vardenafil) and **nitrates** may potentiate vasodilatory effects. May cause additive CNS depression when used with other **CNS depressants**.

Natural-Natural: Additive effect with other cardiac glycoside—containing **herbs** (**digitalis leaf**, **black heliobore**, **oleander leaf**, and others). Additive hypotensive effects with herbs than lower BP such as **ginger**, **Panax ginseng**, **coenzyme Q-10** and **valerian**. Additive effect with other cardioactive herbs (**devil's claw**, **fengugreek**, and others).

Route/Commonly Used Doses

PO (Adults): *Heart failure*—160–1800 mg standardized hawthorne leaf with flower extract in 2–3 divided doses daily. *Hawthorne fluid extract (1:1 in 25% alcohol)*—0.5–1 mL tid; *hawthorne fruit tincture (1:5 in 45% alcohol)*—1–2 mL tid; *dried hawthorne berries*—300–1000 mg tid.

Availability (generic available)

Dried fruit^{OTC}; **Liquid extract of the fruit or leaf**^{OTC}; **Tincture of the fruit or leaf**^{OTC}.

NURSING IMPLICATIONS

Assessment

- Monitor intake and output rations and daily weight. Assess for peripheral edema, auscultate lungs for rales and crackles during therapy.
- Assess BP and pulse periodically during therapy.

Potential Nursing Diagnoses

Decreased cardiac output (Indications)

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- Administered as 2–3 divided doses daily at the same time.
- May be taken without regard to food.

Patient/Family Teaching

- Advise patients that there are other proven therapies available for treatment of heart failure. These therapies should be employed prior to initiating treatment with hawthorne.
- Tell patient not to take hawthorne without the advice of health care professional.
- Instruct patients in the symptoms of a heart attack (pain in the region of the heart, jaw, arm, or upper abdomen; sweating; chest tightness) and heart failure (shortness of breath, chest tightness, dizziness, sweating) and to promptly contact health care professional if they occur.
- Advise patient to report weight gain or persistent swelling of the feet to health care professional.
- May cause dizziness and fatigue. Patients should avoid driving or other activities that require mental alertness until response to herb is known.
- Avoid alcohol and other CNS depressants while taking hawthorne without consulting health care professional.
- Profuse sweating and dehydration under extreme heat may increase the BP-lowering properties of haw-

thorne, leading to severe hypotension. Warn patients to avoid exertion in hot weather to minimize the risk of side effects.

- Instruct patients that hawthorne helps control the symptoms of heart failure but does not cure the disease. Lifestyle changes (salt restriction, weight management, exercise as tolerated, adherence to medication regimens) still need to be followed.
- Instruct patient to consult health care professional before taking Rx, OTC, or other herbal products concurrently with hawthorne.
- Advise female patients to use contraception during therapy and to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation

- Decrease in symptoms of HF. Effects may not be seen for 6 wks.
- Improved cardiac output as evidenced by improved activity tolerance.

Hypericum perforatum, see **St. John's wort**

kava-kava (*Piper methysticum*) (ka-va ka-va)

Other Name(s):

Ava pepper, intoxicating pepper, kao, kew, tonga, wurzelstock, yagona

Classification

Therapeutic: antianxiety agents, sedative/hypnotics

Common Uses

Anxiety, stress, restlessness, insomnia, benzodiazepine withdrawal. Mild muscle aches and pains. Menstrual cramps and PMS.

Action

Alters the limbic system modulation of emotional processes. Shown to have centrally acting skeletal muscle relaxant properties activated. **Therapeutic Effects:** Relief of anxiety. Sedation.

Pharmacokinetics

Absorption: Peak plasma level occurs about 1.8 hr after an oral dose.

Distribution: Enters breast milk.

Metabolism and Excretion: Elimination occurs primarily by renal excretion (both unchanged and metabolites) and in the feces. Metabolized by the liver (reduction or demethylation).

Half-life: Approximately 9 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	1.8 hr	unknown	8 hr

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Contraindications/Precautions

Contraindicated in: Pregnancy (may affect uterine tone) and lactation; Patients with endogenous depression (may ↑ risk of suicide); Children under 12 yr of age; Hepatitis or other liver disease.

Use Cautiously in: Concurrent use of other hepatotoxic agents; Depression and Parkinson's disease (may worsen symptoms); Should not be used for >3 mo to prevent psychological addiction.

Adverse Reactions/Side Effects

CNS: dizziness, headache, drowsiness, sensory disturbances, extrapyramidal effects. **EENT:** Pupil dilation, red eyes, visual accommodation disorders. **GI:** **HEPATIC TOXICITY**, gastrointestinal complaints. **Derm:** allergic skin reactions, yellow discoloration of skin, pellagroid dermatopathy. **Hemat:** decreased lymphocytes, decreased platelets. **Metab:** weight loss (long term, high dose). **Neuro:** ataxia, muscle weakness.

Interactions

Natural Product-Drug: Additive effect when used with **alprazolam**. Potentiates effect of **CNS depressants** (ethanol, barbiturates, benzodiazepines, opioid analgesics). Has ↓ effectiveness of **levodopa** in few cases. May have additive effects with **antiplatelet agents**. May ↑ risk of liver damage with other **hepatotoxic agents**.

Natural-Natural: Concurrent use with other hepatotoxic products such as **DHEA**, **coenzyme Q-10** (high doses), and **niacin** can ↑ risk of liver damage. May have additive sedative effects when used with other **herbs** with sedative properties.

Route/Commonly Used Doses

PO (Adults): *Antianxiety*—100 mg (70 mg kavalactones) 3 times daily; *Benzodiazepine withdrawal*—50–300 mg/day over 1 wk while tapering benzodiazepine over 2 wk (use 70% kavalactone extract). *Insomnia*—180–210 mg kavalactones. Typically taken as a tea by simmering the root in boiling water and then straining.

Availability (generic available)

Dried root extracts (alcohol or acetone based) containing 30–70% kavapyrones.

NURSING IMPLICATIONS

Assessment

- Assess muscle spasm, associated pain, and limitations of movement prior to and periodically during therapy.
- Assess degree of anxiety and level of sedation (visual disturbances and changes in motor reflexes are side effects) prior to and periodically during therapy.
- Assess sleep patterns and level of sedation upon arising.
- Prolonged use may lead to ↓ of platelet and lymphocyte counts and ↑ liver function tests.

Potential Nursing Diagnoses

Anxiety (Indications)

Impaired physical mobility (Adverse Reactions)

Risk for injury (Side Effects)

Implementation

- Prepared as a drink from pulverized roots, tablets, capsules, or extract.

Patient/Family Teaching

- Inform patient that significant, serious side effects may occur with prolonged use. Use for longer than 1 mo is not recommended without supervision of health care professional.
- Caution patient to avoid alcohol or other CNS depressants while taking this herb; may increase sedative effect.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to herb is known.
- Warn patients to stop use of the herb immediately if shortness of breath or signs of liver disease (yellowing of the skin or whites of the eyes, brown urine, nausea, vomiting, light-colored stools, unusual tiredness, weakness, stomach or abdominal pain, loss of appetite) occur and contact health care professional.
- Advise patients who have liver disease or liver problems, or persons who are taking drug products that can affect the liver, to consult health care professional before using kava-containing supplements.
- Inform patient that although there is no evidence of physiological dependence, the risk of psychological dependence still exists.
- Advise female patients to use contraception during therapy and to notify health care professional immediately if pregnancy is planned or suspected or if breast feeding.
- Instruct patient to consult health care professional before taking any Rx, OTC, or other herbal products concurrently with kava-kava.
- Kava has been banned in other countries due to hepatotoxicity.

Evaluation

- Decrease in anxiety level.
- Decrease in muscle spasms.
- Relief of insomnia.

milk thistle (milk this-ul)

Other Name(s):

Holy thistle, Lady's thistle, Mary Thistle, Silybin, Silymarin

Classification

Therapeutic: antidotes

Common Uses

Cirrhosis, chronic hepatitis, gallstones, psoriasis, liver cleansing and detoxification, treatment of liver toxicity due to *Amanita* mushroom poisoning (European IV formulation), and chemicals. Dyspepsia (in combination with other herbs). Diabetes.

Action

The active component, silymarin, has antioxidant and hepatoprotectant actions. Silymarin helps prevent toxin

penetration and stimulates hepatocyte regeneration.

Therapeutic Effects: Liver detoxification. Improved dyspepsia symptoms. Decreased fasting blood glucose.

Pharmacokinetics

Absorption: 23–47% absorbed after oral administration.

Distribution: Unknown.

Metabolism and Excretion: Hepatic metabolism by cytochrome P450 3A4.

Half-life: 6 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	5–30 days or more	unknown	unknown

Contraindications/Precautions

Contraindicated in: Pregnancy and lactation (insufficient information available); Allergy to chamomile, ragweed, asters, chrysanthemums, and other members of the family *Asteraceae/Compositae*.

Use Cautiously in: Hormone sensitive cancers/conditions (milk thistle plant parts may have estrogenic effects).

Adverse Reactions/Side Effects

GI: Laxative effect, nausea, bloating, anorexia. **Misc:** Allergic reactions.

Interactions

Natural Product-Drug: In vitro, milk thistle extract inhibited the drug-metabolizing enzyme **cytochrome P450 3A4**. Interactions have not been reported in humans, but milk thistle should be used cautiously with other drugs metabolized by 3A4, such as **cyclosporine**, **carbamazepine**, **HMG-CoA inhibitors**, **ketoconazole**, and **alprazolam**.

Natural-Natural: None known.

Route/Commonly Used Doses

PO (Adults): *Hepatic cirrhosis*—420 mg/day of extract containing 70–80% silymarin; *Chronic active hepatitis*—240 mg bid of silybinin; *Diabetes*—200 mg tid of silymarin; *Tea*—3–4 times daily 30 minutes before meals. Tea is not recommended as silymarin is not sufficiently water soluble.

IV (Adults): 20–50 mg/kg over 24 hr, 48 hr post mushroom ingestion (IV formulation not available in US).

Availability

Capsules^{OTC}, Tablets^{OTC}, Crude drug^{OTC}, Tea^{OTC}, Extract^{OTC}.

NURSING IMPLICATIONS

Assessment

- Assess patients for signs of liver failure (jaundice, mental status changes, abdominal distention, ascites, generalized edema).
- Evaluate consistency and frequency of bowel movements.
- **Lab Test Considerations:** Monitor liver function, lipid profile, and blood glucose periodically during therapy.

Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- Orally as an extract, capsule, tablets, or as a dried fruit as a single daily dose or divided into three doses.
- Tea is not recommended as milk thistle is not water-soluble.

Patient/Family Teaching

- Inform patient of the symptoms of liver failure; advise patient to report worsening symptomatology promptly to health care professional.
- Emphasize the need for blood tests to monitor liver function tests.
- Advise patients to avoid alcohol and follow diet for liver or gall bladder disease being treated.

Evaluation

- Normalization of liver function tests.
- Reduction in jaundice, abdominal distention, fatigue and other symptoms associated with liver disease.

Panax ginseng, see **ginseng**.

Piper methysticum, see **kava-kava**.

SAME (sam-ee)

Other Name(s):

Ademetionine, S-adenosylmethionine,

Classification

Therapeutic: antidepressants

Pregnancy Category UK

Common Uses

Treatment of depression. Has also been used to manage: osteoarthritis, fibromyalgia, liver disease, migraine headaches

Action

May aid in the production, activation, and metabolism of various amines, phospholipids, hormones, and neurotransmitters. May stimulate articular cartilage growth and repair. **Therapeutic Effects:** Decreased depression. Anti-inflammatory and analgesic effects improve symptoms of osteoarthritis.

Pharmacokinetics

Absorption: Rapidly and extensively metabolized following oral administration.

Distribution: Unknown.

Metabolism and Excretion: Actively metabolized by the liver.

Half-life: 100 min.

TIME/ACTION PROFILE (antidepressant action)

ROUTE	ONSET	PEAK	DURATION
PO (depression)	1–2 wk	unknown	unknown
PO (osteoarthritis)	30 days	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Bipolar disorder.

Use Cautiously in: Pregnancy, lactation, or children (safety not established); Bipolar disorder (can induce mania); Parkinson's disease (may worsen symptoms); Surgery (discontinue 2 wk prior to elective procedures).

Adverse Reactions/Side Effects

CNS: agitation, dizziness, mild insomnia, manic reactions (in patients with bipolar disorder). **GI:** vomiting, diarrhea, flatulence.

Interactions

Natural Product-Drug: Avoid use with antidepressants, meperidine, pentazocine, tramadol, and dextromethorphan (additive serotonergic effects may occur). May ↓ effectiveness of levodopa and worsen Parkinsonian symptoms. Should not be used concurrently with MAO inhibitors. Avoid use of SAME within 2 wk of using a MAO inhibitor.

Natural-Natural: Avoid use with natural products that increase serotonin levels such as L-tryptophan and St. John's wort.

Route/Commonly Used Doses

PO (Adults): Depression—200 mg once or twice daily, adjusted upward over 2 wk (range 400–1600 mg/day); Liver disorders—1200–1600 mg/day; Osteoarthritis—200 mg tid; Fibromyalgia—800 mg/day.

Availability

Tablets: 100 mg, 200 mg, 400 mg^{OTC}.

NURSING IMPLICATIONS**Assessment**

- Assess mental status for symptoms of depression prior to and periodically during therapy; advise patients with depression to be evaluated by a health care professional.
- Assess symptoms of pain and fatigue prior to and periodically during therapy.

Potential Nursing Diagnoses

Ineffective coping (Indications)

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- **PO:** Administer on an empty stomach. Initial dose should be 200 mg once or twice daily to minimize GI disturbances. Dose may be adjusted upward over 1–2 wk depending on response and tolerance.

Patient/Family Teaching

- Instruct patient to take SAME as directed.
- Advise patients to discontinue 2 wk prior to elective surgical procedures.
- Advise women to consult health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation

- Decrease in symptoms of depression.
- Improvement in osteoarthritis symptoms.

saw palmetto
(saw pal-met-toe)**Other Name(s):**

American Dwarf Palm Tree, Cabbage Palm, Ju-Zhong, Palmier Nain, Sabal, Sabal Fructus, Saw Palmetto Berry, *Serenoa repens*

Classification

Therapeutic: benign prostatic hyperplasia (BPH) agents

Common Uses

Benign prostatic hyperplasia.

Action

Exerts antiandrogenic, anti-inflammatory, and antiproliferative properties in prostate tissue resulting in improvement in BPH symptoms such as frequent urination, hesitancy, urgency, and nocturia. Comparable in efficacy to finasteride but may be less effective than prazosin. **Therapeutic Effects:** Decreased urinary symptoms of BPH.

Pharmacokinetics

Absorption: Unknown.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	1–2 mo	unknown	48 wk (longest studied treatment duration)

Contraindications/Precautions

Contraindicated in: Pregnancy and lactation.

Use Cautiously in: Prior to surgery (discontinue 2 wk before to prevent bleeding).

Adverse Reactions/Side Effects

CNS: dizziness, headache. **GI:** nausea, vomiting, constipation, and diarrhea.

Interactions

Natural Product-Drug: Hormonal action may interfere with other hormonal therapies (testosterone, hormonal contraceptives). Avoid use with antiplatelet or anticoagulant drugs (may ↑ bleeding risk).

Natural-Natural: Concomitant use with herbs that affect platelet aggregation such as **ginger, garlic, ginkgo**, and **ginseng** may ↑ bleeding risk.

Route/Commonly Used Doses

PO (Adults): *Lipophilic extract (80–90% fatty acids)*—160 mg twice daily or 320 mg once daily. *Whole berries*—1–2 grams daily. *Liquid extract from berry pulp*—1–2 mL three times daily. *Tea (efficacy is questionable due to lipophilicity of active constituents)*—1 cup three times daily. Tea is prepared by steeping 0.5–1 gram dried berry in 150 mL boiling water for 5–10 minutes.

Availability

Lipophilic extract (80–90% fatty acids)^{OTC}; **Whole berries**^{OTC}; **Liquid extract**^{OTC}.

NURSING IMPLICATIONS

Assessment

- Assess patient for symptoms of benign prostatic hyper trophy (BPH) (urinary hesitancy, feeling of incomplete bladder emptying, interruption in urinary stream, impairment in size and force of urinary stream, terminal urinary dribbling, straining to start flow, dysuria, urgency) before and periodically during therapy.
- Rectal exams prior to and periodically throughout therapy to assess prostate size are recommended.

Potential Nursing Diagnoses

Impaired urinary elimination (Indications)
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- Take on a full stomach to minimize GI effects.

Patient/Family Teaching

- Advise patients to start therapy with this herbal supplement only after evaluation by a health care professional who will provide continued follow-up care.
- Inform patients that saw palmetto does not alter the size of the prostate but still should relieve the symptoms associated with BPH.
- Tell patients that taking this herbal supplement with food should reduce the GI effects and make it easier to tolerate.

Evaluation

- Decrease in urinary symptoms of BPH.

St. John's wort (*Hypericum perforatum*) (saynt jonz wort)

Other Name(s):

Amber, Demon chaser, Goatweed, Hardhay, Klamath weed, Rosin rose, Tipton weed

Classification

Therapeutic: antidepressants

Common Uses

PO: Management of mild to moderate depression and obsessive compulsive disorder (OCD). (Not effective for major depression.) **Topical:** Inflammation of the skin, blunt injury, wounds, and burns. Other uses are for capillary strengthening, decreasing uterine bleeding, and reducing tumor size.

Action

Derived from *Hypericum perforatum*; the active component is *hypericin*. **PO:** Antidepressant action may be due to ability to inhibit reuptake of serotonin and other neurotransmitters. **Topical:** Anti-inflammatory, antifungal, antiviral, and antibacterial properties. **Therapeutic Effects:** **PO:** Decreased signs and symptoms of depression. **Topical:** Decreased inflammation of burns or other wounds.

Pharmacokinetics

Absorption: Unknown.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: *Hypericum constituents*—24.8–26.5 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	10–14 days	within 4–6 wk	unknown

Contraindications/Precautions

Contraindicated in: Pregnancy, lactation, or children.

Use Cautiously in: History of phototoxicity; Surgery (discontinue 2 wk prior to surgical procedures); Alzheimer's disease (may induce psychosis); Patients undergoing general anesthesia (may cause cardiovascular collapse); History of suicide attempt, severe depression, schizophrenia, or bipolar disorder (can induce hypomania or psychosis).

Adverse Reactions/Side Effects

CNS: dizziness, restlessness, sleep disturbances. **CV:** hypertension. **Endo:** hypoglycemia. **GI:** abdominal pain, bloating, diarrhea, dry mouth, feeling of fullness, flatulence, nausea, vomiting. **Neuro:** neuropathy. **Derm:** allergic skin reactions (hives, itching, skin rash), phototoxicity. **Misc:** serotonin syndrome.

Interactions

Natural Product-Drug: Concurrent use with alcohol or other antidepressants (including SSRIs and MAO inhibitors) may ↑ risk of adverse CNS reactions. May ↓ the effectiveness and serum concentrations of digoxin, alprazolam, amitriptyline, imatinib, irinotecan, warfarin, and protease inhibitors. Use with MAO inhibitors, tramadol, pentazocine, and selective serotonin agonists could result in serotonin syndrome. May ↓ effectiveness of oral contraceptives. May ↓ plasma cyclosporine and tacrolimus levels by 30–70% and cause acute transplant rejection. May ↑ metabolism of phenytoin and phenobarbital and cause loss of seizure control. Avoid use of St. John's Wort and MAO inhibitors within 2 wk of each other.

Natural-Natural: May ↑ risk of serotonin syndrome when taken with **tryptophan** and **SAM-e**.

Route/Commonly Used Doses

PO (Adults): *Mild Depression*—300 mg of St. John's Wort (standardized to 0.3% hypericin) 3 times daily or 250 mg twice daily of 0.2% hypericin extract. *OCD*—450 mg twice daily of extended release preparation.

Topical (Adults): 0.2–1 mg total hypericin daily.

Availability

Preparations for Oral Use

Dried herb^{OTC}; **Dried (hydroalcoholic) extract**^{OTC}; **Oil**^{OTC}; **Tincture**^{OTC}.

Preparations for Topical Application

Liquid^{OTC}; **Semisolid**^{OTC}.

NURSING IMPLICATIONS

Assessment

- **Depression:** Assess patient for depression periodically during therapy.
- **Inflammation:** Assess skin or skin lesions periodically during therapy.

Potential Nursing Diagnoses

Ineffective coping (Indications)

Anxiety (Indications)

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

Implementation

- **PO:** Tea can be prepared by mixing 2–4 dried herbs in 150 mL of boiling water and steeping for 10 min.

Patient/Family Teaching

- Instruct patient to take St. John's wort as directed.
- Patients with depression should be evaluated by health care professional. Standard therapy may be of greater benefit for moderate to severe depression.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Caution patients to avoid sun exposure and use protective sunscreen to reduce the risk of photosensitivity reactions.
- Inform patient to purchase herbs from a reputable source and that products and their contents vary among different manufacturers.
- Caution patient not to use alcohol while taking St. John's wort.
- Warn patients that St. John's Wort may reduce the therapeutic effectiveness of several drugs.
- May potentiate effect of sedatives and side effects of other antidepressants. Do not take within 2 wk of MAO Inhibitor therapy.
- Instruct patient to consult health care professional before taking other Rx, OTC, or herbal products concurrently with St. John's wort.
- Inform patient that St. John's wort is usually taken for a period of 4–6 wk. If no improvement is seen, another therapy should be considered.

Evaluation

- Decrease in signs and symptoms of depression or anxiety.
- Improvement in skin inflammation.

valerian (vuh-lare-ee-en)

Other Name(s):

Amantilla, All-Heal, Baldrian, Baldrian-wurzel, Belgium Valerian, Common Valerian, Fragrant Valerian, Garden Heliotrope, Garden Valerian, Indian Valerian, Mexican Valerian, Pacific Valerian, Tagara, Valeriana, *Valeriana officinalis*, *Valerianae radix*, Valeriana rhizome, Valeriane

Classification

Therapeutic: antianxiety agents, sedative/hypnotics

Common Uses

Insomnia. Anxiety.

Action

May increase concentrations of the inhibitory CNS transmitter GABA. **Therapeutic Effects:** Improvement in sleep quality.

Pharmacokinetics

Absorption: Unknown.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	30–60 min	2 hr	unknown

Contraindications/Precautions

Contraindicated in: Pregnancy and lactation.

Use Cautiously in: Alcohol use (may have additive sedative effects); Surgery (discontinue use 2 wk prior to elective procedures).

Adverse Reactions/Side Effects

CNS: drowsiness, headache. **GI:** dry mouth. **Misc:** Benzodiazepine-like withdrawal symptoms with discontinuation after long-term use.

Interactions

Natural Product-Drug: Additive CNS depression with alcohol, antihistamines, anesthetic agents, sedative hypnotics, and other CNS depressants. Alcohol-containing preparations may interact with **disulfiram** and **metronidazole**.

Natural-Natural: Additive sedative effects can occur when used with herbal supplements with sedative properties such as **kava**, **l-tryptophan**, **melatonin**, **SAME**, and **St. John's wort**.

Route/Commonly Used Doses

PO (Adults): *Tea*—1 cup tea 1–5 times daily. Tea is made by steeping 2–3 g root in 150 mL boiling water for 5–10 min then straining. *Tincture*—1–3 mL 1–5 times daily. *Extract*—400–900 mg up to 2 hours before bedtime or 300–450 mg divided tid.

Availability

Capsules^{OTC}; Extract^{OTC}; Tea^{OTC}; Tincture^{OTC}.

NURSING IMPLICATIONS

Assessment

- Assess degree of anxiety and level of sedation prior to and periodically throughout therapy.
- Assess sleep patterns.
- Assess response in the elderly population where drowsiness and loss of balance may pose a significant risk for injury.

Potential Nursing Diagnoses

Anxiety (Indications)

Risk for injury (Side Effects)

Implementation

- Take 1–2 hr before bedtime if used for nighttime hypnotic.

- Administer orally three to five times daily to control anxiety.

Patient/Family Teaching

- Encourage patients to avoid stimulants such as caffeine and to provide an environment that promotes restful sleep.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to drug is known.
- Caution patient to avoid use of alcohol and other medications or herbals that have a sedative effect; may increase drowsiness.
- Advise patients to discontinue 2 wk prior to elective surgical procedures.
- Inform patients not to take this herbal supplement if pregnant or breast-feeding.
- Notify patients that dependence with withdrawal symptoms may develop with prolonged use.

Evaluation

- Decreased anxiety level.
- Improvement in sleep with a feeling of restfulness without drowsiness upon awakening.

***Zingiber officinale*, see ginger.**

PEDIATRIC INTRAVENOUS MEDICATION QUICK REFERENCE CHART

Risk of fluid overload in infants and children is always a consideration when administering IV medications. The following table provides maximum concentrations—the smallest amount of fluid necessary for diluting specific medications—and the maximum rate at which the medications be given.

Drug	Maximum Concentration	Maximum Rate
acetaminophen	10 mg/ml	Give over 15 min
acetazolamide	100 mg/ml	500 mg/min ²
acyclovir	7 mg/ml	Give over 1 hr
adenosine	3 mg/ml	Give over 1-2 sec
allopurinol	6 mg/ml	Give over 30 min
amikacin	10 mg/ml	Give over 30-60 min
aminocaproic acid	20 mg/ml	Give over 1 hr
aminophylline	25 mg/ml	25 mg/min
amphotericin B conventional	0.1 mg/ml (peripherally) 0.5 mg/ml (centrally)	Give over 2-6 hr Give over 2-6 hr
amphotericin B liposomal	2 mg/ml	Give over 2 hr
amphotericin B colloidal	0.83 mg/ml	Give over 2 hr
ampicillin	100 mg/ml	100 mg/min
ampicillin/sulbactam	30 mg/ml (ampicillin)	Give over 15-30 min
anidulafungin	0.77 mg/ml	1.1 mg/min
atropine	1 mg/ml	Give over 1 min
azithromycin	2 mg/ml	Give over 1 hr
aztreonam	20 mg/ml	Give over 20-60 min
bumetanide	0.25 mg/ml	Give over 1-2 min
caffeine citrate	20 mg/ml	Give over 10-20 min
calcitriol	2 mcg/ml	Give over 15 sec
calcium chloride	100 mg/ml	100 mg/min
calcium gluconate	100 mg/ml	100 mg/min ²
caspofungin	0.5 mg/ml	Give over 1 hr
cefazolin	138 mg/ml (IVP) 20 mg/ml (Intermittent infusion)	Give over 3-5 min Give over 10-60 min
cefepime	160 mg/ml	Give over 30 min
cefotaxime	200 mg/ml (IVP) 60 mg/ml (Intermittent infusion)	Give over 3-5 min Give over 10-30 min
cefoxitin	200 mg/ml (IVP) 40 mg/ml (Intermittent infusion)	Give over 3-5 min Give over 10-60 min
ceftazidime	180 mg/ml (IVP) 40 mg/ml (Intermittent infusion)	Give over 3-5 min Give over 10-30 min
ceftriaxone	40 mg/ml	Give over 10-30 min
cefuroxime	100 mg/ml (IVP) 137 mg/ml (Intermittent infusion) ²	Give over 3-5 min Give over 15-30 min
chlorothiazide	28 mg/ml	3-5 min
chlorpromazine	1 mg/ml	0.5 mg/min
ciprofloxacin	2 mg/ml	Give over 60 min
clindamycin	18 mg/ml	30 mg/min
cyclosporine	2.5 mg/ml	Give over 2-6 hr
dexamethasone	10 mg/ml	Doses ≤ 10 mg: Give over 1-4 min Doses > 10 mg: Give over 15-30 min
dexmedetomidine	4 mcg/ml	Give bolus over 5-10 min
diazepam	5 mg/ml	2 mg/min
digoxin	100 mcg/ml	Give over 5 min
diphenhydramine	25 mg/ml	25 mg/min
doxycycline	1 mg/ml	Give over 1 hr
enalaprilat	1.25 mg/ml	Give over 5 min
erythromycin	5 mg/ml	Give over 20-120 min
esomeprazole	8 mg/ml	Give over 10-30 min
ethacrynic acid	2 mg/ml	Give over 5-30 min
famotidine	4 mg/ml (IVP) 0.2 mg/ml (Intermittent infusion)	10 mg/min Give over 15-30 min
fentanyl	50 mcg/ml	Give over 1-3 min
fluconazole	2 mg/ml	Give over 1-2 hr
flumazenil	0.1 mg/ml	0.2 mg/min
foscarnet	12 mg/ml (peripherally) 24 mg/ml (centrally)	60 mg/kg/hr
fosphenytoin	25 mg/ml	3 mg/kg/min
furosemide	10 mg/ml	0.5 mg/kg/min
ganciclovir	10 mg/ml	Give over 1 hr
gentamicin	10 mg/ml	Give over 30 min
glicopyrrolate	0.2 mg/ml	20 mcg/min

PEDIATRIC INTRAVENOUS MEDICATION QUICK REFERENCE CHART		
Drug	Maximum Concentration	Maximum Rate
granisetron	1 mg/ml (IVP) 50 mcg/ml (Intermittent infusion)	Give over 30 sec Give over 30-60 min
hydralazine	20 mg/ml	0.2 mg/kg/min
hydrocortisone sodium succinate	50 mg/ml (IVP) 5 mg/ml (Intermittent infusion)	Give over 30 sec Give over 10-30 min
ibuprofen	10 mg/ml	Give over 15 min
imipenem/cilastatin ²	7 mg/ml	Give over 15-60 min
inamrinone	5 mg/ml	Give bolus over 2-3 min
indomethacin	1 mg/ml	Give over 20-30 min
kanamycin	5 mg/ml	Give over 30-60 min
ketamine	50 mg/ml (IVP) 2 mg/ml (Intermittent infusion)	0.5 mg/kg/min 0.5 mg/kg/min
ketorolac	30 mg/ml	Give over 1-5 min
labetalol	5 mg/ml (IVP)	2 mg/min
lacosamide	10 mg/ml	Give over 30-60 min
levetiracetam	15 mg/ml	Give over 5-15 min
levocarnitine	200 mg/ml	Give over 2-3 min
levothyroxine	100 mcg/ml	Give over 2-3 min
linezolid	2 mg/ml	Give over 30-120 min
lorazepam	4 mg/ml	2 mg/min or 0.05 mg/kg over 2-5 min
magnesium sulfate	200 mg/ml	10-20 min
meperidine ²	10 mg/ml	Give over 5 min
meropenem	50 mg/ml (Intermittent infusion) 20 mg/ml (Intermittent infusion)	Give over 3-5 min Give over 15-30 min
methylprednisolone	125 mg/ml (IVP) 2.5 mg/ml (Intermittent infusion)	Give over 1-30 min Give over 20-60 min
metoclopramide	5 mg/ml	5 mg/min
metronidazole	8 mg/ml	Give over 1 hr
micafungin	1.5 mg/ml	Give over 1 hr
midazolam	5 mg/ml	Give over 20-30 sec (5 min in neonates)
milrinone	1 mg/ml	Give over 10 min
morphine ²	5 mg/ml	Give over 5-30 min
nafcillin ²	125 mg/ml	Give over 15-60 min
naloxone	1 mg/ml	Give over 30 sec
ondansetron	2 mg/ml	Give over 2-15 min
oxacillin	100 mg/ml (IVP) 40 mg/ml (Intermittent infusion)	Give over 10 min Give over 15-30 min
pancuronium	2 mg/ml (IVP)	Give over 3-5 seconds
panoprazole	4 mg/ml	Give over 2-15 min
penicillin G ²	100,000 units/ml	Give over 15-30 min
pentamidine	6 mg/ml	Give over 1-2 hr
pentobarbital	50 mg/ml	50 mg/min
phenobarbital	130 mg/ml	30 mg/min
phenytoin	10 mg/ml	1 mg/kg/min (neonates) 3 mg/kg/min (children)
phytonadione	10 mg/ml	1 mg/min
piperacillin	200 mg/ml (IVP) 20 mg/ml (Intermittent infusion)	Give over 3-5 min Give over 20-60 min
piperacillin/tazobactam	200 mg/ml	Give over 30 min
potassium chloride	80 mEq/L (peripherally) 200 mEq/L (centrally)	1 mEq/kg/hr
promethazine	25 mg/ml	25 mg/min
propranolol	1 mg/ml	1 mg/min
protamine	10 mg/ml	5 mg/min
ranitidine	2.5 mg/ml	10 mg/min
rifampin	6 mg/ml	Give over 30 min
tacrolimus	0.02 mg/ml	Give over 4-24 hr
terbutaline	1 mg/ml	Give over 5-10 min
ticarcillin/clavulanate	100 mg/ml	Give over 30 min
tobramycin	10 mg/ml	Give over 30 min
trimethoprim/sulfamethoxazole	1 ml drug per 10 ml diluent ²	Give over 1-1.5 hr
valproate sodium	50 mg/ml	3 mg/kg/min
vancomycin	5 mg/ml	Give over 60 min
vasopressin	1 unit/ml	Give over 5-30 min
verapamil	2.5 mg/ml (IVP)	Give over 2-3 min
voriconazole	5 mg/ml	3 mg/kg/hr
zidovudine	4 mg/ml	Give over 60 min

BEERS CRITERIA

The Beers criteria for potentially inappropriate medication use in adults 65 and older in the United States is a compilation of drugs and drug classes found to increase the risk of adverse events in older adults. Frequently, older adults are more sensitive to the medications or their side effects. These adverse events have significant economic and quality of life costs for society and individuals and can result in more frequent hospitalizations, permanent injury, or death. Often, the potential for adverse events can be minimized by prescribing safer alternatives or prescribing at the lowest effective dose. The list of medications below represents an update to the list previously published in 2003.

alprazolam (Niravam, Xanax)	ketoprofen
amobarbital (Amytal Sodium)	ketorolac
amiodarone (Cordarone, Pacerone)	lorazepam (Ativan)
amitriptyline	loxapine (Loxitane)
aripiprazole (Abilify)	lurasidone (Latuda)
asenapine (Saphris)	meclofenamate
aspirin (>325 mg/day)	mefenamic acid (Ponstel)
belladonna alkaloids (Donnatal)	megestrol (Megace, Megace ES)
benztropine (Cogentin)	meloxicam (Mobic)
brompheniramine	meperidine (Demerol)
butabarbital (Butisol Sodium)	meprobamate
carbinoxamine	metaxalone (Skelaxin)
carisoprodol (Soma)	methocarbamol (Robaxin)
chlordiazepoxide (Librium)	methyldopa
chlordiazepoxide-amitriptyline	methyldopa-hydrochlorothiazide
chlorpheniramine (Chlor-Trimeton)	methyltestosterone (Android, Testred)
chlorpromazine	metoclopramide (Metozolv ODT, Reglan)
chlorpropamide (Diabinese)	mineral oil
chlorthalidone (Parafon Forte DSC)	nabumetone
clidinium-chlordiazepoxide (Librax)	naproxen (Aleve, Anaprox, Naprosyn)
clomipramine (Anafranil)	nifedipine (short-acting) (Procardia)
clonazepam (Klonopin)	nitrofurantoin (Furadantin, Macrobid, Microdantin)
clonidine (Catapres, Duraclon, Kapvay)	olanzapine (Zyprexa)
clorazepate (Tranxene)	orphenadrine (Norflex)
clozapine (Clozaril, FazaClo, Versacloz)	oxaprozin (Daypro)
cyclobenzaprine (Amrix, Fexmid)	oxazepam
cyproheptadine	paliperidone (Invega)
desiccated thyroid (Armour Thyroid)	pentazocine (Talwin)
dexchlorpheniramine	pentobarbital (Nembutal Sodium)
diazepam (Valium)	perphenazine
diclofenac (Cambia, Cataflam, Voltaren XR, Zipsor, Zorvolex)	perphenazine-amitriptyline
dicyclomine (Bentyl)	phenobarbital
diflunisal	pimozide (Orap)
digoxin (>0.125 mg/day) (Lanoxin)	piroxicam (Feldene)
diphenhydramine (Benadryl)	prazosin (Minipress)
dipyridamole (short-acting) (Persantine)	procainamide
disopyramide (Norpace)	promethazine (Promethegan)
dofetilide (Tikosyn)	propafenone (Rythmol, Rythmol SR)
doxylamine	propantheline
doxazosin (Cardura)	quazepam (Doral)
doxepin (>6 mg/day)	quetiapine (Seroquel)
dronedarone (Multaq)	quinidine
ergoloid mesylates (Hydergine)	reserpine (>0.1 mg/day)
estazolam	risperidone (Risperdal)
estrogens	scopolamine (Transderm-Scop)
eszopiclone (Lunesta)	secobarbital (Seconal Sodium)
etodolac	sotalol (Betapace, Betapace AF, Sorine)
fenopropfen (Nalfon)	spironolactone (>25 mg/day) (Aldactone)
flecainide	sulindac (Clinoril)
fluoxetine (Prozac)	temazepam (Restoril)
fluphenazine	terazosin
flurazepam	testosterone (Androderm, Androgel, Axiron, Delatestryl, Fortesta, Striant, Testim)
glyburide (Diabeta, Glynase)	thioridazine
growth hormone	thiothixene
guanfacine (Tenex)	ticlopidine
haloperidol (Haldol)	tolmetidine
hydroxyzine (Vistaril)	triazolam (Halcion)
hyoscyamine (Anaspaz, Levsin)	trifluoperazine
ibuprofen (Advil, Motrin)	trihexyphenidyl
ibutilide (Corvert)	trimethobenzamide (Tigan)
iloperidone (Fanapt)	trimipramine (Surmontil)

indomethacin (Indocin)	ziprasidone (Geodon)
insulin (sliding scale)	zolidem (Ambien, Ambien CR, Edluar, Intermezzo, Zolpimist)
isoxsuprine	

The American Geriatrics Society 2012 Beers Criteria Update Expert Panel. American Geriatrics Society updated Beers criteria for potentially inappropriate medication use in older adults. J Am Geriatr Soc. 2012;60:616-631."

DRUGS ASSOCIATED WITH INCREASED RISK OF FALLS IN THE ELDERLY

Many factors are associated with falls in the elderly, including frailty, disease, vision, polypharmacy, and certain medications. Below is a list of drugs associated with falls. Assess geriatric patients on these medications for fall risk and implement fall reduction strategies.

ACE Inhibitors		phenelzine (Nardil)	Beta Blockers
benazepril (Lotensin)		protriptyline (Vivactil)	acebutolol (Sectral)
captopril (Capoten)		sertraline (Zoloft)	atenolol (Tenormin)
enalapril (Vasotec)		tranylcypromine (Parnate)	bisoprolol (Zebeta)
fosinopril		trazodone	carvedilol (Coreg)
lisinopril (Prinivil, Zestril)		trimipramine (Surmontil)	labetalol (Trandate)
moexipril (Univasc)		venlafaxine (Effexor XR)	metoprolol (Lopressor, Toprol XL)
perindopril (Aceon)		Antihistamines/Antinauseants	propranolol (Inderal, InnoPran XL)
quinapril (Accupril)		dimenhydrinate (Dramamine)	timolol
ramipril (Altace)		diphenhydramine (Benadryl)	Calcium Channel Blockers
trandolapril (Mavik)		hydroxyzine (Vistaril)	amlodipine (Norvasc)
Angiotensin II Receptor Antagonists		meclizine (Antivert, Bonine)	diltiazem (Cardizem, Cartia XT, Dilacor XR, Taztia XT, Tiazac)
azilsartan (Edarbi)		metoclopramide (Metozolv ODT, Reglan)	felodipine
candesartan (Atacand)		prochlorperazine (Compro)	isradipine
eprosartan (Teveten)		promethazine (Promethegan)	nicardipine (Cardene)
irbesartan (Avapro)		scopolamine patch (Transderm Scop)	nifedipine (Adalat CC, Afeditab CC, Procardia XL)
losartan (Cozaar)		Antiparkinsonian Agents	nisoldipine (Sular)
olmesartan (Benicar)		amantadine	verapamil (Calan, Isoptin, Verelan)
telmisartan (Micardis)		bromocriptine (Parlodel)	Diuretics
valsartan (Diovan)		entacapone (Comtan)	amiloride/HCTZ
Antiarthritics		levodopa/carbidopa (Parcopa, Sinemet)	bumetanide
digoxin (Lanoxin)		pramipexole (Mirapex)	furosemide (Lasix)
disopyramide (Norpace)		selegiline (Eldepryl, Zelapar)	hydrochlorothiazide (Microzide)
Anticonvulsants		Antipsychotics (Atypical)	triamterene/HCTZ (Dyazide, Maxzide)
carbamazepine (Carbatrol, Epitol, Equetro, Tegretol)		aripiprazole (Abilify)	Opioid Analgesics
ethosuximide (Zarontin)		clozapine (Clozaril, FazaClo, Versacloz)	codeine
felbamate (Felbatol)		olanzapine (Zyprexa)	codeine (Abstral, Actiq, Duragesic, Fentora, Lazanda, Onsolis, Sublimaze, Subsyst)
gabapentin (Gralise, Neurontin)		paliperidone (Invega)	hydrocodone
lamotrigine (Lamictal)		quetiapine (Seroquel)	hydromorphone (Exalgo)
levetiracetam (Keppra)		risperidone (Risperdal)	levorphanol
methsuximide (Celontin)		ziprasidone (Geodon)	meperidine (Demerol)
phenobarbital (Luminal)		Antipsychotics (Neuroleptics)	methadone (Dolophine)
phenytoin (Dilantin, Phenytek)		chlorpromazine	morphine (Astramorph, Avinza, Duramorph, Infumorph, Kadian, MS Contin)
pregabalin (Lyrica)		fluphenazine	oxycodone (Oxecta, OxyContin, Roxicodone)
primidone (Mysoline)		haloperidol (Haldol)	oxymorphone (Opana)
tiagabine (Gabatril)		loxapine (Loxitane)	pentazocine (Talwin)
topiramate (Topamax, Trokendi XR)		perphenazine	Skeletal Muscle Relaxants
valproate (Depakene, Depakote, Stavzor)		pimozide (Orap)	baclofen (Gablofen, Lioresal)
zonisamide (Zonegran)		thioridazine	Vasodilators
Antidepressants		thiothixine (Navane)	doxazosin (Cardura)
amitriptyline		trifluoperazine	hydralazine
amoxapine		Anxiolytics	isosorbide (Dilatrate SR, Imdur, Ismo, Isordil, Monoket)
bupropion (Aplenzin, Wellbutrin)		buspirone	nitroglycerin (Minitran, Nitro-Dur, Nitromist, Nitrostat)
citalopram (Celexa)		meprobamate	prazosin (Minipress)
clomipramine (Anafranil)		Benzodiazepines (Long Acting)	terazosin (Hytrin)
desipramine (Norpramin)		chlordiazepoxide (Librium)	
doxepin		clonazepam (Klonopin)	
duloxetine (Cymbalta)		clorazepate (Tranxene)	
escitalopram (Lexapro)		diazepam (Valium)	
fluoxetine (Prozac)		flurazepam	
fluvoxamine (Luvox CR)		quazepam (Doral)	
imipramine (Tofranil)		Benzodiazepines (Intermediate Acting)	
isocarboxazid (Marplan)		alprazolam (Niravam, Xanax)	
maprotiline		estazolam	
mirtazapine (Remeron)		lorazepam (Ativan)	
nefazodone		oxazepam	
paroxetine (Paxil, Pexeva)		temazepam (Restoril)	
		Benzodiazepines (Short Acting)	
		triazolam (Halcion)

Sonata	Soriatane	TOLBUTamide	TOLAZamide
Soriatane	Loxitane		

Brand names always start with an upper case letter. Some brand names incorporate tall man letters in initial characters and may not be readily recognized as brand names. Brand name products appear in black; generic/other products appear in red.

LIST OF CONFUSED DRUG NAMES continued

Drug Name	Confused Drug Name
Topamax	Toprol-XL
Toprol-XL	Topamax
Toradol	Foradil
t-PA	TNKase
Tracleer	Tricor
traMADol	traZODone
traZODone	traMADol
TREntal	TEGretol
tretinoin	ISOTretinoin
Tricor	Tracleer
tromethamine	Trophamine
Trophamine	tromethamine
tuberculin purified protein derivative (PPD)	influenza virus vaccine
tuberculin purified protein derivative (PPD)	tetanus diphtheria toxoid (Td)
Tylenol	Tylenol PM
Tylenol PM	Tylenol
Ultracet	Duricef
vaIACYclovir	vaIGANCiclovir
Valcyte	Valtrex
vaIGANCiclovir	vaIACYclovir
Valtrex	Valcyte
Varivax	VZIG (varicella-zoster immune globulin)
Vesanoïd	Vesicare
Vesicare	Vesanoïd
Vexol	Vosol
Viagra	Allegra
Videx	Bidex
vinBLASTine	vinCRIStine
vinCRIStine	vinBLASTine
Viokase	Viokase 8
Viokase 8	Viokase
Vioxx	Zyvox
Viracept	Viramune
Viramune	Viracept
Vosol	Vexol
VZIG (varicella-zoster immune globulin)	Varivax
Wellbutrin SR	Wellbutrin XL
Wellbutrin XL	Wellbutrin SR
Xanax	Fanapt
Xanax	Zantac
Xeloda	Xenical

Drug Name	Confused Drug Name
Xenical	Xeloda
Yasmin	Yaz
Yaz	Yasmin
Zantac	Xanax
Zantac	ZyrTEC
Zavesca (escitalopram) [non-US product]	Zavesca (miglustat)
Zavesca (miglustat)	Zavesca (escitalopram) [non-US product]
Zebeta	Diabeta
Zebeta	Zetia
Zegerid	Zestril
Zelapar (Zydis formulation)	ZyPREXA Zydis
Zestril	Zegerid
Zestril	Zetia
Zestril	ZyPREXA
Zetia	Bextra
Zetia	Zebeta
Zetia	Zestril
Ziac	Tiazac
Zocor	Cozaar
Zocor	ZyrTEC
ZOLMitriptan	SUMATriptan
Zonegran	SINEquan
Zostrix	Zovirax
Zovirax	Doribax
Zovirax	Zyvox
Zovirax	Zostrix
Zyban	Diovan
ZyPREXA	CeleXA
ZyPREXA	Reprexain
ZyPREXA	Zestril
ZyPREXA	ZyrTEC
ZyPREXA Zydis	Zelapar (Zydis formulation)
ZyrTEC	Lipitor
ZyrTEC	Zantac
ZyrTEC	Zocor
ZyrTEC	ZyPREXA
ZyrTEC	ZyrTEC-D
ZyrTEC (cetirizine)	ZyrTEC Itchy Eye Drops (ketotifen fumarate)
ZyrTEC-D	ZyrTEC
ZyrTEC Itchy Eye Drops (ketotifen fumarate)	ZyrTEC (cetirizine)
Zyvox	Vioxx

Brand names always start with an upper case letter. Some brand names incorporate tall man letters in initial characters and may not be readily recognized as brand names. Brand name products appear in black; generic/other products appear in red.

DO NOT CRUSH!							
Do not crush any oral medication that is labeled as:							
Delayed Release Enteric-coated (EC) Effervescent tablet (EVT) Irritant (I) Mucous Membrane irritant (MMI) Orally Disintegrating tablets (ODT) Slow-release (SR) Sublingual forms of drugs Sustained-release							
Do not crush any oral medication that ends in the following letters:							
CD	CR	ER	LA	SR	XL	XR	XT
MEDICATIONS THAT SHOULD NOT BE CRUSHED:							
Amibid DM Aciphex Tablet (SR) Actiq lozenge (SR) Actonel Tablet (I) Adalat CC tablet (SR) Adderall XR Capsule (SR) see code "C" AeroHist Plus Tablet (SR) Afeditab CR Tablet (SR) Afinitor Tablet (MMI) Aggrenox Capsule (SR) Alavert Allergy Sinus 12 Hour Tablet (SR) Allegra-D Tablet (SR) Allfen Jr Tablet (SR) Allfen Jr Capsule (SR) see code "C" Alpophen Tablet (EC) Alprazolam ER Tablet (SR) Altoprev Tablet (SR) Ambien CR Tablet (SR) Amitiza Capsule (SR) Amrix Capsule (SR) Amlenizin Aprisor Capsule (SR) see code "C" Aptivus Capsule Aquatab C Tablet (SR) may break scored tablet only Aquatab D Tablet (SR) Arthrotec Tablet (EC) Asacol Tablet (SR) Ascriptin A/D Tablet (EC) Aspirin Bayer Enteric coated Caplet (EC) Aspirin Bayer Low Adult Tablet (EC) Aspirin Bayer Regular Strength Caplet (EC) Atelevia (ER) Augmentin XR tablet (SR) see codes "A" and "B" Avinza Capsule (SR) see code "C" Avodart Capsule (women of childbearing age should not handle this tablet) Azulfidine EN-tablet (EC) Bayer Regular Aspirin – (EC) Bellahist–D LA Tablet (SR) Biaxin-XL Tablet (SR) Bidhist–D Tablet (SR) Bidhist Tablet (SR) Biltricide tablet see code "B" Bisa-lax Tablet (EC) see code "D" Biohist LA Tablet (SR) see code "B" Bisac-Evac Tablet (EC) see code "D" Bisacodyl Tablet (EC) see code "D" Boniva Tablet (alteration of tablet may cause oropharyngeal irritation) Bromfed PD Capsule (SR) Budeprion SR Tablet (SR) Calan SR Tablet (SR) see code "B" Carbatrol Capsule (SR) see code "C"

Recent Drug Approvals

To view full-text monographs of drugs that have been recently released from the FDA or to learn about changes to dosage forms, please visit www.DrugGuide.com.

bosutinib (boe-sue-ti-nib) Bosulif

Classification

Therapeutic: antineoplastics

Pharmacologic: kinase inhibitors

Pregnancy Category D

Indications

Treatment of adults with chronic/accelerated/blast phase chronic myelogenous leukemia that is resistant/intolerant to previous therapies.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; **Lactation:** Breast feeding should be avoided; **OB:**

Pregnancy (may cause fetal harm); Concurrent use of moderate to strong CYP3A4 inhibitors/inducers or P-gp inhibitors (may significantly alter drug effects).

Use Cautiously in: Hepatic impairment (dose ↓ recommended); Patients with reproductive potential (effective contraception is recommended); **Pedi:** Safe and effective use in children <18 yr has not been established.

Adverse Reactions/Side Effects

CNS: dizziness, fatigue, headache. **EENT:** tinnitus. **Resp:** cough. **CV:** chest pain, fluid retention, pericarditis, prolonged QT interval. **GI:** abdominal pain, ↓ appetite, diarrhea, nausea, vomiting, dysgeusia, gastritis, GI bleeding, hepatic toxicity, pancreatitis. **Derm:** itching, rash, acne. **F and E:** dehydration, hyperkalemia. **Hemat:** anemia, neutropenia, thrombocytopenia. **MS:** arthralgia, back pain, myalgia. **Misc:** hypersensitivity reactions including **ANAPHYLAXIS**, fever.

Route/Dosage

PO (Adults): 500 mg once daily, if complete hematologic response has not occurred by 8 wk, or complete cytologic response by 12 wk or there has been no occurrence of ≥ Grade 3 adverse reactions, consider dose ↑ to 600 mg once daily. Dose adjustments should be made for toxicity (hematologic and nonhematologic).

Renal Impairment

PO (Adults): *CCr* <30 mL/min—300 mg once daily.

Hepatic Impairment

PO (Adults): *Transaminases* >5 times *ULN*—discontinue until transaminases are ≤2.5 × *ULN*, then restart treatment at 400 mg once daily if recovery has taken 4 wk or less; *any degree of hepatic impairment*—200 mg once daily.

botulism antitoxin, heptavalent (bot-yoo-lizm an-ti-toks-in, hepta-vay-lent) BAT

Classification

Therapeutic: antitoxes

Pharmacologic: immune globulins

Pregnancy Category C

Indications

Treatment of symptomatic botulism after documented/suspected exposure to botulism neurotoxins A,B, C, D, E, F, or G.

Contraindications/Precautions

Contraindicated in: None.

Use Cautiously in: Patients at risk of acute hypersensitivity reactions, including history of hypersensitivity to horses, equine products, asthma or hay fever (consider skin sensitivity testing); **OB:** Use only if benefits outweigh risks; **Lactation:** Use cautiously if breast feeding.

Adverse Reactions/Side Effects

CNS: headache, fatigue. **CV:** edema, vasovagal reaction. **GI:** nausea. **Derm:** pruritus, urticaria, rash. **MS:** arthralgia, myalgia. **Misc:** chills, fever, delayed allergic reactions including **SERUM SICKNESS**, hypersensitivity reactions including **ANAPHYLAXIS**, infusion reactions, transmission of infectious agents (equine plasma source).

Route/Dosage

IV (Adults and Children ≥17 yr): One vial.

IV (Children 1–<17 yr): *Body weight* >55 kg—100% of adult dose; *body weight*

50–54 kg—80% of adult dose; *body weight*
 45–49 kg—75% of the adult dose; *body weight*
 40–44 kg—70% of adult dose; *body weight*
 35–39 kg—65% of adult dose; *body weight*
 30–34 kg—60% of adult dose; *body weight*
 25–29 kg—50% of adult dose; *body weight*
 20–24 kg—40% of adult dose; *body weight*
 15–19 kg—30% of adult dose; *body weight*
 10–14 kg—20% of adult dose.

IV (Infants <1 yr): 10% of the adult dose.

**centruroides (scorpion)
 immune F(ab')₂ (equine)
 injection**
 (sen-troo-roy-dees im-myoon fab)
 Anascorp

Classification

Therapeutic: antitoxins

Pharmacologic: antivenom

Pregnancy Category C

Indications

Treatment of clinically important signs of scorpion envenomation which may include loss of muscle control, roving/abnormal eye movements, slurred speech, respiratory distress, excessive salivation, frothing at the mouth, and vomiting.

Contraindications/Precautions

Contraindicated in: No contraindications noted.

Use Cautiously in: Known allergies to horse protein (↑ risk of serious hypersensitivity reactions); sensitization may develop from previous treatment; **Lactation:** Use cautiously, secretion into breast milk is not known; **OB:** Use during pregnancy only if clearly needed.

Adverse Reactions/Side Effects

CNS: fatigue, headache, lethargy. **EENT:** rhinorrhea. **Resp:** cough. **GI:** nausea, vomiting, diarrhea. **Derm:** pruritus, rash. **Local:** localized reactions (from cresol excipient). **MS:** generalized myalgias (from cresol excipient), myalgia. **Misc:** hypersensitivity reactions including **ANAPHYLAXIS**, delayed hypersensitivity reactions including **SERUM SICKNESS**, fever.

Route/Dosage

IV (Adults): 3 vials initially, followed by 1 vial every 30–60 min as needed.

dabrafenib (da-braf-e-nib)
 Tafinlar

Classification

Therapeutic: antineoplastics

Pharmacologic: kinase inhibitors

Pregnancy Category D

Indications

Treatment of metastatic/unresectable melanoma in patients with the BRAF V600E mutation.

Contraindications/Precautions

Contraindicated in: **OB:** Pregnancy (may cause fetal harm); **Lactation:** Breast feeding should be avoided; Concurrent use of CYP3A4/CYP2C8 inhibitors or inducers (may significantly alter levels and effects).

Use Cautiously in: BRAF Wild-type melanoma (may ↑ proliferation); **H** History of Glucose-6-Phosphate Dehydrogenase Deficiency (may cause hemolytic anemia); Moderate to severe hepatic impairment (blood levels may be ↑); Moderate to severe renal impairment; **OB:** Patients with reproductive potential (hormonal contraceptives may be less effective, additional methods required); **Pedi:** Safe and effective use in children has not been established.

Adverse Reactions/Side Effects

CNS: headache, fatigue. **EENT:** iritis, uveitis.

Resp: cough, nasopharyngitis. **GI:** constipation, pancreatitis. **Derm:** alopecia, hyperkeratosis, palmar-plantar erythrodysesthesia, papilloma, cutaneous squamous cell carcinoma. **F and E:** hypophosphatemia, hyponatremia. **MS:** arthralgia, back pain, myalgia. **Misc:** fever including serious febrile reactions, ↑ alkaline phosphatase, chills, tumor promotion.

Route/Dosage

PO (Adults): 150 mg twice daily, continued until disease progression or unacceptable toxicity. Dose modifications recommended for various levels of related toxicities.

eslicarbazepine
 (es-lye-kar-bay-ze-peen)
 Aptiom

Classification

Therapeutic: anticonvulsants

Pharmacologic: carbamazepine analogues

Pregnancy Category C

Indications

Adjunctive treatment of partial-onset seizures.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to eslicarbazepine or oxcarbazepine; Severe hepatic impairment; **OB:** May cause fetal harm; **Lactation:** Enters breast milk, avoid breast feeding.

Use Cautiously in: Concurrent use with carbamazepine ($\uparrow$ risk of adverse reactions); Renal impairment (dose adjustment required for CCr <50 mL/min); **Geri:** Consider age-related decrease in renal, hepatic, and cardiovascular function, concurrent disease states and drug therapies; **Pedi:** Safe and effective use in children <18 yr has not been established.

Adverse Reactions/Side Effects

CNS: **SUICIDAL BEHAVIOR/IDEATION**, dizziness, drowsiness, fatigue, cognitive dysfunction, depression, headache, insomnia, vertigo. **EENT:** visual changes. **GI:** nausea, drug-induced liver injury, vomiting. **Derm:** serious dermatologic reactions including **STEVENS-JOHNSON SYNDROME**. **Endo:** abnormal thyroid function. **F and E:** hyponatremia. **Neuro:** gait disturbance, tremor. **Misc:** hypersensitivity reactions including **ANAPHYLAXIS**, **ANGIOEDEMA**, drug reaction with **EOSINOPHILIA** and **SYSTEMIC SYMPTOMS (STRESS)/MULTI-ORGAN HYPERSENSITIVITY**.

Route/Dosage

PO (Adults): 400 mg once daily initially, after 1 wk $\uparrow$ to 800 mg daily, can be $\uparrow$ after 1 wk to maximum of 1200 mg daily (usual maintenance dose is 800 mg daily). Do not discontinue abruptly.

Renal Impairment

PO (Adults): CCr <50 mL/min—200 mg once daily initially, after 2 wk $\uparrow$ to 400 mg once daily, may be $\uparrow$ to a maximum maintenance dose of 600 mg once daily. Do not discontinue abruptly.

glycerol phenylbutyrate
(gli-ser-ol fen-il-bue-ti-rate)
Ravicti

Classification

Therapeutic: orphan drugs

Pharmacologic: nitrogen-binding agents

Pregnancy Category C

Indications

Chronic treatment of hyperammonemia associated with urea cycle disorders (UCDs) that cannot be managed by dietary protein restriction and/or amino acid supplementation, which must be continued. Not to be used for acute treatment of hyperammonemia.

Contraindications/Precautions

Contraindicated in: Known hypersensitivity to phenylbutyrate (wheezing, dyspnea, coughing, hypotension, flushing, nausea, rash); **Lactation:** Avoid breast feeding; **Pedi:** Age <2 mo.

Use Cautiously in: Moderate to severe hepatic impairment (initiate treatment at low end of dose range; Pancreatic insufficiency/intestinal malabsorption (may $\downarrow$ absorption of phenylbutyrate); Renal impairment (monitor ammonia levels carefully); **Geri:** Consider age-related decrease in renal/hepatic/cardiac function, concurrent disease states and medications; **OB:** Use only if maternal benefit justifies potential fetal risk.

Adverse Reactions/Side Effects

CNS: headache, fatigue ($\uparrow$ in adults). **GI:** abdominal pain ($\uparrow$ in children), $\downarrow$ appetite, diarrhea, flatulence, nausea, dyspepsia, vomiting. **Derm:** rash ($\uparrow$ in children). **Metab:** hyperammonemia. **Neuro:** neurotoxicity.

Route/Dosage

Total daily dose is given in three equally divided doses, adjustments based on plasma ammonia, urinary phenylacetylglutamine or plasma phenylacetate. Consider estimated ability to synthesize urea, dietary protein intake and adherence to dietary recommendations.

PO (Adults and Children ≥ 2 yr): *Switching from sodium phenylbutyrate*—total daily dose of glycerol phenylbutyrate = daily dose of sodium phenylbutyrate (g) $\times 0.86$; *initial dose in phenylbutyrate naïve patients*—4.5–11.2 mL/m²/day (5–12.4 g/m²/day). Total daily dose is divided into three equal doses, rounded up to the nearest 0.5 mL.

Hepatic Impairment

PO (Adults and Children ≥ 2 yr): Initiate therapy at lower end of dose range.

✳ = Canadian drug name. H = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

REMS

macitentan (ma-si-ten-tan)
Opsumit**Classification**

Therapeutic: Agents for pulmonary hypertension, none assigned
Pharmacologic: endothelin receptor antagonists

Pregnancy Category X**Indications**

Treatment of pulmonary hypertension (PAH, WHO Group I) to delay disease progression.

Contraindications/Precautions

Contraindicated in: Strong inhibitors or inducers of the CYP3A4 enzyme system (can significantly alter drug effectiveness/risk of toxicity); **OB:** Causes fetal harm, should not be used during pregnancy; **Lactation:** Discontinue drug or breast feeding.

Use Cautiously in: Females with reproductive potential (pregnancy must be excluded prior to treatment and for 1 mo following treatment, effective contraception must be utilized); Pulmonary veno-occlusive disease (↑ risk of pulmonary edema); **Pedi:** Safe and effective use in children has not been established.

Adverse Reactions/Side Effects

CNS: headache. **Resp:** pulmonary edema. **GI:** hepatotoxicity. **GU:** ↓ sperm count. **Hemat:** anemia.

Route/Dosage

PO (Adults): 10 mg once daily.

obinutuzumab
(oh-bi-nue-too-z-ue mab)
Gazyva**Classification**

Therapeutic: antineoplastics
Pharmacologic: monoclonal antibodies

Pregnancy Category C**Indications**

Treatment-naïve patients with chronic lymphocytic leukemia (in combination with chlorambucil).

Contraindications/Precautions

Contraindicated in: Prior or concurrent live virus vaccinations; **Lactation:** Breast feeding should be avoided.

Use Cautiously in: Hepatitis B infection (may reactivate); **OB:** Use only in pregnancy if potential benefit outweighs fetal risks; **Pedi:** Safe and effective use in children has not been established.

Adverse Reactions/Side Effects

CNS: PROGRESSIVE MULTIFOCAL LEUKOENCEPHALOPATHY. **Resp:** cough. **CV:** hypotension. **GI:** hypocalcemia, hypokalemia, hyponatremia. **Hemat:** neutropenia, thrombocytopenia, anemia. **MS:** musculoskeletal disorder. **Misc:** INFUSION REACTIONS, TUMOR LYSIS SYNDROME, hepatitis B reactivation, fever.

Route/Dosage**Premedication is required**

IV (Adults): Day 1 of Cycle 1—100 mg; Day 2 of Cycle 1—900 mg; Days 8 and 15 of Cycle 1—1000 mg; Day 1 of Cycles 2–6—1000 mg. In the case of serious reactions/toxicity, treatment modification may be necessary.

omacetaxine
(oh-ma-sat-ax-een)
Synribo**Classification**

Therapeutic: antineoplastics
Pharmacologic: protein synthesis inhibitors

Pregnancy Category D**Indications**

Treatment of chronic or accelerated phase chronic myeloid leukemia (CML) that has become resistant or intolerant to at least 2 tyrosine kinase inhibitors.

Contraindications/Precautions

Contraindicated in: **OB, Lactation:** Pregnancy or lactation.

Use Cautiously in: **Geri:** ↑ risk of hematologic toxicity in patients >65 yr; **Pedi:** Safe and effective use in children has not been established.

Adverse Reactions/Side Effects

CNS: fatigue, headache, insomnia, anxiety, depression, mental status changes. **EENT:** epistaxis, ear pain, tinnitus. **Resp:** cough. **CV:** angina, arrhythmias, peripheral edema. **GI:** diarrhea, anorexia, mucositis, nausea, constipation, stomatitis, ↑ transaminases, upper abdominal pain, vomiting. **Derm:** alopecia, rash, hyperpigmentation, pruritus. **Endo:** HYPERGLYCEMIA. **Hemat:** ANEMIA, NEUTROPENIA, THROMBOCYTOPENIA, lymphopenia. **Local:** injection site reactions. **MS:** athralgia, myalgia,

musculoskeletal pain. **Metab:** infection, fever. **Misc:** hypersensitivity reactions, night sweats.

Route/Dosage

Subcut (Adults): *Induction*—1.25 mg/m² twice daily for 14 consecutive days of a 28-day cycle; *maintenance*—1.25 mg/m² twice daily for 7 consecutive days of a 28-day cycle. Modifications required for toxicity, treatment should be continued as long as benefit is noted.

perampanel (per-am-pa-nel) Fycompa

Classification

Therapeutic: anticonvulsants
Pharmacologic: glutamate receptor antagonists

Pregnancy Category C

Drug schedule to be determined after DEA review.

Indications

Adjunctive treatment (with other anti-epileptic drugs [AEDs]) of partial-onset seizures with or without secondarily generalized seizures in epileptic patients ≥ 12 yr.

Contraindications/Precautions

Contraindicated in: Strong P450 inducers (other than AEDs); Severe hepatic impairment.

Use Cautiously in: History of homicidal/suicidal ideation or other psychiatric/behavioral issues; **Geri:** $\uparrow$ risk of adverse reactions, slower titration recommended; **OB:** Use in pregnancy only when potential benefits outweigh potential fetal risks.; **Lactation:** Use cautiously; **Pedi:** Safe and effective use in children < 12 yr has not been established.

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, headache, aggression, anger, fatigue, psychiatric/behavioral problems, hostility, irritability, suicidal ideation, vertigo. **Metab:** weight gain. **Neuro:** ataxia, balance disorder, gait disturbance. **Misc:** falls.

Route/Dosage

PO (Adults and Children ≥ 12 yr): 2 mg once daily at bedtime initially, may be $\uparrow$ by 2 mg weekly up to 4–12 mg daily; *concurrent enzyme-inducers*—4 mg once daily at bedtime initially may be $\uparrow$ by 2 mg weekly up to 12 mg daily. Daily dose should not exceed 12 mg.

PO (Geriatric Patients): 2 mg once daily at bedtime initially, may be $\uparrow$ by 2 mg every 2 wk up to 4–12 mg daily; *concurrent enzyme-inducers*—4 mg once daily at bedtime initially may be $\uparrow$ by 2 mg every 2 wk up to 12 mg daily. Daily dose should not exceed 12 mg.

Hepatic Impairment

PO (Adults and Children ≥ 12 yr): *Mild hepatic impairment*—2 mg once daily at bedtime initially, may be $\uparrow$ by 2 mg every 2 wk up to 6 mg daily; *concurrent enzyme-inducers*—4 mg once daily at bedtime initially may be $\uparrow$ by 2 mg every 2 wk up to 6 mg daily. Daily dose should not exceed 6 mg; *moderate hepatic impairment*—2 mg once daily at bedtime initially, may be $\uparrow$ by 2 mg after 2 wk up to 4 mg daily; *concurrent enzyme-inducers*—4 mg once daily at bedtime; daily dose should not exceed 4 mg.

raxibacumab

(rax-ee-bak-ue-mab)
ABthrax

Classification

Therapeutic: antidotes
Pharmacologic: monoclonal antitoxin

Pregnancy Category B

Indications

Treatment of inhalational anthrax in combination with anti-infective agents. Prevention of inhalational anthrax when other agents cannot be used or are unavailable.

Contraindications/Precautions

Contraindicated in: No contraindications noted.

Use Cautiously in: Infusion reactions (premedication with diphenhydramine is recommended); **OB:** Effects in pregnant women are not known; **Lactation:** Use cautiously; **Pedi:** Safe and effective use in children > 16 yr has not been studied.

Adverse Reactions/Side Effects

CNS: drowsiness. **Derm:** pruritus, rash. **MS:** extremity pain. **Misc:** infusion reactions (rash/urticaria/pruritus).

Route/Dosage

Pretreatment with diphenhydramine is recommended.

★ = Canadian drug name. ⚠ = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

IV (Adults and Children > 50 kg): 40 mg/kg single dose.

IV (Children >15 kg–50 kg): 60 mg/kg single dose.

IV (Children ≤15 kg): 80 mg/kg single dose.

riociguat (rye-oh-sig-ue-at) Adempas

Classification

Therapeutic: agents for pulmonary hypertension

Pharmacologic: soluble guanylate cyclase stimulators (sGS)

Pregnancy Category X

Indications

Treatment of chronic thromboembolic pulmonary hypertension (CTEPH, WHO Group 4) after surgery or in nonsurgical candidates. Treatment of pulmonary arterial hypertension (PAH, WHO Group 1).

Contraindications/Precautions

Contraindicated in: Severe hepatic impairment (Child Pugh C); Severe renal impairment (CCr <15 mL/min or on dialysis); Known pulmonary veno-occlusive disease; Concurrent use of nitrates, nitric oxide donors, or phosphodiesterase (PDE) inhibitors; **OB:** May cause fetal harm, pregnancy should be avoided (negative pregnancy tests required before and monthly during treatment); **Lactation:** Discontinue breast feeding.

Use Cautiously in: Resting hypotension, hypovolemia, severe left-ventricular outflow obstruction, autonomic dysfunction, concurrent anti-hypertensive therapy or CYP, and P-gp/BCRP inhibitors (↑ risk of hypotension, consider dose reduction); Cigarette smokers (require ↑ doses, with subsequent adjustment if smoking is stopped); Patients with reproductive potential (effective contraception is required); **Geri:** Elderly may have ↑ blood levels and be more sensitive to drug effects; **Pedi:** Safe and effective use in children has not been established.

Adverse Reactions/Side Effects

CNS: dizziness, headache. **CV:** **PULMONARY**

EDEMA (↑ **IN VENO-OCCLUSIVE DISEASE**), hypotension. **GI:** dyspepsia, gastritis, nausea, vomiting, constipation, diarrhea, gastroesophageal reflux.

Hemat: **BLEEDING**, anemia.

Route/Dosage

PO (Adults): 1 mg three times daily initially; if hypotension a risk factor, initiate treatment with

0.5 mg three times daily. ↑ dose by 0.5 mg at 2 wk (or more) intervals up to maintenance dose of 2.5 mg three times daily; **smokers**—consider titrating to doses >2.5 mg three times daily if tolerated (readjust following smoking cessation; **concurrent CYP and P-gp/BCRP inhibitors**—consider initiating treatment at 0.5 mg three times daily, with careful monitoring for hypotension.

simeprevir (sim-e-pre-vir) Olysio

Classification

Therapeutic: antivirals

Pharmacologic: proteasome inhibitors

Pregnancy Category C (alone), X (for combination with ribavirin and peginterferon alfa)

Indications

Treatment of hepatitis C in combination with other agents (peginterferon alfa and ribavirin) as a total regimen in patients with infection caused by the hepatitis C virus (HCV) genotype 1 (other genotypes may not respond). Not to be used as monotherapy.

Contraindications/Precautions

Contraindicated in: Moderate-to-severe hepatic impairment (ribavirin and peginterferon alfa contraindication); Any condition in which peginterferon alfa or ribavirin is contraindicated; Concurrent use of moderate or strong inhibitors or inducers of the CYP3A system (may significantly change in blood levels, effectiveness and risk of toxicity/adverse reactions); **OB:** Pregnant women and men whose female partners are pregnant (ribavirin contraindication). **Use Cautiously in:** History of sulfonamide hypersensitivity (cross-sensitivity may occur); **EA** East Asian ancestry (high blood levels, ↑ risk of adverse reactions including rash and photosensitivity); Severe renal impairment/dialysis.

Adverse Reactions/Side Effects

Reflects combination use with peginterferon alfa and ribavirin.

Resp: dyspnea. **GI:** hyperbilirubinemia, nausea. **Derm:** photosensitivity, pruritus, rash. **MS:** myalgia.

Route/Dosage

PO (Adults): 150 mg once daily (with peginterferon alfa and ribavirin) for 12 wk. Treatment with peginterferon alfa and ribavirin may continue for 12–48 wk depending on virologic response.

tbo-filgrastim

(tbo fil-gras-tim)

Granix

Classification

Therapeutic: colony-stimulating factors

Pregnancy Category C**Indications**

To reduce the duration/severity of neutropenia in patients with nonmyeloid malignancies who have received myelosuppressive antineoplastics associated with significant febrile neutropenia.

Contraindications/Precautions

Contraindicated in: Hypersensitivity, including previous hypersensitivity to filgrastim or pegfilgrastim.

Use Cautiously in: Sick-cell disease; **OB:** Use only if potential benefit justifies potential fetal risk; **Lactation:** Use cautiously; **Pedi:** Safety and effectiveness not established.

Adverse Reactions/Side Effects

Resp: ACUTE RESPIRATORY DISTRESS SYNDROME.

GI: SPLENIC RUPTURE. **Derm:** rash, urticaria.

Hemat: SICKLE-CELL CRISIS, leukocytosis. **MS:** bone pain. **Misc:** hypersensitivity reactions including ANAPHYLAXIS and ANGIONEUROTIC EDEMA, potential for tumor growth stimulation.

Route/Dosage

Subcut (Adults and Children >18 yr): 5 mcg/kg per day; given no earlier than 24 hr following myelosuppressive chemotherapy; continue until expected neutrophil nadir is passed and neutrophil recovery has occurred.

turoctocog alfa

(too-rok-to-cog al-fa)

Novoeight

Other Name(s):

Antihemophilic factor (recombinant)

Classification

Therapeutic: hemostatic agents, none assigned

Pharmacologic: clotting factor replacements

Pregnancy Category C**Indications**

Prevention/control of bleeding in patients with hemophilia A.

Contraindications/Precautions

Contraindicated in: Life-threatening hypersensitivity to turoctocog alfa or any of its components, including hamster protein.

Use Cautiously in: **OB:** Use during pregnancy only if clearly needed; **Lactation:** Use only if clearly indicated; **Pedi:** Clearance in more rapid in children (↑ dose or more frequent dosing may be necessary).

Adverse Reactions/Side Effects

GI: ↑ liver enzymes. **Local:** injection site reactions. **Misc:** hypersensitivity reactions including ANAPHYLAXIS, fever, presence of activity-neutralizing antibodies.

Route/Dosage**General dosing**

IV (Adults and Children): *General dosing*—Dosage required (IU) = body weight (kg) × Desired Factor VIII ↑ (IU/dL or % normal) × 0.5 (IU/kg per IU/dL).

Control/prevention of bleeding episodes

IV (Adults and Children): *Minor bleeding*—20–40% of normal Factor VIII level required every 12–24 hr for at least one day until resolution of bleeding; *moderate bleeding*—30–60% of normal Factor VIII level required every 12–24 hr until pain/disability resolves (3–4 days); *major bleeding*—60–100% of normal Factor VIII level required every 8–24 hr until resolution of bleed (7–10 days).

Perioperative management

IV (Adults and Children): *Minor procedures (including tooth extraction)*—30–60% of normal Factor VIII level required every 24 hr for one day until healing achieved; *major procedures*—80–100% of normal Factor VIII level required every 8–24 hr pre- and postoperative until adequate wound healing achieved then continue for 7–10 days maintaining 30–60% of normal activity.

Routine prophylaxis

IV (Adults and Children ≥12 yr): 20–50 IU/kg three times weekly or 20–40 IU/kg every other day.

IV (Children <12 yr): 25–60 IU/kg three times weekly or 25–50 IU/kg every other day.

✶ = Canadian drug name. ⚠ = Genetic implication. ~~Stricken through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

NEW DOSAGE FORMS

Generic Name (Brand Name)	New Dosage Form
acetaminophen/oxycodone (Xartemis XR)	Extended release acetaminophen 325 mg/oxycodone 7.5 mg tablet for moderate to severe acute pain, made with abuse-deterrent technology.
cysteamine ophthalmic (Cystaran)	Treatment of corneal cystine crystal accumulation in patients with cystinosis.
epinephrine auto-injector (Auvi-Q)	Auto-injector for treatment of anaphylaxis includes audio prompts.
esomeprazole strontium (generic only)	New salt form of the proton-pump inhibitor (PPI) esomeprazole.
indomethacin (Tivorbex)	Oral capsule formulation for mild to moderate acute pain in adults.
influenza vaccine (Flublock)	Formulation contains no egg protein.
influenza vaccine (Flucelvax)	Cell-based influenza vaccine.
polidocanol (Varithena)	Injectable foam formulation for varicose veins.
posaconazole (Noxafil)	Tablet and IV formulations.
propranolol (Hemangeol)	Oral solution 4.28 mg/mL (strawberry/vanilla flavor) for treatment of proliferating infantile hemangioma requiring systemic therapy.
pseudoephedrine (Nexafed)	Tablets contain a deterrent to avoid illegal conversion to methamphetamine.
tazarotene (Fabior)	0.1% foam for acne.
testosterone (Aveed)	Injectable formulation requiring less-frequent dosing.
topiramate (Qudexy XR)	Extended-release capsule for treatment of partial onset seizures, primarily generalized tonic-clonic seizures, and Lennox-Gastaut Syndrome.
treprostinil (Orenitram)	Oral-extended release tablet for pulmonary arterial hypertension.
triamcinolone nasal (Nasacort Allergy 24HR)	Rx-to-OTC switch (Rx was Nasacort AQ).

RECENT LABELING CHANGES (New Warnings/Indications)

Generic Name (Brand Name)	Labeling Change
acetaminophen oral	Health care professionals should not prescribe or dispense combination products containing >325 mg/dosage unit.
acetaminophen IV (Ofirmev)	Warning regarding potential medication errors and ↑ warning of hepatotoxicity.
alvimopan (Entereg)	Risk of MI with long-term use (unlabeled use).
Anticoagulants, Antiplatelet agents, low-molecular weight heparins, NSAIDs	Strengthened warning about timing of neuroaxial procedures and drug administration.
collagenase clostridium histolyticum injection (Xiaflex)	Expanded indication for Peyronie's disease in men.
doribax (Doripenem)	↓ cure rates, ↑ mortality when used to treat ventilator-acquired pneumonia (unlabeled use).
esomeprazole IV (Nexium)	Indicated for prevention of bleeding/rebleeding following endoscopy and short-term treatment of esophagitis in patients 1–17 yr when oral therapy is not feasible.
fentanyl transdermal (Duragesic)	Strengthened warning about accidental exposure to children/pets, color change made to patch ink.
haemophilus b conjugate vaccine (ActHIB)	Upper age limit expanded to 5 yr.
ivacaftor (Kalydeco)	Expanded indication for other gene mutations associated with cystic fibrosis.
ketoconazole (oral) (Nizoral)	Concurrent use of additional drugs contraindicated: cisapride, methadone, disopyramide, dronedarone and ranolazine.

RECENT LABELING CHANGES (New Warnings/Indications) (continued)

Generic Name (Brand Name)	Labeling Change
methylphenidate (Biphentin, Concerta, Metadate, Methylin, Quillivant, Ritalin)	May cause priapism (rare but serious), may result in permanent damage to the penis.
opioids, extended-release and long-acting	New guidelines for prescribing and cautions for use during pregnancy which may result in neonatal opioid withdrawal syndrome (NOWS).
ponatinib (Iclusig)	Briefly taken off market, then reintroduced with strengthened warnings of ↑ risk of blood clots and narrowing of blood vessels.
propranolol (Hemangeol)	Oral solution 4.28 mg/mL (strawberry/vanilla flavor) for treatment of proliferating infantile hemangioma requiring systemic therapy.
rosiglitazone (Avandia), rosiglitazone/metformin (Avandamet), rosiglitazone/glimepiride (Avandaryl)	Lessening of cardiovascular restrictions.
vigabatrin (Sabril)	Approved as add-on treatment for refractory complex seizures.

DISCONTINUED DRUGS

Generic Name (Brand Name)	Reason for Discontinuation
asparaginase (Elspar)	Discontinued by manufacturer.
buprenorphine/naloxone tablets (Suboxone)	Discontinued due to ↑ accidental exposure in children compared to film dose form.
gancyclovir	Discontinued by manufacturer.
peginesatide (Omontys)	Serious hypersensitivity reactions and deaths.
sotalol injection	Discontinued by manufacturer.

🇨🇦 = Canadian drug name. ⚠️ = Genetic implication. ~~Striked through~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

Combination Drugs

Note: The drugs listed in this section are in alphabetical order according to trade names. If the trade name does not specify dose form, the dose form is either a tablet or capsule. Following each trade name are the generic names and doses of the active ingredients contained in each preparation. For information on these drugs, look up each generic name in the combination. For inert ingredients, see drug label. (otc) signifies “over-the-counter” or nonprescription medication.

- ❖ **222**—aspirin 375 mg + codeine 8 mg + caffeine 30 mg (otc)
- Acanya Topical Gel**—1.2% clindamycin + 2.5% benzoyl peroxide
- Accuretic 10/12.5**—quinapril 10 mg + hydrochlorothiazide 12.5 mg
- Accuretic 20/12.5**—quinapril 20 mg + hydrochlorothiazide 12.5 mg
- Accuretic 20/25**—quinapril 20 mg + hydrochlorothiazide 25 mg
- Activella 0.5/0.1**—estradiol 0.5 mg + norethindrone 0.1 mg
- Activella 1/0.5**—estradiol 1 mg + norethindrone 0.5 mg
- Actoplus Met 15/500**—pioglitazone 15 mg + metformin 500 mg
- Actoplus Met 15/850**—pioglitazone 15 mg + metformin 850 mg
- Actoplus Met XR 15/1000**—pioglitazone 15 mg + metformin extended-release 1000 mg
- Actoplus Met XR 30/1000**—pioglitazone 30 mg + metformin extended-release 1000 mg
- Adderall XR 5 mg**—dextroamphetamine saccharate 1.25 mg + dextroamphetamine sulfate 1.25 mg + amphetamine aspartate monohydrate 1.25 mg + amphetamine sulfate 1.25 mg
- Adderall XR 10 mg**—dextroamphetamine saccharate 2.5 mg + dextroamphetamine sulfate 2.5 mg + amphetamine aspartate monohydrate 2.5 mg + amphetamine sulfate 2.5 mg
- Adderall XR 15 mg**—dextroamphetamine saccharate 3.75 mg + dextroamphetamine sulfate 3.75 mg + amphetamine aspartate monohydrate 3.75 mg + amphetamine sulfate 3.75 mg
- Adderall XR 20 mg**—dextroamphetamine saccharate 5 mg + dextroamphetamine sulfate 5 mg + amphetamine aspartate monohydrate 5 mg + amphetamine sulfate 5 mg
- Adderall XR 25 mg**—dextroamphetamine saccharate 6.25 mg + dextroamphetamine sulfate 6.25 mg + amphetamine aspartate monohydrate 6.25 mg + amphetamine sulfate 6.25 mg
- Adderall XR 30 mg**—dextroamphetamine saccharate 7.5 mg + dextroamphetamine sulfate 7.5 mg + amphetamine aspartate monohydrate 7.5 mg + amphetamine sulfate 7.5 mg
- Advair Diskus 100**—(per actuation) fluticasone 100 mcg + salmeterol 50 mcg
- Advair Diskus 250**—(per actuation) fluticasone 250 mcg + salmeterol 50 mcg
- Advair Diskus 500**—(per actuation) fluticasone 500 mcg + salmeterol 50 mcg
- Advair HFA 45**—(per actuation) fluticasone 45 mcg + salmeterol 21 mcg
- Advair HFA 115**—(per actuation) fluticasone 115 mcg + salmeterol 21 mcg
- Advair HFA 230**—(per actuation) fluticasone 230 mcg + salmeterol 21 mcg
- Advicor 500/20**—extended-release niacin 500 mg + lovastatin 20 mg
- Advicor 750/20**—extended-release niacin 750 mg + lovastatin 20 mg
- Advicor 1000/20**—extended-release niacin 1000 mg + lovastatin 20 mg
- Advicor 1000/40**—extended-release niacin 1000 mg + lovastatin 40 mg
- Advil Allergy and Congestion Relief**—phenylephrine 10 mg + ibuprofen 200 mg + chlorpheniramine 4 mg (otc)
- Advil Allergy Sinus**—pseudoephedrine 30 mg + ibuprofen 200 mg + chlorpheniramine 2 mg (otc)
- Advil Cold & Sinus**—pseudoephedrine 30 mg + ibuprofen 200 mg (otc)
- Advil Congestion Relief**—phenylephrine 10 mg + ibuprofen 200 mg (otc)
- Advil PM**—diphenhydramine citrate 38 mg + ibuprofen 200 mg (otc)
- Aggrenox**—aspirin 25 mg + extended-release dipyridamole 200 mg
- Alavert Allergy and Sinus D-12**—loratadine 5 mg + pseudoephedrine 120 mg (otc)
- Aldactazide 25/25**—hydrochlorothiazide 25 mg + spironolactone 25 mg
- Aldactazide 50/50**—hydrochlorothiazide 50 mg + spironolactone 50 mg

- Aleve-D Sinus & Cold**—naproxen 220 mg + extended-release pseudoephedrine 120 mg (OTC)
- Alka-Seltzer Effervescent, Original**—citric acid 1000 mg + sodium bicarbonate 1916 mg + aspirin 325 mg (OTC)
- Alka-Seltzer Effervescent, Xtra-Strength**—citric acid 1000 mg + sodium bicarbonate 1985 mg + aspirin 500 mg (OTC)
- Alka-Seltzer Plus Cold & Cough Formula Liquid Gels**—dextromethorphan 10 mg + phenylephrine 5 mg + chlorpheniramine 2 mg + acetaminophen 325 mg (OTC)
- Alka-Seltzer Plus-D Multi-Symptom Sinus & Cold Liquid Gels**—dextromethorphan 10 mg + pseudoephedrine 30 mg + chlorpheniramine 2 mg + acetaminophen 325 mg (OTC)
- Alka-Seltzer Plus Day Non-Drowsy Cold & Flu Formula Liquid Gels**—dextromethorphan 10 mg + phenylephrine 5 mg + acetaminophen 325 mg (OTC)
- Alka-Seltzer Plus Effervescent Cold & Cough Formula**—dextromethorphan 10 mg + phenylephrine 7.8 mg + chlorpheniramine 2 mg + aspirin 325 mg (OTC)
- Alka-Seltzer Plus Effervescent Cold & Flu Formula**—dextromethorphan 10 mg + phenylephrine 5 mg + chlorpheniramine 2 mg + acetaminophen 250 mg (OTC)
- Alka-Seltzer Plus Effervescent Night Cold Formula**—dextromethorphan 10 mg + phenylephrine 7.8 mg + doxylamine 6.25 mg + aspirin 500 mg (OTC)
- Alka-Seltzer Plus Effervescent Sparkling Original Cold Formula**—phenylephrine 7.8 mg + chlorpheniramine 2 mg + aspirin 300 mg (OTC)
- Alka-Seltzer Plus Mucus & Congestion Max Cough Liquid Gels**—dextromethorphan 10 mg + guaifenesin 200 mg (OTC)
- Alka-Seltzer Plus Night Cold & Flu Formula Liquid Gels**—acetaminophen 325 mg + doxylamine 6.25 mg + dextromethorphan 10 mg + phenylephrine 5 mg (OTC)
- Alka-Seltzer Plus Severe Allergy, Sinus Congestion & Headache Formula Liquid Gels**—acetaminophen 325 mg + doxylamine 6.25 mg + phenylephrine 5 mg (OTC)

- Exforge HCT 10/320/25**—amlodipine 10 mg + valsartan 320 mg + hydrochlorothiazide 25 mg
- Falmina**—levonorgestrel 0.1 mg + ethinyl estradiol 20 mcg
- Femcon Fe**—norethindrone 0.4 mg + ethinyl estradiol 35 mcg + ferrous fumarate 75 mg
- Femhrt 0.5/2.5**—norethindrone 0.5 mg + ethinyl estradiol 2.5 mcg
- Femhrt 1/5**—norethindrone 1 mg + ethinyl estradiol 5 mcg
- Ferro-Sequels**—docusate sodium 100 mg + ferrous fumarate 150 mg (otc)
- Fioricet**—acetaminophen 325 mg + caffeine 40 mg + butalbital 50 mg
- Fioricet with Codeine**—acetaminophen 325 mg + caffeine 40 mg + butalbital 50 mg + codeine 30 mg
- Fiorinal**—aspirin 325 mg + caffeine 40 mg + butalbital 50 mg
- Fiorinal with Codeine**—aspirin 325 mg + caffeine 40 mg + butalbital 50 mg + codeine 30 mg
- Fosamax Plus D 70/2800**—alendronate 70 mg + cholecalciferol 2800 IU
- Fosamax Plus D 70/5600**—alendronate 70 mg + cholecalciferol 5600 IU
- Gaviscon Extra Strength**—magnesium carbonate 105 mg + aluminum hydroxide 160 mg (otc)
- Gaviscon Extra-Strength Liquid**—(per 5 mL) aluminum hydroxide 254 mg + magnesium carbonate 237.5 mg (otc)
- Gaviscon Regular Strength**—magnesium trisilicate 14.2 mg + aluminum hydroxide 80 mg (otc)
- Gaviscon Regular Strength Liquid**—(per 5 mL) aluminum hydroxide 31.7 mg + magnesium carbonate 119.3 mg (otc)
- Gelusil**—aluminum hydroxide 200 mg + magnesium hydroxide 200 mg + simethicone 25 mg (otc)
- Generess Fe**—norethindrone 0.8 mg + ethinyl estradiol 25 mcg + ferrous fumarate 75 mg
- Gianvi**—drospirenone 3 mg + ethinyl estradiol 20 mcg
- Gildagia**—norethindrone 0.4 mg + ethinyl estradiol 35 mcg
- Gildess Fe 1/20**—norethindrone 1 mg + ethinyl estradiol 20 mcg + ferrous fumarate 75 mg
- Gildess Fe 1.5/30**—norethindrone 1.5 mg + ethinyl estradiol 30 mcg + ferrous fumarate 75 mg
- Glucovance 1.25/250**—glyburide 1.25 mg + metformin 250 mg
- Glucovance 2.5/500**—glyburide 2.5 mg + metformin 500 mg
- Glucovance 5/500**—glyburide 5 mg + metformin 500 mg
- Golytely**—PEG 3350 236 g + sodium sulfate 22.74 g + sodium bicarbonate 6.74 g + sodium chloride 5.86 g + potassium chloride 2.97 g
- Golytely Packets**—PEG 3350 227.1 g + sodium sulfate 21.5 g + sodium bicarbonate 6.36 g + sodium chloride 5.53 g + potassium chloride 2.82 g
- Granulex Topical Aerosol**—(per 0.8 mL) trypsin 0.12 mg + Balsam Peru 87 mg + castor oil 788 mg
- Helidac**—bismuth subsalicylate 262.4-mg tablets + metronidazole 250-mg tablets + tetracycline 500-mg capsules in a compliance package
- Humalog Mix 50/50**—insulin lispro protamine suspension 50% + insulin lispro solution 50%
- Humalog Mix 75/25**—insulin lispro protamine suspension 75% + insulin lispro solution 25%
- Hyzaar 50/12.5**—losartan 50 mg + hydrochlorothiazide 12.5 mg
- Hyzaar 100/12.5**—losartan 100 mg + hydrochlorothiazide 12.5 mg
- Hyzaar 100/25**—losartan 100 mg + hydrochlorothiazide 25 mg
- Ibudone 5/200**—hydrocodone 5 mg + ibuprofen 200 mg
- Ibudone 10/200**—hydrocodone 10 mg + ibuprofen 200 mg
- Imodium Multi-Symptom Relief**—loperamide 2 mg + simethicone 125 mg (otc)
- Inderide 40/25**—propranolol 40 mg + hydrochlorothiazide 25 mg
- Introvale**—levonorgestrel 0.15 mg + ethinyl estradiol 30 mcg
- IsonaRif**—isoniazid 150 mg + rifampin 300 mg
- Jalyn**—dutasteride 0.5 mg + tamsulosin 0.4 mg
- Janumet 50/500**—sitagliptin 50 mg + metformin 500 mg

- Janumet 50/1000**—sitagliptin 50 mg + metformin 1000 mg
Janumet XR 50/500—sitagliptin 50 mg + metformin extended-release 500 mg
Janumet XR 50/1000—sitagliptin 50 mg + metformin extended-release 1000 mg
Janumet XR 100/1000—sitagliptin 100 mg + metformin extended-release 500 mg
Jentadueto 2.5/500—linagliptin 2.5 mg + metformin 500 mg
Jentadueto 2.5/850—linagliptin 2.5 mg + metformin 850 mg
Jentadueto 2.5/1000—linagliptin 2.5 mg + metformin 1000 mg
Jinteli—norethindrone 1 mg + ethinyl estradiol 5 mcg
Jolessa—levonorgestrel 0.15 mg + ethinyl estradiol 30 mcg
Junel 1/20—norethindrone 1 mg + ethinyl estradiol 20 mcg
Junel 1.5/30—norethindrone 1.5 mg + ethinyl estradiol 30 mcg
Junel Fe 1/20—norethindrone 1 mg + ethinyl estradiol 20 mcg + ferrous fumarate 75 mg
Junel Fe 1.5/30—norethindrone 1.5 mg + ethinyl estradiol 30 mcg + ferrous fumarate 75 mg
Kaletra 100/25 tablets—lopinavir 100 mg + ritonavir 25 mg
Kaletra 200/50 tablets—lopinavir 200 mg + ritonavir 50 mg
Kaletra solution—(per mL) lopinavir 80 mg + ritonavir 20 mg
Kariva—desogestrel 0.15 mg + ethinyl estradiol 20 mcg/10 mcg
Kazano 12.5/500—alogliptin 12.5 mg + metformin 500 mg
Kazano 12.5/1000—alogliptin 12.5 mg + metformin 500 mg
Kelnor—ethynodiol 1 mg + ethinyl estradiol 35 mcg
Kombiglyze XR 2.5/1000—saxagliptin 2.5 mg + metformin extended-release 1000 mg
Kombiglyze XR 5/500—saxagliptin 5 mg + metformin extended-release 500 mg
Kombiglyze XR 5/1000—saxagliptin 5 mg + metformin extended-release 1000 mg
Kurvelo—levonorgestrel 0.15 mg + ethinyl estradiol 30 mcg
Lactinex—mixed culture of *Lactobacillus acidophilus* and *L. bulgaricus* (OTC)
Larin Fe 1/20—norethindrone 1 mg + ethinyl estradiol 20 mcg + ferrous fumarate 75 mg
Larin Fe 1.5/30—norethindrone 1.5 mg + ethinyl estradiol 30 mcg + ferrous fumarate 75 mg
Leena
 Phase I—norethindrone 0.5 mg + ethinyl estradiol 35 mcg
 Phase II—norethindrone 1 mg + ethinyl estradiol 35 mcg
 Phase III—norethindrone 0.5 mg + ethinyl estradiol 35 mcg
Lessina-28—levonorgestrel 0.1 mg + ethinyl estradiol 20 mcg
Levonest
 Phase I—levonorgestrel 0.05 mg + ethinyl estradiol 30 mcg
 Phase II—levonorgestrel 0.075 mg + ethinyl estradiol 40 mcg
 Phase III—levonorgestrel 0.125 mg + ethinyl estradiol 30 mcg
Levora-28—levonorgestrel 0.15 mg + ethinyl estradiol 30 mcg
Lida-Mantle-HC Topical Cream—0.5% hydrocortisone + 3% lidocaine
Liptruzet 10/10—atorvastatin 10 mg + ezetimibe 10 mg
Liptruzet 20/10—atorvastatin 20 mg + ezetimibe 10 mg
Liptruzet 40/10—atorvastatin 40 mg + ezetimibe 10 mg
Liptruzet 80/10—atorvastatin 80 mg + ezetimibe 10 mg
Loestrin 21 1/20—norethindrone 1 mg + ethinyl estradiol 20 mcg
Loestrin 21 1.5/30—norethindrone 1.5 mg + ethinyl estradiol 30 mcg
Loestrin 24 Fe—norethindrone 1 mg + ethinyl estradiol 20 mcg with 4 tablets of ferrous fumarate 75 mg per container
Loestrin Fe 1/20—norethindrone 1 mg + ethinyl estradiol 20 mcg with 7 tablets of ferrous fumarate 75 mg per container
Loestrin Fe 1.5/30—norethindrone 1.5 mg + ethinyl estradiol 30 mcg with 7 tablets of ferrous fumarate 75 mg per container
Lo Loestrin Fe
 Phase I—norethindrone 1 mg + ethinyl estradiol 10 mcg
 Phase II—ethinyl estradiol 10 mcg
 Phase III—ferrous fumarate 75 mg
Lo Minastrin Fe—norethindrone 1 mg + ethinyl estradiol 10 mcg + ferrous fumarate 75 mg
Lomotil—diphenoxylate 2.5 mg + atropine 0.025 mg
Lonox—diphenoxylate 2.5 mg + atropine 0.025 mg
Lo/Ovral-28—ethinyl estradiol 30 mcg + norgestrel 0.3 mg
Lopressor HCT 50/25—metoprolol tartrate 50 mg + hydrochlorothiazide 25 mg
Lopressor HCT 100/25—metoprolol tartrate 100 mg + hydrochlorothiazide 25 mg

- Lopressor HCT 100/50**—metoprolol tartrate 100 mg + hydrochlorothiazide 50 mg
- Lortab 5/500**—hydrocodone 5 mg + acetaminophen 500 mg
- Lortab 7.5/500**—hydrocodone 7.5 mg + acetaminophen 500 mg
- Lortab 10/500**—hydrocodone 10 mg + acetaminophen 500 mg
- Lortab Elixir**—(per 5 mL) hydrocodone 2.5 mg + acetaminophen 167 mg
- Loryna**—drospirenone 3 mg + ethinyl estradiol 20 mcg
- LoSeasonique**—levonorgestrel 0.1 mg + ethinyl estradiol 20 mcg
- Lotensin HCT 5/6.25**—benazepril 5 mg + hydrochlorothiazide 6.25 mg
- Lotensin HCT 10/12.5**—benazepril 10 mg + hydrochlorothiazide 12.5 mg
- Lotensin HCT 20/12.5**—benazepril 20 mg + hydrochlorothiazide 12.5 mg
- Lotensin HCT 20/25**—benazepril 20 mg + hydrochlorothiazide 25 mg
- Lotrel 2.5/10**—amlodipine 2.5 mg + benazepril 10 mg
- Lotrel 5/10**—amlodipine 5 mg + benazepril 10 mg

- Veltin Topical Gel**—1.2% clindamycin + 0.025% tretinoin
- Vestura**—drospirinone 3 mg + ethinyl estradiol 20 mcg
- Vicoprofen**—hydrocodone 7.5 mg + ibuprofen 200 mg
- Vimovo 375/20**—naproxen 375 mg + esomeprazole 20 mg
- Vimovo 500/20**—naproxen 500 mg + esomeprazole 20 mg
- Viokace**—lipase 10,440 units + amylase 39,150 units + protease 39,150 units
- Viokace**—lipase 20,880 units + amylase 78,300 units + protease 78,300 units
- Viorele**—desogestrel 0.15 mg + ethinyl estradiol 20 mcg/10 mcg
- Visine-A Ophthalmic Solution**—0.025% naphazoline + 0.3% pheniramine (OTC)
- Vituz Oral Solution**—(per 5 mL) hydrocodone 5 mg + chlorpheniramine 4 mg
- Vusion Topical Ointment**—0.25% miconazole + 15% zinc oxide
- Vyfemla**—norethindrone 0.4 mg + ethinyl estradiol 35 mcg
- Vytorin 10/10**—ezetimibe 10 mg + simvastatin 10 mg
- Vytorin 10/20**—ezetimibe 10 mg + simvastatin 20 mg
- Vytorin 10/40**—ezetimibe 10 mg + simvastatin 40 mg
- Vytorin 10/80**—ezetimibe 10 mg + simvastatin 80 mg
- Wera**—norethindrone 0.5 mg + ethinyl estradiol 35 mcg
- Wymzya Fe**—norethindrone 0.4 mg + ethinyl estradiol 35 mcg + ferrous fumarate 75 mg
- Xenaderm Topical Ointment**—(per g) trypsin 90 USP units + Balsam Peru 87 mg + castor oil 788 mg
- Zenpep**—lipase 3000 units + amylase 16,000 units + protease 10,000 units
- Zenpep**—lipase 5000 units + amylase 27,000 units + protease 17,000 units
- Zenpep**—lipase 10,000 units + amylase 55,000 units + protease 34,000 units

Zenpep—lipase 15,000 units + amylase 82,000 units + protease 51,000 units

Zenpep—lipase 20,000 units + amylase 109,000 units + protease 68,000 units

Zenpep—lipase 25,000 units + amylase 136,000 units + protease 85,000 units

Xerese Topical Cream—5% acyclovir + 1% hydrocortisone

Yasmin—drospirinone 3 mg + ethinyl estradiol 30 mcg

Yaz—drospirinone 3 mg + ethinyl estradiol 20 mcg

Zarah—drospirinone 3 mg + ethinyl estradiol 30 mcg

Zegerid—omeprazole 40 mg + sodium bicarbonate 1100 mg

Zegerid OTC Capsules—omeprazole 20 mg + sodium bicarbonate 1100 mg (otc)

Zegerid Powder for Oral Suspension—(per pkt) omeprazole 20 mg + sodium bicarbonate 1680 mg (otc)

Zegerid Powder for Oral Suspension—(per pkt) omeprazole 40 mg + sodium bicarbonate 1680 mg

Zenchant—norethindrone 0.4 mg + ethinyl estradiol 35 mcg

Zenchant Fe—norethindrone 0.4 mg + ethinyl estradiol 35 mcg + ferrous fumarate 75 mg

Zestoretic 10/12.5—lisinopril 10 mg + hydrochlorothiazide 12.5 mg

Zestoretic 20/12.5—lisinopril 20 mg + hydrochlorothiazide 12.5 mg

Zestoretic 20/25—lisinopril 20 mg + hydrochlorothiazide 25 mg

Ziac 2.5/6.25—bisoprolol 2.5 mg + hydrochlorothiazide 6.25 mg

Ziac 5/6.25—bisoprolol 5 mg + hydrochlorothiazide 6.25 mg

Ziac 10/6.25—bisoprolol 10 mg + hydrochlorothiazide 6.25 mg

Ziana Topical Gel—1.2% clindamycin + 0.025% tretinoin

Zosyn for Injection 2.25 g—piperacillin 2 g + tazobactam 0.25 g

Zosyn for Injection 3.375 g—piperacillin 3 g + tazobactam 0.375 g

Zosyn for Injection 4.5 g—piperacillin 4 g + tazobactam 0.5 g

Zovia 1/35—ethynodiol 1 mg + ethinyl estradiol 35 mcg

Zovia 1/50—ethynodiol 1 mg + ethinyl estradiol 50 mcg

Zubsolv 1.4/0.36—buprenorphine 1.4 mg + naloxone 0.36 mg

Zubsolv 5.7/1.4—buprenorphine 5.7 mg + naloxone 1.4 mg

Zutripro Oral Solution—(per 5 mL) chlorpheniramine 4 mg + pseudoephedrine 60 mg + hydrocodone 5 mg

Zydone 5/400—hydrocodone 5 mg + acetaminophen 400 mg

Zydone 7.5/400—hydrocodone 7.5 mg + acetaminophen 400 mg

Zydone 10/400—hydrocodone 10 mg + acetaminophen 400 mg

Zylet Ophthalmic Suspension—0.5% loteprednol + 0.3% tobramycin

Zyrtec-D Allergy & Congestion—cetirizine 5 mg + pseudoephedrine 120 mg (otc)

APPENDIX C

Ophthalmic Medications

General Info: See Appendix D for administration techniques for ophthalmic agents.

Consult health care professional regarding:

Concurrent use of contact lenses (medication or additives may be absorbed by the lens).

Concurrent administration of other ophthalmic agents (order and spacing may be important).

ADRs = adverse reactions.

DRUG NAME	DOSE	NOTES
Anesthetics		
Uses: Provide brief local anesthesia to allow measurement of intraocular pressure, removal of foreign bodies, or other superficial procedures.		
CAUTIONS: Repeated use may result in ↑ risk of CNS and cardiovascular toxicity; cross-sensitivity with some local anesthetics may occur.		
lidocaine (Akten)	Adults and children: 2 drops of 3.5% gel (single dose)	● Does not interact with ophthalmic cholinesterase inhibitors ● ADRs: ophthalmic—irritation; systemic—irregular heartbeat, CNS depression
proparacaine (Alcaïne, Ophthaine, Ophthetec)	Adults and children: 1–2 drops of 0.5% solution (single dose)	● Does not interact with ophthalmic cholinesterase inhibitors ● ADRs: ophthalmic—irritation; systemic—irregular heartbeat, CNS depression
tetracaine (Altracaine, Tetcaine)	Adults: 1–2 drops of 0.5% solution (single dose)	● May interact with ophthalmic cholinesterase inhibitors, resulting in ↑ duration of action and risk of toxicity ● ADRs: ophthalmic—irritation; systemic—irregular heartbeat, CNS depression
Antihistamines		
Uses: Various forms of allergic conjunctivitis.		
alcaftadine (Lastacaft)	Adults and children ≥2 yr: 1 drop of 0.25% solution once daily	● ADRs: transient burning/stinging, headache
azelastine (Optivar)	Adults and children ≥3 yr: 1 drop of 0.05% solution twice daily	● ADRs: transient burning/stinging, headache, bitter taste
bepotastine (Bepreve)	Adults and children ≥2 yr: 1 drop of 1.5% solution twice daily	● ADRs: taste disturbance, headache, local irritation
emedastine (Emadine)	Adults and children ≥3 yr: 1 drop of 0.05% solution up to 4 times daily	● ADRs: headache, drowsiness, malaise, local irritation
epinastine (Elestat)	Adults and children ≥2 yr: 1 drop of 0.05% solution twice daily	● ADRs: headache, local irritation
ketotifen (Alaway, Claritin Eye, Zaditor, Zyrtec Itchy Eye)	Adults and children ≥3 yr: 1 drop of 0.025% solution twice daily (given 8–12 hr apart)	● OTC ● ADRs: local irritation
olopatadine (Pataday, Patanol)	Adults and children ≥2 yr: <i>Patanol</i> —1 drop of 0.1% solution twice daily (given 6–8 hr apart); <i>Pataday</i> —1 drop of 0.2% solution once daily	● Small amounts are absorbed; excreted in urine ● ADRs: headache, conjunctival irritation
Anti-infectives/Antifungals/Antivirals		
Uses: Localized superficial ophthalmic infections (e.g., bacterial conjunctivitis).		
CAUTIONS: Small amounts may be absorbed and result in hypersensitivity reactions.		

DRUG NAME	DOSE	NOTES
azithromycin (AzaSite)	Adults and children ≥ 1 yr: 1 drop of 1% solution twice daily (given 8–12 hr apart) for 2 days, then once daily for 5 more days	● When used to treat ocular chlamydial infections, concurrent systemic therapy is required ● ADRs: eye irritation
bacitracin	Adults and children: $\frac{1}{4}$ – $\frac{1}{2}$ -in. strip q 3–4 hr for acute infections or 2–3 times daily for mild-moderate infections	● ADRs: eye irritation
besifloxacin (Besivance)	Adults and children ≥ 1 yr: 1 drop of 0.6% suspension 3 times daily (given 4–12 hr apart) for 7 days	● ADRs: headache, eye irritation
ciprofloxacin (Gloxan)	Adults and children > 1 yr (solution) or > 2 yr (ointment): <i>Bacterial conjunctivitis</i> —Solution: 1–2 drops of 0.3% solution q 2 hr while awake for 2 days, then q 4 hr while awake for 5 more days; Ointment: $\frac{1}{2}$ -in. strip 3 times daily for 2 days, then twice daily for 5 more days; <i>Corneal ulcers</i> —Solution: 2 drops of 0.3% solution q 15 min for 6 hr, then q 30 min while awake for rest of day, then q 1 hr while awake for next 24 hr, then q 4 hr while awake for next 12 days or longer if re-epithelialization does not occur.	● May cause harmless white crystalline precipitate that resolves over time ● ADRs: altered taste, systemic allergic reactions, photophobia, discomfort
erythromycin (★ AK Mycin, ★ Diomycin)	Adults and children: <i>Treatment of infections</i> — $\frac{1}{2}$ -in. strip 2–6 times daily Infants: <i>Prophylaxis of ophthalmia neonatorum</i> —thin strip in each eye as a single dose	● ADRs: irritation
gatifloxacin (Zymaxid)	Adults and children ≥ 1 yr: 1 drop of 0.5% solution q 2 hr while awake (up to 8 times/day) for 1 day, then 2–4 times daily while awake for 6 more days	● ADRs: irritation, headache, ↓ visual acuity, taste disturbance
gentamicin (★ Alcomicin, ★ Diogent, ★ Garamycin, Genoptic, Gentak)	Adults and children: <i>Solution</i> —1–2 drops of 0.3% solution q 2–4 hr; <i>Ointment</i> — $\frac{1}{2}$ -in. strip q 8–12 hr	● ADRs: irritation, burning, stinging, blurred vision (ointment)
levofloxacin (Iquix, Quixin)	Adults and children ≥ 1 yr: <i>Quixin (bacterial conjunctivitis)</i> —1–2 drops of 0.5% solution q 2 hr while awake for 2 days (up to 8 times/day); then every 4 hr while awake for 5 more days (up to 4 times/day); <i>Iquix (conjunctival ulcers)</i> —1–2 drops of 1.5% solution q 30 min–2 hr while awake and q 4–6 hr while sleeping for 3 days, then q 1–4 hr while awake for day 4 and until completion of therapy.	● ADRs: altered taste, systemic allergic reactions, photophobia
moxifloxacin (Moxeza, Vigamox)	Adults and children ≥ 1 yr (Vigamox) or ≥ 4 mo (Moxeza): <i>Moxeza</i> —1 drop of 0.5% solution twice daily for 7 days; <i>Vigamox</i> —1 drop of 0.5% solution 3 times daily for 7 days.	● ADRs: irritation, ↓ visual acuity
ofloxacin (Ocuflox)	Adults and children ≥ 1 yr: <i>Bacterial conjunctivitis</i> —1–2 drops of 0.3% solution q 2–4 hr while awake for 2 days, then 4 times daily for 5 more days; <i>Corneal ulcer</i> —1–2 drops of 0.3% solution q 30 min while awake and q 4–6 hr while sleeping for 2 days, then q hr while awake for 4–6 more days, then 4 times daily until cured.	● ADRs: altered taste, systemic allergic reactions, photophobia

DRUG NAME	DOSE	NOTES
sulfacetamide (Bleph-10, ★ Diosulf, ★ Sodium Sulamyd)	Adults and children >2 mo: <i>Solution</i> —1–2 drops of 10% solution q 2–3 hr while awake (less frequently at night) for 7–10 days; <i>Ointment</i> —½-in. strip q 3–4 hr and at bedtime	● Cross-sensitivity with other sulfonamides (including thiazides) may occur ● ADRs: local irritation
tobramycin (AK-Tob, Tobrex)	Adults and children ≥2 mo: <i>Solution</i> —1–2 drops of 0.3% solution q 2–4 hr depending on severity of infection; <i>Ointment</i> —½-in. strip q 8–12 hr	● Ointment may retard corneal wound healing ● ADRs: irritation, burning, stinging, blurred vision (ointment)
Antifungal		
natamycin (Natacyc)	Adults: <i>Fungal keratitis</i> —1 drop of 5% suspension q 1–2 hr for 3–4 days, then 6–8 times/day for 2–3 wk; <i>Fungal blepharitis or conjunctivitis</i> —1 drop of 5% suspension q 4–6 hr for 2–3 wk	● ADRs: irritation, swelling
Antivirals		
ganciclovir (Zirgan)	Adults and children ≥2 yr: 1 drop of 0.15% gel 5 times daily (q 3 hr while awake) until corneal ulcer heals, then 3 times daily for 7 days	● ADRs: blurred vision, irritation, keratopathy
trifluridine (Viroptic)	Adults and children ≥6 yr: 1 drop of 1% solution q 2 hr while awake (up to 9 drops/day) until re-epithelialization occurs, then q 4 hr while awake for 7 more days (not to exceed 21 days)	● ADRs: burning, stinging, keratopathy
Artificial Tears/Ocular Lubricants (sterile buffered isotonic solutions/ointments)		
Uses: Artificial tears—keep the eyes moist with isotonic solutions and wetting agents in the management of dry eyes due to lack of tears; also provide lubrication for artificial eyes. Ocular lubricants—provide lubrication and protection in a variety of conditions including exposure keratitis, ↓ corneal sensitivity, corneal erosions, keratitis sicca, during/following ocular surgery or removal of a foreign body.		
Artificial tears (Adsorbotear, Akwa Tears, Aquasite, Artificial Tears Plus, Cellufresh, Celluvisc, Comfort Tears, Dakrina, Dry Eye Therapy, Dry Eyes, Duratears Naturale, Dwelle, Eye-Lube-A, Genteal Lubricant Eye Gel, HypoTears, HypoTears PF, Isopto Alkaline, Isopto Plain, Just Tears, Lacril, Lacri-Lube NP, Lacri-Lube S.O.P., Lacrisert, Liquifilm Forte, Liquifilm Tears, LubriTears, Moisture Drops, Murine Solution, Murocol, Nature's Tears, Nu-Tears, Nu-Tears II, Nutra Tear, Paralube, Refresh, Refresh PM, Tear Drop, TearGard, Teagen, Tearisol, Tears Naturale, Tears Naturale Free, Tears Naturale II, Tears Plus, Tears Renewed, Ultra Tears, Vit-A-Drops, Viva-Drops)	Adults and children: <i>Artificial tears</i> —Solution: 1–2 drops 3–4 times daily; Insert: 1 insert 1–2 times daily; <i>Ocular lubricants</i> —small amount instilled into conjunctiva several times daily	● May alter effects of other concurrently administered ophthalmic medications ● ADRs: photophobia, lid edema stinging (insert only), transient blurred vision, eye discomfort
Beta Blockers		
Uses: Treatment of open-angle glaucoma and other forms of ocular hypertension (↓ formation of aqueous humor).		
CAUTIONS: Systemic absorption is minimal but may occur. Systemic absorption may result in additive adverse cardiovascular effects (bradycardia, hypotension), especially when used with other cardiovascular agents (antihypertensives, antiarrhythmics). Other systemic adverse reactions may occur, including bronchospasm or delirium (geriatric patients). Concurrent use with ophthalmic epinephrine may ↓ effectiveness.		
betaxolol (Betoptic, Betoptic S)	Adults: <i>Betoptic</i> —1–2 drops of 0.5% solution twice daily; <i>Betoptic S</i> —1 drop of 0.25% suspension twice daily	● ADRs: conjunctivitis, ↓ visual acuity, ocular burning, rash (may be less likely than others to cause bronchospasm if systemically absorbed)

DRUG NAME	DOSE	NOTES
carbetolol	Adults: 1 drop of 1% solution twice daily	● ADRs: ocular burning, ↓ visual acuity
levobunolol (AKBeta, Betagan)	Adults: 1–2 drops of 0.25% solution twice daily or 1–2 drops of 0.5% solution once daily	● ADRs: conjunctivitis, ↓ visual acuity, ocular burning, rash
metipranolol (OptiPranolol)	Adults: 1 drop of 0.3% solution twice daily	● Lasts up to 24 hr ● ADRs: conjunctivitis, ↓ visual acuity, ocular burning, rash
timolol (Betimol, Istalol, Timoptic, Timoptic-XE)	Adults: <i>Solution</i> —1 drop of 0.25–0.5% solution 1–2 times daily; <i>Gel-forming solution</i> —1 drop of 0.25–0.5% solution once daily	● Lasts up to 24 hr ● ADRs: conjunctivitis, ↓ visual acuity, ocular burning, rash

Carbonic Anhydrase Inhibitors

Uses: Treatment of open-angle glaucoma and other forms of ocular hypertension (↓ formation of aqueous humor).

CAUTIONS: May exacerbate kidney stones; should not be used in patients with CCr <30 mL/min; may have cross-sensitivity with sulfonamides.

brinzolamide (Azopt)	Adults: 1 drop of 1% suspension 3 times daily	● ADRs: burning, stinging, unusual taste
dorzolamide (Trusopt)	Adults and Children: 1 drop of 2% solution 3 times daily	● ADRs: bitter taste, ocular irritation, or allergy

Cholinergics (direct-acting)

Uses: Treatment of open-angle glaucoma (facilitates the outflow of aqueous humor); also used to facilitate miosis after ophthalmic surgery or before examination (to counteract mydriatics).

CAUTIONS: Conditions in which pupillary constriction occurs should be avoided. If significant systemic absorption occurs, bronchospasm, sweating, and ↑ urination and salivation may occur.

acetylcholine (Miochol-E)	Adults: 0.5–2 mL instilled into anterior chamber before or after securing one or more sutures	● ADRs: corneal edema, corneal clouding
carbachol (Isopto Carbachol, Miostat)	Adults: <i>Glaucoma</i> —1–2 drops of 0.01–3% solution 1–3 times daily; <i>To facilitate miosis</i> —0.5 mL instilled into anterior chamber before or after securing sutures	● ADRs: blurred vision, altered vision, stinging, eye pain
pilocarpine (★ Akcarpine, ★ Diocarpine, Isopto Carpine, Pilopine HS)	Adults: <i>Glaucoma</i> —Solution: 1–2 drops of 0.5–4% solution up to 6 times daily; Gel: ½-in. strip once daily at bedtime; <i>Counteracting mydriatic sympathomimetics</i> —1 drop of 1% solution (may be repeated prior to surgery)	● ADRs: blurred vision, altered vision, stinging, eye pain, headache

Cholinergics (cholinesterase inhibitors)

Uses: Treatment of open-angle glaucoma not controlled with short-acting miotics or other agents; also used in varying doses for accommodative esotropia (diagnosis and treatment).

CAUTIONS: Enhance neuromuscular blockade from succinylcholine; intensify the actions of cocaine and some other local anesthetics; additive toxicity with antimuscarinics, anticholinergics, and cholinesterase inhibitors (including some pesticides). Use cautiously in patients with history or risk of retinal detachment.

echothiophate (Phospholine Iodide)	Adults: 1 drop of 0.125% solution 1–2 times daily	● Irreversible cholinesterase inhibitor ● May cause hyperactivity in patients with Down syndrome ● ADRs: blurred vision, change in vision, brow ache, miosis, eyelid twitching, watering eyes

Corticosteroids

Uses: Management of inflammatory eye conditions including allergic conjunctivitis, nonspecific superficial keratitis, anterior endogenous uveitis; infectious conjunctivitis (with anti-infectives); management of corneal injury; suppression of graft rejection following keratoplasty; prevention of postoperative inflammation.

CAUTIONS: Use cautiously in patients with infectious ocular processes (avoid in herpes simplex keratitis), especially fungal and viral ocular infections (may mask symptoms); diabetes, glaucoma, or epithelial compromise.

DRUG NAME	DOSE	NOTES
dexamethasone (AK Dex, AK Trol, Diodex, Maxidex)	Adults: <i>Solution</i> —1–2 drops of 0.1% solution q hr during the day and q 2 hr during the night, gradually ↓ the dose to q 4 hr, then to 3–4 times daily; <i>Suspension</i> —1–2 drops of 0.1% suspension up to 4–6 times daily	● As condition improves, ↓ frequency of administration ● ADRs: corneal thinning, ↑ intraocular pressure, irritation
difluprednate (Durezol)	Adults and children: <i>Postoperative inflammation</i> —1 drop of 0.05% emulsion 4 times daily beginning 24 hr after surgery and continued for 2 wk, then 2 times daily for 1 wk, then taper; <i>Uveitis</i> —1 drops of 0.05% emulsion 4 times daily for 14 days, then taper	● As condition improves, ↓ frequency of administration ● ADRs: blepharitis, photophobia, ↓ visual acuity
fluorometholone (Flarex, FML, FML Forte)	Adults and children >2 yr: <i>Suspension</i> —1–2 drops of 0.1% suspension 4 times daily (up to 2 drops q 2 hr during initial 24–48 hr) or 1 drop of 0.25% suspension 2–4 times daily (up to 1 drop q 4 hr during initial 24–48 hr); <i>Ointment</i> —½-in. strip 1–3 times daily (up to q 4 hr during initial 24–48 hr)	● As condition improves, ↓ frequency of administration ● ADRs: blurred vision (ointment), corneal thinning, ↑ intraocular pressure, irritation
loteprednol (Alrex, Lotemax)	Adults: <i>Allergic conjunctivitis</i> —Alrex: 1 drop of 0.2% suspension 4 times daily; <i>Inflammatory conditions</i> —Lotemax Suspension: 1–2 drops of 0.5% suspension 4 times daily (up to 1 drop q hr may be used in first wk); <i>Postoperative inflammation</i> —Lotemax Gel/Suspension: 1–2 drops of 0.5% gel/suspension 4 times daily beginning 24 hr after surgery and continued for 2 wk; Ointment: ½-in. strip 4 times daily beginning 24 hr after surgery and continued for 2 wk	● ADRs: corneal thinning, ↑ intraocular pressure, irritation
prednisolone (Diopred, Omnipred, Pred Forte, Pred Mild)	Adults and children: 1–2 drops of 0.12–1% solution/suspension 2–4 times daily	● As condition improves, ↓ frequency of administration ● ADRs: corneal thinning, ↑ intraocular pressure, irritation
rimexolone (Vexol)	Adults: <i>Postoperative inflammation</i> —1–2 drops of 1% suspension 4 times daily beginning 24 hr after surgery and continued for 2 wk; <i>Uveitis</i> —1–2 drops of 1% suspension q hr while awake for 1 wk, then 1 drop q 2 hr while awake for 1 wk, then taper	● As condition improves, ↓ frequency of administration ● ADRs: corneal thinning, ↑ intraocular pressure, irritation

Cycloplegic Mydriatics

Uses: Preparation for cycloplegic refraction; management of uveitis (not tropicamide).

CAUTIONS: Use cautiously in patients with a history of glaucoma; systemic absorption may cause anticholinergic effects such as confusion, unusual behavior, flushing, hallucinations, slurred speech, drowsiness, swollen stomach (infants), tachycardia, or dry mouth.

atropine (Atropine-Care, Isopto Atropine)	Adults: <i>Cycloplegic refraction</i> —1–2 drops of 1% solution 1 hr before procedure; <i>Uveitis</i> —Solution: 1–2 drops of 1% solution 4 times daily; Ointment: 0.3–0.5-cm strip up to 3 times daily	● Effects on accommodation may last 6 days; mydriasis may last 12 days ● ADRs: irritation, blurred vision, photophobia

DRUG NAME	DOSE	NOTES
cyclopentolate (★ AK Pentolate, Cyclogyl, ★ Diopentolate, Pentolair)	Adults: 1 drop of 1–2% solution; may repeat in 5 min Children: 1 drop of 0.5–2% solution; may be followed 5–10 min later by 1 drop of 0.5–1% solution	● Peak of cycloplegia is within 25–75 min and lasts 6–24 hr ● Peak of mydriasis is within 30–60 min and may last several days ● 2% solution used for heavily pigmented iris ● ADRs: irritation, blurred vision, photophobia
homatropine (Isopto Homatropine)	Adults: <i>Cycloplegic refraction</i> —1–2 drops of 2% solution or 1 drop of 5% solution, may repeat in 5–10 min for 2 more doses; <i>Uveitis</i> —1–2 drops of 2–5% solution 2–3 times daily (up to q 3–4 hr) Children: <i>Cycloplegic refraction</i> —1 drop of 2% solution, may repeat in 10 min if needed; <i>Uveitis</i> —1 drop of 2% solution 2–3 times daily	● Cycloplegia and mydriasis may last for 24–72 hr ● ADRs: irritation, blurred vision, photophobia
scopolamine (Isopto Hyoscine)	Adults: <i>Cycloplegic refraction</i> —1–2 drops of 0.25% solution 1 hr before procedure; <i>Uveitis</i> —1 drop of 0.25% solution up to 4 times daily	● Shorter duration than atropine, but mydriasis and cycloplegia may last for 3–7 days ● ADRs: irritation, blurred vision, photophobia
tropicamide (★ Diotrope, Mydracil, Tropicacyl)	Adults and children: 1–2 drops of 0.5–1% solution	● Stronger solution/repeated dosing may be required in patients with dark irides ● Peak effect occurs in 20–40 min ● Cycloplegia lasts 2–6 hr; mydriasis lasts up to 7 hr ● ADRs: irritation, blurred vision, photophobia

Immunomodulators

Uses: ↑ tear production when the cause of dry eye is inflammation secondary to keratoconjunctivitis sicca.

CAUTIONS: Tear production is not ↑ during concurrent use of ophthalmic NSAIDs or punctal plugs.

cyclosporine (Restasis)	Adults and Children ≥16 yr: 1 drop of 0.05% emulsion q 12 hr	● Emulsion should be inverted to obtain uniform opaque appearance prior to use. ● ADRs: irritation, blurred vision

Mast Cell Stabilizers

Uses: Vernal keratoconjunctivitis.

CAUTIONS: Require several days of treatment before effects are seen.

croamolyn (Crolom, ★ Opticrom)	Adults and children >4 yr: 1–2 drops of 4% solution 4–6 times daily	● ADRs: irritation
iodoxamide (Alomide)	Adults and children >2 yr: 1–2 drops of 0.1% solution 4 times daily for up to 3 mo	● ADRs: blurred vision, foreign body sensation, irritation
nedocromil (Alocril)	Adults and children ≥3 yr: 1–2 drops of 2% solution twice daily throughout period of exposure to allergen	● ADRs: headache, ocular burning, unpleasant taste, nasal congestion
epirolast (Alamast)	Adults and children >3 yr: 1–2 drops of 0.1% solution 4 times daily	● Symptoms may improve within a few days, but optimal response may take up to 4 wk ● ADRs: discomfort, dry eyes, foreign body sensation

Nonsteroidal Anti-inflammatory Drugs

Uses: Management of pain/inflammation following surgery (bromfenac, diclofenac, ketorolac, nepafenac), allergic conjunctivitis (ketorolac), inhibition of perioperative miosis (flurbiprofen).

CAUTIONS: Cross-sensitivity with systemic NSAIDs may occur; concurrent use of anticoagulants, other NSAIDs, thrombolytics, some cephalosporins, and valproates may ↑ the risk of bleeding. May slow/delay healing. Avoid contact lens use.

DRUG NAME	DOSE	NOTES
bromfenac (Bromday, Prolensa)	Adults: <i>Bromday</i> — 1 drop of 0.09% solution once daily starting 1 day before surgery and continued on day of surgery and for 2 wk after surgery; <i>Prolensa</i> — 1 drop of 0.07% solution once daily starting 1 day before surgery and continued on day of surgery and for 2 wk after surgery	● Contains sulfites ● ADRs: irritation, headache
diclofenac (Voltaren Ophthalmic)	Adults: <i>Cataract surgery</i> — 1 drop of 0.1% solution 4 times daily starting 24 hr after surgery and for 2 wk after surgery; <i>Corneal refractive surgery</i> — 1–2 drops of 0.1% solution within hr before surgery, within 15 min after surgery, then continue 4 times daily for up to 3 days	● ADRs: irritation, allergic reactions
flurbiprofen (Ocufen)	Adults: 1 drop of 0.03% solution q 30 min, beginning 2 hr prior to surgery (4 drops total in each eye)	● ADRs: irritation, allergic reactions
ketorolac (Acular, Acular LS, Acuvail)	Adults and children ≥ 2 yr: <i>Allergic conjunctivitis</i> — Acular: 1 drop of 0.5% solution 4 times daily; <i>Postoperative pain/inflammation</i> — Acular: 1 drop of 0.5% solution 4 times daily starting 24 hr after cataract surgery and for 2 wk after surgery; Acular LS: 1 drop of 0.4% solution 4 times daily for up to 4 days after corneal refractive surgery; Acuvail: 1 drop of 0.45% solution twice daily starting 1 day before cataract surgery and continued for 2 wk after surgery	● ADRs: irritation, allergic reactions
nepafenac (Ilevro, Nevanac)	Adults and children ≥ 10 yr: <i>Ilevro</i> — 1 drop of 0.3% suspension once daily starting one day before cataract surgery and continued for 2 wk after surgery; instill 1 additional drop 90–120 min before surgery; <i>Nevanac</i> — 1 drop of 0.1% suspension 3 times daily starting one day before cataract surgery and continued for 2 wk after surgery	● ADRs: irritation, photophobia, headache, hypertension, nausea/vomiting

Ocular Decongestants/Vasoconstrictors

Uses: ↓ ocular congestion due to irritation by vasoconstricting conjunctival blood vessels; stronger solutions have mydriatic effects.

CAUTIONS: Systemic absorption may result in adverse cardiovascular effects; excessive/prolonged use may produce rebound hyperemia; use caution in patients at risk for acute angle-closure glaucoma; cardiovascular effects may be exaggerated by MAO inhibitors and dose adjustment may be required within 21 days of MAO inhibitors; ↑ risk of arrhythmias with inhalation anesthetics.

naphazoline (★ AK-Con, Albalon, Clear Eyes Redness Relief, Comfort Eye Drops, ★ Diophton, ★ Naphcon A, ★ Opcon A, VasoClear)	Adults: 1–2 drops of 0.012–0.025% solution up to 4 times daily (for up to 3 days) or 1–2 drops of 0.1% solution q 3–4 hr as needed	● ADRs: ophthalmic-rebound hyperemia; nausea, sweating, weakness
oxymetazoline (OcuClear, Visine LR)	Adults and children ≥ 6 yr: 1–2 drops of 0.025% solution q 6 hr as needed (for up to 3 days)	● ADRs: ophthalmic-rebound hyperemia; systemic-headache, insomnia, nervousness, tachycardia
phenylephrine (★ AK Dilate, ★ Dioneprhrine, ★ Mydrin, ★ Prefrin)	Adults: <i>Decongestant</i> — 1–2 drops of 0.12% solution up to 4 times daily as needed (for up to 3 days); <i>Mydriasis</i> — 1 drop of 2.5–10% solution, may repeat in 10–60 min as needed Children ≥ 1 yr: <i>Mydriasis</i> — 1 drop of 2.5–10% solution, may repeat in 10–60 min as needed	● ADRs: ophthalmic-blurred vision, irritation; systemic-dizziness, tachycardia, hypertension, paleness, sweating, trembling

DRUG NAME	DOSE	NOTES
tetrahydrozoline (Murine Tears Plus, Visine)	Adults: 1–2 drops of 0.05% solution 2–4 times daily	● ADRs: ophthalmic—irritation; systemic—tachycardia, hypertension

Prostaglandin Agonists

Uses: Treatment of open-angle glaucoma (↑ outflow of aqueous humor).

CAUTIONS: May change eye color to brown; will form precipitate with thimerosal-containing products; can be used with other agents to ↓ intraocular pressure.

bimatoprost (Lumigan)	Adults: 1 drop of 0.01–0.03% solution once daily in the evening	● ADRs: local irritation, foreign body sensation, ↑ eyelash growth, ↑ brown pigmentation in iris
latanoprost (Xalatan)	Adults: 1 drop of 0.005% solution once daily in the evening	● ADRs: local irritation, foreign body sensation, ↑ eyelash growth, ↑ brown pigmentation in iris
tafluprost (Zioptan)	Adults: 1 drop of 0.0015% solution once daily in the evening	● ADRs: local irritation, foreign body sensation, ↑ eyelash growth, ↑ brown pigmentation in iris
travoprost (Travatan Z)	Adults and Children ≥16 yr: 1 drop of 0.004% solution once daily in the evening	● ADRs: local irritation, foreign body sensation, ↑ eyelash growth, ↑ brown pigmentation in iris

Sympathomimetics

Uses: Treatment of open-angle glaucoma and other forms of intraocular hypertension (↓ formation of aqueous humor).

CAUTIONS: Systemic absorption may result in adverse cardiovascular and CNS reactions (especially in patients with cardiovascular disease); avoid use in patients predisposed to acute angle-closure glaucoma.

apraclonidine (Iopidine)	Adults: <i>Postoperative reduction of intraocular pressure</i> —1–2 drops of 0.5% solution 3 times daily or 1 drop of 1% solution 1 hr before surgery and upon completion of surgery	● Used to ↓ intraocular pressure after surgery ● A selective alpha-adrenergic agonist ● Monitor pulse and blood pressure ● Avoid concurrent use with MAO inhibitors ● ADRs: ophthalmic—irritation, mydriasis; systemic—allergic reactions, arrhythmias, bradycardia, drowsiness, dry nose, fainting, headache, nervousness, weakness
brimonidine (Alphagan P)	Adults and children ≥2 yr: 1 drop of 0.1–0.2% solution 3 times daily (8 hr apart)	● A selective alpha-adrenergic agonist ● Avoid concurrent use with MAO inhibitors ● Tricyclic antidepressants may ↓ effectiveness; additive CNS depression may occur with other CNS depressants, additive adverse cardiovascular effects with other cardiovascular agents ● ADRs: ophthalmic—irritation; systemic—drowsiness, dizziness, dry mouth, headache, weakness, muscular pain
dipivefrin (Propine)	Adults: 1 drop of 0.1% solution q 12 hr	● Converted to epinephrine in the eye ● Wait 15 min before inserting soft contact lenses ● ADRs: ophthalmic—local irritation, macular edema (aphakic patients); systemic—arrhythmias, hypertension

Medication Administration Techniques

Subcutaneous Injection Sites

Administration of Ophthalmic Medications

For instillation of ophthalmic solutions, instruct patient to lie down or tilt head back and look at ceiling. Pull down on lower lid, creating a small pocket, and instill solution into pocket. With systemically acting drugs, apply pressure to the inner canthus for 1–2 min to minimize systemic absorption. Instruct patient to gently close eye. Wait 5 min before instilling second drop or any other ophthalmic solutions.

For instillation of ophthalmic ointment, instruct patient to hold tube in hand for several minutes to warm. Squeeze a small amount of ointment ($\frac{1}{4}$ – $\frac{1}{2}$ in.) inside lower lid. Instruct patient to close eye gently and roll eyeball around in all directions with eye closed. Wait 10 min before instilling any other ophthalmic ointments.

Do not touch cap or tip of container to eye, fingers, or any surface.

Administration of Medications with Metered-Dose Inhalers

Instruct patient on the proper use of the metered-dose inhaler. There are 3 methods of using a metered-dose inhaler. Shake inhaler well. (1) Take a drink of water to moisten the throat; place the inhaler mouthpiece 2 finger-widths away from mouth; tilt head back slightly. While activating the inhaler, take a slow, deep breath for 3–5 sec; hold the breath for 10 sec; and breathe out slowly. (2) Exhale and close lips firmly around mouthpiece. Administer during second half of inhalation, and hold breath for as long as possible to ensure deep instillation of medication. (3) Use of spacer. Consult health care professional to determine method desired prior to instruction. Allow 1–2 min between inhalations. Rinse mouth with

water or mouthwash after each use to minimize dry mouth and hoarseness. Wash inhalation assembly at least daily in warm running water.

For use of dry powder inhalers, turn head away from inhaler and exhale (do not blow into inhaler). Do not shake. Close mouth tightly around the mouthpiece of the inhaler and inhale rapidly.

Steps for Using Your Inhaler*

1. Remove the cap and hold inhaler upright.
2. Shake the inhaler.
3. Tilt your head back slightly and breathe out slowly.
4. Position the inhaler in one of the following ways (A or B is optimal, but C is acceptable for those who have difficulty with A or B. C is required for breath-activated inhalers):

A. Open mouth with inhaler 1 to 2 inches away.

B. Use space/holding chamber (this is recommended especially for young children and for people using corticosteroids).

C. In the mouth. Do not use for corticosteroids.

D. NOTE: Inhaled dry powder capsules require a different inhalation technique. To use a dry powder inhaler, it is important to close the mouth tightly around the mouthpiece of the inhaler and to inhale rapidly.

5. Press down on the inhaler to release medication as you start to breathe in slowly.
6. Breathe in slowly (3–5 sec).
7. Hold your breath for 10 sec to allow the medicine to reach deeply into your lungs.
8. Repeat puff as directed. Waiting 1 minute between puffs may permit second puff to penetrate your lungs better.
9. Spacers/holding chambers are useful for all patients. They are particularly recommended for young children and older adults and for use with **inhaled corticosteroids**. Avoid common inhaler mistakes. Follow these inhaler tips:
 - Breathe out before pressing your inhaler.
 - Inhale slowly.
 - Breathe in through your mouth, not your nose.
 - Press down on your inhaler at the start of inhalation (or within the first second of inhalation).
 - Keep inhaling as you press down on inhaler.
 - Press your inhaler only once while you are inhaling (one breath for each puff).
 - Make sure you breathe in evenly and deeply.
 - If you are using a short-acting bronchodilator inhaler and a corticosteroid inhaler, use the bronchodilator first, and allow 5 min to elapse before using the corticosteroid.

Other inhalers have become available in addition to the one illustrated here. Different types of inhalers may require different techniques.

Administration of Medications by Nebulizer

Administer in a location where patient can sit comfortably for 10–15 min. Plug in compressor. Mix medication as directed, or empty unit-dose vials into nebulizer. Do not mix different types of medications

*Source: Expert Panel Report 2: Guidelines for the Diagnosis and Management of Asthma. National Asthma Education and Prevention Program, National Heart, Lung, and Blood Institute, 1997.

without checking with health care professional. Assemble mask or mouthpiece and connect tubing to port on compressor. Have patient sit in a comfortable upright position. Make sure that mask fits properly over nose and mouth and that mist does not flow into eyes, or put mouthpiece into mouth. Turn on compressor. Instruct patient to take slow deep breaths. If possible, patient should hold breath for 10 sec before slowly exhaling. Continue this process until medication chamber is empty. Wash mask in hot soapy water; rinse well and allow to air dry before next use.

Administration of Nasal Sprays

Clear nasal passages of secretions prior to use. If nasal passages are blocked, use a decongestant immediately prior to use to ensure adequate penetration of the spray. Keep head upright. Breathe in through nose during administration. Sniff hard for a few minutes after administration.

Intramuscular Injection Sites

Deltoid site

Ventrogluteal site

Dorsogluteal site

Vastus lateralis site

The dorsogluteal site is associated with sciatic nerve injury. The deltoid and ventrogluteal sites are the preferred sites for adults; the vastus lateralis site is preferred in children under 2 yr of age.

Formulas Helpful for Calculating Doses

Ratio and Proportion

A ratio is the same as a fraction and can be expressed as a fraction ($\frac{1}{2}$) or in the algebraic form (1:2). This relationship is stated as *one is to two*.

A proportion is an equation of equal fractions or ratios.

$$\frac{1}{2} = \frac{4}{8}$$

To calculate doses, begin each proportion with the two known values, for example 15 grains = 1 gram (known equivalent) or 10 milligrams = 2 milliliters (dosage available) on one side of the equation. Next, make certain that the units of measure on the opposite side of the equation are the same as the units of the known values and are placed on the same level of the equation.

Problem A:
$$\frac{15 \text{ gr}}{1 \text{ g}} = \frac{10 \text{ gr}}{x \text{ g}}$$

Problem B:
$$\frac{10 \text{ mg}}{2 \text{ mL}} = \frac{5 \text{ mg}}{x \text{ mL}}$$

Once the proportion is set up correctly, cross-multiply the opposing values of the proportion.

Problem A:
$$\begin{array}{c} \frac{15 \text{ gr}}{1 \text{ g}} \times \frac{10 \text{ gr}}{x \text{ g}} \\ 15x = 10 \end{array}$$

Problem B:
$$\begin{array}{c} \frac{10 \text{ mg}}{2 \text{ mL}} \times \frac{5 \text{ mg}}{x \text{ mL}} \\ 10x = 10 \end{array}$$

Next, divide each side of the equation by the number with the x to determine the answer. Then, add the unit of measure corresponding to x in the original equation.

Problem A:
$$\begin{array}{c} \frac{15x}{15} = \frac{10}{15} \\ x = \frac{2}{3} \text{ or } 0.6 \text{ g} \end{array}$$

Problem B:
$$\begin{array}{c} \frac{10x}{10} = \frac{10}{10} \\ x = 1 \text{ mL} \end{array}$$

Calculation of IV Drip Rate

To calculate the drip rate for an intravenous infusion, 3 values are needed:

I. The amount of solution and corresponding time for infusion. May be ordered as:

1000 mL over 8 hr

or

125 mL/hr

II. The equivalent in time to convert hr to min.

1 hr = 60 min

III. The drop factor or number of drops that equal 1 mL of fluid. (This information can be found on the IV tubing box.)

10 gtt = 1 mL

Set up the problem by placing each of the 3 values in a proportion.

$$\frac{125 \text{ mL}}{1 \text{ hr}} \times \frac{1 \text{ hr}}{60 \text{ min}} \times \frac{10 \text{ gtt}}{1 \text{ mL}}$$

Units of measure can be canceled out from the upper and lower levels of the equation.

The units cancel, leaving:

$$\frac{125}{1} \times \frac{1}{60 \text{ min}} \times \frac{10 \text{ gtt}}{1}$$

Next, multiply each level across and divide the numerator by the denominator for the answer.

$$\frac{125}{1} \times \frac{1}{6 \text{ min}} \times \frac{1 \text{ gtt}}{1}$$

$$125/6 = 20.8 \text{ or } 21 \text{ gtt/min}$$

Calculation of Creatinine Clearance (CCr) in Adults from Serum Creatinine

$$\text{Men: CCr} = \frac{\text{ideal body weight (kg)} \times (140 - \text{age})}{72 \times \text{serum creatinine (mg/dL)}}$$

$$\text{Women: CCr} = 0.85 \times \text{calculation for men}$$

Calculation of Body Surface Area (BSA) in Adults and Children

Dubois method:

$$\text{SA (cm}^2\text{)} = \text{wt (kg)}^{0.425} \times 71.84$$

$$\text{SA (m}^2\text{)} = K \times \sqrt[3]{\text{wt}^2 \text{ (kg)}} \quad (\text{common K value } 0.1 \text{ for toddlers, } 0.103 \text{ for neonates})$$

Simplified method:

$$\text{BSA (m}^2\text{)} = \sqrt{\frac{\text{ht (cm)} \times \text{wt (kg)}}{3600}}$$

Body Mass Index

$$\text{BMI} = \text{wt (kg)} / \text{ht (m}^2\text{)}$$

APPENDIX F

Body Surface Area Nomograms

ESTIMATING BODY SURFACE AREA IN CHILDREN

For pediatric patients of average size, body surface area may be estimated with the scale on the left. Match weight to corresponding surface area. For other pediatric patients, use the scale on the right. Lay a straightedge on the correct height and weight points for your patient, and observe the point where it intersects on the surface area scale at center.

DRUG	THERAPEUTIC LEVEL	TOXIC LEVEL
acetaminophen	10–30 mcg/mL	>200 mcg/mL at 4 hr or 50 mcg/mL at 12 hr after ingestion
amikacin	peak: 20–30 mcg/mL trough: <8 mcg/mL	peak: >40 mcg/mL trough: >10 mcg/mL
amiodarone	0.5–2.5 mg/L	>2.5 mg/L
amitriptyline	0.5–2.5 mcg/mL	>2.5 mcg/mL
amoxapine	120–150 ng/mL	>500 ng/mL
carbamazepine	4–12 mcg/mL	>15 mcg/mL
chloramphenicol	peak: 10–25 mcg/mL trough: 5–15 mcg/mL	peak: >40 mcg/mL trough: >15 mcg/mL
chlordiazepoxide	0.1–3 mcg/mL	>25 mcg/mL
chlorpromazine	50–300 ng/mL	>750 ng/mL
clonazepam	20–80 ng/mL	>80 ng/mL
cyclosporine	100–400 ng/mL	>400 ng/mL
desipramine	50–300 ng/mL	>300 ng/mL
diazepam	0.2–1.5 mcg/mL	>1.5 mcg/mL
digoxin	0.5–2 ng/mL	>2.5 ng/mL
disopyramide	2.8–7.5 mcg/mL	>7.5 mcg/mL
doxepin	110–250 ng/mL	>500 ng/mL
ethosuximide	40–100 mcg/mL	>100 mcg/mL
flecainide	0.2–1 mcg/mL	>1 mcg/mL
gentamicin	peak: 6–10 mcg/mL trough: <1 mcg/mL	trough: >1 mcg/mL
haloperidol	5–20 ng/mL	>42 ng/mL
imipramine	150–250 ng/mL	>500 ng/mL
kanamycin	peak: 15–30 mcg/mL trough: 5–10 mcg/mL	peak: >35 mcg/mL trough: >10 mcg/mL
lidocaine	1.5–5 mcg/mL	>6 mcg/mL
lithium	0.6–1.2 mEq/L	>1.5 mEq/L
meperidine	70–500 ng/mL	>1000 ng/mL
mexiletine	0.5–2 mcg/mL	>2 mcg/mL
morphine	65–80 ng/mL	>200 ng/mL
nortriptyline	50–150 ng/mL	>500 ng/mL
phenobarbital	15–40 mcg/mL	>40 mcg/mL
phenytoin	10–20 mcg/mL	>30 mcg/mL
primidone	5–12 mcg/mL	>15 mcg/mL
procainamide	procainamide: 4–10 mcg/mL	procainamide: >10 mcg/mL

	N-acetylprocainamide (NAPA): 15–25 mcg/mL	
propranolol	50–100 ng/mL	>150 ng/mL
quinidine	2–5 mcg/mL	>6 mcg/mL
salicylate	100–400 mcg/mL	>400 mcg/mL
theophylline	10–20 mcg/mL	>20 mcg/mL
tobramycin	peak: 6–10 mcg/mL trough: <1 mcg/mL	trough: >1 mcg/mL
trazadone	0.5–2.5 mcg/mL	>2.5 mcg/mL
valproic acid	50–125 mcg/mL	>125 mcg/mL
vancomycin	trough: 10–20 mcg/mL	trough: >20 mcg/mL

Commonly Used Abbreviations

ABGs	arterial blood gases	DVT	deep vein thrombosis
ac	before meals	ECG	electrocardiogram
ACE	angiotensin-converting enzyme	ECMO	extracorporeal membrane oxygenation
ADH	antidiuretic hormone	EENT	eye, ear, nose, and throat
A-G ratio	albumin-globulin ratio	Endo	endocrine
AHF	antihemolytic factor	ER	extended-release
ALT	alanine aminotransferase	ESRD	end-stage renal disease
ANA	antinuclear antibodies	F and E	fluid and electrolyte
ANC	absolute neutrophil count	g	gram(s)
AST	aspartate aminotransferase	GABA	gamma-aminobutyric acid
ATP	adenosine triphosphate	GERD	gastroesophageal reflux disease
AV	atrioventricular	GFR	glomerular filtration rate
bid	two times a day	GI	gastrointestinal
BMI	body mass index	G6PD	glucose-6-phosphate dehydrogenase
BP	blood pressure	gt(t)	drop(s)
bpm	beats per minute	GTT	glucose tolerance test
BSA	body surface area	GU	genitourinary
BUN	blood urea nitrogen	Hb A_{1c}	hemoglobin A _{1c} , glycosylated hemoglobin
cap	capsule	HDL	high-density lipoproteins
CBC	complete blood count	Hemat	hematologic
CCr	creatinine clearance	HF	heart failure
COMT	catechol-O-methyltransferase	hr(s)	hour(s)
CNS	central nervous system	HR	heart rate
CPK	creatine phosphokinase	HRT	hormone replacement therapy
CR	controlled-release	IA	intra-articular
CSF	colony-stimulating factor; cerebrospinal fluid	IL	intralesional
CT	computed tomography	IM	intramuscular
CV	cardiovascular	Inhaln	inhalation
CVP	central venous pressure	INR	international normalized ratio
D5/LR	5% dextrose and lactated Ringer's solution	IS	intrasynovial
D5/0.9% NaCl	5% dextrose and 0.9% NaCl; 5% dextrose and normal saline	IT	intrathecal
D5/0.25% NaCl	5% dextrose and 0.25% NaCl; 5% dextrose and quarter normal saline	IV	intravenous
D5/0.45% NaCl	5% dextrose and 0.45% NaCl; 5% dextrose and half normal saline	K	potassium
D5W	5% dextrose in water	KCl	potassium chloride
D10W	10% dextrose in water	kg	kilogram
Derm	dermatologic	L	liter
dL	deciliter	LA	long-acting
DMARD	disease-modifying antirheumatic drug	LDH	lactic dehydrogenase
DNA	deoxyribonucleic acid	LDL	low-density lipoproteins
		LR	lactated Ringer's solution
		M	molar
		MAOI	monoamine oxidase inhibitor
		mcg	microgram(s)
		MDI	metered dose inhaler

mEq	milliequivalent	qid	four times a day
Metab	metabolic	q 2 hr	every 2 hours
mg	milligram(s)	q 3 hr	every 3 hours
min(s)	minute(s)	q 4 hr	every 4 hours
Misc	miscellaneous	RBC	red blood cell count
mL	milliliter(s)	Rect	rectally or rectal
mM	millimole	REM	rapid eye movement
MRI	magnetic resonance imaging	Resp	respiratory
MS	musculoskeletal	RTU	ready to use
MUGA	multiple-gated (image) acquisition (analysis)	Rx	prescription
Na	sodium	SA	sinoatrial
NaCl	sodium chloride	subcut	subcutaneous
0.9% NaCl	0.9% sodium chloride, normal saline	sec(s)	second(s)
Neuro	neurologic	SL	sublingual
NPO	nothing by mouth	SR	sustained-release
NS	sodium chloride, normal saline (0.9% NaCl)	SSRI(s)	selective serotonin reuptake inhibitor(s)
NSAIDs	nonsteroidal anti-inflammatory drugs	stat	immediately
 OCD	obsessive-compulsive disorder	supp	suppository
Oint	ointment	tab	tablet
Ophth	ophthalmic	tbsp	tablespoon(s)
OTC	over-the-counter	tid	three times a day
pc	after meals	Top	topically or topical
PCA	patient-controlled analgesia	tsp	teaspoon(s)
PO	by mouth, orally	UK	unknown
prn	as needed	Vag	vaginal
PT	prothrombin time	VF	ventricular fibrillation
PTT	partial thromboplastin time	VLDL	very low-density lipoproteins
PVC	premature ventricular contraction	VT	ventricular tachycardia
q	every	WBC	white blood cell count
		wk(s)	week(s)
		yr(s)	year(s)

Pregnancy Categories

Category A

Adequate, well-controlled studies in pregnant women have not shown an increased risk of fetal abnormalities.

Category B

Animal studies have revealed no evidence of harm to the fetus; however, there are no adequate and well-controlled studies in pregnant women. **or** Animal studies have shown an adverse effect, but adequate and well-controlled studies in pregnant women have failed to demonstrate a risk to the fetus.

Category C

Animal studies have shown an adverse effect and there are no adequate and well-controlled studies in pregnant women. **or** No animal studies have been conducted and there are no adequate and well-controlled studies in pregnant women.

Category D

Studies, adequate well-controlled or observational, in pregnant women have demonstrated a risk to the fetus. However, the benefits of therapy may outweigh the potential risk.

Category X

Studies, adequate well-controlled or observational, in animals or pregnant women have demonstrated positive evidence of fetal abnormalities. The use of the product is contraindicated in women who are or may become pregnant.

Note: The designation UK is used when the pregnancy category is unknown.

Controlled Substances Schedules

General

A controlled substance is any type of drug that the federal government has categorized as having significant potential for abuse or addiction. While controlled substances are regulated in both the United States (U.S.) and Canada, differences exist between the two countries with respect to scheduling and enforcement.

In the United States:

The Drug Enforcement Agency (DEA), an arm of the United States Justice Department, classifies controlled substances according to five schedules, based on the potential for abuse and dependence liability (physical and psychological) of the medication. Some states may have stricter prescription regulations. Physicians, dentists, podiatrists, and veterinarians may prescribe controlled substances. Nurse practitioners and physician assistants may also prescribe controlled substances with limitations that vary from state to state.

Schedule I (C-I)

Potential for abuse is so high as to be unacceptable. May be used for research with appropriate limitations. Examples are LSD and heroin.

Schedule II (C-II)

High potential for abuse and extreme liability for physical and psychological dependence (amphetamines, opioid analgesics, dromabinol, certain barbiturates). Outpatient prescriptions must be in writing. In emergencies, telephone orders may be acceptable if a written prescription is provided within 72 hr. No refills are allowed.

Schedule III (C-III)

Intermediate potential for abuse (less than C-II) and intermediate liability for physical and psychological dependence (certain nonbarbiturate sedatives, certain nonamphetamine CNS stimulants, and certain opioid analgesics). Outpatient prescriptions can be refilled 5 times within 6 mo from date of issue if authorized by prescriber. Telephone orders are acceptable.

Schedule IV (C-IV)

Less abuse potential than Schedule III with minimal liability for physical or psychological dependence (certain sedative/hypnotics, certain anti-anxiety agents, some barbiturates, benzodiazepines, chloral hydrate, pentazocine, and propoxyphene). Outpatient prescriptions can be refilled 6 times within 6 mo from date of issue if authorized by prescriber. Telephone orders are acceptable.

Schedule V (C-V)

Minimal abuse potential. Number of outpatient refills determined by prescriber. Some products (cough suppressants with small amounts of codeine, antidiarrheals containing paregoric) may be available without prescription to patients >18 yr of age.

In Canada:

The federal *Controlled Drugs and Substances Act (CDSA)* along with the *Narcotic Control Regulations*, Part G of the *Food and Drug Regulations*, and the *Benzodiazepines and Other Targeted Substances Regulations* regulate narcotics, controlled drugs, and targeted substances.

The CDSA classifies controlled substances according to eight schedules and three classes of precursors. While a few examples are listed below, a complete list of drugs scheduled in Canada's Controlled Drugs and Substances act can be accessed at: <http://laws-lois.justice.gc.ca/eng/acts/C%2D38.8/>

Schedule I

—opioids and derivatives and related drugs (e.g., morphine, oxycodone, heroin)

Schedule II

—cannabis (marihuana) and derivatives

Schedule III

—amphetamines and related drugs and substances (e.g., methylphenidate, LSD)

Schedule IV

—barbiturates and derivatives, anabolic steroids and related drugs, and benzodiazepines (e.g., diazepam)

Schedule V

—propylhexedrine

Schedule VI

—precursors Class A (e.g., pseudoephedrine and salts)
—precursors Class B (e.g., acetone, toluene)
—precursors Class C mixtures of the above

Schedules VII & VIII

—cannabis and its resins in varying amounts

(Note: In Canada marihuana may be used for medical purposes. It is regulated by the Marihuana for Medical Purposes Regulations.)

The CDSA federally regulates conditions of sale, distribution, and accountability relating to controlled substances. Provincial legislation complements how patients access controlled substances from regulated health professionals. As such, it is imperative for an individual to become familiar with legislation pertaining to the specific province he/she is working in. Some federal regulations are as follows:

Narcotic drug—Two subcategories of prescription narcotics—“Straight” Narcotics and Verbal Prescription Narcotics

(e.g., codeine, morphine, fentanyl, oxycodone)

Straight Narcotics

- All single active ingredient products containing a narcotic, along with all narcotics for parenteral use and narcotic compounds containing more than one narcotic entity or less than two non-narcotic ingredients.
- Prescription can be written or faxed and must be signed and dated by prescriber.
- Refills are not permitted, but a prescription may be dispensed in divided portions. Prescription transfers from one pharmacist to another are not permitted.

Verbal Prescription Narcotic

(e.g., Tylenol No.2 and Tylenol No.3)

- Refers to oral combination products containing only one narcotic and two or more non-narcotic ingredients in a therapeutic dose. (Excluding diacetylmorphine, oxycodone, hydrocodone, methadone, or pentazocine. This means that an oral combination product that contains these drugs cannot be classified as a Verbal Prescription Narcotic.)
- Similar rules as above but prescriptions may be verbal.

Exempted Codeine Preparations

(e.g., Tylenol No.1)

- Under federal regulations, products containing codeine (meaning codeine phosphate or its equivalent) may be purchased over the counter, without a prescription, provided they have two other medicinal ingredients and a **maximum** of 8 mg of codeine per solid oral dosage unit or 20 mg per 30 mL of liquid.
- The product may not be supplied if there are reasonable grounds to suspect the product will be used for other than recognized medical or dental purposes.

Controlled Drugs—Part 1

(e.g., Dexedrine, Ritalin, pentobarbital, secobarbital)

- Refers to drugs listed in Part I of the Schedule to Part G of the Food and Drug Regulations.
- Prescription may be written or verbal; no refills allowed if prescription is verbal.
- Refills are permitted if the number of repeats and the frequency or interval between refills is specified. Prescription transfers are not permitted.

Controlled Drugs—Parts 2 and 3

(e.g., other barbiturates and anabolic steroids)

- Refers to drugs listed in Parts II and III of the Schedule to Part G of the Food and Drug Regulations.
- Prescription may be written or verbal.
- Refills are permitted if prescribed in writing or verbally and the number of repeats and frequency or interval between refills is specified. Prescription transfers are not permitted.

Benzodiazepines and Other Targeted Substances

(e.g., lorazepam, diazepam)

- Refers to all benzodiazepines except flunitrazepam, which is listed in Schedule III of the Act as an illicit substance.
- Prescriptions may be written or verbal. Refills are permitted if the prescription is less than 1 year old and the prescriber specifies the number of times it can be refilled. If the prescriber indicated the interval between refills, the pharmacist cannot refill the prescription if that interval has expired. Prescription transfers are permitted, but only once.

APPENDIX K

Equianalgesic Dosing Guidelines

OPIOID ANALGESICS STARTING ORAL DOSE COMMONLY USED FOR SEVERE PAIN

NAME	EQUIANALGESIC DOSE		STARTING ORAL DOSE		COMMENTS	PRECAUTIONS AND CONTRAINDICATIONS
	ORAL ^a	PARENTERAL ^d	ADULTS	CHILDREN		
a. Morphine-like agonists (μ agonists)						
morphine	30 mg	10 mg	15–30 mg	0.3 mg/kg	Standard of comparison for opioid analgesics. Sustained release preparations (MS Contin, OramorphSR) release over 8–12 hr. Other formulations (Kadian and Avinza) last 12–24 hr. Generic sustained release morphine preparations are now available. Slightly shorter duration than morphine.	For all opioids, caution in patients with impaired ventilation, bronchial asthma, increased intracranial pressure, liver failure.
hydromorphone (Dilaudid)	7.5 mg	1.5 mg	4–8 mg	0.06 mg/kg		
fentanyl		0.1 mg				
oxycodone	20 mg	—	10–20 mg	0.3 mg/kg		
methadone	10 mg	5 mg	5–10 mg	0.2 mg/kg	Good oral potency, long plasma half-life (24–36 hr).	Accumulates with repeated dosing, requiring decreases in dose size and frequency, especially on days 2–5. Use with caution in older adults.
levorphanol (Levodromoran)	4 mg (acute), 1 mg (chronic)	2 mg (acute), 1 mg (chronic)	2–4 mg	0.04 mg/kg	Long plasma half-life (12–16 hr, but may be as long as 90–120 hr after one wk of dosing).	Accumulates on days 2 and 3. Use with caution in older adults.
oxymorphone (Opana)	10 mg	1 mg	—	—	5 mg rectal suppository ~5 mg morphine parenteral.	Like parenteral morphine.

NAME	EQUIANALGESIC DOSE		STARTING ORAL DOSE		COMMENTS	PRECAUTIONS AND CONTRAINDICATIONS
	ORAL ^a	PARENTERAL [†]	ADULTS	CHILDREN		
meperidine (Demerol)	Not recommended	Not recommended	Not Recommended		Slightly shorter acting than morphine accumulates with repetitive dosing causing CNS excitation; avoid in children with impaired renal function or who are receiving monoamine oxidase inhibitors. [‡]	Use with caution. Normeperidine (toxic metabolite) accumulates with repetitive dosing causing CNS excitation and a high risk of seizure. Avoid in children, renal impairment, and patients on monoamine oxidase inhibitors. [‡]
b. Mixed agonists—antagonists (kappa agonists)						
nalbuphine (Nubain)	—	10 mg	—	—	Not available orally, not scheduled under Controlled Substances Act.	Incidence of psychotomimetic effects lower than with pentazocine; may precipitate withdrawal in opioid-dependent patients. Like nalbuphine.
butorphanol (Stadol)	—	2 mg	—	—	Like nalbuphine. Also available in nasal spray.	
pentazocine (Talwin)	50 mg	30 mg	—	—		
c. Partial agonist						
buprenorphine (Buprenex)	—	0.4 mg	—	—	Lower abuse liability than morphine; does not produce psychotomimetic effects. Sublingual tablets now available both plain and with naloxone for opioid-dependent patient management for specially certified physicians. These tablets are not approved as analgesics.	May precipitate withdrawal in narcotic-dependent patients; not readily reversed by naloxone; avoid in labor.

^aStarting dose should be lower for older adults.

[†]These are standard parenteral doses for acute pain in adults and can also be used to convert doses for IV infusions and repeated small IV boluses. For single IV boluses, use half the IM dose. IV doses for children >6 mo. = parenteral equianalgesic dose times weight (kg)/100.

[‡]Irritating to tissues with repeated IM injections.

Modified from *American Pain Society, Principles of Analgesic Use in the Treatment of Acute Pain and Cancer Pain*, ed.6. American Pain Society, 2008.

GUIDELINES FOR PATIENT-CONTROLLED INTRAVENOUS OPIOID ADMINISTRATION FOR ADULTS WITH ACUTE PAIN

DRUG	USUAL STARTING DOSE AFTER LOADING	USUAL DOSE RANGE	USUAL LOCKOUT (MIN)	USUAL LOCKOUT RANGE (MIN)
Morphine (1 mg/mL)	1 mg	0.5–2.5 mg	8	5–10
Hydromorphone (0.2 mg/mL)	0.2 mg	0.05–0.4 mg	8	5–10
Fentanyl (50 mcg/mL)	20 mcg	10–50 mcg	6	5–8

*Standard concentrations for most PCA machines are listed in parentheses.

Modified from *American Pain Society, Principles of Analgesic Use in the Treatment of Acute Pain and Cancer Pain*, ed. 6. American Pain Society, 2008.

FENTANYL TRANSDERMAL DOSE BASED ON DAILY MORPHINE DOSE

ORAL 24-HR MORPHINE (mg/day)	TRANSDERMAL FENTANYL (mg/day)	FENTANYL TRANSDERMAL (mcg/hr)
30–90	0.6	25
91–150	1.2	50
151–210	1.8	75
211–270	2.4	100
271–330	3.0	125
331–390	3.6	150
391–450	4.2	175
451–510	4.8	200
511–570	5.4	225
571–630	6.0	250
631–690	6.6	275
691–750	7.2	300
For each additional 60 mg/day	+0.6	+25

*A 10-mg IM or 60-mg oral dose of morphine every 4 hr for 24 hr (total of 60 mg/day IM or 360 mg/day oral) was considered approximately equivalent to fentanyl transdermal 100 mcg/hr.

Recommendations for the Safe Handling of Hazardous Drugs*

Hazardous Drugs (HDs) have toxic, carcinogenic, mutagenic, and/or teratogenic potential; may cause irritation to the skin, eyes, and mucous membranes; and may cause ulceration and necrosis of tissue. For these obvious reasons, health care workers must minimize their exposure to these chemicals. The U.S. Department of Labor, Occupational Safety & Health Administration (OSHA) has laid out very specific recommendations called Guidelines for the Safe Handling of Hazardous Drugs, which can be found at http://www.osha.gov/dts/osta/otm/otm__vi/otm__vi__2.html. Refer to this document and your facility's policy and procedure manuals for detailed recommendations.

Means of Exposure

Exposure to HDs occurs during preparation and administration of these drugs or during patient care. Inhalation of aerosolized particles, accidental exposure to skin and eyes, and handling contaminated linens or equipment are the primary potential routes of exposure. Even when great care is taken, splattering, spraying, and aerosolization of HDs can occur when withdrawing the needle from a drug vial, opening an ampule, or expelling air from a syringe. Blood, body fluids, and excreta can contain HDs and expose staff to potentially dangerous amounts of hazardous drugs.

Protecting Against Exposure

Preparation of HDs should occur in a specified area called a Biological Safety Cabinet (BSC). If a BSC is not available, the nurse or other staff member preparing an HD should wear a respirator with a high-efficiency filter and full face coverage or partial face coverage with splash goggles and a respirator. Staff should also wear protective gowns and don two sets of latex gloves. Tuck gloves in at the wrist (inner glove under cuff, outer glove over cuff).

Use aseptic technique when preparing the drug for administration and handle equipment carefully to prevent dripping, spraying, or other exposure. Once prepared, wipe bags or bottles with moist gauze to remove spray or spills and swab entry ports with alcohol. Label all syringes and IV bags with a warning label and standard labeling. If being transported, the bag, bottle, or vial should be packaged in a sealed plastic bag and placed inside a secure container. Excess solution should be discarded in a covered disposable container.

Administration of HDs

Wear the same personal protective equipment (PPE) (gown, gloves, splash goggles) for administering the HD as for preparing it. Always wear a respirator when administering aerosolized drugs. In addition to wearing PPE, obtain the following equipment to use during administration: gauze for cleanup, alcohol wipes, disposable plastic-backed absorbent liner, puncture-resistant container (for needles/syringes), resealable plastic bag with warning label, and other accessory warning labels.

*Controlling occupational exposure to hazardous drugs. OSHA Technical Manual. Section VI: Chapter 2. Available at http://www.osha.gov/dts/osta/otm__vi/otm__vi__2.html. Accessed January 27, 2012.

Caring for Patients Receiving HDs

The following precautions are recommended:

- Observe standard precautions.
- Wear gown and gloves when in the patient's room for 48 hr following administration of a hazardous drug.
- Wear eye protection if splashing is possible.
- Wear a gown and gloves when handling contaminated laundry. Bag contaminated linens separately.

Managing Spills

Have spill kits available in areas where HDs are handled. The kit should include splash goggles, 2 pairs of gloves, utility gloves, gown, 2 sheets of absorbent material, spill-control pillows (2 sizes), "sharps" container, and 2 large HD disposal bags.

- Clean up spills only when properly protected and using the facility's procedure.
- Report area of spill to administrative staff.
- For small spills (less than 5 mL or 5 g), mop up liquids with absorbent gauze or use damp gauze to pick up solid contaminated material. Broken fragments should be picked up with a scoop and disposed in a sharps container. Wash the area three times with detergent followed by water.
- Isolate large spill areas and use absorbent sheets or spill-control pads. Use damp cloths if a powder is spilled. Spills greater than 150 mL (or 1 vial) require decontamination.

If Exposure Occurs

Risk of injury can be minimized by following these steps:

- Immediately remove gloves and gown.
- Immediately wash the affected skin with soap and water.
- Flood eyes at eyewash fountain or flush with water or isotonic eyewash for at least 15 min.
- Obtain medical attention and follow protocols for specific exposure.
- Document exposure.

APPENDIX M

Food Sources for Specific Nutrients

Potassium-Rich Foods

artichoke	mango	prunes/prune juice
avocados	meats	pumpkin
bananas	milk	rhubarb
cantaloupe	dried peas and beans	salt substitute
cassava	nuts	spinach
dried fruits	oranges/orange juice	sunflower seeds
grapefruit	papaya	Swiss chard
honey dew	peaches	tomatoes/tomato juice
jack fruit	pears	vegetable juice
kiwi	plantains	winter squash
kohlrabi	pomegranate	
lima beans	potatoes (white and sweet)	

Sodium-Rich Foods

baking mixes (pancakes, muffins)	canned spaghetti sauce	pickles
barbecue sauce	cured meats	potato salad
butter/milk	dry onion soup mix	pretzels, potato chips
butter/margarine	“fast” foods	salad dressings (prepared)
canned chili	frozen dinners	salt
canned seafood	macaroni and cheese	sauerkraut
canned soups	microwave dinners	tomato ketchup
	Parmesan cheese	

Calcium-Rich Foods

almond (milk/nuts)	greens: collard/ mustard/ turnip	spinach
calcium fortified foods	kale	tofu
canned salmon/sardines	milk	yogurt
cheese	soy (beans/milk)	
cream soups (with milk)		

Vitamin K-Rich Foods

asparagus	collard greens	mustard greens
beet greens	dandelion leaves	parsley
broccoli	garden cress	spinach
brussel sprouts	green tea leaves	swiss chard
cabbage	kale	turnip greens

Low-Sodium Foods

baked or broiled poultry	grits (not instant)	potatoes
canned pumpkin	honey	puffed wheat and rice
cooked turnips	jams and jellies	red kidney and lima beans
egg yolk	lean meats	sherbet
fresh vegetables	low-calorie mayonnaise	unsalted nuts
fruit	macaroons	whiskey

Foods That Acidify Urine

cheeses	grains (breads and cereals)	plums
corn	lentils	poultry
cranberries	meats	prunes
eggs	nuts (Brazil, filberts, walnuts)	
fish	pasta	rice

Foods That Alkalinize Urine

all fruits except cranberries, prunes, plums	all vegetables (except corn) milk	nuts (almonds, chesnuts)

Foods Containing Tyramine

aged cheeses (blue, Boursault, brick, Brie, Camembert, cheddar, Emmenthaler, Gru- yère, mozzarella, Parmesan, Romano, Roquefort, Stilton, Swiss)	caffeine-containing beverages (coffee, tea, colas)	peanuts
American processed cheese	caviar	raisins
avocados (especially over- ripe)	chocolate	raspberries
bananas	distilled spirits	red wine (especially Chianti)
bean curd	fermented sausage (bologna, salami, pepperoni, summer sausage)	sauerkraut
beer and ale	liver	sherry
	meats prepared with tenderizer	shrimp paste
	miso soup	smoked or pickled fish
	over-ripe fruit	soy sauce
		vermouth
		yeasts
		yogurt

Iron-Rich Foods

cereals	dried fruit	molasses (blackstrap)
clams	leafy green vegetables	organ meats
dried beans and peas	lean red meats	

Vitamin D-Rich Foods

canned salmon, sardines, tuna	fish	fortified milk
cereals	fish liver oils	nonfat dry milk

Insulins and Insulin Therapy

The goal of therapy for diabetic patients is to provide insulin coverage that most closely resembles endogenous insulin production and results in the best glycemic control without hypoglycemia. Although daytime control of hyperglycemia may be accomplished with bolus doses of rapid-acting insulin analogs, elevations in fasting glucose may remain a problem. If fasting blood glucose levels remain elevated, the basal insulin dose (intermediate or long-acting) may have to be adjusted.

Most insulins used today are recombinant DNA human insulins. Produced through genetic engineering, synthetic human insulin is “manufactured” by yeast or nonpathogenic *E. coli*. In recent years, pharmaceutical companies have developed several new types and formulations of insulin.

Different insulins are distinguished by how quickly they are absorbed, the time and length of peak activity, and overall duration of action. Onset, peak, and duration of action times are approximate and vary according to individual factors such as injection site, blood supply, concurrent illnesses, lifestyle, and exercise level. These factors can vary from patient to patient and can vary in any patient from day to day.

There are 5 kinds of insulins: rapid-acting, short-acting, intermediate-acting, long-acting, and combination insulins.

Rapid-Acting Insulins

Rapid-acting insulins are analogs of regular insulin. An analog is a chemical structure very similar to another but differing in one component. Humalog (lispro), Apidra (glulisine), and Novolog (aspart) are rapid-acting insulin analogs. The amino acid sequences of these analogs are nearly identical to human insulin. They differ in the positioning of certain proteins, which allow them to enter the bloodstream rapidly—within 15 min of subcutaneous injection. This closely mimics the body’s own insulin response and allows greater flexibility in eating schedules for diabetic patients. Also, because these insulins leave the bloodstream quickly, the risk of hypoglycemic episodes several hours after the meal is lessened. The peak time for rapid-acting insulins is 1–2 hr and the duration is 3–4 hr. Rapid-acting insulin solutions are clear. Both insulin aspart and insulin glulisine can be given intravenously in selected situations under medical supervision.

Short-Acting Insulin

Regular insulin is short-acting insulin and is available commercially as Humulin R or Novolin R. The onset of regular insulin is 0.5–1 hr; its peak activity occurs 2–4 hr after subcutaneous injection and its duration of action is 5–7 hr. This time/action profile makes rigid meal scheduling necessary, as the patient must estimate that a meal will occur within 45 min of injection. Short-acting insulin solutions are clear. Regular insulin can be given intravenously.

Intermediate-Acting Insulins

Intermediate-acting insulin contains protamine, which delays onset, peak, and duration of action to provide basal insulin coverage. Basal insulins are given to control blood glucose levels throughout the day when not eating. Commercially, intermediate-acting insulins are available as Humulin N or Novolin N. (The “N” stands for NPH.) Action starts between 2 and 4 hr after injecting. Peak activity occurs between 4 and 10 hr. Duration of action lasts 10–16 hr. The addition of protamine causes the cloudy appearance of intermediate-acting insulins and results in the formulation being a suspension rather than a solution. This is why these insulins must be gently mixed before administering. Intermediate-acting insulins can be mixed with short- or rapid-acting insulins to provide both basal and bolus coverage.

Long-Acting Insulins

Long-acting insulins have the most delayed onset and the longest duration of all insulins. Products include Lantus (insulin glargine) and Levemir (insulin detemir). Peaks are not as prominent in long-acting insulins. In fact, insulin glargine has no real peak action because it forms slowly dissolving crystals in the subcutaneous tissue. The onset of action of insulin glargine is 3–4 hr after subcutaneous injection. Full activity occurs within 4 to 5 hr and remains constant for 24 hr. Even though insulin glargine and insulin detemir are clear solutions, neither can be diluted or mixed with any other insulin or solution. Mixing insulin glargine or insulin detemir with other insulin products can alter the onset of action and time to peak effect. If bolus insulin is to be given at the same time as insulin glargine or insulin detemir, two separate syringes and injection sites must be used.

Combination Insulins

Various combinations of premixed insulins are available, containing fixed proportions of two different insulins, usually a short- and an intermediate-acting insulin. Typically the intermediate-acting insulin makes up 70–75% of the mixture, with rapid- or short- acting insulin making up the remainder. Onset, peak, and duration vary according to each specific product. Brand names of these products include Humulin 70/30 (70% NPH, 30% regular), Humalog Mix 75/25 (75% insulin lispro protamine suspension and 25% insulin lispro), Humalog Mix 50/50 (50% insulin lispro protamine suspension and 50% insulin lispro), and Novolin 70/30 (70% NPH, 30% regular), or Novolog 70/30 (70% insulin aspart protamine suspension and 30% insulin aspart).

BRAND NAME	GENERIC NAME	TYPE OF INSULIN	ONSET/PEAK/DURATION
Humalog Mix 75/25	insulin lispro protamine suspension &	Combination Insulins	15–30 min/2.8 hr/24 hr
Humalog Mix 50/50	insulin lispro injection mixtures		
Novolog Mix 70/30	insulin aspart protamine suspension	Combination Insulins	15 min/1–4 hr/18–24 hr
	insulin & aspart injection mixtures		
Humulin 70/30	NPH/regular insulin mixture	Combination Insulins	15 min/2–12 hr/24 hr
Novolin 70/30			
Apidra	insulin glulisine	Rapid-Acting	Within 15 min/1–2 hr/3–4 hr
Humalog	insulin lispro	Rapid-Acting	Within 15 min/1–2 hr/3–4 hr
Novolog	insulin aspart	Rapid-Acting	Within 15 min/1–2 hr/3–4 hr
Humulin R	regular insulin (subcut)	Short-Acting	½–1 hr/2–4 hr/5–7 hr
Novolin R	regular insulin (IV)	Short-Acting	10–30 min/15–30 min/30–60 min
Humulin N	NPH	Intermediate-Acting	2–4 hr/4–10 hr/10–16 hr
Novolin N			
Levemir	insulin detemir	Long-Acting	3–4 hr/3–14 hr/6–24 hr
Lantus	insulin glargine	Long-Acting	3–4 hr/No Peak/24 hr

Canadian and U.S. Pharmaceutical Practices

In the United States and Canada, most drugs are prescribed and used similarly. However, certain processes and actions of the U.S. and Canadian pharmaceutical industries differ in significant ways, affecting both consumers and health care providers. Safety, marketing, and availability are three of these issues.

Safety

Controversy related to the importation of medications from Canada by U.S. consumers has sometimes raised concerns about the safety of these drugs. These fears are unfounded; in fact, the Canadian approval and manufacturing processes are very similar to U.S. processes. Both countries have pharmaceutical-related standards, laws, and policies to ensure that chemical entities marketed for human diseases and conditions are safe and effective. The process of taking a new drug from the laboratory to the pharmacy shelves includes:

Scientific development. The process begins with research. Scientists develop a new molecular entity targeted at a specific disease, symptom, or condition.

Patenting. The manufacturer applies for a patent, which prevents other drug companies from manufacturing a chemically identical drug. Patent protection lasts 17 years in the United States and 20 years in Canada. After the patent expires, any manufacturer can make generic versions of the chemical; generics typically cost much less than the brand-name drug.

Preclinical testing. Before the drug is taken by human subjects, preclinical testing of the chemical is performed on animals. Testing helps identify drug action, toxicity effects, side effects, adverse reactions, dosage amounts and routes, and administration procedures. This phase can take 3–5 years.

Permission to begin clinical testing. Once the drug is found to have demonstrable positive health effects and to be safe for animals, the manufacturer applies for permission to begin clinical studies on human subjects. In the United States, this is called New Drug Application (NDA) and is administered by the Food and Drug Administration (FDA). In Canada, this is called a Clinical Trial Application (CTA) and is administered by Health Canada.

Clinical trials. Clinical trials are initiated to establish the potential benefits and risks for humans. Several sub-phases are required in the clinical trials phase whereby increasingly larger sample sizes are used.

Phase 0: A new designation for first-in-human trials, which are designed to assess whether the drug affects humans in the manner expected.

Phase I: Between 20 and 80 healthy volunteers are recruited to assess safety, tolerance, dosage ranges, pharmacokinetics, and pharmacodynamics.

Phase II: Up to 300 patients with the disease are enrolled to assess efficacy and toxicity. Variables from Phase I trials may also be assessed.

Phase III: Between 1000 and 3000 patients are entered into a randomized, double-blind study designed to confirm effectiveness, compare the new treatment with existing treatments, and study side effects further.

Phase IV: Ongoing surveillance of the drug after it receives approval and is marketed to assess for rare or long-term effects.

Approval. The results of the clinical studies are reviewed by Health Canada in Canada and by the FDA in the United States. These regulatory bodies assess every aspect of the drug, including the labeling. The approval process has been deemed excessively long by physicians and patients anxious to try new remedies for refractory or terminal diseases, and efforts have been made to shorten the process in both countries. Although approval times for new drugs were found to be significantly longer in Canada, it has been noted that significantly fewer drugs have been pulled from the market for safety reasons. Statistically, Canadians remove 2% of new drugs for safety reasons, whereas 3.6% of new drugs are taken off the market in the United States.¹

Marketing. Once a drug has been approved, it can be prescribed to consumers or, if it does not require a prescription, purchased by them.

Postmarketing Surveillance. More clinical data become available when the drug is marketed and used by many people for longer periods of time. Pharmacovigilance is the term used to refer to the process of ongoing assessment of a drug's safety and effectiveness during this phase.

Differences Between Canadian and U.S. Drug Pricing and Marketing

One major difference between the two countries is pricing. In Canada, the Patented Medicine Prices Review Board (PMPRB) regulates the prices manufacturers can charge for prescription and non-prescription medicines. This is to ensure that prices are not excessive. No such controls exist in the United States, which is why many citizens purchase their medications from Canadian online pharmacies. One study found that U.S. citizens can save approximately 24% if they buy their medications from Canadian pharmacies rather than from a U.S. chain pharmacy.²

Another difference is in advertising. In the United States, manufacturers can market drugs directly, and forcefully, to consumers, a controversial privilege that has resulted in consumers requesting specific medications despite not necessarily understanding the complete risks and benefits. In Canada, such advertising is limited and subject to the approval of the Advertising Standards Canada (ASC) agency and the Pharmaceutical Advertising Advisory Board (PAAB). To address this issue in the United States, the Institute of Medicine (IOM) has recommended that the FDA ban direct-to-consumer advertising for the first 2 years after a drug is marketed. Such a delay may help to prevent large numbers of people experiencing side effects not observed in the clinical trials, such as occurred with sildenafil (Viagra) when several patients died or developed vision problems in the first months after marketing began.

Drug Schedule, Availability, and Pregnancy Category Differences

Most Canadian provinces (with the exception of Québec) use drug schedules similar to U.S. schedules of controlled substances. Canada uses four categories, whereas the United States uses five (see Appendix J for controlled substance schedules). The Canadian drug schedules are:

- **Schedule I:** Available only by prescription and provided by a pharmacist.
- **Schedule II:** Available only from a pharmacist; must be kept in an area with no public access.
- **Schedule III:** Available via open access in a pharmacy (over-the-counter).
- **Unscheduled:** Can be sold in any store without professional supervision.

Another difference is in availability. Some potentially dangerous drugs—such as heparin, insulin, and codeine-containing cough medicines—are available only with a prescription in the United States but are available over the counter in Canada. Similarly, some Canadian drugs are available in combinations not found in the United States (see Appendix B for new Canadian combination drugs).

Although Canada currently does not have pregnancy categories like the United States, it is developing them. Canadian prescribers practice under the premise that no drug should be given to a pregnant woman unless the benefits to the mother clearly outweigh the potential risks to the fetus. Canadian health care providers may refer to a drug's FDA pregnancy category for guidance (see Appendix I).

Routine Pediatric and Adult Immunizations

Immunization recommendations change frequently. For the latest recommendations see <http://www.cdc.gov/vaccines/schedules/hcp/index.html>.

ROUTINE PEDIATRIC IMMUNIZATIONS (0–18 yr)

GENERIC NAME (BRAND NAMES)	ROUTE/DOSAGE	CONTRAINDICATIONS/ PRECAUTIONS	ADVERSE REACTIONS/ SIDE EFFECTS	NOTES
Diphtheria toxoid, tetanus toxoid, and acellular pertussis vaccine (DTaP, Daptacel, Infanrix)	0.5 mL IM at 2, 4, 6, 15–18 mo and 4–6 yr (1st dose may be given as early as age 6 wk; 4th dose may be given as early as age 12 mo).	Acute infection; previous CNS damage; convulsions.	Redness, tenderness, induration at site; fever; malaise; myalgia; urticaria; hypotension; neurologic reactions; allergic reactions.	Individual components may be given as separate injections if unusual reactions occur. The same product should be used for all doses when possible.
Haemophilus b conjugate vaccine (Hib, ActHIB, Hiberix, PedvaxHIB)	ActHIB—0.5 mL IM at 2, 4, and 6 mo, with a booster at 12–15 mo (1st dose may be given as early as age 6 wk); <i>PedvaxHIB</i> —0.5 mL IM at 2 and 4 mo, with a booster dose at 12–15 mo (1st dose may be given as early as age 6 wk); <i>Hiberix</i> —0.5 mL IM; can only be used for the booster dose (any of the products can be used for the booster dose).	If coadministered with other immunizations, consider contraindications of all products.	Induration, erythema, tenderness at injection site; fever.	
Hepatitis A vaccine (HepA, Havarix, Vaqta)	Should be given to all children age 12–23 mo; give a total of 2 doses of pediatric formulation (each 0.5 mL) IM 6–18 mo apart.	Acute febrile illness	Local reactions, headache.	Also recommended in children ≥ 2 yr who live in areas with high rates of hepatitis A or are in other high-risk groups (e.g., chronic liver disease, clotting factor disorders, illicit drug users).

GENERIC NAME (BRAND NAMES)	ROUTE/DOSAGE	CONTRAINDICATIONS/ PRECAUTIONS	ADVERSE REACTIONS/ SIDE EFFECTS	NOTES
Hepatitis B vaccine (HepB, Engerix-B, Recombivax HB)	0.5 mL IM at 0, 1–2, and 6–18 mo; if mother's HBsAg status is unknown, administer hepatitis B vaccine within 12 hr of birth. Dose is same for patients age 0–19 yr. <i>Infants born to HBsAg-positive mothers:</i> Administer 0.5 mL of hepatitis B immune globulin IM and 1st dose of hepatitis B vaccine within 12 hr of birth; give 2nd and 3rd doses of hepatitis B vaccine at 1–2 mo and 6 mo, respectively.	Hypersensitivity to yeast.	Local soreness.	A 2-dose series (separated by ≈ 4 mo) of the adult formulation (Recombivax HB) can be used in children 11–15 yr.
Human papillomavirus vaccine, bivalent (HPV2, Cervarix)	0.5 mL IM in females age 11–26 yr (1st dose may be given as early as age 9 yr), repeat at 1–2 and 6 mo after 1st dose.	Hypersensitivity to yeast; pregnancy.	Fatigue, myalgia, arthralgia, itching, local soreness.	Used to prevent cervical, vulvar, and vaginal cancer caused by HPV types 16 and 18 in females. HPV series should be completed with same product, when possible.
Human papillomavirus vaccine, quadrivalent (HPV4, Gardasil)	0.5 mL IM in males and females age 11–26 yr (1st dose may be given as early as age 9 yr), repeat at 1–2 and 6 mo after 1st dose.	Hypersensitivity to yeast; pregnancy.	Headache, dizziness, fever, nausea, diarrhea, syncope, local soreness.	Used to prevent cervical, vulvar, and vaginal cancer caused by HPV types 16 and 18 in females and to prevent genital warts caused by HPV types 6 and 11 and anal cancer caused by HPV types 16 and 18 in males and females. HPV series should be completed with same product, when possible.
Influenza vaccine <i>Injection (trivalent inactivated):</i> (Afluria, Fluax, Flucevax, Flulaval, Fluvirin, Fluzone; <i>Intranasal (live attenuated):</i> (FluMist)	<i>Injection:</i> Age 6–35 mo: 2 doses of 0.25 mL IM given 4 wk apart for initial season, then one dose annually. Age 3–8 yr: 2 doses of 0.5 mL IM given 4 wk apart for initial season, then one dose annually. Age ≥ 9 yr: 0.5 mL IM single dose annually. <i>Intranasal:</i> Age 2–8 yr: If not previously vaccinated with influenza vaccine—2 doses of 0.2 mL (given as 0.1 mL in each nostril) 4 wk apart, then one dose annually. If previously vaccinated with influenza vaccine—1 dose of 0.2 mL (given as 0.1 mL in each nostril) annually. Age ≥ 9 yr: 1 dose of 0.2 mL (given as 0.1 mL dose in each nostril) annually.	Hypersensitivity to eggs/egg products. Hypersensitivity to thimerosal (injection only). Avoid use in patients with acute neurologic compromise. Afluria should only be used in children ≥ 8 yr (because of $\uparrow$ risk of fever and febrile seizures in children 5–8 yr). Fluvirin should only be used in children ≥ 4 yr. Fluax should only be used in children ≥ 3 yr. FluMist should be avoided in pregnancy; chronic pulmonary (including asthma), cardiovascular (not hypertension), renal, hepatic, neurological, hematologic, or metabolic (including diabetes) disorders; immunosuppression (including HIV); children < 5 yr with wheezing in past 12 mo; chronic salicylate therapy (children 2–17 yr).	<i>Injection:</i> local soreness, fever, myalgia, possible neurologic toxicity. <i>Intranasal:</i> upper respiratory congestion, malaise.	Immunosuppression may $\downarrow$ antibody response to injection and $\uparrow$ the risk of viral transmission with intranasal route. Flucevax may be considered in patients with a mild egg allergy (manufactured using cell culture technology instead of chicken egg product).

GENERIC NAME (BRAND NAMES)	ROUTE/DOSAGE	CONTRAINDICATIONS/ PRECAUTIONS	ADVERSE REACTIONS/ SIDE EFFECTS	NOTES
Measles, mumps, and rubella vaccine (MMR, M-M-R II)	0.5 mL subcut at 12–15 mo and at 4–6 yr (2nd dose may be given earlier if $\approx$ 4 wk have elapsed since the 1st dose).	Allergy to egg, gelatin, or neomycin; active infection; severe immunosuppression (in the absence of severe immunosuppression, HIV is not a contraindication); pregnancy.	Burning, stinging, pain at injection site; arthritis/ar-thralgia; fever; encephalitis; allergic reactions.	If unusual reactions occur, individual components may be given as separate injections. Immunosuppression may ↓ antibody response to injection and ↑ the risk of viral transmission.
Meningococcal conjugate vaccine (MCV4, Menactra, Menveo)	0.5 mL IM single dose at 11–12 yr with a booster dose at age 16 yr; single dose can be given at age 13–18 yr if not previously vaccinated (if received 1st dose at age 13–15 yr, should receive booster dose at age 16–18 yr). Single dose should be given to previously unvaccinated college freshmen living in dormitories. Minimum interval between doses is 8 wks.	Hypersensitivity to any components.	Fatigue, malaise, anorexia, pain at injection site.	Routine vaccination with meningococcal vaccine also is recommended for certain children (>9 mo) who are at high risk (anatomic or functional asplenia, persistent complement component deficiency, travel or reside in areas in which meningococcal disease is epidemic).
Pneumococcal conjugate vaccine (13-valent) (PCV13, Prevnar 13)	0.5 mL IM at 2, 4, 6, and 12–15 mo (1st dose may be given as early as 6 wk). If previously received 4 doses of Prevnar 7 (and age 14–59 mo), give single dose of Prevnar 13 $\geq$ 2 mo after most recent dose. If previously received 4 doses of Prevnar 7 (and high-risk children age 24–71 mo), give single dose of Prevnar 13 $\geq$ 2 mo after most recent dose.	Hypersensitivity to all components including diphtheria toxoid; moderate to severe febrile illness.	Erythema induration, tenderness, nodule formation at injection site, fever.	One dose may also be given to previously unvaccinated healthy children age 24–59 mo. For high-risk children (e.g., sickle cell disease; anatomic or functional asplenia; chronic cardiac, pulmonary, or renal disease; diabetes; HIV; immunosuppression; cerebrospinal fluid leaks; cochlear implant) age 24–71 mo, give 2 doses ($\approx$ 8 wk apart) if previously unvaccinated (if previously received <3 doses, give 2 doses $\approx$ 8 wk apart, with 1st dose being given $\geq$ 2 mo after most recent dose) (if previously received 3 doses, give 1 dose $\approx$ 2 mo after most recent dose).
Pneumococcal polysaccharide vaccine (PPSV23; Pneumovax 23)	0.5 mL IM or subcut $\approx$ 8 wk after final dose of PCV in high-risk children $\geq$ 2 yr (see Notes section for pneumococcal conjugate vaccine for definition of high risk).	Hypersensitivity to all components including diphtheria toxoid; moderate to severe febrile illness.	Erythema induration, tenderness, nodule formation at injection site, fever.	A 2nd dose may be given 5 yr later in children with immunosuppression, sickle cell disease, or anatomic/functional asplenia.
Polio vaccine, inactivated (IPV, IPOL)	0.5 mL IM or subcut at 2, 4, and 6–18 mo and at 4–6 yr (1st dose may be given as early as age 6 wk).	Hypersensitivity to neomycin, streptomycin, or polymyxin B; acute febrile illness; pregnancy.	Erythema, induration, pain at injection site; fever.	Oral polio vaccine (OPV) is no longer recommended for use in the United States.

GENERIC NAME (BRAND NAMES)	ROUTE/DOSAGE	CONTRAINDICATIONS/ PRECAUTIONS	ADVERSE REACTIONS/ SIDE EFFECTS	NOTES
Rotavirus vaccine (RV, Rotarix [RV1], RotaTeq [RV5])	<i>Rotarix</i> —1 mL PO at 2 and 4 mo; <i>RotaTeq</i> —2 mL PO at 2, 4, and 6 mo. First dose of either product may be given as early as age 6 wk; final dose should be given no later than age 8 mo.	Rotarix: History of uncorrected congenital malformation of GI tract, intussusception, or severe combined immunodeficiency disease. Previous reactions to DTaP; progressive neurological disease; recent (within 7 days) CNS pathology.	Fever, irritability, diarrhea, vomiting.	Series should not be started in infants ≥ 15 wk. Series should be completed with same product, when possible. If RotaTeq used in any of the doses, a total of 3 doses should be given.
Tetanus toxoid, reduced diphtheria toxoid, and acellular pertussis vaccine adsorbed (Tdap, Adacel, Boostrix)	0.5 mL IM given at age 11–12 yr if previously completed DTaP series, then followed by booster doses of Td every 10 yr; one-time dose (in place of single Td booster) may be given to all adolescents who have not received previous Tdap at age 11 or 12.		Fatigue, headache, gastrointestinal symptoms, pain at injection site.	Pertussis protection in addition to diphtheria and tetanus designed to protect against older children becoming ill with pertussis from passing it on to very young unprotected children in whom the disease has heightened morbidity.
Varicella vaccine (Var, Varivax)	0.5 mL subcut at 12–15 mo and at 4–6 yr (2nd dose may be given earlier if ≥ 3 mo have elapsed since the 1st dose); for persons 7–18 yr who have not been vaccinated or without a history of chickenpox, 2 doses should be given (≥ 3 mo apart if 7–12 yr or ≥ 4 wk apart if ≥ 13 yr).	Allergy to gelatin or neomycin; severe immunosuppression (in the absence of severe immunosuppression, HIV is not a contraindication); pregnancy.	Local soreness, fever.	Given to children and adolescents who do not have evidence of immunity. Immunosuppression may ↓ antibody response to injection and ↑ the risk of viral transmission.

Nursing Implications:

Assessment

Assess previous immunization history and history of hypersensitivity.

Assess for history of latex allergy. Some prefilled syringes may use latex components and should be avoided in those with hypersensitivity.

Potential Nursing Diagnoses

Infection, risk for (indications).

Knowledge, deficient, related to medication regimen (Patient/Family Teaching).

Implementation

Measles, mumps, and rubella vaccine and diphtheria toxoid, tetanus toxoid, and pertussis vaccine may be given concomitantly. Do not administer Flumist concurrently with other vaccines, or in patients who have received a live virus vaccine within 1 mo or an inactivated vaccine within 2 wk of vaccination.

Administer each immunization by appropriate route:

PO: Rotarix.

Subcut: measles, mumps, rubella, polio, varicella, pneumococcal polysaccharide.

IM: diphtheria, tetanus toxoid, pertussis, polio, Haemophilus b, hepatitis B, meningococcal conjugate, pneumococcal polysaccharide, influenza injection, human papillomavirus.

Intranasal: Flumist.

Patient/Family Teaching

Inform parent of potential and reportable side effects of immunization. Notify health care professional if patient develops fever higher than 39.4°C (103°F); difficulty breathing; hives; itching; swelling of eyes, face, or inside of nose; swollen, severe tiredness or weakness; or convulsions.

Review next scheduled immunization with parent.

Evaluation

Prevention of diseases through active immunity.

ROUTINE ADULT IMMUNIZATIONS				
GENERIC NAME (BRAND NAMES)	INDICATIONS	DOSAGE/ROUTE	CONTRAINDICATIONS	ADVERSE REACTIONS/SIDE EFFECTS
Hepatitis A vaccine (HepA, Havrix, Vagta)	High-risk groups (e.g., chronic liver disease, receive clotting factor concentrates, IV drug users, men who have sex with men, working with infected prisoners or with hepatitis A virus in a research laboratory setting); travel to endemic areas; unvaccinated individuals who anticipate close personal contact with an international adoptee during the initial 60 days after their arrival in the U.S. from a country with intermediate or high endemicity.	1 mL IM, followed by 1 mL IM 6–12 mo (for Havrix) or 6–18 mo (for Vagta) later.	Hypersensitivity to alum or 2-phenoxyethanol.	Local reactions, headache.
Hepatitis B vaccine (HepB, Engerix-B, Recombivax HB)	High-risk patients (e.g., household contacts or sex partners of persons with chronic hepatitis B virus infection, IV drug users, sexually active persons not in a long-term monogamous relationship [having >1 sex partner in past 6 mo], men who have sex with men, HIV, STDs, end-stage renal disease, hemodialysis, health care workers, inmates, chronic liver disease); travel to endemic areas; all unvaccinated adolescents; unvaccinated adults (19–59 yr) with diabetes (may also be administered at prescriber's discretion to adults ≥ 60 yr with diabetes).	1 mL IM, given at 0, 1 and 4–6 mo.	Anaphylactic allergy to yeast.	Local soreness.
Human papillomavirus vaccine, bivalent (HPV2, Gardasil)	All previously unvaccinated women through age 26 yr. Not indicated for males.	0.5 mL IM, repeat at 1–2 and 6 mo after initial dose.	Hypersensitivity to yeast; pregnancy.	Fatigue, myalgia, arthralgia, itching, local soreness.
Human papillomavirus vaccine, quadrivalent (HPV4, Gardasil)	All previously unvaccinated females and males through age 26 yr.	0.5 mL IM, repeat at 1–2 and 6 mo after initial dose.	Hypersensitivity to yeast; pregnancy.	Headache, dizziness, fever, nausea, diarrhea, syncope, local soreness.

GENERIC NAME (BRAND NAMES)	INDICATIONS	DOSAGE/ROUTE	CONTRAINDICATIONS	ADVERSE REACTIONS/SIDE EFFECTS
Influenza vaccine <i>Injection (trivalent inactivated)</i> : (Afluria, Fluarix, Flucelvax, Flulaval, Fluvirin, Fluzone); <i>Intranasal (live attenuated)</i> : FluMist	All adults.	<i>Injection</i> : 0.5 mL IM annually. <i>Intranasal (for healthy adults <50 yr)</i> : Single 0.2 mL dose (given as 0.1 mL in each nostril) annually.	Hypersensitivity to eggs/egg products. Hypersensitivity to thimerosal (injection only). Patients with acute neurologic compromise. FluMist should be avoided in pregnancy; chronic pulmonary (including asthma), cardiovascular (not hypertension), renal, hepatic, neurological, hematologic, or metabolic (including diabetes) disorders; immunosuppression (including HIV); age ≥ 50 yr.	<i>Injection</i> : local soreness, fever, myalgia, possible neurologic toxicity. <i>Intranasal</i> : upper respiratory congestion, malaise. Immunosuppression may $\uparrow$ antibody response to injection and the risk of viral transmission with intranasal route. Flucelvax may be considered in patients with a mild egg allergy (manufactured using cell culture technology instead of chicken egg protein).
Measles, mumps, and rubella vaccine (MMR, M-M-R II)	Adults born in or after 1957 with unreliable history of MMR illness or immunization; high-risk groups (e.g., health care workers, college students, international travelers); women of childbearing age (with no evidence of rubella immunity or immunization).	Adults born in or after 1957 with unreliable history: 1 or 2 doses of 0.5 mL subcut (with ≥ 28 days between doses); high-risk groups should receive a total of 2 doses (with ≥ 28 days between doses).	Allergy to egg, gelatin, or neomycin; severe immunosuppression (in the absence of severe immunosuppression, HIV is not a contraindication); pregnancy (also avoid becoming pregnant for 4 wk after immunization).	Burning, stinging, pain at injection site; arthritis/arthritis; fever; encephalitis; allergic reactions. Immunosuppression may $\downarrow$ antibody response to injection and $\uparrow$ the risk of viral transmission.
Meningococcal conjugate vaccine (MCV4, Menactra, Menveo)	College freshmen (up to age 21) living in dormitories if they have not previously received a dose on or after their 16th birthday; military recruits; anatomic or functional asplenia; persistent complement component deficiency; HIV; travel or residence in areas in which meningococcal disease is hyperendemic or epidemic.	Age ≥ 55 yr: 0.5 mL IM single dose; Age ≤ 55 yr with anatomic or functional asplenia, persistent complement component deficiency, or HIV: 0.5 mL IM, repeat at 2 mo after initial dose. Revaccination with MCV4 every 5 yr is indicated in patients previously vaccinated with MCV4 or meningococcal polysaccharide vaccine (MPSV4) and who also remain at $\uparrow$ risk for infection (anatomic or functional asplenia or persistent complement component deficiency).	Hypersensitivity to any components.	Fatigue, malaise, anorexia, pain at injection site.
Pneumococcal conjugate vaccine (13-valent) (PCV13, Prevnar 13)	Adults ≥ 19 yr with chronic renal failure, anatomic or functional asplenia, sickle cell disease, cerebrospinal fluid leaks, cochlear implants, or immunosuppression.	0.5 mL IM single dose followed by single dose of PPSV23 ≈ 8 wk later; if already received PPSV23, give PCV13 single dose (0.5 mL IM) ≈ 1 yr after dose of PPSV23.	Hypersensitivity to all components including diphtheria toxoid.	Pain at injection site, fatigue, headache, myalgia, arthritis, chills.

GENERIC NAME (BRAND NAMES)	INDICATIONS	DOSAGE/ROUTE	CONTRAINDICATIONS	ADVERSE REACTIONS/SIDE EFFECTS
Pneumococcal polysaccharide vaccine (PPSV23, Pneumovax 23)	All adults ≥ 65 yr; high-risk patients (e.g., chronic cardiac or pulmonary disease including COPD and asthma, chronic liver disease, alcoholism, diabetes, cigarette smoker, anatomic or functional asplenia, sickle cell disease; immunosuppression including HIV), chronic renal failure, cochlear implants, cerebrospinal fluid leaks, residents of long-term care facilities). Single dose should be given to replace one of the 10-yr Td boosters in all adults who did not previously receive a dose of Tdap or if their vaccine status is unknown. Single dose should also be given as soon as feasible to all pregnant women (preferred during 27–36 weeks' gestation), close contacts of infants <12 mo, and health care workers with direct patient contact.	0.5 mL IM or subcut; one-time revaccination should also be given ≥ 5 yr after 1st dose to those ≥ 65 yr (if 1st dose was given ≥ 5 yr ago and before age 65) and to high-risk patients age 19–64 yr (chronic renal failure, anatomic or functional asplenia, sickle cell disease, immunosuppression).	Hypersensitivity to all components including diptheria toxoid.	Erythema induration, tenderness, nodule formation at injection site, fever.
Tetanus toxoid, reduced diptheria toxoid and acellular pertussis vaccine absorbed (Tdap, Adacel, Boostrix)	Any adult without a history of chickenpox or herpes zoster (shingles); a history of receiving 2 doses of varicella vaccine at least 4 wk apart, or laboratory evidence of immunity. Health care workers and pregnant women born in U.S. before 1980 who do not meet the above criteria should be tested for immunity. All adults ≥ 60 yr (regardless of previous history of chickenpox or herpes zoster).	0.5 mL IM single dose.	Previous reactions to DTap ^a ; progressive neurological disease; recent (within 7 days) CNS pathology.	Fatigue, headache, gastrointestinal symptoms, pain at injection site.
Tetanus-diphtheria (Td, Tenivac)	All adults who lack written documentation of a primary series consisting of ≥ 3 doses of tetanus– and diptheria–toxoid-containing vaccine; booster dose should be given to all adults every 10 yr (see info above regarding use of Tdap to replace one dose of Td in booster series).	<i>Unimmunized</i> : 2 doses of 0.5 mL IM 8 wk apart, then a 3rd dose 6–8 mo later; <i>Immunized</i> : 0.5 mL IM booster every 10 yr.	Neurologic or severe hypersensitivity reaction to prior dose.	Local pain and swelling.
Varicella vaccine (Var, Varivax)	Any adult without a history of chickenpox or herpes zoster (shingles); a history of receiving 2 doses of varicella vaccine at least 4 wk apart, or laboratory evidence of immunity. Health care workers and pregnant women born in U.S. before 1980 who do not meet the above criteria should be tested for immunity.	0.5 mL subcut; repeated 4–8 wk later.	Allergy to gelatin or neomycin; severe immunosuppression (in the absence of severe immunosuppression, HIV is not a contraindication); pregnancy (also avoid becoming pregnant for 4 wk after immunization).	Local soreness, fever. Immunosuppression may $\downarrow$ antibody response to infection and $\uparrow$ the risk of viral transmission.
Zoster vaccine (Zos, Zostavax)	All adults ≥ 60 yr (regardless of previous history of chickenpox or herpes zoster).	0.65 mL subcut single dose.	Allergy to gelatin or neomycin; severe immunosuppression (in the absence of severe immunosuppression, HIV is not a contraindication); pregnancy.	Local soreness, fever. Immunosuppression may $\downarrow$ antibody response to infection and $\uparrow$ the risk of viral transmission.

Administering Medications to Children

General Guidelines

Medication administration to a pediatric patient can be challenging. Prescribers should order dosage forms that are age appropriate for their patients. If a child is unable to take a particular dosage form, ask the pharmacist if another form is available or for other options.

Oral Liquids

Pediatric liquid medicines may be given with plastic medicine cups, oral syringes, oral droppers, or cylindrical dosing spoons. Parents should be taught to use these calibrated devices rather than using household utensils. If a medicine comes with a particular measuring device, do not use it with another product. For young children, it is best to squirt a little of the dose at a time into the side of the cheek away from the bitter taste buds at the back of the tongue.

Eye Drops/Ointments

Tilt the child's head back and gently press the skin under the lower eyelid and pull the lower lid away slightly until a small pouch is visible. Insert the ointment or drop (1 at a time) and close the eye for a few minutes to keep the medicine in the eye.

Ear Drops

Shake otic suspensions well before administration. For children <3 yr, pull the outer ear outward and downward before instilling drops. For children ≥3 yr, pull the outer ear outward and upward. Keep child on side for 2 min and instill a cotton plug into ear.

Nose Drops

Clear nose of secretions prior to use. A nasal aspirator (bulb syringe) or a cotton swab may be used in infants and young children. Ask older children to blow their nose. Tilt child's head back over a pillow and squeeze dropper without touching the nostril. Keep child's head back for 2 min.

Suppositories

Keep refrigerated for easier administration. Wearing gloves, moisten the rounded end with water or petroleum jelly prior to insertion. Using your pinky finger for children <3 yr and your index finger for those ≥3 yr, insert the suppository into the rectum about ½ to 1 inch beyond the sphincter. If the suppository slides out, insert it a little farther than before. Hold the buttocks together for a few minutes and have the child hold their position for about 20 min, if possible.

Topicals

Clean affected area and dry well prior to application. Apply a thin layer to the skin and rub in gently. Do not apply coverings over the area unless instructed to do so by the prescriber.

Metered-Dose Inhalers

Generally the same principles apply in children as in adults, except the use of spacers is recommended for young children (see Appendix D).

Pediatric Dosage Calculations

Most drugs in children are dosed according to body weight (mg/kg) or body surface area (BSA) (mg/m²). Care must be taken to properly convert body weight from pounds to kilograms (1 kg = 2.2 lb) before calculating doses based on body weight. Doses are often expressed as mg/kg/day or mg/kg/dose, therefore orders written “mg/kg/d,” which is confusing, *require further clarification from the prescriber*.

Chemotherapeutic drugs are commonly dosed according to body surface area, which requires an extra verification step (BSA calculation) prior to dosing. Medications are available in multiple concentrations, therefore *orders written in “mL” rather than “mg” are not acceptable and require further clarification*.

Dosing also varies by indication, therefore diagnostic information is helpful when calculating doses. The following examples are typically encountered when dosing medication in children.

Example 1.

Calculate the dose of amoxicillin suspension in mLs for otitis media for a 1-yr-old child weighing 22 lb. The dose required is 40 mg/kg/day divided BID and the suspension comes in a concentration of 400 mg/5 mL.

Step 1. Convert pounds to kg:	$22 \text{ lb} \times 1 \text{ kg}/2.2 \text{ lb} = 10 \text{ kg}$
Step 2. Calculate the dose in mg:	$10 \text{ kg} \times 40 \text{ mg/kg/day} = 400 \text{ mg/day}$
Step 3. Divide the dose by the frequency:	$400 \text{ mg/day} \div 2 \text{ (BID)} = 200 \text{ mg/dose BID}$
Step 4. Convert the mg dose to mL:	$200 \text{ mg/dose} \div 400 \text{ mg}/5 \text{ mL} = \mathbf{2.5 \text{ mL BID}}$

Example 2.

Calculate the dose of ceftriaxone in mLs for meningitis for a 5-yr-old weighing 18 kg. The dose required is 100 mg/kg/day given IV once daily and the drug comes prediluted in a concentration of 40 mg/mL.

Step 1. Calculate the dose in mg:	$18 \text{ kg} \times 100 \text{ mg/kg/day} = 1800 \text{ mg/day}$
Step 2. Divide the dose by the frequency:	$1800 \text{ mg/day} \div 1 \text{ (daily)} = 1800 \text{ mg/dose}$
Step 3. Convert the mg dose to mL:	$1800 \text{ mg/dose} \div 40 \text{ mg/mL} = \mathbf{45 \text{ mL once daily}}$

Example 3.

Calculate the dose of vincristine in mLs for a 4-yr-old with leukemia weighing 37 lb and is 97 cm tall. The dose required in 2 mg/m² and the drug comes in 1 mg/mL concentration.

Step 1. Convert pounds to kg:	$37 \text{ lb} \times 1 \text{ kg}/2.2 \text{ lb} = 16.8 \text{ kg}$
Step 2. Calculate BSA (see Appendix F):	$\sqrt{16.8 \text{ kg} \times 97 \text{ cm}/3600} = 0.67 \text{ m}^2$
Step 3. Calculate the dose in mg:	$2 \text{ mg/m}^2 \times 0.67 \text{ m}^2 = 1.34 \text{ mg}$
Step 4. Calculate the dose in mL:	$1.34 \text{ mg} \div 1 \text{ mg/mL} = \mathbf{1.34 \text{ mL}}$

Pediatric Fluid and Electrolyte Requirements

How to calculate maintenance fluid requirements in children:

1. Body Surface Area Method (commonly used in children >10 kg):

$$1500\text{--}2000 \text{ mL/m}^2/\text{day} \div 24 = \text{fluid rate in mL/hr}$$

Example: Calculate maintenance fluids in mL/hr for a child with a BSA = 0.8 m².

$$\text{Answer: } 1500 \text{ mL/m}^2/\text{day} \times 0.8 \text{ m}^2 = 1200 \text{ mL/day} \div 24 \text{ hr} = 50 \text{ mL/hr}$$

$$2000 \text{ mL/m}^2/\text{day} \times 0.8 \text{ m}^2 = 1600 \text{ mL/day} \div 24 \text{ hr} = 66.6 \text{ mL/hr}$$

Range: 50–66.6 mL/hr.

2. Body Weight Method

<10 kg	100 mL/kg/day
11–20 kg	1000 mL + 50 mL/kg for each kg >10
>20 kg	1500 mL + 20 mL/kg for each kg >20

Example: Calculate maintenance fluids in mL/hr for a child weighing 25 kg.

$$\text{Answer: } 1500 \text{ mL} + 20 \text{ mL/kg} \times 5 \text{ kg} = 1500 \text{ mL} + 100 \text{ mL} = 1600 \text{ mL}$$

$$1600 \text{ mL} \div 24 \text{ hr} = 66.6 \text{ mL/hr}$$

Daily Electrolyte Requirements in Children

Sodium	2–6 mEq/kg/day
Potassium	2–4 mEq/kg/day
Calcium	1–4 mEq/kg/day*
Magnesium	0.3–0.5 mEq/kg/day
Phosphorous	0.5–2 mmol/kg/day*

*Neonates may require the higher end of the calcium and phosphorous dosage range due to rapid bone development.

Conditions That May Alter Fluid Requirements in Children

Fever	Renal failure
Hyperventilation	Diarrhea
Sweating	Congenital heart disease
Hyperthyroidism	Chronic lung disease

Oral Rehydration Therapy (ORT)

ORT is as effective as IV therapy in managing fluid and electrolytes in children with mild to moderate dehydration due to diarrhea. Commercially available premixed ORT solutions typically contain low concentrations of glucose (2–3%), 45–75 mEq/L sodium, 20–25 mEq/L potassium, 30–35 mEq/L of citrate (bicarbonate source). Low sugar content provides little caloric support but facilitates intestinal sodium and water absorption. All commercially available ORT solutions are equally safe and effective, and are preferred over household remedies (e.g., colas, juices, chicken broth) that are not formulated based on the physiology of acute diarrhea.

Early Management of Anaphylactic Reactions

1. Discontinue suspected drug.

(stop IV, tourniquet IM or subcut site.)

2. Maintain airway.

Aminophylline or other bronchodilators may be required for severe respiratory distress.

3. Administer *epinephrine*.

IM, Subcut (Adults): 0.3–0.5 mg, may repeat q 5–15 min

IM, Subcut (Children): 0.01 mg/kg, or 0.1 mg may repeat q 5–15 min

IV (Adults): 0.1 mg over 5 min or 1–4 mcg/min infusion

IV (Children): 0.01 mg/kg/dose or 0.1–0.2 mg over 5 min, may repeat q 30 min or 0.1–1.5 mcg (maximum)/kg/min infusion

4. Administer *antihistamines*.

May prevent recurrence and decrease intensity of reaction.

diphenhydramine (Benadryl)

IM, IV (Adults): 50–100 mg single dose, may follow with 50 mg every 6 hr for 1–2 days

IM, IV (Children): 5 mg/kg/day in divided doses q 6–8 hr (not to exceed 300 mg/day), may follow with oral therapy for 1–2 days

cimetidine (Tagamet)

IV (Adults): 300 mg q 6 hr

IV (Children): 25–30 mg/kg/day in 6 divided doses

5. Support blood pressure.

If necessary, use fluids and/or vasopressors. Patients receiving beta blockers may be resistant to the effects of vasopressors.

6. Administer corticosteroids.

(May decrease intensity of reaction.)

hydrocortisone (Solu-Cortef)

IV (Adults and Children): 100–1000 mg, may follow with 7 mg/kg/day IV or oral therapy for 1–2 days.

7. Document reaction.

In medical record, inform patient/family to carry identification.

The Cytochrome P450 System: What Is It and Why Should I Care?^{1,2,3}

Looking beyond the obvious takes time, energy, insight, and fortitude; yet this is what we are called to do. We are nurses—tireless care providers. Yet, when the subject of the liver's enzyme system, also called the cytochrome P450 system, is discussed, we feel the urge to run the other way . . . or better yet, to just ignore the conversation. Yet, can we do this as the tireless care provider? The answer to this question is clear and simple: no, we cannot. This is because numerous medications, nutrients, and herbal therapies are metabolized through the cytochrome P450 (CYP450) enzyme system. This system can be inhibited or induced by drugs, and once altered can be clinically significant in the development of drug-drug interactions that may cause unanticipated adverse reactions or therapeutic failures. This article will review the basic concepts of the CYP450 system and relate these concepts to clinically significant altered responses.

The CYP450 enzymes are essential for the production of numerous agents including cholesterol and steroids. Additionally, these enzymes are necessary for the detoxification of foreign chemicals and the metabolism of drugs. CYP450 enzymes are so named because they are bound to membranes within a cell (cyto) and contain a heme pigment (chrome and P) that absorbs light at a wavelength of 450 nm when exposed to carbon monoxide.² There are more than 50 CYP450 enzymes, but the CYP1A2, CYP2C19, CYP2D6, CYP1A2, CYP3A4, and CYP3A5 enzymes are responsible for metabolizing 45% of drug metabolism. The CYP2D6 (20–30%), the CYP2C9 (10%) and the CYP2E1 and CYP1A2 (5%) complete this enzyme system.³

Drugs that cause CYP450 drug interactions are referred to as either inhibitors or inducers. An inducing agent can increase the rate of another drug's metabolism by as much as two- to threefold that develops over a period of a week. When an inducing agent is prescribed with another medication, the dosage of the other medication may need to be adjusted since the rate of metabolism is increased and the effect of the medication reduced. This can lead to a therapeutic failure of the medication. Conversely, if a medication is taken with an agent that inhibits its metabolism, then the drug level can rise and possibly result in a harmful or adverse effect. Information regarding a drug's CYP450 metabolism and its potential for inhibition or induction can be found on the drug label and accessed through the U.S. Food and Drug Administration (FDA) or manufacturer's websites.²

When we assess our patients and provide management modalities, these are implemented within a framework of the patient's heritage, race, and culture. This is also true in pharmacology as well (i.e., "pharmacogenetics"). This concept is important to examine since we know that there exists genetic variability, which may influence a patient's response to commonly prescribed drug classes. This genetic variability can be defined as polymorphism. Seven percent of Caucasians and 2–7% of African Americans are poor metabolizers of drugs dependent on CYP2D6, which metabolizes many beta blockers, antidepressants, and opioids. This is because the drug's metabolism via CYP450 enzymes exhibits genetic variability.²

Recently, researchers have studied the genetic variability in metabolism among women who were prescribed tamoxifen and medications that inhibit the CYP2D6 enzyme. To review, tamoxifen is biotransformed to the potent antiestrogen, endoxifen, by this enzyme. CYP2D6 genetic variation (individuals considered extensive metabolizers versus poor metabolizers) and inhibitors of the enzyme markedly reduce endoxifen plasma concentrations in tamoxifen-treated patients.

The researchers concluded that CYP2D6 metabolism is an "independent predictor of breast cancer outcome in post-menopausal women receiving tamoxifen for early breast cancer. Determination of CYP2D6 genotype may be of value in selecting adjuvant hormonal therapy and it appears CYP2D6 inhibitors should be avoided in tamoxifen-treated women."⁴ Do oncology patients come to us with only their cancer and its treatment? No, they come with multifaceted dimensions and co-morbid conditions such as hypertension, dyslipidemia, depression, seizure disorders, etc. For example, several antidepressants (paroxetine [Paxil] and fluoxetine [Prozac]) are inhibitors of metabolism when given with drugs me-

tabolized through the CYP2D6 enzyme, such as haloperidol (Haldol), metoprolol (Lopressor), and hydrocodone. Thus, the therapeutic response can be accentuated. Medications that inhibit the CYP3A4 enzyme such as amiodarone and antifungals, can affect the therapeutic response of fentanyl, alprazolam (Xanax), and numerous statins; as a result, the effect of these drugs can be enhanced leading to potential toxic levels.⁵

At times, these CYP450 inducers and inhibitors are commonly ingested items such as grapefruit juice and tobacco. In the case of grapefruit juice, there are numerous medications known to interact with grapefruit juice including statins, antiarrhythmic agents, immunosuppressive agents, and calcium channel blockers. Furthermore, the inhibition of the enzyme system seems to be dose dependent; thus, the more a patient drinks, the more the inhibition that occurs. Additionally, the effects can last for several days if grapefruit juice is consumed on a regular basis. Luckily, the effect of this is not seen with other citrus juices.

Hopefully, this brief review has opened the door to your inquisitive nature on how the liver's enzyme system is effected by numerous medications and why some patients experience clinically significant unanticipated adverse reactions or therapeutic failures.

CYP1A2

Substrates	Inhibitors	Inducers
alosepron, amitriptyline, clozapine, cyclobenzaprine, desipramine, diazepam, duloxetine, fluvoxamine, imipramine, mexiletine, mirtazapine, olanzapine, propranolol, ropinirole, theophylline, (R)-warfarin	cimetidine, ciprofloxacin, fluvoxamine, ketoconazole, lidocaine, mexiletine	carbamazepine, cigarette smoke, phenobarbital, rifampin

CYP2C9

Substrates	Inhibitors	Inducers
celecoxib, glimepiride, glipizide, losartan, montelukast, nateglinide, phenytoin, sulfamethoxazole, voriconazole, (S)-warfarin	amiodarone, efavirenz, fluconazole, fluvastatin, ketoconazole, sulfamethoxazole, zafirlukast	carbamazepine, phenobarbital, phenytoin, rifampin

CYP2C19

Substrates	Inhibitors	Inducers
citalopram, diazepam, escitalopram, esomeprazole, imipramine, lansoprazole, nelfinavir, omeprazole, pantoprazole, phenytoin, rabeprazole, voriconazole	efavirenz, esomeprazole, fluoxetine, fluvoxamine, lansoprazole, omeprazole, rabeprazole, sertraline, ticlopidine	carbamazepine, phenytoin, rifampin

CYP2D6

Substrates	Inhibitors	Inducers
amitriptyline, aripiprazole, atomoxetine, codeine, desipramine, dextromethorphan, duloxetine, flecainide, fluoxetine, haloperidol, imipramine, lidocaine, metoprolol, mexiletine, mirtazapine, nefazodone, nortriptyline, oxycodone, paroxetine, propafenone, propranolol, risperidone, ritonavir, tramadol, venlafaxine	amiodarone, cimetidine, clozapine, desipramine, duloxetine, fluoxetine, haloperidol, lidocaine, methadone, paroxetine, pirozide, quinidine, ritonavir, sertraline, ticlopidine	None

CYP3A		
Substrates	Inhibitors	Inducers
alprazolam, amiodarone, aprepitant, aripiprazole, atorvastatin, boceprevir, buspirone, calcium channel blockers, carbamazepine, clobazam, citalopram, clarithromycin, clonazepam, cyclosporine, dapson, diazepam, disopyramide, efavirenz, ergot derivatives, erlotinib, erythromycin, escitalopram, estrogens, fentanyl, gefitinib, glucocorticoids, imatinib, indinavir, irinotecan, itraconazole, ketoconazole, lansoprazole, lidocaine, losartan, lovastatin, methadone, midazolam, mirtazapine, montelukast, nateglinide, nefazodone, nelfinavir, nevirapine, ondansetron, paclitaxel, pimozide, protease inhibitors, quetiapine, quinidine, repaglinide, rifabutin, , sildenafil, simvastatin, sirolimus, sorafenib, sunitinib, tacrolimus, tadalafil, tamoxifen, telaprevir, theophylline, tiagabine, ticlopidine, vardenafil, (R)-warfarin, zolpidem, zonisamide	amiodarone, aprepitant, cimetidine, clarithromycin, cyclosporine, diltiazem, efavirenz, erythromycin, fluconazole, grapefruit juice, imatinib, indinavir, itraconazole, ketoconazole, metronidazole, nefazodone, nelfinavir, quinidine, ritonavir, saquinavir, sertraline, verapamil, voriconazole	carbamazepine, efavirenz, nevirapine, phenobarbital, phenytoin, rifabutin, rifampin, St. John's wort
